Huston Thompson, formerly chairman of the Federal Trade Commission and an intimate friend of the late President Wilson, contributes another article on the various political issues involved in the damming of the Colorado River for irrigation and the regeneration of hundreds of miles of land that is at present worse than useless.

* * *

A river like the Colorado is like a colossal monster that cannot be harnessed or controlled without disturbing the balance of things somewhere. But politics cannot stop progress. Politics did not prevent Niagara power from becoming a boon on both sides of the international border. (p. 1)

* * *

Senator Borah uses direct methods in most things. He did so when he addressed a message to President Calles of Mexico asking him to define that country's attitude toward American oil men. Calles' reply, which we reproduce, is characteristically courteous and illuminative, and it is remarkably interesting. (p. 3)

* * *

To write sympathetically and understandingly about Orientals one must have an intimate acquaintance with the peoples of the various countries of Asia. A. M. Spoer is thus equipped and his travels and sojournings 'east of Suez' have given him an insight into the Oriental mind that few Occidentals possess. 'The other fellow' is not so bad as he is usually made out to be, and in some cases can give good example to the white man. (p. 4)

* * *

Hugh Walpole appraises the work of the critics and the value of criticism. His conclusions go to show that criticism is of little or no value in a writer's career. Mr. Walpole published his first novel nearly twenty years ago, has come through the literary mill, and ought to know. But it must be conceded that the mere fact that there are critics ready to criticize is a spur to writers to do their best. (p. 6)

* * *

How news stories are collected and passed on to the public is in itself a story worth telling. To have 'a nose for news' is an essential in a newspaper sleuth, but some of the biggest newspaper scoops have been got quite by accident. A newspaper is a mirror which reflects the happenings of the world, but the mirror must be placed in such a position as to catch the reflection clearly. The mirror holder has a big responsibility. (p. 7)

* * *

A mystic in a very modern world seems somewhat incongruous, but incongruity does not mean impossibility. One can be modern, it appears, and still be a mystic. One can build houses, cultivate the soil, grow grapes and still be a mystic. Thomas Lake Harris was a blend of the seer and the business man, and his life story claims the reader's attention from the beginning. (p. 8)

* * *

That Benedict Arnold was not the double-dyed villain that some of the history books make him out to be seems now well authenticated. Randolph G. Adams, custodian of the William L. Clements Library of American History at the University of Michigan, who has made considerable research into the subject, presents Arnold in an entirely new light. Undoubtedly he was unjustly treated during life. It now appears that he has been traduced and vilified after death. (p. 12)

* * *

'Schoolma'ams' are now scarcely ever heard of. Their place has been taken by smartly dressed and thoroughly modern young girls. The schoolma'am was usually a very circumspect lady of mature years. Julian Hawthorne's Aunt Lizzie was one of this type, but she had ideas on education in advance of her time and did not hesitate to put them into practice. She was not a mere teacher; she was an educator. (p. 14)

* * *

Biographers have been busy with Abraham Lincoln for the past year or two, but little has been written about Nancy Hanks, his mother. Her childhood years, courtship and marriage to Tom Lincoln constitute an intensely human story which is an essential part of American history. William E. Barton, Lincoln's biographer, has collected many interesting facts about Nancy Hanks. She had a somewhat pillar-to-post existence when a child, but after her marriage showed herself a good and true woman. (p. 15)

* * *

There is a fish course at the University of Washington, but it does not follow that there is fish on the menu. It is a special training in fish culture. (p. 22)

* * *

Another of the brief biographies of gentlewomen of note of a former generation is contributed by Frances Holbrook Pfeiffer. The Countess of Clifford and Pembroke is the subject this week. (p. 24)

REMARKS BY OUR READERS

James River, Virginia.

In a former issue there appeared an article by Donald A. Laird, 'What's Become of the Old-Time Craftsmen?'

I want to take a little whack at Mr. Laird. Why should he heap demerit upon the craftsmanship of our forefathers? It is indeed from out of their wonderful craftsmanship, and because of it, that our modern production has come.

My machinist friends, and I, in turning and boring, have calipered driving and sliding fits to the ten thousandth part of an inch, and this by the highly developed craftsmanship sense of feeling. Later on the micrometer proved that we were accurate. I have seen a large piston rod of a river steamer, an old river steamer, the threads on it chipped and filed, and produced entirely by hand, with such accuracy that Mr. Laird could not have told but what they were chased in a machine.

If craftsmanship means cunning and skill, did not the workmen of the old day possess it to an admirable degree?

Without our modern machine tools we would have no quantity production; and, more to the point, without the fine cunning of the old craftsmen we would have no modern machine tools to build up quantity production.

It is not a question of our excelling the old-timer in production and machine workmanship. Certainly we do. But for my part, I do not see how it can be doubted that the earlier artificers excel us moderns in the sheer cunning of handicraft.

I would ask Mr. Laird to chronicle the full truth: 'Render unto Caesar the things that are Caesar's'; and give the old craftsmen their just dues.

A Craftsman; by name:
S. C. CARTY.

Fayetteville, North Carolina.

I want to take this opportunity to tell you how fortunate I consider myself to be on the mailing list of THE DEARBORN INDEPENDENT. It is a splendid publication and I enjoy reading it very much. The stories it contains are always good, and the 'Briefly Told' page is especially interesting. I also enjoy the front and back covers.

Tour in Safety and Comfort

The program of safety through right tire equipment, inaugurated by Firestone, is one reason why so many women drive their own cars today, in comfort and confidence.

On the long tour, the reliable, safe performance of Gum-Dipped Balloons is especially appreciated. You have all the health benefits in relaxed comfort. No anxious tension, no nerve-strain; the tires respond to wheel and brake instantly, stopping or starting at your touch. And you will revel in the smooth, easy glide—shocks and jars absorbed by the restful cushioning.

Gum-Dipping is the Firestone process which, by saturating every fiber of every cord in a rubber solution, greatly increases mileage. The scientific tread is especially designed for the low-pressure type of tire. The small units and sharp projections are so placed that they permit easy flexing and insure a safe hold.

Call the Firestone Dealer near you. He is equipped to give first-hand information and advice. Let him explain why Gum-Dipped Tires are "Better" and why you should have them on your car—now!

Engineers' conception of a dam between the walls of the canyon of the Colorado.

The Solution of the Colorado River Problem

By HUSTON THOMPSON

IN THE jam of the last hours of the recent Congress, when the Swing-Johnson bill providing for the control and use of the lower Colorado River was lost, and the battle clouds had rolled away, certain facts stood forth.

First, the opposition to the bill has revealed a close-knit, well-organized group against it that must be considered in all future movements.

Second, it is quite evident that unless the northern group of states, including Colorado, Wyoming, Utah, and New Mexico, had the amount of water they should be permitted to appropriate in the future settled separate and apart from the California-Arizona issue over the location of a flood control reservoir, then the Colorado River problem might continue endlessly in the political arena.

Third, the threat of destruction of the farming interests of the Imperial Valley of California by floods from the lower part of the river is ever present.

—*Wiswall Bros. Photo.*
Grand Lake, Colorado.

Judged by the time that it has taken to construct reservoirs such as the Shoshone in Wyoming, the Elephant Butte in New Mexico and other large reclamation dams, approximately six years would be consumed in building a dam of sufficient height and reservoir capacity in the Colorado River to store the flood waters, protect the Imperial Valley, supply water for irrigation and domestic uses, and create power. Meanwhile the specter of Arizona carrying out her threat to tie up in the courts any legislation looking to the construction of a dam not satisfactory to her continues to stalk in the background.

The question naturally intrudes itself, 'Why wait on possible court action by Arizona? Are there no steps that can be taken of a practical nature which will tend to disentangle this great problem from its political aspects?' I believe there are, if we separate the controversy into three major divisions.

The first is the determination of the amount of water that the four northern states may *now* be assured they can have when they apply it to beneficial use at some future time.

To the uninitiated a word is necessary at this juncture to explain the fear that moves the people of the northern basin. In all of the states interested in the Colorado River problem, except California, there is in force the doctrine of prior appropriation. This commonly means that the first person to take water out of a stream and apply it to reclamation of arid lands, domestic use or power, has a prior right ahead of any person on the same stream any distance above or below who appropriates the water at a later date. In other words, the person above cannot use the water of the stream ex-

—*National Park Service Photo.*
In Rocky Mountain National Park.

cept he first allow for the rights of the prior appropriator below. The citizens of these northern states, fearful that some projects located in Arizona will withdraw from their needs all of the water, before it is necessary or practical for those in the northern states to use it, are insisting that the rights of those in the northern basin shall be determined *now*. Then they can plan the development of their cities and provide for reclamation and power projects for the future with some peace of mind.

The second and most impending problem is the protection of the residents of the Imperial Valley of southern California from destructive floods that threaten and have in the past occurred when there was high water in the Colorado River. Wrapped up in this question are a number of differences between California and Arizona over the amount of water each shall have from the total that is allowed to the southern basin. There is the problem of building a diverting canal which will carry water to the Imperial Valley without going through Mexico; the location of the storage reservoir; the claim of Arizona of the right to tax the use of water power produced in that state; the location of a power plant and, finally, the diversion of the water for the use of cities of southern California.

The third problem is an international one and involves our neighbor Mexico. The Colorado River crosses the Mexican line and empties into the Gulf of California. Contiguous to its banks there are in Mexico great areas of arid land that can be, and some of which are being, reclaimed by diversion of the water of this stream. Her citizens assert vested rights in the amount of water used.

Mexico's claims come within the realm of international accord. Action upon them can be initiated at once. Whatever rights she has now must be finally agreed to by treaty. The question of the construction of reservoir, canals, and irrigation projects in the United States, though of primary importance to us and strictly and solely within our sovereign powers, must nevertheless be arrived at in such a way as to permit us as a nation to accord Mexico whatever rights she may have acquired.

Near the beginning of a great waterway system—inlet of the Colorado River into Grand Lake.

If we face this threefold problem as one great inseparable one, with the whole affair wrapped up in a political maze, practical action on the solution looks a long way off. But if it is approached as three distinct questions, then the solution does not appear impossible or too remote.

The representatives of the seven states involved in this controversy appeared to be in accord over the diversion of the flow of the river, with 7,500,000 acre feet to be allotted to the upper states as one group and a like amount, plus an allowance for water already supplied, to the lower group.

All seem to be of one mind that a storage reservoir or reservoirs should be built somewhere on the river to catch the floods, protect the people of the Imperial Valley, supply water for irrigation and domestic uses and create water power. Finally though with reluctance on the part of some there is no objection to the settlement of the question involving Mexico, if there be one.

With the representatives of all the states apparently agreeing in principle on these propositions, it would seem a simple matter to carry out the details. But Arizona and California have come to grips over the use and control of the water in the lower basin. Utah has allowed herself to be drawn into the controversy and has withdrawn from the Seven-State Compact over the division of the water for the two basins. California refuses to go ahead with the compact until she has the matter pertaining to the location and construction of the dam determined. Arizona threatens to enjoin any steps authorized by congressional action by starting suit.

It is possible that a determination of the first problem could be had with reasonable facility if the method of approach were for any one or all of the states to apply to

French High Finance *and* France's Future

By Our Correspondent in France

HOW different are finance and business! The fact that the ordinary rules of business are violated, especially in great national financial transactions, is most clearly shown by the history of French finance during the nine months in which Poincaré has been in absolute power.

In ordinary business any reorganizer who doubled in terms of real money the debt of a concern would hardly be termed the benefactor of the business. But precisely this is what the so-called 'Savior of the Franc' has done. The great internal debt of France, several times the total exterior debt including war debts to America and England, has in terms of gold been doubled during the administration of Poincaré. When the franc fell to two American cents in the summer of 1926, France was in a panic. Poincaré took hold of matters vigorously, restored confidence, and brought the franc up from two cents to four cents.

BUT the price that France as a whole pays for this restoration is very hard. The *rentiers* of France, those holding the war bonds, may well be satisfied at this process which has made out of every paper income of one thousand francs the double in terms of world prices. But the workers who must produce these francs may not be so content. Twice as much in real value must be produced to pay the interest on the internal debt. This internal debt is the real trouble with the French financial situation and the Poincaré solution may not be so highly regarded twenty years from now as it is today.

There is much French complaint about the terms of the American debt arrangements, particularly as to continuing payments over sixty-two years. But the internal debt is largely in terms of perpetual bonds, designed for the benefit of the grandchildren and the great-grandchildren of the present holders.

No! the rise of the franc from two cents to four cents may well turn out to be a venture which imposes upon future generations a far greater load than was necessary.

In ordinary business the administrator who bought securities which steadily fell in value would not be regarded as a financial wizard. Yet precisely this is what Poincaré has done. Very early in the game the Bank of France began to buy, with French paper francs, gold and silver and foreign securities. Many billions (the exact figures are not published) of paper francs have been issued for securities which today are worth considerably less than when purchased in paper francs. This loss on French purchases of securities nowhere appears in the French financial statements. But that there was great loss cannot be denied.

In ordinary business the manager who reduced the factory's output and threw the employes out of work would not be regarded as highly successful. Yet this is what has been accomplished by Poincaré. The export trade of France suffered such a severe blow that it became necessary to abolish the export taxes. Thousands of workmen have been thrown out of work. While the situation is not so serious as in Germany which enjoyed a more radical financial recovery, nor so bad as in Great Britain which made the earliest and most complete financial recovery, yet the situation in France is serious.

THE French worker's daily wage is so low that few have any resources upon which to draw in the time of unemployment. The full effect of the rise in the franc upon French foreign trade will not be known for some months, but the unemployment has been marked despite vigorous efforts to provide work and also apparently to conceal the extent of the industrial crisis.

One must admit that the wages of workers, measured in terms of gold, have been increased. However, unfortunately, the worker's purchasing is almost wholly concerned with native products. The anticipated decline in prices has not yet materialized. But in many industries wages have already been reduced. Where the daily wage is around a dollar a day, the decrease of eight cents a day is serious; the mine workers have just accepted this reduction.

In some ways the most outstanding financial achievement of Poincaré has been to consolidate in large measure the floating debt. Bonds due within a period of a year or less have largely been replaced by bonds extending over a fairly long period of time. The issue of short-term paper has ceased.

RECENTLY the French purchases of credits in pounds sterling reached such a point that France made tentative steps toward repayment with the object of getting back the gold deposited as security. France desired the gold possibly with a view to use in a legal stabilization; and further the Bank of France pays a high rate of interest upon the full loan, despite the security.

In ordinary business a creditor would welcome with open arms the debtor who threatened to pay. But the French proposal created quite a furore in the British press. Apparently, so some alleged, the French gold was being used as a part of the reserve of the Bank of England. However the French move was only a gesture. When finally the Bank of England was ready to release the gold, no definite offer of payment was forthcoming. But it still remains open to question as to which bank was bluffing.

Recently the French Government had the opportunity to turn over for a period of years the government match monopoly to a Swedish or Swedish-American company. This would have been a real benefit, giving greater profits and better matches. It is hardly possible that there are worse matches than those manufactured in France. However, the best part of the offer of the match trust was to make eighty millions of dollars (yes, *dollars*) immediately available to France in consideration of the acquisition of the monopoly of some twenty years. However the socialists and communists raised so much objection that the project was temporarily shelved.

Cluttered Fields of Conquest

By H. G. SALSINGER

BEFORE the year 1927 was two months old, Sabin Carr, twenty-two years old, a junior student of Yale, and whose home is in Dubuque, Iowa, had pole-vaulted to a new world record. Only a year before, Americans watched Charlie Hoff of Norway set record after record on his tour of the United States and at that time all seemed agreed that it would probably be a generation before another man vaulted higher than Hoff but here was a Yale undergraduate beating Hoff's best mark.

More than two hundred records in the various branches of athletic competition were smashed last year. Most of these were minor records but an equal lack of reverence was shown for major marks; several of them were tossed into the discard. By the end of 1926 few records made in the last ten years still remained on the books. In the standard running events the 440-yard mark still stood while in the field events three weight records had proved better than the best performances in a decade.

Just how far this record making will go no one ventures to predict. All seemed agreed that many more new marks will be established in the future and that each succeeding year will contribute a large quota.

I ASKED four of the leading track coaches to explain this continued wrecking of records and a composite of their answers follows:

'It is not that the race is getting stronger, faster, bigger and better. The race today is no better physically than it was twenty or thirty years ago. The reason for the many new records is heavier competition, improved methods and more rivalry and interest.

'There are one hundred men and boys competing in athletics today where only was one competing twenty or thirty years ago. There are several times as many more coaches today as there were then.

'The modern methods are more scientific and the laboratory has helped considerably. The cinder paths and shoes in use now are much better than they were a few decades ago. All the paraphernalia used in connection with track and field competition has been scientifically improved.

'Rivalry is keen between individuals and institutions and consequently there is a passion for athletic supremacy that was not known in the old days.

'There is glory in being a champion that was lacking years ago. At that time the newspapers gave but a column or so to sport, and track and field meets, when they were held, received but scant mention. Now columns are written about the winners and this publicity has been the factor that pushed many men to new records.'

When the great Finnish distance runner Paavo Nurmi came to the United States a few years ago and began demolishing records, an era of record making such as this country had never known before was the result. Nurmi set the pace and since Nurmi could create new marks every track and field athlete asked himself why he could not do the same. Nurmi set new marks to shoot at and the shooting has been lively ever since.

Charlie Hoff furnished the same impetus last year and this year it has been Edvin Wide, the Swedish schoolmaster and conqueror of Nurmi.

The story of Wide incidentally illustrates the point made by the track coaches. Wide wanted to go to Stockholm. He had no money for transportation and so he walked. He stopped overnight at an inn. He picked up a newspaper there and, turning the pages, he discovered pictures of famous runners. A few columns were devoted to them and Wide decided to become a great runner and get his picture in the newspapers. He began to run and continued running. Nurmi was the greatest of the distance runners and Wide resolved to beat him. If Nurmi could run a mile in 4.12 there was no reason why Wide could not run it in 4.11. That is what Wide argued. He met Nurmi a number of times and lost each time, but last year he caught him in a two-mile race and won.

AMONG the popular track events only one mark has withstood the challenges of the last decade and that is the 440-yard record. This event has an unusual history. In 1900 Maxie Long covered the distance in 47 seconds flat. No one approached this mark closely but later the running tracks were laid out in oval shape and the 440-yard straightaway was abandoned. Long's record was made over a straightaway and when Ted Meredith, the famous Pennsylvania quarter-miler, ran the distance in 47 2/5 seconds his time was accepted as the record, since a runner who goes 440 yards around a turn is handicapped more than two-fifths of a second and undoubtedly Meredith's time was a fraction of a second better than Long's. However, as often as the 440-yard event is run, Long remains the only man who did the distance in 47 seconds flat in more than twenty-five years.

The 16-pound shot is a standard field event and a popular one but for more than fifteen years the weight stars tried to break Ralph Rose's record and failed. Rose was a modern Hercules who came out of California and attended the University of Michigan, where he soon established himself as the best weight performer of his time, and of any previous time for that matter. On August 21, 1909, he put the 16-pound weight a distance of 51 feet in a national amateur athletic meet and it is this mark that the weight tossers have been pounding at ever since but without any success.

Pat Ryan still holds the hammer throw record, 189 feet 6.5 inches, made in 1913, and Matt McGrath's 56-pound weight record, 40 feet 6⅜ inches, made in 1911, also stands, but neither of these events is popular and rarely included in an athletic program. Both hammer throw and 56-pound weight record will probably remain in the books for years to come.

TWENTY-THREE running events are listed in the record books, starting with the 100-yard dash and concluding with the total number of miles and yards covered in two hours. Up to and including the 5-mile run only four records made before 1920 remain. These are Meredith's 440-yard mark, Bernie Wefers' record for the 300-yard event made in 1896, Mel Sheppard's 600-yard time, established in 1910, and T. B. Conneff's record for the 1,320-yard race, set in 1895. But these are odd distances with the exception of the 440-yard run. From six miles to twenty-five miles every record was made prior to 1910. Alfred Shrubb, the great English distance runner, set five world records on November 5, 1904, and all five still stand. They are for six, seven, eight, nine and ten miles.

There is little competition in the events where old records linger, with the exception of the 440-yard run and the 16-pound shot put. Competition causes new records and the stiffer the competition the better the chance for wrecking one of the old marks. When Wide finally beat Nurmi, the loser as well as the winner of the race cracked the two-mile mark. It has frequently happened that two men have broken a record in the same event, one pushing the other.

No record is safe. No one can tell when the limit will be reached. While the race is not getting bigger or stronger, more and more men are engaging in athletics and there

(Continued on page 26)

NORTH CAROLINA:

A Great State Growing Greater

By EDWARD E. BRITTON

Concrete highway between High Point and Winston-Salem.

WHAT North Carolina needs is a press agent,' is the declaration made by one of America's foremost humorists in a recent article appearing in a leading magazine. Be that as it may, the prevailing opinion among North Carolinians is that there is one thing that would be far better than even a superpress agent, and that is—visitors, for it is the confident belief of the North Carolinian that if folk will just come, look, and listen, North Carolina will 'sell' itself without any other press-agenting, declaring that the state has the goods and can deliver.

Buyers and sellers at a tobacco sale, Wilson, North Carolina.

'Facts are stubborn things,' and the cold, bare, unadulterated facts show that North Carolina is making progress with Jack-the-Giant-Killer speed. It is not on the way to making progress, but is right now showing that it has made progress, and that its loins are girded for more progress.

On the great state seal are the words: '*Esse Quam Videri,*' which freely translated means, 'To be, rather than to seem to be,' and the progress that the state is making is in the spirit of that motto. So great is the development that has been made and that is now going on in the 'Old North State' that it challenges the attention and the admiration of the nation. 'Come and see,' is the invitation that it repeats with confidence.

A publication that is meat to the bone about the state has been issued by the North Carolina State Board of Agriculture, this with the title of *North Carolina—The Land of Opportunity.*

This book sets forth a fund of interesting facts, and in doing so it discloses, briefly, the historical background of this great old state, new in the wonders of its progress. There are some points given that are worthy of note:

Making a deep cut for a future North Carolina highway.

North Carolina took the lead for independence. The struggle for freedom from British rule on the part of the Colonies really found first expression in the early rebellion under Durant and his associates around the year 1670, and later was in evidence from time to time. The operation of the British Stamp Act was openly prevented by force of arms in 1766. The royal governor met open defiance, and on August 25, 1774, the people held a convention at New Bern, near the coast in eastern North Carolina, 'to formulate plans of resistance and elect delegates to the Continental Congress.'

The people of North Carolina uttered a note of defiance; on May 20, 1775, the famed Mecklenburg Declaration of Independence was adopted. These North Carolinians backed up their words with their deeds, for on February 27, 1776, they successfully defended the independence of North Carolina by meeting and defeating the loyalists in the battle of Moores' Creek Bridge. On April 12, 1776, another date famous in the state's history, the Halifax Convention instructed its delegates to join 'with the delegates of the other colonies in declaring independency' of Great Britain.

'North Carolina troops,' says the record, 'helped drive Lord Dunmore from Virginia in 1775-1776. They helped drive the British from Charleston. Her militia under Rutherford conquered the Cherokees in the West. Her Continental regiments fought under Washington at Brandywine, Germantown, and Monmouth, and were among the picked men to storm Stony Point under Wayne. Against Ferguson at King's Mountain and Cornwallis at Guilford Courthouse her troops served faithfully and well.'

Freedom accomplished, North Carolina was among the very last of the states to accept the Constitution, declining to enter the Union until certain rights were guaranteed, and bringing into being amendments to the Constitution to accomplish this. Once in, North Carolina took its part in the upbuilding of the nation, and when the Civil War broke forth was next to the last state to leave the Union, joining the Confederacy only when Lincoln began the invasion of the South, electing then to stand with her sister states of the South.

AS ONE of the Confederate states of America, North Carolina led the way. There was no hesitancy on its part and no state surpassed the Civil War record of North Carolina. With its military quota set as 115,369 troops, it sent forward 127,000, one-fifth the Confederate Army, clothed, fed, and equipped them. The state lost more in battle, from wounds and disease, than any other state, its losses totaling 40,305. The Civil War ended, North Carolina was left practically destitute, 'a conquered territory at the mercy of carpetbaggers and renegades.' The North Carolina soldiers returned to their homes and to the dark and discouraging task of again building up their state. Quietly, with no blare of trumpets, but building on a solid foundation, after a half-century and more of patient toil, North Carolina steps to the front as, perhaps, the most progressive state in the Union. It is so, and, without any thought of boasting, its citizens will quietly acquiesce in the statement and back this up with: 'Come and see.'

Out of the plenitude of her vast domain North Carolina gave for the creation of other states, feeling something of parental pride in the newer states of the West and Southwest because of the fact that it has furnished so many settlers who pioneered forth and did men's parts in building up the great West. For a period of some thirty years, following 1800, the population of the state remained at practically a standstill, because of the great number of settlers that left its borders called by the lure of the West. It is the estimate made that more than nine hundred thousand heads of families have gone forth from North Carolina to take their part in other fields in the nation's life. Out of this there is a tie that binds the state to the heart of the nation better than any written document.

North Carolina gave its full quota of volunteers—with many more offering—for the Spanish-American War, and, during the World War, contributed 84,577 men to the Army, 7,312 to the Navy, 621 to the Marines, and many to the hospital and ambulance corps. These men were scattered in every division of the American Expeditionary Forces that fought in Belgium and in France. Its famous Thirtieth Division broke the so-called impregnable Hindenburg line in the most famous battle of the war, while, when the Armistice was signed, the Eighty-First Division was victoriously moving through the Argonne. In that conflict which shook the world North Carolina casualties were 2,645 dead and 4,128 wounded.

While the sons of the state were afield on the battle line the sons and daughters at home were diligent in their services likewise. Citizens of the Old North State gave $160,000,000 in Liberty bonds and War Savings Stamps and more than $3,000,000 to the Red Cross and other societies working to aid the soldiers. Perhaps its two foremost citizens serving the country in the World War were Josephus Daniels, Secretary of the Navy, and Walter Hines Page, Ambassador to the Court of St. James. The stress of the World War over North Carolina again bestirred itself and made progress apace.

FOR years the state has given attention to the subject of good roads, and has made wondrous strides in improving and extending its state highway system, and the statement of its officials, confidentially made, is that: 'In highway construction and maintenance North Carolina ranks second to none in the United States, and with an extensive construction program being actively pursued, will, in a short time, be covered with a network of the highest type roads over which its diversified products can be economically hauled to a ready market. There are in the state more than 50,000 miles of roads, and from this mileage there has been set aside about 6,000 miles of highways which is designated as the state highway system, and which connects all of the county seats and principal towns by the most practicable route.'

North Carolina has authorized the expenditure of many millions of dollars to increase the educational facilities of the state, for North Carolina is not alone in developing and progressing in material things, but is going ahead in the mental development of its sons and daughters, wonderful strides having been made in education since 1900. Its university and state colleges are thriving as never before in finance, in number, in influence. Modern high schools are going up all over the state. Its primary system of education is being expanded, while instead of three or four small district schools these are being consolidated into one large high school in the various districts, motor buses carrying the students to and from the school.

Upon the soil of North Carolina the first white child was born in America, and with this

From GREELEY *to* GUMP

The Pathway *Taken by* American Journalism

By PAUL DERESCO AUGSBURG

'WHAT does Greeley say?' Back in the middle of the 19th Century, citizens in Manhattan and Boston and Washington and Jones Corners were curious and eager to know what the irascible Horace had said in the editorial columns of his New York *Tribune.* Or, if their personal preference was otherwise, they avidly read the opinions of William Cullen Bryant in the *Evening Post,* or of the elder Bennett in the *Herald,* or of Dana in the *Sun.*

'What's Andy Gump doing?' your modern citizen demands, disregarding the first page and turning back to the comic section of his paper. He looks over all the chuckle drawings very carefully and methodically; then he scans the news and features.

THE modern citizen's action is symbolical. It symbolizes the passing of a personal editorial following, the frivolous trend of a jazz-time age, the coming of standardized, syndicate-fed newspapers and, by the same token, the death of an individualized fourth estate. They're turning out papers according to pattern now, and the publisher has only to choose his style and lay down his money.

The last of the great 19th Century thunderers, whose editorials had a national reputation and influence, was Henry Watterson of Louisville. When one thought of 'Marse Henry' he thought of the *Courier-Journal,* and vice versa. 'Marse Henry' and the *Courier-Journal* were one.

IN THE present field of politics the dailies of the larger cities have little influence whatever. In fact, some shrewd politicians have formed the opinion that to be fought by the newspapers is to insure victory at the polls. William Hale Thompson thrived under editorial lashings in Chicago. So it is no longer because of its editorials that a certain paper is bought. Nor because of its more important news, either, for your average reader takes absolutely for granted that every paper on the stand contains *all* the news. The recurring boxes in conspicuous corners of the make-up, calling his attention to this 'scoop' and that, leave him completely cold. He expects to find all the news in his paper, and if some of it is missing he doesn't know the difference anyway!

That leaves the real battle for circulation a contest of features, with which the dailies are becoming more and more cluttered. By features are meant the comic strips, the good-night stories, the joke columns, the advice on love and marriage, the motion picture fluff, the interpretation of dreams—in other words, the endless chain of magazine drool which has not the slightest resemblance to live news. And yet—

'It's the features that sell the newspapers,' is a maxim of the 20th Century, third-decade publisher. Wherefore he goes shopping for the most alluring features he can buy; and to make room for them all he'll even curtail the space allotted to live news.

The market for features has given rise to syndicates which peddle their offerings to dailies throughout the country. It is a comparatively young field of endeavor, developed within the past few years, and yet there are nearly twoscore of such distributing agencies. Their wares range all the way from a couple of 'funny paragraphs' each day to a Sunday magazine filled with exhaustive post-mortems of dead scandals.

WRITTEN features, however, have not the seductive properties of pictures. The publisher who cannot get a string of popular comics for his readers to devour is in sad shape to battle for circulation. The safest way is to run a full page of them—but there are even more strategic methods.

The comic strips are supplied to the subscribing newspapers in the form of mats, all ready for casting. Sid Smith keeps three weeks ahead of publication in drawing his daily Gumps; seven weeks ahead on the Sunday offering. Between times he amuses himself refusing to go on the Chautauqua circuit for $1,500 a day, which is twice as much as Bryan received from the same source when he was Secretary of State.

A product of the war is the eight-column line, by which the public is apprised in large type of the most momentous piece of news available at press time. The eight-column line was both fitting and proper in the days of big battles and attendant important events, but the ordinary run of news since the Armistice has not been 'big' enough to warrant such a display of type.

This typifies the modern newspaper tendency to inflate the value of mediocre news, to cry 'Wolf!' so often that, when a real story breaks, the public either mistrusts its import or fails to appreciate it. Thus it was that an anguished Chicago managing editor, made frantic with a sudden deluge of fairly momentous occurrences, gave birth to that classic screamer across his first page in letters three full inches high:

BIG NEWS TODAY!

Never has a hapless editor's despair been so poignantly expressed as in those three brief words. Reading their message from afar, one could almost see the poor fellow rushing about the local room tearing his hair. Yet subsequent performances showed he paid little heed to the unshakable principle of the fourth estate that you *cannot create news value with big type.*

STILL another development of newspapers since 1914 has been in size. Publications which used to stop at page 16 now contain fifty or more pages, while their Sunday editions have expanded into shameful wastes of print paper. The answer is advertising, which has made money-grabbing gluttons of some publishers.

Benjamin Franklin's Autobiography, the little book that sent James Gordon Bennett and many another young enthusiast upon the journalistic road, would now find a hollow echo in the hearts of most of them. They understand only such literature as Bradstreet and the daily *vers libre* of the stock exchange.

IT'S A long gallop from 1704, when the Boston *News Letter* issued with a single two penny advertisement, to the present day of dollar-coining journalism.

It is the Sunday issues which are the biggest impositions, however, upon a childish public's time and semi-intelligence. If for no other reason than as a conservation measure, federal legislation is needed to limit the amount of white paper which may be desecrated in the publication of Sunday monstrosities.

As long as the public permits itself to be lured by a gaudy colored comic section and similar vapid bait, these time-killing, forest-slaughtering monstrosities will continue their Sunday invasion of the American home.

The Origin of the Twine Binder

By T. W. JOHNSON

BOYS of pioneer days sat around the home fireplace evenings and watched their mothers spin. As the mother sat holding a younger sister or brother with one arm, she would use the free hand to guide the spinning wheel. Now and then the mother thrust her left hand forward and grasped the two free ends of the homespun yarn, and with the aid of the thumb, the index and third fingers she skilfully tied the granny knot.

The tying of the granny knot was an everyday, commonplace part of the mother's household duties in the eyes of those boys. Not so with John Francis Appleby who with his parents had wended his way down the Ohio, and thence by covered wagon across the prairies of Illinois, finally to arrive at Hart Prairie, Wisconsin, in 1845.

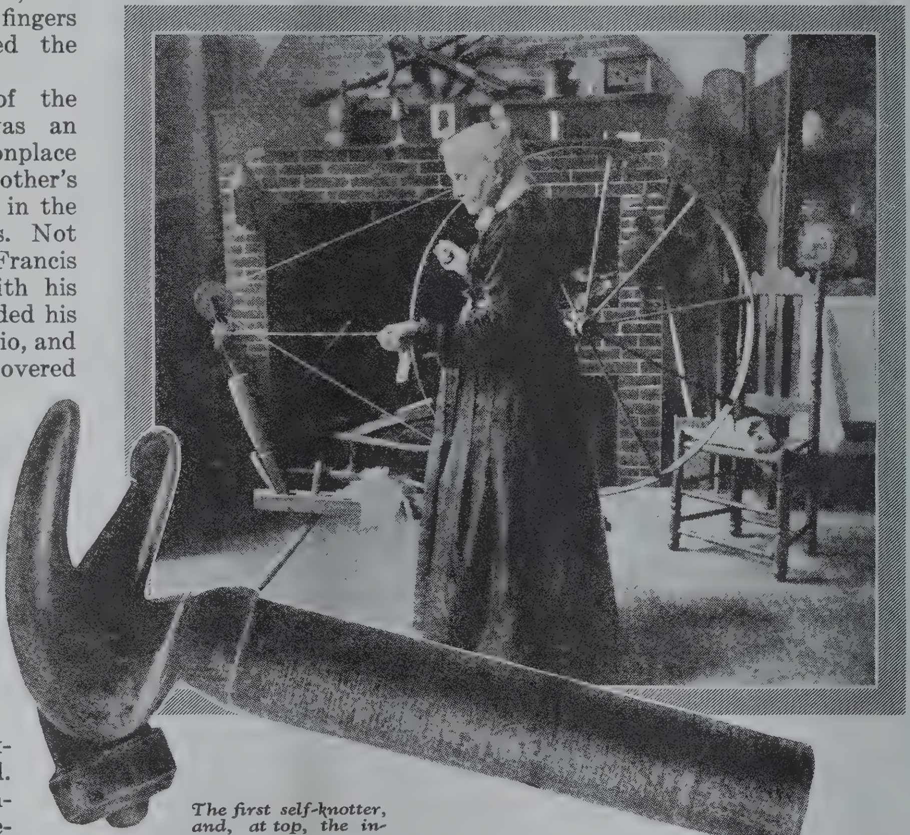
John at an early age had to follow the cradler and tie the golden bundles of grain by the old backbreaking method. From early morning till late evening, he sweat and toiled. One evening as he sat by the home fireplace brooding over his aching back and sore hands a happy thought came to him as he watched his mother tie the granny knot. Why couldn't a mechanical device be constructed to take the place of the hand in tying the knot?

Little did John's mother dream that her simple act would some day revolutionize the grain industry!

John had spent much of his spare time in George Esterly's little machine shop up to the evening he had conceived the idea of the self-knotter. After that, every spare moment he could escape from the duties on the farm were spent at the shop experimenting and dreaming. Perseverance to carry to a finish the germ of an idea was rewarded with the completion of the first self-knotter.

The model was turned out of metal at Palmyra, Wisconsin, by Harry Pierce. That model is now in possession of the Wisconsin Historical Museum at Madison.

Three years passed by, and no self-knotter or self-binder was given to the world. John Appleby enlisted along with hundreds of other Wisconsin lads with the Union armies. Upon his return from war, John went down to the little old machine shop. There he tinkered about, and was in his glory. Years rolled by, and so far as the youthful inventor was concerned the world should never know that there ever existed such a device as a self-knotter.



The first self-knotter, and, at top, the inventor's inspiration.

In the early seventies, harvesters of different manufacture were being produced. They successfully bound the bundles of grain with wire. The eyes of the grain industry and grain farmers were turned toward this new invention. Men boasted that the wire binder would revolutionize the work of harvesting, and even Appleby became enthusiastic over it.

In 1874 a little machine shop at Beloit, operated by Charles Parker and Gustavus Stone, put out an excellent type of wire binder that had been planned by Appleby.

Reports came from far and near that cattle valued at thousands of dollars were dying due to eating bits of wire which had been used to tie the grain bundles. In the process of threshing, the bands had gone through the threshers, and were cut or broken into small bits. These were eaten along with the straw by the cattle.

Explosions in flour mills, claimed by the millers to have been caused by small bits of wire in the wheat, gave another hard blow to the wire binder.

The appalling damage opened the eyes of the Beloit shopmen. Something had to be done. Appleby came to the rescue by offering to construct a twine binder. He secluded himself in an upstairs room of the little old machine shop, and after two months of hard work, completed the first twine binder. The knotter was the bird-billed type which he had conceived when a boy.

The problem of mounting the binder to receive the cut grain was nearly as hard as the construction of the self-knotter. Several months passed before the entire machine was perfected. When the first complete twine binder was all set up and ready to work, Appleby, Parker and Stone hitched up the horses and gave the machine a thorough tryout in a nearby rye field. It worked, and then a war started between the wire and the twine binder men.

Those who advocated wire binders spread abroad the news that the twine binder had failed because the crickets and mice chewed the twine, and this loosened the bundles of grain so that they could not be handled. However, the reports did not daunt the twine enthusiasts, for they came back stronger than ever the following year.

During the latter part of 1878 Parker and Stone made 115 twine binders, and shipped them to various parts of the West, Middle West and Texas.

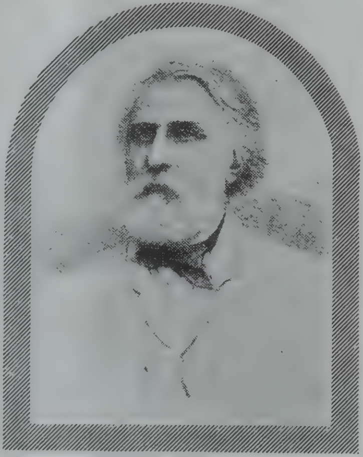
Probably a million or more self-binders are now in use each year, all because a farmer lad watched his mother tie the granny knot.

Great Figures in FICTION

Bazarov and Colonel Sellers

By LEWIS WORTHINGTON SMITH

IN THE main, Russian novels are revolutionary. Their protest against the existing order is bitter, gloomy and violent; it is seldom thoughtful and restrained. Turgenev had more of the artist's poise than Tolstoy or Dostoievsky, and his revolutionary preoccupation was therefore less passionate and better disciplined. He saw the need of change, but he was not temperamentally destructive. He traveled and was fond of the English. His novels exhibit a literary technique such as he might have learned from English writers. Quite possibly he was affected by the English feeling for balance, for measure, for moderation, the English distaste for violence and clamor.



Ivan Turgenev.

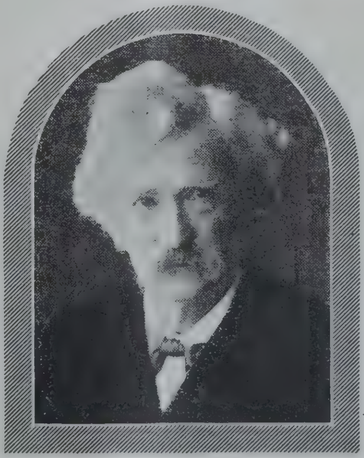
In this he so far differed from his fellow writers in Russia that, on the publication of *Fathers and Sons*, they were bitterly displeased. The outstanding character of that novel is the skeptical Bazarov. From him and the social and political creed that he professed the terms 'nihilist' and 'nihilism' are derived. In the history, not only of Russian literature, but of social and political as well, Bazarov is a notable creation. He has studied medicine at the university in St. Petersburg and has brought back to his rural home a scientific and materialistic outlook deriving from the West. His scientific studies have reduced life to a mechanical and chemical phenomenon. Such a life contains no certain social values, moral values, emotional values, esthetic values—simply no values worthy of being accepted and maintained. The old motives by which men have been animated in their loves and hates become altogether questionable.

Bazarov visits at the home of his fellow student, Arkady, and explodes his radical ideas before Arkady's father and uncle. They think the thoughts of an older day. Bazarov's skeptical and materialistic attitude angers the uncle, and saddens the father. They are disturbed because Arkady has fallen under his influence. Intellectual hatred and Bazarov's attentions to the mistress of Arkady's father culminate in a duel between the former and the uncle. It is a natural outcome of the struggle that in other forms takes place everywhere between youth and age.

In *Fathers and Sons* this conflict is peculiarly Russian. The gap between the ideas of the younger university men and those of their elders, between the oncoming materialistic negation and the sanguine romanticism that has been, is tragically greater than any such gap can be in our Western world.

Despite Bazarov's skepticism and detachedness, he yields to some of the fascinations to which men are liable. Madame Odintsov attracts him.

'All people are like one another,' he tells Madam Odintsov, 'in soul as in body; each of us has brain, spleen, heart and lungs made alike; and the so-called moral qualities are the same in all; the slight variations are of no importance. A single human specimen is enough to judge of all by. People are like trees in a forest; no botanist would think of studying each individual birch tree.'



Samuel L. Clemens.

While he reduces life to a uniform colorlessness, he falls in love with Madame Odintsov. Theoretically that is a thing impossible for him. He has thought of romantic love as a lunacy, an imbecility, a sort of deformity or disease. None the less he finds himself surrendering to it, possessed by it, driven by it. The torture of it is double, because it is a negation of the negation to which he is intellectually inclined. It is a further torture because, when his passion forces him to declare himself, Madame Odintsov does not encourage him. His philosophy does not now suffice to give him tranquillity.

So he became something of a hero. Possibly his heroism is that of disillusion, and it is notable that, dying of typhus, he begs Madame Odintsov, who has compassionately come to see him in his illness, to 'breathe on the dying lamp, and let it go out.' When he has felt her lips on his forehead he is comforted and so passes into forgetfulness.

Bazarov discovers, and at the same time rejects, the truth, that it it quite as futile to defy the humanity to which he is born as it is to defy the disease by which he is being borne under.

The enthusiasm that Bazarov repudiates is the mainspring of character in Colonel Beriah Sellers of Mark Twain's and Charles Dudley Warner's *The Gilded Age*. Bazarov is a product of the cramped life of Russia; Sellers is a product of the expanding life of America. His optimistic zeal has its initial revelation in the kindred optimism of Squire Hawkins. In the little Tennessee village where the story opens life moves at so slow a pace that Hawkins is unwilling to wait for it. Sellers has gone on to Missouri and is urging him to follow. He decided to do so; reporting to Mrs. Hawkins his in-

In the Face of Difficulties

TO TACKLE difficulties with zest and vigor is to set out on an adventure which may not have the results hoped for but which will have its compensations in the additional experience gained and the joy that accompanies healthy effort. Difficulties should not dismay men or women who possess healthy minds and bodies and who are in full possession of all their faculties.

Every fresh difficulty is but another gateway to opportunity, a chance of accomplishing something in which others have failed. Not only this, it affords the prospect of performing some service which will be of lasting benefit to one's fellow men. Besides, when you have set out to solve some problem you never know what discovery you may stumble across in the course of your search.

ONE should not be turned aside by difficulties from the pursuit of some legitimate object. A thing would not be worth pursuing at all if the road were open and easy. When one does not attain the object in view the world may call it failure, but some of the greatest discoveries recorded in history have followed closely on the heels of failure. In an unsuccessful search for one thing another of far more value is sometimes found. The joy of adventure comes to those who tread unknown paths, and this desire to open up and explore fresh avenues of discovery has proved an incentive to men of enterprise since the beginning of time.

The joy of adventure has proved an incentive to men of enterprise since the beginning of time, and some of the greatest discoveries have been made while searching for something else that was never found. Columbus set out to find the Indies and discovered America, the Philippines were stumbled across by Magellan after he had sailed through the straits which bear his name, and arctic explorers looking for the Northwest Passage were the first to realize the possibilities both agricultural and mineral of the northern half of North America.

It has been the same way in the region of science. In medieval times chemists were spending much time and effort in search of what was called 'the elixir of life,' which was to make men live forever, when they made some of the discoveries that are now part and parcel of the physician's equipment. The search for the 'philosopher's stone' which was to have the power of turning lead into gold, and similar feats, has had similar results.

Were there no difficulties in life there would be nothing to be won and no credit to be gained. Were the avenues to success too easy the path would scarcely be worth exploring. Besides, so many would be traveling it that it would not be worth while.

People are fond of talking about the joy of life, of enjoying themselves, of having a good time. They run after excitement and pleasure and the more they get of it the less they are satisfied. They work harder in finding how things ought not to be done than in seeking a way to do them right.

It is just as exciting to follow up a difficulty in search of a way out as it is to run after a so-called pleasure with the idea of taking part in it. When people talk of enjoying themselves, of having a good time, they themselves scarcely know what they mean. Enjoying themselves is sometimes another name for hard work that is entirely profitless. And having a good time is often in reality having a very bad time.

In tackling difficulties a man has to be sure that he is not wasting his energies in chasing a shadow. After years of research a man may think that he has made a discovery when the fact is that he has merely come to the end of his line of thought and arrived at a conclusion that others have reached many years before.

Men tackle financial problems. They are in search of a formula which will not only straighten out the finances of the country in which they live but which will solve all the money problems of the world at large. Here, there and everywhere are men who have occupied their spare hours with the great subject of money. Farmers, storekeepers, mechanics, editors collectively roll up a mass of research and speculative literature on this subject.

But the only remarkable thing about the majority of these financial cure-alls is that they are not new. They are not discoveries at all. Other 'financial experts' have already traveled along the same lines and arrived at the same conclusions.

Other futile discoveries are made. The department at Washington which deals with patents is cluttered with models and plans of 'discoveries' that have never been put on the market and never will be. But at the same time these futile inventions represent ideas and these ideas may some day lead to others that can be put to practical use.

Take flying for example. Men have thought of navigating the air from Scriptural times and efforts to do so are recorded in the Greek myths. Failure followed failure all through the centuries, and it is only in our own time that discoveries have been made which have made aerial transportation possible.

We see from this that in the pursuit of some definite object it may take thousands of years before all difficulties are overcome, but this does not mean that the vigor with which they are pursued should be in the least diminished.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

EDITORIALS

OF THE DEARBORN INDEPENDENT

They Watch Through Eternity

TEN years have passed since United States troops first sailed for France, and once more Americans are flocking to the land of the tricolor. Boat after boat is following the trail blazed earlier in the year by Lindbergh; the streets of Paris are beginning to sparkle with the bronze of the American Legionnaires. The convention is a momentous thing—one long to be remembered.

And yet there is an eternal convention of American soldiers in France—the convention of those who sailed but did not return. Row on row they sleep; and so they will remain throughout eternity. Their comrades are returning for a moment only; but theirs is the watch of the dead. So long as they rest in French soil, neither America nor France can forget the common cause for which they died.

Heroes and Hero Worship

WEBSTER defines a hero as 'a person of distinguished valor or fortitude.' But a man may be a pirate, a smuggler or a highwayman and still be brave enough. One is struck by the widely divergent angles at which historical personages are viewed. The Scots regarded Wallace as a national hero, but the English king looked upon him as a rebel and marauder and had him hanged, drawn and quartered. Sir Francis Drake was acclaimed as a hero by the people of England, but the Spaniards regarded him as a common pirate. Heroes do not always possess the god-like qualities attributed to them. But to become a hero, a man must have evoked the gratitude and admiration of someone. Hero worship is among the most ancient of the cults that survive today.

Exchange Journalism

CONSIDERING their enterprise in other directions, it is rather strange that newspapers have not adopted the idea of Exchange Reporterships. It is apparent from contact with newspapers that such a system would add greatly to the efficiency of the daily press. No city now is self-contained. We have motor centers and pickle centers and steel and textile centers and agricultural centers and financial centers and political centers and propaganda centers, knowledge of which outside them is dependent on what comes over the wire. Rumors that fly abroad and that arrive at newspaper offices by every kind of channel are impossible of judgment, there seldom being on the staff a man of first-hand knowledge of the probabilities. If newspapers in the pickle center could exchange, say, two of their best young men with newspapers in the motor centers, and permit them to undergo an intensive process of getting acquainted with industries and conditions away from home—acquainted, not as hurried travelers looking for a story, but as guest reporters working along the regular lines—it would make for a broadening view of our country as a whole. As it is, newspapermen get a semblance of this by becoming something very like tramp reporters.

The press of the country needs more of research and less of reporting just now. Very much of what it reports is not true, but it does not know that. It knows that it gives a true report of what it receives, but it has no standard by which to judge the truth or completeness of what it receives. There are industrial organizations in this country that no longer rely on the press, because the press will no longer dig to the basic strata of the facts with which it deals. The newspaper is so vital to the country, and instant confidence in it may become so necessary in a moment of emergency, that no means should be spared to bring it to a higher degree of service and reliability than ever before.

B. Franklin—Enlightener

IT IS interesting to note that the theory held today of the mechanics of tornado formation and procedure coincides exactly with that advanced by Dr. Benjamin Franklin in 1753 or thereabout. In the complete edition of Dr. Franklin's works is a diagram to illustrate his theory. But the text itself is so clear that the drawing serves only as an extra guaranty.

The general conception of Dr. Franklin as a provincial Hogarth takes in only one relatively unimportant part of his character. His title of 'philosopher' is thought to refer to his capacity for homely wisdom. In fact, it refers to his contributions to physical science. The examination and explanation of natural phenomena was in his day regarded as a philosophical function. What opened the doors of the Royal Philosophical Society to him was his invention of the lightning rod and his electrical experiments in general. His scientific activities comprehended a great deal more than the study of lightning. In his correspondence he tells of experiment after experiment made by him with electricity generated in his laboratory. He observed its effect on fowls, metals and other creatures and substances. He tested and classified materials according to their conductivity. He used electricity as a curative force in paralytic diseases.

Moreover, he wrote about his activities and speculations in such admirable language that one would wish to see modern discoursers on scientific subjects take him for a model. Even when he makes use of terms evidently contrived by himself, one follows him more easily than one could possibly do Bertrand Russell or any other contemporary enlightener of the people.

By JULIAN HAWTHORNE

When Booth and Irving Acted Together

—Culver Photo.
Henry Irving as Hamlet.

A SMALL boy sat in front of a vast green curtain which glimmered, waved and wrinkled mysteriously, suspended between two worlds. He was in the midst of a hollow space, extending around and above him, filled with hundreds of people sitting hushed and waiting like himself. He was hardly conscious of them; his soul was intent upon the green curtain, behind which the world of dreams was to come true. The curtain, therefore, had a fascination of its own—it was a symbol of the veil which hides all that man desires to know. The moment before the revelation was a great moment for the small boy; such a moment as comes only once, but is never forgotten.

This was seventy years ago, and of the hundreds who sat there with the small boy, few besides himself remain. For aught he knows, the great old Drury Lane Theater in London has itself passed away, and Grand Christmas Pantomimes are no longer presented to a generation which disbelieves in fairies and whose ideas of drama have changed since then.

I saw something of the drama as it was, and am here to give the present age a few glimpses of it, imperfect but authentic. Inasmuch as the Grand Christmas Pantomime of the year 1856 was the first dramatic performance I saw, I will begin with that. It was entitled *The Grasshoppers Feast and the Butterflies Ball,* and historic Drury Lane Theater was packed to see it.

Historic, yes! Old Sir William Drury gave his name to the Lane, in Henry the Eighth's time; and Christopher Wren designed the building in 1674, after the first one was burned down. It was in that year that Robert William Elliston was born, and on its stage, in due time, he acted all the great characters of tragedy and comedy. Then, one after another, came the Kembles, the Keans, Grimaldi, Helen Faucit and Ellen Tree, Vestris, Macready, and in its halls are busts and statues of them.

On Twelfth-night, January 6, there used to be provided a great cake, cut up and eaten by the company. But all that was before my day, and Drury Lane, instead of being a 'main artery' of London, as when Sir William Drury built his house there, was the Gin Lane of William Hogarth, as I first saw it, with drunken drabs reeling in and out of its dives, with infants, also drunk, on their shoulders. But the walls of the great theater still rose up from it, and the greatest actors played in the greatest plays there, and during the Christmas holidays, there was the Pantomime. The small boy who witnessed *The Grasshoppers Feast and the Butterflies Ball* knew nothing of what had been; the palpitating hour was enough for him.

The wings of the butterflies were six feet across; they sat upon gigantic flowers and waved them softly, the gorgeous colors glowing in the magic light. The grasshoppers were as big as people, and might easily have taken a hundred yards at a hop, but they contented themselves with crawling about and making themselves agreeable to the butterflies. The woodland dell in which these magnificent insects held their ball was on the same scale—blades of grass tall as trees, and moss like a tangled forest; violets of the diameter of cartwheels, and daisies big enough to hide under. The waltzes, polkas and Sir Roger de Coverleys of this ball must take place in the upper air, there was no room for them in the dell.

But while the preliminary courtesies and flirtations were still going on, and partners were being chosen, there was an appalling interruption: a terrible monster—two of them indeed—as large as crocodiles but having the form of toads—crept into the midst of the happy company, bringing terror and disaster; the beautiful insects would be torn in pieces and devoured! The valiant grasshoppers sprang to defend the butterflies, but they were powerless against the jaws and claws of the monsters. The small boy might have rushed to their aid, but at that moment a stupendous thing happened.

In mid-air, over the heads of the combatants, a wondrous and beautiful creature floated into view: she could be no other than Titania, queen of fairies; and she waved her wand. Instantly there was a miraculous transformation: the grasshoppers split open fore and aft and became handsome youths; the butterflies had laid aside their wings and were pretty maidens; and the toads were two ugly old men, threatening the merrymakers with pitchforks.

Another touch of the wand, and the prettiest of the maidens underwent a second change into an adorable being, almost as lovely as Titania herself; and her partner glittered from head to foot in a skin-tight suit of kaleidoscopic colors; there was a sword in his hand, and he pulled down a black half-mask over his eyes. Columbine put her hand in his; he flourished his sword over his head and in the twinkling of an eye the two had vanished, and the woodland scene with them.

WE were now on a village green, with rustic cottages, and in the midst a huge yew tree, upon the bark of which Harlequin smote with his magic sword; it opened and the lovers entered; it snapped shut again in the faces of their malignant pursuers and we were off again into a series of thrilling adventures, always escaping with barely an inch to spare, under apparently insurmountable obstacles—until at last Titania reappears, the lovers become a Prince and Princess, and Clown and Pantaloon shrink back into the old toad and his mate, to be lost in the glory of a sparkling Paradise.

Down came the great green curtain; the Grand Christmas Pantomime was over, and the small boy was himself again—but never quite the same small boy that he was two hours before, 'For he on honeydew had fed, and had drunk the milk of Paradise.'

* * *

Not until after several years, and on the western side of the Atlantic, did the boy, no longer small, again await the rising of the green curtain. The auditorium was as vast and as populous as before, and perhaps the boy was almost as tremulous with anticipation; but the people around him were Bostonians, unprejudiced, but unimpassioned. They would recognize merit when they saw it; if they didn't see it, they wouldn't hiss, or throw eggs, but would get up one after another, quietly, and walk out, and return to their homes on Beacon Street.

—Brown Brothers Photo.

Edwin Booth.

However, the Boston Theater seldom disappointed its patrons. And the public was favorably disposed toward the young son of the famous Junius Brutus Booth; he had been on the stage since his sixteenth year, though little known as yet in Boston. So they had laid aside their volumes of the essays of Emerson and the sermons of Channing, and were assembled to deliver their verdict on the young man's performance of Sir Edward Mortimer, or *The Iron Chest*. It was a tragedy, with a slight leaning toward melodrama; a bit antiquated perhaps in this year 1863, but one mustn't expect always Shakespeare. We hoped to be agreeably entertained at least!

THE boy, by the indulgence of a benevolent friend—his father's publisher in fact—had a good seat, well forward, and he was all agog; less because he knew anything about Edwin Booth than because he was under the spell of the theater, home of imagination, where things happen and persons appear not in obedience to dull laws of necessity but in response to the summons of the enchanter's wand. After the tedium of logical fact, how exhilarating is the emancipation bestowed by free fancy! Though Oliver Wendell Holmes might jest,

> Here every foundling finds his lost mamma,
> Each rogue, repentent, meets his fond papa,

I have seen the cheery little philosopher with tears on his cheeks at the tragic power of Ristori or Charlotte Cushman; yes, and shouting with joy over this very Edwin Booth's portrayal of Petruchio; or chuckling in helpless glee at William Warren's prodigious humor. Whoever has a soul is at the mercy of the drama—as Charles Reade so tellingly showed, long ago, in his *Peg Woffington*. But I am speaking of drama as it was two generations ago; I hold no license to comment on or to criticize what claims to be drama, dramatists and actors today, or since the Russian Revolution.

Havana, showing the Prado, the principal thoroughfare, and Morro Castle in the distance.

Housekeeping *in* HAVANA

By KATHARINE HAVILAND TAYLOR

WHEN I started for Havana I knew I was going to the Havana that most people miss, which I anticipated with great pleasure. I hate the stereotyped and the usual—Cook Tours, American hotels (in foreign countries) and tourists, and I knew I wouldn't encounter any of these antipathies because I was to use the apartment of a friend who was visiting in the States, and she had told me what to expect.

'You won't find any Americans in the Cerro,' she said, 'but you have enough Spanish to get on (she was very cheerful and sure about it) and the situation is convenient. There is a grocery below and you can buy there, if you want to eat at home. There's a fruit stall across the street, too; and the grocery man, whose name is Carlos Plats, will bring up the ice and milk. And by the way,' she added, 'you don't even have to go downstairs to shop if you don't want to—there is a little window in the court, and you can open that if you prefer, and call down, "*Carlos, quatro botillas de lager.*" '

At which I laughed.

'You'll get on all right,' said Florencia, with a most encouraging and sweet little nod, and we did, my mother, my brother and I. We went to the Cuban's Havana, met only Cubans, who spoke only Spanish; ate their food, learned their ways and loved everything.

Housekeeping in Havana is a bit different from housekeeping in the States and I think we could learn a good deal from it. The power of the sun has taught the Cubans how to economize energy in hot times. Why, in the southern climates especially, do we of the States use rugs in summer? I saw no rugs in Havana, and I was in a good many houses. Instead I saw tiled floors, where the mellowed color of the tiles kept all feeling of bareness afar, and where one got the most delightful sense of sanitation.

These floors, in a well-kept house, are mopped every day, and they should be; for the houses are built upon the streets, the doorways are open, and the world and its dust is ever with one. I saw no hangings or shades in windows but often opalescent glass in the small panes or wooden shutters outside. The effect is not bare, or the light glaring; but gives an impression of spotlessness and delightful simplicity, increased by much wicker and little or no upholstery in the furnishings.

The ceilings are incredibly high—and they keep a breeze going. The roofs are flat, and it is upon the roofs that one hangs the wash, the dish towels, dries one's hair, or, if in a pensive mood, stares up at the stars to wonder at it all.

When one gets up in the morning—a little languidly, for it is hot in Havana—after one has tubbed in a perfectly appointed, modern bathroom, and has slipped into one's coolest, no-sleeve frock, there is breakfast. This means Cuban oranges which are deliciously sweet and Cuban bread, which is rather too white but which has a lovely crust. Cuban butter—or the Cuban butter used most—has stamped upon it, 'Marca de Brookfield,' and is the same brand to be bought at home. But price—let no one think Cuba a place to economize! Any grocery proprietor would be a millionaire within six months—if an *American* family moved into his neighborhood.

The meats are troublesome to deal with, especially for people who keep steaks under a layer of olive oil for days before they are cooked. Cattle are killed and sold in one day (under penalty of law) and the meats are ferociously red. I ate fish for the most part.

The chickens are good, as are also the cheeses. We found that fruits, cheeses and salads made the best diet. A somewhat woolly lettuce, bought from a Japanese fruit dealer, fixed with native tomatoes, small native tomatoes because they ripen so quickly in the sun, and the invariable French dressing and a rarebit was our usual menu. If we were hungry, after that we braved the sun of the balcony to look for dessert.

NEARLY everything one can imagine is sold in the streets—would you like an ice? Then wait for the cart that is driven by a man who pipes a tune as sweet to the children as that of the Pied Piper of Hamelin. Call, and the cart comes to a standstill when you may select your ices.

Or would you like a pastry? You wait a bit longer, perhaps, until the boy comes along with a little glass show case balanced on his head. At your signal he takes this down, and upon the tripod legs which sat atop it he sets his case, and behold you have a counter!

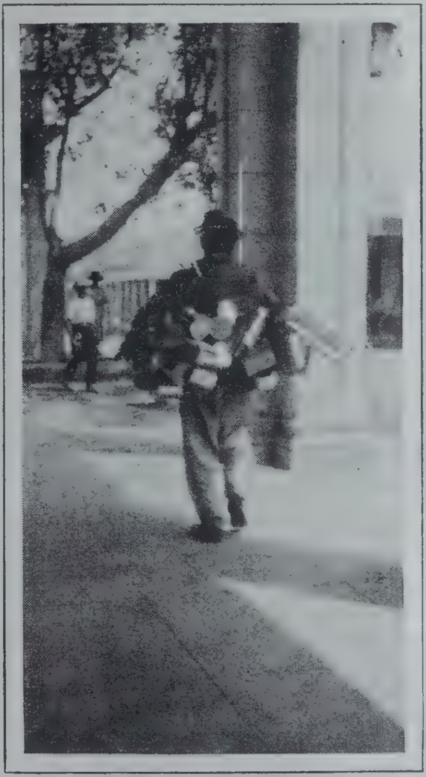
Or needing a pan, or a bath towel, you wait a bit longer, just a little bit longer, and sooner or later the vender of *anything* you might want will make his appearance.

All the things you have ever seen are peddled to make housekeeping in Havana a delightful adventure, and with these are many things, I shall venture to say, you have never seen. They were new to me, and I've lived in Italy, in England and around the States.

Here, in Havana, Jose turned in.

There is a cone made of a sweet, brittle pastry peddled by a man who plays a tune on a bit of iron, triangular in shape. (The children love him.) These are *barquillos*, long twisted spills of crisp pastry, and these—three, wrapped in glazed paper—always appear with ice cream. There are sweets more unusual to us than the famed guava, fruits of too long a list to mention, and everywhere, as in all tropical countries, there are wines.

You make your call in the afternoon (for that is a part of housekeeping, or homemaking, in Havana) and you are proferred a tiny glass of wine, which is taken as the frankly interested passers-by stand outside the beautiful iron grill at the window to stare at you as you drink it.

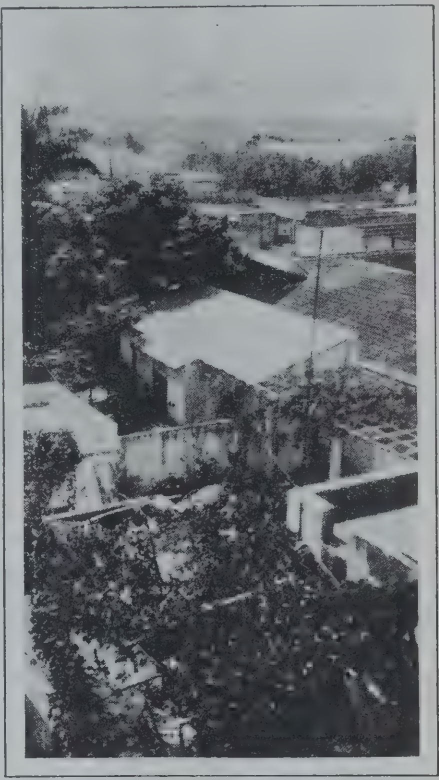


A hardware store.

My brother went to have his hair cut, and the barber sent out for a small glass of wine to offer him.

My mother went to see an old Negress about doing our laundry, and she was offered a glass of wine by her. It is—'the courtesy.' The laundry wagons, by the way, are often the tops of kinky heads.

At night, you may go to a Cuban restaurant, which is opened, if on a corner, on two sides to the street. Here, with the breezes that always play after sundown sweeping softly over you, you order—after you are a bit used to Cuban ways, and know what is good in Cuban housekeeping—fruit cocktails, fried bananas (green or ripe, as you like), red snapper steak (an unusual grilled potato comes with it), sautéed spinach, a little salad, no? No—instead, a *pina colada;* a fruit drink made of pineapple, a most delicious nectar if you order *pina colada sola, sin agua* (pineapple juice alone, without water); and then, a guava-banana ice cream, or a piña, or a cream made from one of their various melons, if you enjoy a heavy ending for your meal; and coffee—but don't expect to like that. It's a paste and a little rank, and made, I think, to stimulate a race whose energy is depleted by too much sun and too many delightfully comfortable places to sit.



The roofs of our neighbors' houses—so much on them!

HAVANA is a glory in itself. One could stand even the idle silliness of hotel-lobby life in Havana, if one had to; the city is so surprisingly foreign, and so full of the antique. The streets, in some quarters, are narrow and old; the houses reflect every color of the rainbow; the old cobbles, the deep ruts, the happily bare babies—all make it a small edition of Italy, but gayer and louder, in both color and tone. The only things I saw in Havana not to my liking were the famed and big hotels.

These, on entering, were New York. The food compared in no way with the Cuban cooking. They were filled with Americans who were eating ham and eggs, and that is *not* the way to see any new town or country, or to hope to *feel* it.

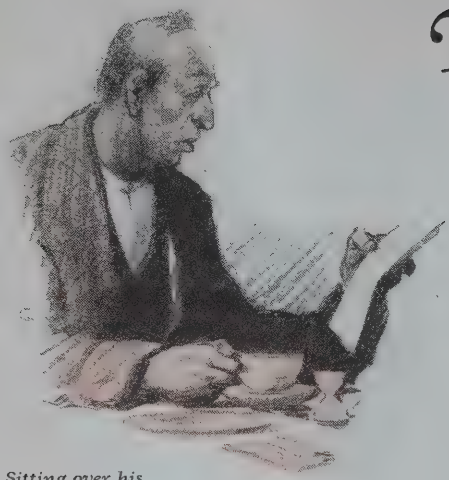
The Dyspeptic CRITIC

By HUGH WALPOLE

Illustrated by W. W. CLARKE
Copyright, HUGH WALPOLE



Sitting over his morning egg and reading.

I HAVE been occasionally asked what was the most romantic thing that ever happened to me. The adventure I am about to describe would nearly win the prize I think. It began in this way.

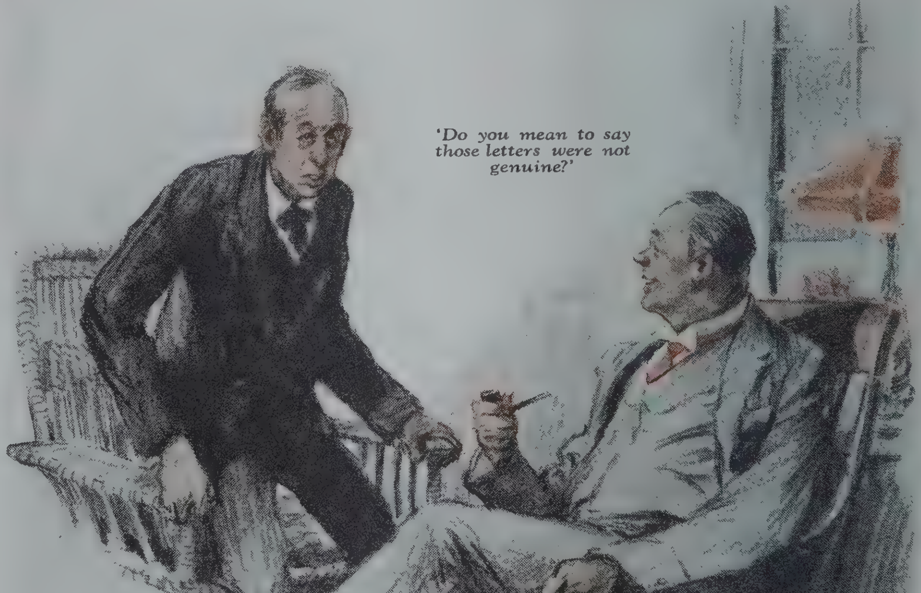
Two friends and myself, bound with the Universal Unemployment ties, spent some of our idle time by endeavoring to help our companions out of difficulties into which their temperament led them.

The hero of this little adventure was one Everard Tallboys.

Tallboys at this time must have been about thirty years of age, was reviewer on the *Athanasian*, the *Blue Review*, *The Protestant Weekly* and the *Quid Nunc*. He was also responsible for two published dramas, *The Queen at Bay* and *The Scarlet Fool;* a volume of verse, *The Lute at Dawn;* three novels, whose names I have forgotten, and a critical book, *William Morris & His Times*. I had seen him on one or two occasions at literary parties and we had once exchanged a word or two of rather heated discussion about a plate of sandwiches which I wanted for a lady and he wanted for himself. He was long, thin, black-haired, with a piercing, bitter nose, eyes grey and cold, and teeth slightly discoloured. His clothes were shabby and his hands not overclean. I am aware that this is not a pleasant description, and indeed I have seldom, in all my literary experience, seen anyone whose appearance was more thoroughly unwholesome and musty than that of Everard Tallboys. His favourite attitude at a party was to stand in a corner, balancing himself on one leg like a stork, look superciliously at the people around him, and say as little as possible to anybody. He had made that important discovery that if you want to be taken for a clever man, the less you say the better. It is the garrulous who are the fools, and Tallboys very quickly obtained a real reputation for wisdom and sagacity by dealing entirely in monosyllables and by saying, 'Do you think so?' in a high, shrill voice to anybody who was courageous enough to offer an opinion.

It will be seen quite clearly that I did not like Tallboys, but I did like him afterwards, as the story will show. It proves perhaps that I wronged him in the first place through ignorance. But, after all, if you never say anything and never come into close quarters with anybody, you stand a risk of being misunderstood; Tallboys was misunderstood by a great many people. He first appeared as critic anonymously and committed, in my opinion, the unpardonable crime of reviewing the same book in various different papers without signing his name, and as he invariably disliked the books that he reviewed, it may be said with truth that somewhere about 1915 almost all the more critical press began to be abusive to current works of fiction, and in many cases to poetry and belles lettres. Then he was forced out of his anonymity, was taken up by Hallard, the editor of the principal literary weekly, who thought that there was a great deal too much general praise of inferior work going about, and in the years that followed the Armistice, Tallboys could be discovered in all sorts of papers, sneering and carping and damning, with a languid superiority that enraged all sorts of suffering authors but did himself great credit. At the same time, such is the impulse of his genius that he was for himself rather unfortunately driven into creating works that went to other people for review. These works were of a universal mediocrity. The plays were in the good old pre-Raphaelite tradition admirably illustrated in Max Beerbohm's *Savonarola*, the novels were in the weaker realistic manner, giving excellent descriptions of tables, chairs, and stair carpets, but leaving something to be desired in the analysis of the human beings who used these pieces of furniture. As to the volume of verse, by general consent the less said the better.

Our writers in general have many very obvious faults; they are weak, vain, credulous, sensitive creatures, but they have good points too, and taking criticism in general, a rather touching faith in the authority and honesty of their critics. It is, however, difficult for them to be patient when a critic comes bearing in one hand abuse of their work and in the other examples of how it ought to be done, examples thoroughly mediocre and incompetent.



'Do you mean to say those letters were not genuine?'

By the end of 1920, Tallboys had nearly as many enemies as Lloyd George. Just at this time, for some reason or another, his photograph began persistently to appear in some of the illustrated papers: 'Mr. Everard Tallboys, the eminent critic.' 'Everard Tallboys, one of the brightest of our younger critics,' and so on. There was something about Tallboys' face in these photographs which caused simple men to long to set to work upon it, to do something to the superior nose, to stretch yet a little farther the protruding ears, and to snatch a tuft or two from the already thinning hair. I am sure that Tallboys himself was quite unaware of the indignation that he was exciting; the small fragments that came to him probably stirred his vanity and made him feel himself to be a real force.

ONE evening, I sat next at dinner to A. E. P. Braun, that well-known and justly popular young writer of romantic fiction. Braun was almost laughably like his name, thickset, bull-necked, his nose crooked, from his contest at the National Sporting Club with young Minards of Plymouth, his mouth too large for his face, but a smiling, genial person, pleasant to meet and talk to. Now most writers of romantic fiction in these days care nothing for the critics, but Braun had in his manly bosom a real ambition to be considered by the superior papers an elegant writer. It was true, as he said to me, that his favourite subjects, Spanish Treasure, Pirate Ships, and the '45 Rebellion, were not entirely suited to modern realistic methods, but he did write, he maintained, a great deal better than these literary fellows pretended.

TALLBOYS had especially got upon his young nerves. That night at dinner he unburdened himself to me. Tallboys had published in the *Quid Nunc* only the week before an article purporting to examine the reasons for the popularity of certain novels; Braun had been one of his victims. He had decided that Braun was popular because of his *naivete*, love of platitudes, and execrable English. 'Damn the fellow,' said Braun. 'Who does he think he is? If he could write a novel himself, there might be something in it, but I never read such stuff as that last book of his.' He paused, looked at his plate very solemnly, then leant closer to me and whispered, 'Look here, Johnson, somebody was telling me the other day that you and young Borden have a scheme for getting rid of tiresome people. Why shouldn't you turn your attention to young Everard? Think how many people would be grateful.'

'Murder him, do you mean?' I asked.

'Well, of course, that would be much the best, but it might lead to unpleasant consequences for all of us. No, the thing would be to turn his attention to something else. I tell you what. Improve his stomach.'

'What?' I asked.

'Yes, all his mangerly criticism comes from indigestion. I'm sure of it. Look at all the superior critics—Burroughs, Wontner, Hallard himself. Have you ever seen such a miserable lot of men? You can see their bones through their clothes, and their dirty white faces look as though they haven't sniffed fresh air for months. They're all the same. I tell you that dyspeptic criticism comes from dyspeptic insides. Cure those insides and you cure the criticism.'

JIM.

'By jove,' I said, 'there is something in that. I'll think it over.'

I should, nevertheless, have in all probability taken no steps in the matter had it not been that three days later I met Tallboys at the house of a mutual friend. He was that day at his most unpleasant.

I am at my worst with anyone whom I dislike, uneasy, unnatural, and over-garrulous, but on this occasion I was squeezed into a corner with Tallboys and we were forced to talk together. Of course I talked too much, said one or two things which were platitudinous and another two or three things that I did not really mean, and equally, of course, Tallboys said 'Do you think so?' and looked at me with that sarcastic patronage that is the hardest thing in the world to bear from a fellow human being. I was stung to the weakest kind of retaliation, saying something about my regret that his last novel had not sold more copies, and then felt exceedingly ashamed of myself for my meanness and cheapness. There followed then one of those silences that are so unagreeable between people who do not wish to be together but cannot escape. When I at last left the party, I asked myself indignantly why Tallboys should consider himself so superior. People will forgive you murder, rape, robbery, cheating at cards, and adultery, a great deal sooner than they will forgive you patronage. The one thing that every human being needs is outside confirmation in the stability of his own position. I have, unwittingly perhaps, patronised in my own time, and it is those to whom I have on some occasion, however slight and fleeting, been arrogant that will bear me a grudge to my dying day. The real reason why everyone hated Tallboys was not that he was a bitter critic, sickly in appearance, unhumorous, narrow-minded, but that he was arrogant.

Those few minutes in the corner of that overcrowded room determined me. It would, I thought, be most delightful to bring Mr. Tallboys down a peg or two. I discussed the matter with Borden, who, being the exact antithesis of Tallboys in every possible way, was just the man for this crisis. We discussed it for a long time. He thoroughly agreed with me that it would be very amusing to 'make the feller jump,' but how? 'If we can only remove him,' I said, 'or change the course of his criticism, or turn his interests to sausages or growing cucumbers, we shall not only please our own natural feelings, we shall earn our £150 as well. What about a lonely farmhouse somewhere?'

'By jove,' cried Borden, smacking his thigh, 'why not the Island?'

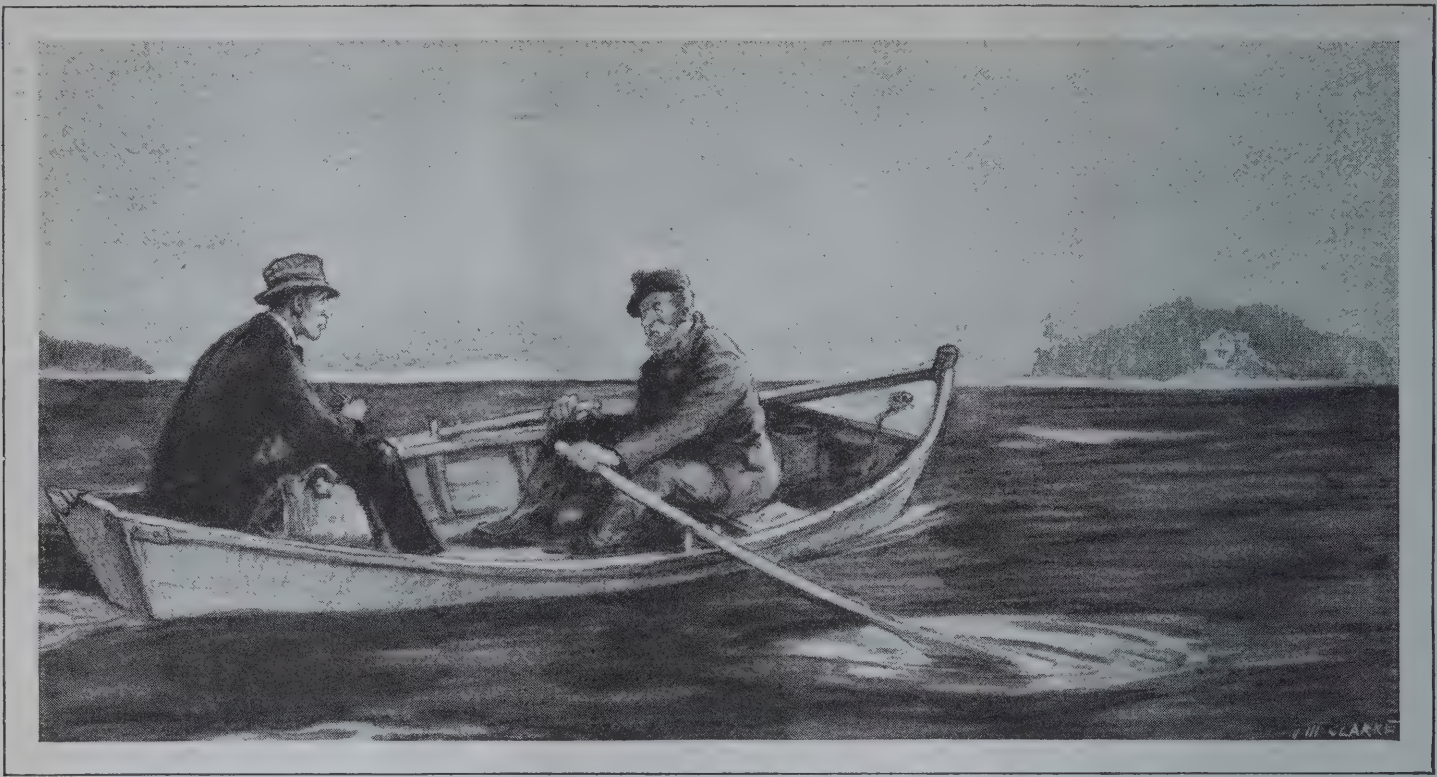
IF I may be allowed for a moment to reveal to the gentle reader the intimate privacies of the Tallboys' home the critic and poet may be seen in a very lousy dressing gown, sitting over his morning egg and reading the following letter.

The letter is headed—

Bird's Island,
Treliss,
North Cornwall.

Dear Mr. Tallboys,

You must, I am sure, be overwhelmed with correspondence from all parts of the country; I am therefore extremely reluctant to take up even a moment of your most valuable time, but it would seem to me ungrateful were I to let no expression of gratitude escape from me when you have given me, during these last weeks, such exquisite pleasure by your two books *The Lute at Dawn* and *Rosemary at Play*. Your novel seems to me without any exaggeration the greatest masterpiece that the 20th Century has yet given us. The nobility and generosity of your hero, Hugo Tremayne, the self-sacrifice with which he gives up one whom he loves so truly as he does Dora to his best friend and companion, the drama of the silent struggle between the two men as they stand one on each side of the fireplace saying nothing but feeling so much, the poetry of your descriptions of dawn and sunset and moonrise, the walk on the moor, the bathe in the sea, all the lovely sights and



Tallboys didn't attempt any conversation. It was not easy for him to talk to men not his own kind.

sounds of nature, these things are revealed by a master hand.

As to your book of poetry, what shall I say? To one who has found during many years of trial and hardship, constant, sweet companionship in the genius of Shelley and Keats, it is perhaps no mean thing that he should feel that that marvellous company has now a third added to its number.

Forgive me these halting words. I feel too deeply to say all that I would wish.

Yours humbly,
Horatio Bickerstaffe.

Three days later another letter was received in the Tallboys' home. It ran as follows:

Dear Mr. Tallboys,

Your kind reception of my little letter has made me a proud man. I live on this beautiful island a sheltered and retired existence. Books and birds, with an occasional rabbit, are my principal companions. Do believe me when I say that I meant and shall always mean every word that I wrote to you in my last.

You say that you know Cornwall but very slightly. Would it not be possible for you to snatch yourself away just for a day or two from your London labours and to seek the quiet and refreshment which this country scene affords? I cannot indeed offer you much in the way of excitement and adventure but at least your brain will be rested as you listen to the lisp of the waves upon the shore, the singing of the birds in the little wood behind my house, the ripple of the stream that chatters at the bottom of my garden.

I am a bachelor and quite alone here. If you cared we could discuss many things, or if you preferred it, I would leave you entirely alone.

The journey is an easy one. You go from Paddington to Truxe without a change and from thence a side line quickly takes you to Treliss. There a boat will await you and row you across to my island, a mile out to sea.

I throw this out as a suggestion, tempted by the extraordinary pleasure that your visit would give me.

Four days later a further letter was received.

Dear Mr. Tallboys,

This is indeed delightful and beyond my wildest dreams. I shall expect you then next Tuesday and can only hope that the weather during your stay will continue to remain as fine as it now is.

What were the motives that impelled Tallboys to take a little holiday? They were not, I imagine, very difficult to discover. It is possible that a good deal of Tallboys' arrogance arose from the fact that he had had during his writing career so little praise and was a hungry man. He was also, I have no doubt, a tired man, working a great deal too hard, sitting up late at night over his reviews and criticisms.

CORNWALL in the month of May is no light temptation, and Mr. Bickerstaffe, although his praise was certainly a little foolish and extravagant, could probably be endured for a night or two without difficulty. In any case, on a beautiful May evening Tallboys might have been seen, a rather grimy bag in one hand and a waterproof in the other, standing on little Treliss pier and looking about him. That it was a most beautiful evening I can bear witness, because I myself was present, not close to Tallboys but waiting discreetly in the background under the rocks where some of the smaller boats are drawn up at high tide.

Treliss, a magic circle of gold and topaz, hung over us veiled in thin purple mist, and the sea, very faintly blue, drew up to the shore and faded away again with a gentle hiss of cosy peace and satisfaction.

Tallboys was a very noticeable figure standing there on the little pier. Presently a fisherman came up to him, touched his cap and said, 'Be you the gentleman for Mr. Bickerstaffe?' 'I am,' said Tallboys. 'There's a boat here, sir, to take you across to the island. Mr. Bickerstaffe asked me to say, sir, that he was partikler sorry he couldn't come across. He's just finishing some letters for the post. If you'll come with me, sir, we'll be over in no time.'

TALLBOYS climbed into the rowing boat, with that rather clumsy movement peculiar to landsmen, seating himself very carefully and clutching his bag, and soon was rowed away. When they had rounded the corner of Trust Point, the little island came into view. Very tiny it looked with the little wood a dark tuft against the sky, a little white building and a thin strip of golden sand. Tallboys didn't attempt any conversation; it was not easy for him to talk to men not of his own kind. I have no doubt and I like to think that he enjoyed the beauty of the evening, the fresh sea breeze, the colour of the sea and sky, and that for those five minutes, at any rate, he was a happy man. He was not, alas, to remain happy very long.

I have travelled in many parts of the globe but I say definitely that I know nothing more beautiful than that gate into Bird's Island, where a little path leads up from the beach over rocky boulders, breaks on to a stretch of coarse-grained down, and finally, skirting a little wood where all the trees, blown sideways by the wind, look as though they were listening for some important news coming across the sea, leads into the rough, ill-paved courtyard that stands in front of the farm. It was in this same courtyard that Tallboys met Borden, and it was from Borden that I received the next portion of this story.

Tallboys stopped in the yard and looked about him and then saw Borden advancing towards him, but that young man's stocky figure, bull-dog countenance, and general air of being just sent down from Oxford for conduct 'unbefitting a gentleman,' was not at all what our friend had expected Mr. Bickerstaffe to be. However, he held out his hand, which Borden gripped and shook vigorously, and said, 'Mr. Bickerstaffe?'

'No,' said Borden, very cheerfully, 'my

name is Borden. Let me carry your bag. Come inside out of the sun.'

EVEN then Tallboys had apparently no suspicion of the truth; he sat down opposite Borden in the low-ceilinged sitting room, across whose floor streaks of sunlight like yellow gauze were filtering; then smiling a little nervously, he said to Borden, 'Mr. Bickerstaffe is finishing some letters, I understand.'

'Oh no, he isn't,' said Borden. 'Any letters he had to write he finished long ago. What I mean is that there isn't any Mr. Bickerstaffe.'

What a pang must then have struck the tender, trusting heart of Everard Tallboys! Borden tells me that he turned a pale green, that his long thin legs began to tremble.

'I don't understand,' he said.

'It's very simple. I and a friend of mine wrote those letters and signed them Bickerstaffe. We were so glad you were able to come.'

'Signed them Bickerstaffe,' cried Tallboys, getting up from his chair, 'what do you mean? I still don't understand.'

'It's just this,' said Borden, in the friendliest manner. 'There are half a dozen fellows in London who think you've been working too hard and haven't been sleeping well of nights. They'd hate you to have a breakdown or anything of that kind, and they knew that you were so conscientious that you'd never take a holiday of your own self, so they thought they'd give you a holiday, get you down here, and then when you saw how much you liked it, why of course you'd stay.'

THAT must have been a terrible moment for Tallboys, whose sense of humour was limited, whose dignity was very easily affronted, whose physical strength was nothing very much to boast about.

'Do you mean to say,' he burst out, 'that those letters weren't genuine?'

'Of course they weren't,' said Borden. 'I've never read a line you've written. Johnson had read a bit, and we made it up from that.'

'Johnson,' cried Tallboys, 'do you mean Seymour Johnson?'

'The very same,' said Borden. 'He'll be here in a few minutes, and very glad to see you.'

'This is a plot,' cried Tallboys. 'Exactly,' said Borden, 'a good old-fashioned melodramatic plot like they have at the Lyceum, only instead of a very beautiful heroine, we have—well, Mr. Tallboys.'

'My God, you shall pay for this,' cried Tallboys, in the most approved melodramatic manner, striding up and down the room. 'I'll have you in jail for this before I'm a day older.'

'You can't do very much today,' said Borden, 'there's no boat going to the mainland; Mr. Perry and his two splendid sons run this little farm and are devoted friends of ours; except for one boy who is next door to an idiot and an old woman who is next door to heaven, there's nobody on the island at all. There isn't a telephone and there isn't a post office. Of course, you can stand on the seashore and wave your handkerchief, or you can build a fire in the good old "Treasure Island" fashion and watch its smoke ascend to heaven, or you can climb a tree with a spyglass, or you can swim to the shore. After all, it's only a mile, and most beautiful weather. If all these things fail you, unless you have an airplane in your pocket, you'll be almost compelled, I am afraid, to spend a day or two with us.'

'But this is infamous,' cried Tallboys. 'I'll have you in jail before the week's out.'

'Yes, and it'll be a lovely story for the papers,' said Borden. 'We'll be in jail, but you'll look terribly foolish. I can see the headlines. "Kidnapped Poet on Deserted Island"—"Lured to Captivity"—"Poet and His Tormentors"—and you know what everyone in London will say, that you were off on some nasty little adventure of your own and got in further than you meant. And then there are Mr. Bickerstaffe's letters. They'll look splendid in print: "Young poet gratified at praise from stranger hurries to deserted island," and so on.'

'By God, I'll have the law on you,' screamed Tallboys, now in a hysterical state and really not far from tears.

'Now look here,' said Borden, 'it's very foolish to make such a fuss. This is a perfectly charming place; the weather looks as though it will hold for a week at least; the water really isn't too cold for bathing; old Mrs. Bolitho is a simple cook but you get so hungry here that you really don't want Carlton fare; the bed is very comfortable; there are no mosquitoes yet; we've a very nice library, you can compose poetry to your heart's content. I think a fortnight here would do you all the good in the world.'

'A fortnight,' screamed Tallboys, 'what about my work? My articles, and the rest of it?'

'Well I'm afraid,' said Borden, 'we can't allow you to send anything by post for the first week or two. Not until we see the bloom of health beginning to steal into your cheeks. You can write as much as you like, only there's no post. Of course the world will be simply all in pieces at having nothing from you for a whole fortnight, and if articles begin to appear in the London press about the missing poet, we're in for it I suppose. But won't it be interesting? You'll really be able to test your public importance. I admit that it might hurt your feelings if you were down here for three whole weeks and nobody in London realised it, but on the other hand it will make you feel very free and independent.'

IT WAS at this moment that I, who had followed in another boat, came in. When Tallboys saw me, he made a sort of spring in my direction, as though he would like to tear me limb from limb, but men who have like Tallboys developed their brains at the expense of every other part of them never meet these situations very effectively, and all he could do was to repeat his parrot-like cry, 'By God, I'll have the law on you.'

'Now we must be sensible,' said Borden. 'The real truth of the matter is that two or three of us want to test a theory that we have, a theory that, if it's tested thoroughly, will really make a difference to human conditions, and when something is for the good of the race, we are all, I'm sure, ready to make a little sacrifice of our personal interests and comforts. The theory is that artistic criticism, in the direction it takes and the spirit behind it, is based largely upon Stomach. Now you won't deny that you have for a number of years been the gloomiest critic in Europe, and that, we maintain, is because your inside is all wrong, because you don't take enough exercise, because you live too much with men of your own kind, and because your sense of humour is so lamentably undeveloped. Now you've really never had a holiday of this sort in lovely surroundings, lots of life and air, plenty of time to sleep, good food, and company who don't in the least respect your opinions. Of course we may fail. It's quite possible that you will hate both us and the place more and more every minute that you stay here, but even then, we flatter ourselves that the after-effects will be excellent and that in days to come you will look back to these hours with longing and even think of us with kindness, and if it should happen that you take life a little more cheerfully and see it a little more thoroughly in the round, how well worth our trouble will have been. You will be happier, we will be happier, and countless thousands of young novelists, poets, and critics will be happier. We really will belong to that small group of earnest men and women known as benefactors of the human race.'

Tallboys turned to me. 'You shall suffer for this, Johnson,' he said. 'I won't rest till I've made you regret this hour.'

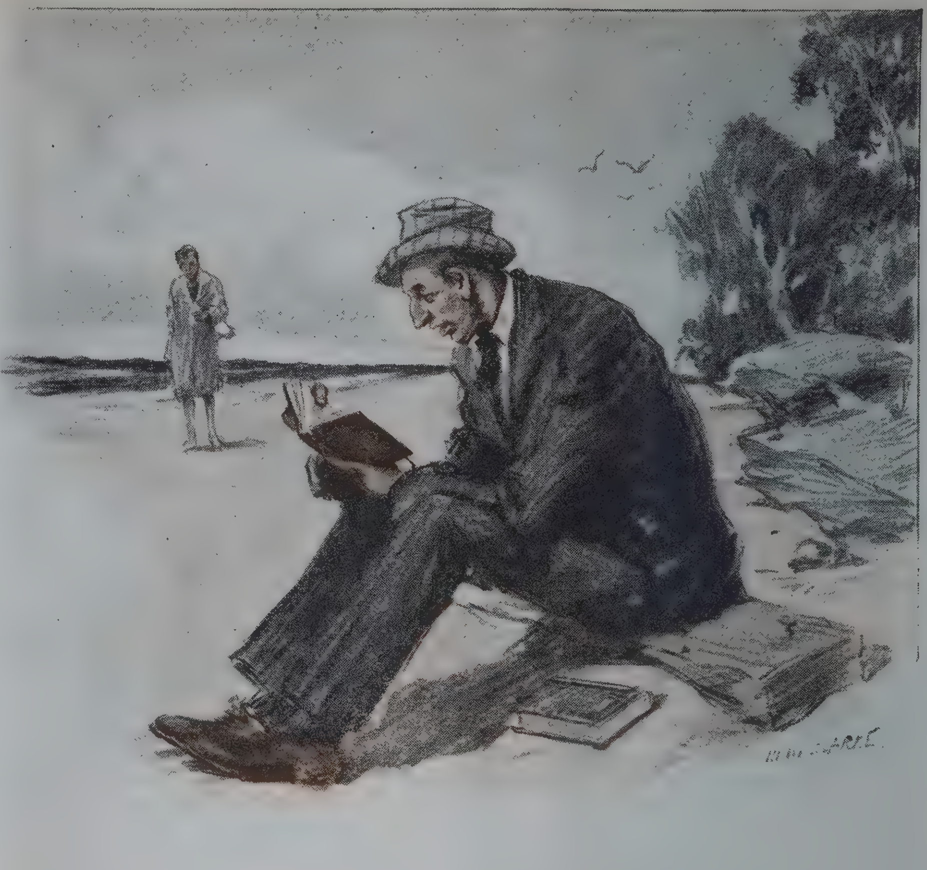
'That's all right, Tallboys,' I answered. 'I quite expected you to be upset at first a bit. I quite understand that you shouldn't have at this moment the friendliest feelings towards Borden and myself, so we're going to leave you in better hands than ours.'

I WENT to the door and shouted 'Jim.' There quickly appeared the large body and rubicund smiling countenance of Jim Perry, the young farmer some twenty-five years of age, six feet three in height, almost as broad as he was tall, one of the best fellows in the world, with an intelligence active enough as regarded birds of the air, the fish in the sea, and nature generally, but his reading limited to *Lloyd's News*, which he spelt out slowly word by word on Sunday afternoon. It had been explained to Jim that we were to have as guest a gentleman from London who was tired and worn out with overwork, whose friends had determined on his taking this holiday, who would certainly protest and try to escape in a boat, whom Jim was to look after as he would his own child, that he was to be kind, tender, and cheerful, and not to let him out of his sight.

THIS had seemed to Jim a capital game, and he looked at Tallboys with exactly the expression that I had seen him use once to a damaged owl whose wing was broken; the bird had been nursed by Jim week after week with the care and kindness of a mother to her only ailing child.

'Oh, yes,' I added, 'there's one other thing. We know you like reading, and so we've selected a library for you.' I waved my hand towards the bookshelves. 'Here you'll find a number of books that I'm sure you've never read. Here are all the works of Sir Arthur Conan Doyle, Rider Haggard, A. E. W. Mason, Stanley Weyman, Henry Seton Merriman, Phillips Oppenheim, and a gentleman called Mr. Rice Burroughs, who has written several books about a monkey called "Tarzan," and a lot of others, too, that will be new to you. We have also the poetry of Walt Whitman, and the "Ingoldsby Legends." Now we'll leave you and Jim together. You needn't see more of us than you want to, and I do hope you'll have a happy time.' Then Borden and I left the room.

Those were indeed strange days for all of us. I will confess that during them I had many misgivings. It will have been



I saw him sitting on the beach, deep in a novel.

noticed by anyone who has glanced at any other of these adventures that most of my cases have been solved simply by a little reshuffle of individuality; I proved to myself in the course of them a great lesson, namely, that no one is a bore to everybody and that the art of getting rid of a bore is simply to find someone to whom he isn't a bore. Old Sir Marcus Pendyce, for instance, was a terrible bore to the Lambs, but a sheer delight to the old ladies in Yorkshire, and Mrs. Farbman drove the Flemings crazy, but was exactly what the host of the Vin Blanc needed.

IT IS also a fact about human nature that the people you dislike are on the whole the people with whom you do not come into close contact, that it is very hard to know anybody very well without discovering their good points. Now Borden and I agreed, after two days in Tallboys' company, that he was indeed a dreary dog but that his enthusiasm for literature was something extremely fine, finer than anything we ourselves possessed.

On the second morning after his arrival, I came into the sitting room and found him, quite unconscious of my presence, looking at the bookshelves. Suddenly he gave a little cry of delight, a very touching little cry, the sort of cry that Penelope must have uttered when she saw Ulysses coming up the garden path. I heard him murmur, 'Oh, how fortunate!' and I saw him take from the shelves a thin red-covered book, most obviously not a novel, and from where I was standing realised that it was the Oxford edition of collected poems of Robert Bridges that had slipped somewhere by mistake in amongst his coarser, more bovine brethren. A smile illumined Tallboys' plain features as he went to the window, clutching the book in his hands; I crept out of the room noiselessly, feeling that although it might wreck our plan, I couldn't but be glad that Bridges had broken in. Tallboys' attitude to us during those first two days was one of silent loathing. I suggested that he should have his meals in his own room if he preferred it, and he gave us to understand through Jim that he did.

THE afternoon of the second day was most glorious weather, and I overheard on the upstairs landing some fragments of a funny little conversation. First there was Jim. 'Do 'ee come down Mr. Torboys and 'ave a swim. It's warm as summer. It'll make 'ee less homesick.'

'Thank you, Perry.' Tallboys' voice was making a struggle for dignity and failing. 'I can't swim.'

'That makes no matter, Mr. Torboys,' came Jim's voice. 'I'll look after 'ee.'

'I haven't got any bathing things,' said Tallboys.

'Oh, that's nothin',' said Jim. 'We don't wear no cloes in this place. There's only old Mrs. Bolitho and she'm over eighty and 'alf blind anyway. Do 'ee come down and try.'

'I suppose I may as well do that as anything else,' came Tallboys' answer.

Later I watched from a knoll in the little wood the two on the seashore. Jim, a magnificent figure in the sunlight, poised on a rock at the farther end of the beach, standing for an instant with hands above his head, then cleaving the air like a flash. Tallboys, strangely gray in the sunlight, stepping timidly into the water, walking out like Agag delicately, soon surrendering himself, and five minutes later, supported by Jim, making absurd splashes and futile strokes with his arms in the course of his first swimming lesson.

That same night Borden and I, seated with our pipes and playing chess in the sitting room, suddenly saw Tallboys enter. 'May I have a word with you?' he asked, stiffly, standing in the doorway.

'Certainly, as many as you like,' said Borden, smiling. 'Have a smoke.'

'No, thank you. You know that you've done a most dastardly thing. You are stronger than I at this particular moment and I am in your hands. I do beg of you to let me go home tomorrow, and, if you do, I promise you I'll not say a word about this affair.'

Borden answered him seriously. 'Look here, Tallboys, it's quite natural for you to hate us, in fact if you don't mind my saying so, I think you ought to hate us a little more than you do. We've taken considerable risks in this affair and now we must play it through to the end. In three weeks from now, we will know whether we've succeeded or not. Of course, we don't pretend that we're going to change you altogether, but we do hope and believe that you're going to be a bit different after your three weeks' rest here away from your own rotten set and getting to know a first-class feller like Jim Perry. We must see our experiment through. Here you are for three weeks. I know that yesterday you tried to get a letter through and that you offered Bill Perry ten quid if he'd row you across, but you see these three men happen to be the very best friends Johnson and I possess. They're loyal as you make 'em, and you may as well know right away that it's perfectly useless trying to bribe them or to get them to act against us in any fashion whatever. Now you may as well make up your mind to these three weeks. If you'll forgive me for saying so, you look better already. I don't want you to admit it but you enjoyed that bathe this afternoon and you know you did. Now Johnson and myself are not, I am aware, the companions you'd have chosen if you'd had a free hand, but really we're not so bad. You don't like Johnson's writing, but he's just as enthusiastic as you are about good things in his own way, and upon my word, I can't understand why you writing fellers who all care about good stuff in distinction to the rest of us who don't know good stuff from bad, why you should spend your time in quarreling and getting into little sets, hating one another. Now I know nothing about literature, but I am not a bad companion and I could show you one or two things on this island that would astonish you. Now why not make the best of a bad job and be friendly while you're here. You can have us up in the courts when you get back, but enjoy yourself while you may.'

'Thank you,' said Tallboys, looking at us both with unutterable loathing. 'I'd rather die than spend five minutes with either of you,' and he departed to his room.

I'VE often wondered since what went on in Jim's mind during these curious weeks. Tallboys was something quite novel to him; it was rather as though the Archbishop of Canterbury had to stay with him, a native from Central Africa, for a week or two. It was just because of this strangeness that he developed towards Tallboys a kind of protective affection that did resemble exactly his attitude to the wounded owl of which I spoke before. Tallboys to him was a sick, melancholy, broken-backed, ignorant creature. All Tallboys' knowledge of the *vers librists*, the modern novelists, and the rest, were to him less than nothing, and he was soon talking to him in the indulgent, kindly voice that a nurse uses to a small, miserable, unhappy child. 'Now don't 'ee, Mr. Tallboys,' we used to hear him say, 'don't 'ee take on so. You'll be better in no time. You're getting some colour in your cheeks now. You won't know yourself in another week's time.'

I saw that in spite of himself Tallboys' appetite was magnificent. He was sleeping superbly. On the fourth night of his stay he took up to bed with him that admirable romance of Mr. Mason's, *The Watchers*. I perceived then that book after book disappeared from the shelves. On the fifth day I was sitting alone, sunning myself in the little wood, when Tallboys turned the corner and came upon me by mistake. He made as though he would retreat again, then thinking better, he came towards me.

'Look here, Johnson,' he said, 'hasn't this gone on long enough? Let me go tomorrow. I don't bear you any malice, I don't indeed. Of course, I think it was a rotten thing to do, but I won't deny that I do feel better for these three or four days. I hadn't, as a matter of fact, been sleeping very well in town, and I had been overworking. Perhaps there is something in what Borden said about my getting a bit narrow. I used to feel it myself sometimes, although I'd never admit it to anybody. Let me go tomorrow.'

'We must stick to our three weeks,' I answered, 'you're through the first week very nearly. You'll find the rest of the time passes ever so much more quickly if you talk to Borden and me a bit. Borden's a very decent fellow, really, and his views on life in general quite worth knowing.'

Tallboys stood there, looking out to sea. 'It is lovely,' I heard him say under his breath, 'more beautiful than I'd ever imagined.'

'Stay here a bit,' I answered. 'I'll admit that this thing began partly as a joke and partly because a lot of us thought you were too damned arrogant for anything.'

'Arrogant?' cried Tallboys. 'I?'

'Why, yes. You thought your own opinion so mighty important, and you and your little crowd were the only people that mattered. All sorts of things go to make up literature. It isn't only a perfect style and supercilious taste that count. But I don't want to get preaching to you. I shall be as bad at my end as you are at yours, but if you like, I'll confess something to you. I couldn't stand the sight of you before you came down, and now I'm getting quite keen on your company.'

Tallboys suddenly laughed. 'Of all the infernal cheek,' he said. 'How you ever dared do it!'

'If you hadn't been so conceited,' I answered, 'you never would have come. I never believed that such absurd letters as those of ours could have brought you.'

TALLBOYS flushed. 'It's all very well,' he said, 'but you'd have gone yourself if you discovered a whole-hearted admirer somewhere. Why shouldn't we care about somebody liking our stuff? We spend all our days and nights thinking about it and trying to do the best we can, and if there's somebody who likes it, well, it's awfully comforting. I think the thing I felt sorest about is that there wasn't anybody after all. Do you suppose I don't realise,' he went on fiercely, 'that I'm not first-class, that it wouldn't matter to anybody if I stopped writing forever tomorrow? But because I'm not first-class myself, it's no reason that I shouldn't want other people to do first-class things.'

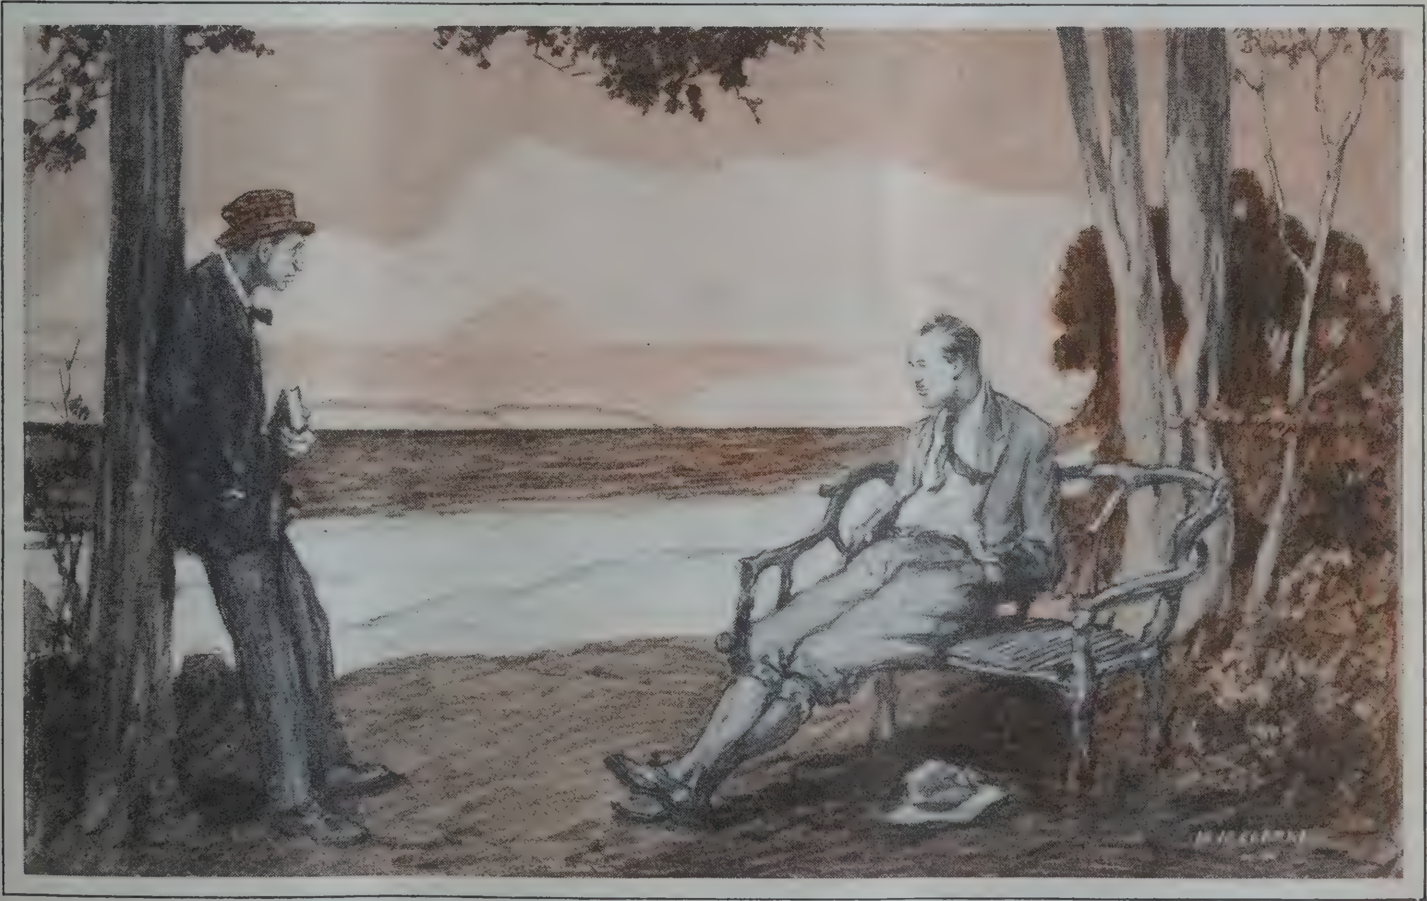
'No, I suppose it isn't,' I answered, 'but it's the way that you deliver your opinions that people mind. We're all in the same box, we are most of us second rate, and we might feel a little more kindly towards one another.'

The result of that conversation was that Tallboys held himself no longer aloof. He was still shy with us, there were many moments when he broke out into abuse of us, many moments when we abused him in return. But there was always Jim in the background, proving to all of us that our little corner of the world was a mighty small one and that while we quarreled about literary values, Jim was looking upon us as the merest children in arms who knew nothing, had seen nothing, and could do nothing, with the possible exception of Borden who fished and swam and walked more like a possible human being.

After that the days flew on wings. The middle of the following week, Jim had a birthday, and a number of fishermen and their wives came over from the mainland to celebrate it. That afternoon, before they arrived, I said to Tallboys, 'Look here, there's going to be a party tonight and some men are coming over from Trellis. If you like you can give us the slip. Don't say anything to anybody but go back with one of them after the party is over if you want to.'

Tallboys said nothing.

That was a wonderful night. June had set the calendar at defiance and slipped into May. It was so warm that we had supper outside the farm on a ridge overlooking the sea. The sky was thick with



Tallboys stood there looking out to sea. 'It is lovely—more beautiful than I had imagined.'

stars, soft and milky with a kind of white spray of silver. The fishermen and their wives shouted and sang, and when the meal was over, an old man and a boy produced two fiddles and the dance went on up and down the turf while the sea murmured below a humming accompaniment of approval and benediction.

Jim looked after Tallboys as though he were his especial property. The drink that was provided was nothing very strong, but the night, the stars, sea, and the mild air went to our heads, and resting suddenly breathless from one of the wildest of the country dances I looked up and saw Tallboys being whirled round, a thin fantastic figure against the night sky, while the old fiddler, seated on a tree trunk, played for his life, and Mrs. Bolitho, who should have been in bed long since, tears of pleasure running down her furrowed cheeks, clapped her hands and beat time with her feet. I stole away up into the little wood and heard, as it were behind a curtain of trees, the screaming of a violin, the laughter and the shouting, and, strangely, more penetrating than any of these, the swaying whisper of the trees above my head.

I went off to bed.

Next morning Tallboys was at breakfast. I said nothing to him until quite casually in the afternoon I remarked, 'Look here, write any letters you like, I'll see that they go.' He nodded his head. I saw him sitting on the beach half an hour later when I came down to bathe, deep in a novel of Stanley Weyman's.

* * *

SIX weeks afterwards, there appeared in the columns of that superior paper, *The Athanasian*, an article headed 'Romance & The Joy of Living.' Its opening sentences were: 'In these days of realism some of us are perhaps inclined to overemphasise the virtues of technique and to lay too strong a stress upon the perfection of form, forgetting that there are other things more important in life than the petty disputes of the schools, and that there are many gates into the temple of literature . . . ' This article was signed 'E. Tallboys.'

A few nights later I tumbled on to Hallard, the editor of that superior weekly. 'I hear,' he said, 'that you've been having Tallboys down in Cornwall with you. It's done his health a lot of good, but can't say that it's done so much for his brains. He was actually advising me to read some rotten story by that fellow Mason.'

'Yes,' I answered, 'I think he enjoyed himself very much. You'd better come and stay with us, Hallard, down in Cornwall.'

'I think I will one day,' said Hallard.

But after all, it would scarcely be fair to Jim Perry, would it?

Those of our readers who are endeavoring to discover their natural literary taste will be interested in Mr. Walpole's essay, *'On a Personal Taste in Letters,'* which will appear in an early issue. Mr. Walpole examines his own tastes, gives his reaction to several writers, and lays his finger on the discoveries which during his experience as a novelist have permitted certain literary enjoyments to become his. 'In my life at least,' he says, 'and the life of many others I suspect there has been too much talking about books to the neglect of the books themselves.'

North Carolina: a Great State

(*Continued from page 6*)

happy omen that came from the birth of Virginia Dare, North Carolina has attained first place in many of the things which go to make up life and the industries. East to west the state is 503¼ miles, with an average breadth of 100 miles, its area being 52,286 square miles, 48,666 land and 3,260 water; its population by the last census, 2,559,123, within its borders being the highest mountain peak east of the Rocky Mountains, Mount Mitchell. On the same parallel of latitude as the Mediterranean the climate is of the best, it having been said of the state, 'All the climates of Italy from Palermo to Milan and Venice are represented.' In natural resources those of North Carolina compare favorably with those of any other state, while the soil is so diversified in its ranges from the mountain to the sea, its altitude from nearly 7,000 feet to the ocean level, that there are the greatest agricultural possibilities.

There is invested in manufacturing establishments in North Carolina over $669,000,000. It leads every southern state in the number of wage and salary earners. It leads the other states of the South in values added to raw material after manufacture.

Decoration by GERALD VAN DER HEYDEN

North Carolina does a great export business because of its varied industries, latest reports showing that in this it stands fourteenth in the list of the forty-eight states, with some of the great states of the Union bringing up the rear. In the export of tobacco it stands second, and only second to Virginia because in North Carolina there are great tobacco manufactories which use a large part of the crop which otherwise would be exported.

In many things North Carolina stands first. Here are some of the things in this list of industries: It has the largest hosiery mills, the largest towel mill, the largest aluminum plant in all the world; the largest denim mill, the largest damask mill, the largest underwear factory, the largest pulp mill, in the United States; more mills which dye and finish their own products than any other southern state. It has a total of more than 6,000 factories, these giving employment to more than 158,000 workers with total yearly wages of more than $127,000,000.

One North Carolina city manufactures more tobacco than any other city in the world. It stands first of all the Southern States in the number of its furniture factories, in invested capital in these, the variety of products, the value of the annual output, and the number of operatives. Only one other city in the country manufactures more furniture than one North Carolina city.

IT LEADS the world in the manufacture of tobacco, and there is consumed in the state one-fourth of all the tobacco used in manufacture in the entire United States; hence North Carolina tobacco manufacturers pay one-fourth of all the tobacco taxes of the nation. North Carolina has more cotton mills than any other state, and stands second in the value of cotton manufactures.

In the value of agricultural products North Carolina ranks fifth of the states, it stands third in the production of sorghum, peanuts, and sweet potatoes, and has grown more corn to the acre than any other state in the Union. The state ranks first in the value and quantity of millstones produced in the United States and first in the value and quantity of mica produced, the talc mined in the state commanding the highest price a ton of any mined in the United States. In mineral products North Carolina has a unique place. With 184 different varieties of native materials there is mined in the state practically every known mineral found in the United States, and some not found in any other state.

The maximum potential water power of the state is estimated at 875,000 horsepower and the maximum power with storage as 2,000,000 horsepower, this evidence that there remains much undeveloped water power.

In the manufacture of cotton North Carolina leads all the states except Massachusetts, and it is rapidly closing up the gap.

The state has more varieties of trees than any other state, its forests being incomparable, with 19,600,000 acres and 43,000,000,000 feet of timber. Possibly there are more inland waterways than in any other state of the Union; the commercial value of the state's fisheries as given by the North Carolina Fisheries Commission amounts to something like $4,000,000 a year, for the coastal waters as well as the inland waters of the state abound in fish of various kinds, and on the coast there are oysters, clams, scallops, and so on.

In the west and in the east North Carolina is famous as a tourist and sportsman's state. An unequaled all-the-year-round climate, there is health and hunting in the state's mountains with the vigor of the balsam-laden air. Eastern North Carolina is a hunter's paradise and the fisherman finds it a magnet in its drawing power. Famous sportsmen come to eastern North Carolina year after year, and give it praise as one of the greatest hunting grounds in America.

The Solution of the Colorado River Problem

(*Continued from page 2*)

the Supreme Court of the United States to assume original jurisdiction of the sole question of determining the rights of the two groups of states to a division of the water. It could be determined very quickly whether the court would take jurisdiction of such a case. Should the court do so it could limit the issue to the amount of water to be allowed each basin, in the event that some of the states attempted to inject other issues.

Those opposing this suggestion might say that cases, originating in the United States Supreme Court, relative to the determination of a stream flowing through different states, have taken an interminable length of time and that it would be dangerous to await such a decision without taking immediate action to control the flood waters.

Original proceedings between states have taken five and even eight years to conclude. However, if Arizona carried out her threat against the building of the reservoir at Boulder Dam, Arizona, in all probability even more time would be consumed, since the case would undoubtedly be started in the United States District Court after Congress had acted and then have to be reviewed in the higher court. If on the other hand an original proceeding were begun with the sole problem before the Supreme Court of a division of the water, it should be determined within a very reasonable time.

The Kansas-Colorado and the Wyoming-Colorado cases that occupied the attention of the Supreme Court for years were bitterly contested controversies, requiring a great deal of testimony. In the Colorado River problem it would appear quite probable that all parties would, under the jurisdiction of our highest court, consent to a decree dividing the flow of the stream equally between the two basins with the measurements to be taken at a certain point. There would be no particular engineering, irrigation or legal problems to solve, since all of these matters were thrashed out by the representatives of the seven states when they met at Santa Fe, New Mexico, and prepared the Seven-State Compact.

SOME question may arise as to whether the United States Supreme Court would take jurisdiction of a proceeding initiated between the states to determine the division of the flow of the Colorado between the upper and the lower groups in advance of the use of the water. Such a proceeding would undoubtedly be unique, being dissimilar in some respects to any that has ever confronted the court. Already this tribunal has assumed jurisdiction between states in more than forty cases, where there was a concrete issue before it.

The question at the very outset to be resolved here would be whether there was a concrete issue on the Colorado River such as would invoke action by the Supreme Court.

The court has said that Congress cannot make compacts between the states. Disputes between the states must be settled either by voluntary agreement in the form of compact or by appeal to our highest court, when there is a concrete issue.

The Supreme Court has also said no state can legislate for or impose its own policy upon another state and that a state is not bound to yield its own views to another. On one occasion the Supreme Court said in a case before it that when action of one state reaches through the agency of natural laws [a river] into the territory of another state, the question of the rights and limitations of the two states becomes the type of dispute which the Supreme Court is called upon to settle.

Those who would approach this tribunal should remember that in cases of this kind the facts of the particular case determine the decision of the court as to whether it shall consider the controversy.

A few years ago a group of states located on the Great Lakes brought the Sanitary District of Chicago and the State of Illinois before the Supreme Court of the United States for the declared purpose of preventing the State of Illinois and the Sanitary District from lowering the depth of the Great Lakes by diverting the water of Lake Michigan beyond a certain amount. It was asserted that a canal leading from the lake to the Illinois River, and thence to the Mississippi, threatened to reverse the flow of the Illinois River to a point where it would injure the navigable capacity of the Great Lakes. In connection with this case there arose a claim by the State of New York that the diversion would interfere with and prevent the use of the Niagara and St. Lawrence rivers for the development of water power.

THIS claim was thrown out because there was no charge of any present use of the water for such purposes which was being disturbed or would be disturbed. The court pointed out that since the State of New York was asking that the State of Illinois be prevented from further lowering the level of the Great Lakes, it was necessary to show an actual or presently threatened interference with its rights. New York's claim that her citizens might use the water for such power purposes was too indefinite.

Undoubtedly if the states here were to ask the Supreme Court to help them decide this problem of the division of the waters they would have to show that either the Government or some of the states are or are about to engage in work or operations which would restrict the welfare and development of the citizens of the states asking the court to take jurisdiction. They would have to go further than simply assert that either the Government or some other state was contemplating doing something in the future that would injure them.

In this connection the upper-basin states could show development taking place along the Colorado River in Mexico, which is requiring more and more water from this river to reclaim its lands. The State of California has been increasing the cultivated areas of the Imperial and other valleys and requiring more water from the Colorado for this purpose. Arizona has been extending its irrigable territory. In fact all the low water flow of the river has already been appropriated. Moreover, the Federal Government has by legislation created a Federal Power Commission and given it the right to issue federal licenses to private parties to build dams and create water power on its rivers.

Already practically every possible site for the creation of water power on the Colorado River has been located on by power companies and others. Should some of these licenses be granted—they are temporarily held up by legislation—and reservoirs constructed as indicated by the power companies and the water used, some of the northern states would have great areas of arid lands put in jeopardy so far as ever being able to irrigate them from the waters of the Colorado.

The right to reclaim these arid lands is not an abstract one. Years ago, Congress declared its policy in respect to them by putting a reclamation law on the statute books, the purpose of which was to encourage, through Government aid, the reclaiming of these otherwise practically useless areas.

NOW that all the water except the flood flow of the Colorado River is already preëmpted it becomes obvious that if the power companies, the Government or others through the construction of the dams in the states of the lower basin are to store any water, it must be flood waters.

It would seem then that under these circumstances the problem of the division of the flow of this great river is well within the realm of the concrete and might appeal to the court for its consideration.

An example of the character of cases that have involved action by the Supreme Court arose over a dispute between the states of Texas and Oklahoma as to the boundary along the line of the Red River. The situation required research into history, geography, plant life, water flow, and many other interesting subjects. At the time that the court took jurisdiction the State of Oklahoma was claiming the title to the river bed from one bank to another, while the State of Texas was claiming the title to the southern half. Within the disputed territory, oil and gas had been struck, apparently of very great value.

Many persons were proceeding to drill for these minerals with the title and ownership uncertain. Possession was being held by intimidation and force. The courts of both states were assuming jurisdiction in injunction proceedings. Armed conflicts between rivals for gas and oil were threatened. In fact, the militia of Texas had been called out to support the order of its courts and there was pressure being brought to bear to call out the militia of Oklahoma. As Justice Van Devanter of the United States Supreme Court says, in his opinion great waste of oil and gas in their extraction and appropriation, to the irreparable injury of the true owner of the area in dispute, was likely to result.

The receiver appointed by the Supreme Court took possession. He appointed six former deputy sheriffs of Oklahoma and six former Texas rangers to take possession of the area and guard it. Each guard was furnished with the necessary horse and equipment and in the early days of the receivership they policed in pairs the land in question. Those having no connection with the properties were removed beyond the border. The guards supervised the sale of fuel oil, confiscated arms and ammunition, and stored and classified removable property. In a word, the Supreme Court took hold of a very ticklish situation. It brought immediate tranquillity into the area in dispute, permitting the taking of testimony and the thrashing out of the issues, and rendered its decision with remarkable facility.

It is true that it took about five years to do this, but the controversy was one which involved an investigation of facts in dispute, the like of which it is hardly possible will develop in the determination of the uncontested features of the Colorado River problem.

It is not the intention of the writer in any way to discount or decry action by Congress over the conflict between Arizona and California as to where the dam shall be located, how the water of the lower basin shall be divided and all of the other matters that are in dispute. This controversy should be pressed before Congress with all possible speed because of the constant threat of flood to the people of the Imperial Valley.

There is no reason why it cannot be presented in the form of proposed legislation, separate and apart from the division of the stream between the upper and lower basins. There is no conflict between the two problems. In fact, if the Supreme Court should consider taking jurisdiction, there could be simultaneous action in Congress upon the dam proposal. Moreover, with the two problems separated, the State of Utah would undoubtedly be relieved of any fear of protection that it now asserts and would have no reason to object to the Seven-State Compact or the settlement of the Arizona-California controversy by legislation.

WITH the Arizona-California controversy placed in the open forum of Congress, the power companies could be compelled to show their hand. The possibility of camouflaging and generally upsetting the policy of the governmental control of the power situation, in the hope that eventually the power companies might gain this great prize, would be minimized.

Back in the administration of Grover Cleveland, Judson Hermon, then Attorney-General, rendered an opinion involving the flow of the Rio Grande, in which he said that the rulings, principles and precedents of international law imposed no duty or obligation upon the United States of denying to its inhabitants the use of the water of that part of the Rio Grande lying entirely within the United States, although such use resulted in reducing the flow of water in the river below the point where it ceases to be entirely within the United States.

If our Government had held to this lawful but rather harsh rule, Mexico would have suffered greatly. The controversy of that period was settled by the building of the Elephant Butte Dam on the Rio Grande in New Mexico and by allowing the Mexican settlers annually a certain amount of the water stored in the reservoir.

In recent years there has grown up a serious threat to irrigation of American lands on the lower Rio Grande. This time the shoe is on the other foot and instead of Mexico's lands being in danger because of the lack of a water supply, it is the lands in Texas that are threatened. American citizens on the north bank of the Rio Grande need about one million acre feet of water originating in the watersheds of Mexico. On the other hand, Mexican citizens south of California need one million acre feet originating in the Colorado River. Here is a possible basis for a trade by treaty.

IN 1924, Congress passed an act providing for the study of the equitable uses of the water of the Rio Grande below Fort Quitman, Texas, in coöperation with the United States of Mexico. By a recent joint resolution of Congress, this act was extended to the Colorado and other rivers crossing the border. The President has been authorized to appoint commissioners to coöperate with the representatives of the Government of Mexico. Our commissioners are Dr. Elwood Mead, chairman; General Lansing H. Beach of Los Angeles, retired chief of Army engineers; and W. E. Anderson of San Benito. They are to secure information upon which to base a treaty with the Government of Mexico relative to the use of the waters of these rivers.

Thus far Mexico has not appointed its commissioners. When the joint commission gets into action, it is just possible that it may work out a solution on the Colorado River as was done on the Rio Grande, where by treaty our Government allowed Mexican landowners a certain amount of water stored in the Elephant Butte Dam. There is no reason why the work of the commission and the treaty-making powers of our Government could not function simultaneously with action by the Supreme Court and Congress in solving the problem.

Since the states apparently cannot agree to carry through the compact, and Congress cannot force them to do so, much time and peace of mind may be gained by considering this great controversy as a threefold problem, with action taken simultaneously. The only practical way left would appear to divide the problem, approaching it from the three angles indicated here and move along on all three fronts at the same time.

Taking Lessons *From* Pliny

EARTH, rammed or tamped into proper shape, forms the walls of a beautiful Washington, D. C., residence, built by Dr. H. B. Humphrey of the Bureau of Plant Industry, United States Department of Agriculture. Neither mortar nor cement was used.

This type of house may be said to be fashioned from a 'new-old' method of wall construction; new in the United States but old in other countries. In France, where walls of earth have long been known, they take the name of *Pise de terre.* England, France, Italy, South Africa, New South Wales, India, and even far-away Tibet, have drawn upon the soil for materials in erecting houses.

It is related that the Romans had knowledge of this form of home construction, and thus it may be said that walls of earth are very old; that is, nobody knows how old. However, this method of construction is novel in this country, and Dr. Humphrey is probably the first person to build such a home in the United States.

The economy of erecting a structure of this type is apparent—in fact, in the house built by this Washington scientist the soil dug up in the process of excavation was used in the walls of this home. The upturned earth was dumped close to the building site. The latter, however, was of such quality as to involve the use of explosives in the removal of several tons of rock. The basement walls were built of 'cast stone' or poured-concrete blocks, laid so as to form a foundation with window and door openings. Upon this foundation were reared the earth walls eighteen inches thick.

Wooden forms are necessary in molding this type of structure. In this instance, they consisted of seasoned pine planks, nine inches wide, one and one-half inches thick, and twelve feet long. These are the carpenter's tools in erecting buildings of this kind and it is highly important that these wooden forms be of good material and properly constructed. The other important factor in ramming or tamping walls for a residence is the selection of the proper kind of soil.

A house incorporating earth walls. Oval—Forms made of planks for molding.

A house built of earth is said to be impervious to rain, wind, and fire. Pliny, of old, in describing such walls, referred to them as 'imperishable.' Again, we are told by ancient literature that one of these structures endured for 150 years. This packed soil takes on the hardness of stone, and if it becomes necessary to enlarge the windows, tools used in quarries have to be resorted to.

Booth and Irving

(*Continued from page 13*)

Of the adventures of Sir Edward Mortimer I recall little; but I fell at once under the sway of his impersonator, a slender, graceful youth, with great, melancholy black eyes and poetic hair, and a voice whose sweetness and power were irresistible. Edwin was what we term 'magnetic' from the first; we might dissent from his interpretation of a part, or he might happen to fall short of his best in rendering it; but in his presence we never rebelled.

HE WAS from the first a master of stagecraft—of that wisdom of artifice, handed down through long tradition from precedent to precedent, which is never natural, but which conveys the feeling of nature by studied exaggerations and suppressions; which does not offend reason by trying to make stage settings and conditions real, but sublimates the whole matter by frankly trusting to the spectator's imagination. It is not skilful forgeries that we go to see, but the spirit of action and passion self-incarnate. The posture, gesture, placing and movements of the actor become true in art by avoiding the clumsiness of fact. If the stage be not art and artifice, it becomes crudity and confusion.

It was the great Henry Irving who began the decadence; poor Beerbohm Tree, parodying him, reduced it to absurdity. I need not follow it further. Edwin Booth was reared in the faith that the actor is the play, and he would have been effective in a barn. Some degree of costuming is right, because that is a part of the man; and yet David Garrick could win fame as Richard Third without help from an archeological tailor; and Charlotte Cushman, to please a little group of friends, could stand up in a drawing-room and carry us with her to the Venice of Portia, dressed in her mid-Victorian hooped petticoat, we feeling no discrepancy, nor distracted from the play of her genius by the incongruity of the environment. When Shakespeare acted and wrote, his scenery could be prepared at ten minutes' notice—'This is the Coast of Bohemia': 'This is the Forest of Arden.' If we coddle our baser senses too much, we atrophy our higher ones.

BOOTH'S stage was not primitive, but it was conventional, though he did take some pains, according to the lights of his time, with his costumes. He had good taste, and liked to be picturesque; his Hamlet dress was inky, but elegant; in Iago he assumed yellow and black, like a hornet; in Romeo he wore a doublet and hose that any Juliet would have loved—a sort of golden brown silk; his toga in Brutus had the dignity of Rome in its folds. During his visit to London, in 1880, he played Richelieu, in Bulwer Lytton's play, and his cardinal's robes were quite correct, I believe. Hon. John Collier, husband of one of Thomas H. Huxley's delightful daughters, made a full-length, life-size portrait of him in that character, and Booth would come to the studio in Chelsea twice or thrice a week to pose; his uplifted right arm (he was hurling the curse of Rome) would get tired often, and the girls would comfort him with tea and brown bread and butter; and I had seldom seen Booth in a happier humor.

He was playing an engagement with Irving, and 'Which is the better actor?' was a topic of conversation in London society. London had by that time decided that Irving's oddities of pronunciation were the proper thing, so that Booth's perfect art and melody of speech were questionable: it was suspected that it must be the American accent. And when Joe Jefferson came to a London theater to play Rip Van Winkle, two English ladies in front of me in the parquet discussed him between acts, and agreed he was a good actor, 'But what a pity he should have that American twang!'

Booth's private story was a mingled skein of personal griefs and public successes; he was a very lovable man, but his character was yielding and gentle, and, to the end of his life, undeveloped. He visited me at my Long Island home, and he said, 'They tell me I'm fifty; but I feel like a giddy boy!' He didn't look like a boy; he wore habitually the Hamlet melancholy; but, aside from his characterizations, he never attained the moral stature of a man.

FROM his famous father he had inherited, besides genius, propensities against which he struggled long; he and his lovely young wife would kneel down together and ask God for help—two children astray in the forest of the world. His loneliness, after her death, induced a second marriage, disastrous to his peace, for, though a good woman, she was a busybody and tortured him with constant interferences. She finally became insane. His brother's crime crushed him for a time, but the stage was his only salvation, and he came back to it. He built his beautiful theater on West 23rd Street; it was burned not long after. Then George Barrett, his friend and friendly rival, died in the midst of the successful tour he was managing for him.

George, by the way, was a painstaking and trained actor, and could never quite understand the public's preference for Edwin. It was the personal equation, the gift of the gods. Barrett had fine eyes, and his stage business was irreproachable, and Booth was only too ready to yield him prominence, but there is no overcoming spiritual ascendancy. There was humor in the situation but neither of them could see it.

After his friend's death, Booth gave himself up almost wholly to Hamlet. It had been before this that he had acted with Salvini, each speaking his own language—a rather grotesque combination; not so bad, however, when Booth would be Iago and the Italian the Moor; but when, next night, the parts would be reversed, it taxed one's faith and gravity. However, the box office was content, and we conceived a personal liking for the huge and earnest Italian, though even in Shakespeare we could only guess at what he was declaiming, and in Samson, where his speeches were long, our faces were pleasant (we hoped) but blank.

Salvini's great countrywoman, Ristori, had come to us years before, bringing her own company with her. An extraordinary catastrophe occurred at her performance of Lady Macbeth at the Boston Theater. What was the matter with the Thane? We hoped he had been taken suddenly ill only; but in the dagger scene we began to fear something inconceivable on the Boston Theater stage. His knees sagged, his feet stumbled, his voice whined and blurred; he seemed about to collapse, and Lady Macbeth was obliged not only to take the daggers, but to hold her spouse up by his neck gear while she lectured him. The scene was cut short, and the sinful Thane didn't appear again at all, and the play ended with the bloodspot on Lady Macbeth's hand. The audience was painfully interested, but it neither laughed nor hissed, but applauded Ristori emphatically. She had proved herself great as both an actress and a woman.

* * *

Charlotte Cushman was not superior to Ristori in her own line, but she included comedy, with tragedy, in her scope, and dignified melodrama in her incomparable Meg Merrilies. She could take male parts too—Hamlet and Romeo, Claude Melnotte; and withal, in private life, she was a great, simple woman, with no tang of the stage about her. She used to visit us in England, when I was a child, and allow me to sit by her side on a footstool, and play with the fascinating little golden charms on her watch chain. She was a devoted friend of my father and mother, and, as every normal boy must have been in love with an actress, she was my first love, though that was years before I knew that she was on the stage.

But long after, when I was an aspirant to Harvard, she came to Boston to play Meg Merrilies; and in sending us tickets she wrote, 'I don't know whether Julian had better come: I'm afraid I might shock him!' But Booth had already broken the ice of my inexperience, and I was in my place when the curtain rose. I had long since known Walter Scott's story, and had my own conception of Meg; I couldn't imagine how my lady of the watch charms would appear in the character. Several scenes passed without her, and I was impatient. Two men were sitting at a table near the front of the stage, drinking ale and talking, one of them, the hero, with his face toward the audience.

SUDDENLY, noiselessly, in the doorway in the rear of the inn room, a figure leaped into view, and halted, stiffened into immobility. Lean and ragged she was, gray hair streaming shaggy about her shoulders, a visage wild and haggard, with piercing, terrible eyes: a weird and ghastly vision. In her left hand she held a long staff, a rough bough from the forest; her right arm was lifted, and she pointed at the young man at the table; she had not seen him since his childhood, but the gypsy had recognized him at a glance. He meanwhile kept on gossiping and drinking with his companion, both of them unaware of the appalling presence in the background. She remained motionless, pointing; it seemed to me that minutes passed; the suspense became intolerable; and not until the man turned, and rose, startled, did I realize that the ghastly apparition was none other than my own Charlotte Cushman.

It was melodramatic, if you please; but I have never since seen, on any stage, an entrance so effective. The suspended breath of the audience was released audibly—and Meg, before a word had been spoken, held two thousand Bostonians captive.

* * *

After Fanny Kemble had (very properly) divorced Pierce Butler and resumed her maiden name, she lived near us in Lenox for a while, where my father was writing *The House of Seven Gables*. She was a heroic woman, in beauty as well as in character: she had pulled her brother, Charles Kemble, the actor, out of his money troubles by giving Shakespearean readings; she acted in England, too, for a time, and wrote several books—reminiscences, plays, criticisms, and poems. She used to come riding up to our little red cottage on her great black charger (this was in 1851) and one day, as I stood gaping up at her, she stooped and seized me by the belt and lifted me up before her on the saddle; off we galloped, wheeled about and returned. She held me out at arm's length: 'Take your son—Julian the Apostate!'

Unlike Charlotte Cushman, she carried the stage about with her in private life, and my mother told how, going into a dry-goods shop to buy a yard of cloth, she frightened the clerk by pointing to a defect in it, with a tragic gesture, and—'Yet there's a spot!' She was robust and ruddy. She didn't put on the dramatic style for effect; it was natural to her, being of a dramatic family.

Booth, shy and modest though he was, could not divest himself of the buskined style; but he had been on the stage so early that I suppose he had no style of his own. Stage people varied in this respect, but you could generally detect an actor or actress by their enunciation; they didn't mumble and clutter up their words, but treated them with respect.

It was an education to converse with Ellen Terry—if you could sufficiently protect yourself from the assault of her overwhelming temperament, from her matchless, sparkling, sensuous charm, to pay attention to her speech. Her long association with Henry Irving was not more surprising in other ways than in the fact that neither of them adopted anything from the other,—they held to their own; though, of course, they stimulated each other to keep their highest level.

* * *

I enjoyed the great comedians of that time; there was a good number of them, and they were consummate artists. Comedy was perhaps more artificial than tragedy, and the working out of the details was delightful to observe. William Warren was with the Boston Museum Company, which was a group of such talents as was not elsewhere to be seen, nor has since then been collected.

Sometimes a star from other regions would come to the Museum for a season; one of them was Lester Wallack, the handsomest man that ever stepped on a stage, and perfect in his parts.

* * *

Edward Sothern—I mean Edward Askew Sothern—was the delight of mankind while he lasted; and when he died, halfway through his fifties, there was none to replace him. When Tom Taylor had written *Our American Cousin*, he had named Dundreary among the *dramatis personae*, to be sure; but his lordship had no more importance in the play than the flunky who announces the carriage. Taylor's knowledge of the type was hardly skin-deep; but when, in a fortunate hour, Sothern was picked to play it, the young actor had the purse of Fortunatus in his grasp. No two characters could be more unlike than were Sothern and Dundreary, but the one immediately knew the other to the marrow, and made him bloom and put forth roots till the rest of the drama became but a negligible vehicle for him; the plant burst the flowerpot. The entire character is made up of Sothern's 'gags'; the others do but minister to his joyous idiocy.

As I look back, it seems to me that I have left untouched half of what I had to say. The twilight is deep, but the shapes that people it do not fade to my eyes, now that I have become accustomed to renewing their environment. But few of them would be recognizable.

Cluttered Fields

(Continued from page 4)

is an ever-increasing number of high school trained competitors. They start young in the present day and generation and if they are not over-hurried they come to the major athletic fields better equipped than any athlete of twenty years ago. Every condition of modern competition helps to better performances and the wrecking should continue indefinitely with the aid of more scientific coaching and the laboratories.

The pole vault will probably see the most frequent changes in records. Here is one event where the indoor record should be better than the outdoor mark. This also applies to the high jump and, possibly, to the broad jump. The jumping events are affected to a certain extent by the wind. Indoors the competitors have no wind to reckon with and the take-off and landing pit can be constructed even better indoors than outside.

As soon as the longer distance events become popular, in Europe if not in this country, then it is certain that a batch of existing records will fall.

All other record making fades before the performances in swimming. The books list 133 records for men and women. Of these 43 were established in 1926 and 36 during the year before. Only three of the swimming records listed at the close of 1926 were more than five years old.

There are a hundred times as many track and field performers today as there were twenty years ago and there are more than two hundred times as many swimmers. The army shooting at the current marks is getting constantly larger and better trained. All of which means that the future will develop more surprises than the past.

Slave *and* King

FEW travelers in the more or less unfrequented tropic clime of northern Haiti have failed to hear of Christophe, or 'King Henri I,' as he called himself. Perhaps none has visited the ancient Caribbean seaport of Cape Haiti without gazing from the harbor along a succession of mountain tops in the rugged interior, until the eye caught one in particular, square-topped and tiny in the distance—Christophe's famous citadel—the strangest memorial ever conceived by one man to perpetuate a notorious career of bloody despotism.

Christophe was originally the slave of a French master who operated a café at Cape Haiti shortly before 1800. After the French had been driven out, Christophe, at the head of the northern section of the island, proclaimed himself 'King Henri I.' Eight dukes, thirty-seven barons, eleven knights, together with princes of the blood and princes of the kingdom, were all created; after which he began the construction of the citadel to provide a safe retreat from possible enemies.

It is estimated that 20,000 blacks perished in this work. Heavy granite blocks were dragged up a specially constructed roadway to a height 2,500 feet above the Caribbean. The walls were made ten to twenty feet thick, with towers nearly 130 feet high. The citadel is four stories high, with vaults, dungeons and tunnels. Some of the cannon still peeping from its portholes are eleven feet long and bear the royal arms of England. How these pieces, weighing ten to fifteen tons, were transported up the steep mountain side is a mystery.

One story told by the natives is that a certain objective was assigned by King Henri each day to various groups of workmen; and at night he personally killed every tenth man from the groups that failed to achieve it. His favorite mode of removing his victims was from the highest point of the citadel, where they had a sheer drop of 1,000 feet.

King Henri I ruled for fifteen years. His end came after a stroke of apoplexy. He is said to have fired a solid silver bullet into his heart. Even before his death his subjects had begun to throw off his yoke. The 'Northern' kingdom was united with the republic of Haiti and the 'Black' republic welded all factions into one whole.

And She Is Blind

By PAUL PAYTON FARRINGTON

Jack Callahan and Mrs. Callahan as she appeared when she lost her sight.

IT IS five years ago. The brilliantly lighted Hippodrome, at the corner of Sixth Avenue and Forty-Third Street, is jammed with hundreds of beautifully gowned women and meticulously dressed men. Far above them, one hundred and twenty feet over a glistening tank of water, a young woman is poised. She is small, dark, attractive, and she is prepared to make her usual swan dive before the metropolitan crowd.

Then, from her, there is a sudden intake of breath which amounts, almost, to a gasp. To herself she whispers, 'My eyes—my eyes.'

Yet there is but one thing for her to do. She again makes the leap. And the crowd, applauding, does not know.

Were it possible for you to glance through a window of a certain modest home of the exclusive Long Island suburb, Kew Gardens, tonight, you might see a diminutive, very pert young woman, addressing herself to the business of preparing dinner. She is absorbed, this young woman, in determining whether the beans are all that a pot of beans should be, and if the other dishes are sufficiently appetizing to recommend themselves.

Not interested? All right. But remember: the young woman is totally blind.

Tonight that young woman, Mrs. Jack Callahan, née Helen Carr, is smiling in her kitchen. And, five years ago, she was playing before eminent spectators. The Prince of Wales has risen to applaud her. The King and Queen of Belgium have done her honor.

And tonight—is she happy?

She is. She is the wife of the man whose fiancée she was before the water robbed her of her sight. She is the wife of the man who refused to give her up when, possibly, her hours were darkest. She is the wife of a New York cartoonist whose comic strips appear in newspapers in the United States, Great Britain, and on the Continent. Jack Callahan, whose progenitors came from County Cork, is the man who created 'Freddie the Sheik,' 'Hon and Dearie,' 'Calamity Jane,' and the 'You-Tell-'Ems.' At present he is the understudy of the internationally known George McManus.

'Of course I'm happy,' Mrs. Callahan said the other night. 'There is, you know, really no reason why I shouldn't be. You see, I dance—just as I always did. And I ice skate. And I dive and swim. And I'm rather foolish about the radio.'

Mrs. Callahan, gowned in a shade of red which cannot be described by most men but which, they sense, cannot be worn except by brunets, paused.

'You know,' she said, 'Jack Callahan is a cheat. I rather hate to say that about my own husband. Ordinarily, you see, he is rather a decent sort. But last night—I believe it was last night—he told me he had got KGW on the radio. And, let me assure you, that isn't possible on our set. I have three callouses on the finger tips of my right hand, and those dials won't take me farther west than Chicago. My husband, I'm afraid, has no sense of radio honor. He's forever boasting about how far he's radioed west—and I'd venture he's never yet reached Buffalo.'

That—Callahan explained later—is the only argument which brings about domestic strife in his family. For hours, he says, he and his sightless wife reach for distant stations. 'Occasionally,' he confided, 'I have stretched a point—or three.'

Right here, for the benefit of those who believe their lots in life have been hard, there should be an interjection, or an interpolation, or an interlude—or something.

When Mrs. Jack Callahan was Miss Helen Carr she dived from a platform quite high above the water. Due to the fact that the dive was, necessarily, a shallow one, the impact of the water on her eyes was extremely severe. After an entire season of diving she discovered, one night, that her sight was somewhat blurred. On the following night the condition was more aggravated. Then she saw a physician.

The expert told her that her ailment was detached retinas. At this time Miss Carr was only the fiancée of Mr. Callahan, but she and he sought out the most brilliant specialists in New York City. They told her that hope was lost.

But the girl refused to quit. Urged by the man who, later, was to become her husband, she went to Europe where she received attention from the most distinguished practitioners on the Continent. Eleven operations she underwent, some of which required that she remain with her head motionless for as long as fourteen days at a time.

Then—after months of pain, of suffering and occasional hope—the girl knew what future was to be hers. She was, forever, to be blind.

There will be no work for the tear-jerkers in this article. Mrs. Callahan wants none of them. She had rather that people understand she is entirely contented with life; that people, usually, have proved themselves a bit of all right, and that there is much joy in life for even those who do not see with their eyes.

And as for Callahan?

'What amuses me most,' he said, 'is the manner in which most persons look on the "boss." They seem to think she shouldn't be happy—and I've never known a person who seems to find more things in life to enjoy. By the way, she *is* the "boss." Before I met my wife I think I was making pretty fair money—at least, as much as the average individual. Now, well you see, under the "boss" I've sort of managed to do a little better. You understand? Together we've managed to save enough to buy a couple of places which we've leased to tenants and, well, we're getting along fairly well, thank you.'

Callahan, who confesses he was one of the most thorough mess sergeants who ever endeavored to starve out a man in uniform during the comparatively recent disturbance, was—because of his absence of weight—associated with a depot brigade at Camp Upton. 'I fought, more or less honorably,' he explained, 'approximately three thousand and some miles behind the lines. My most intrepid work was done as a mess sergeant of prison barracks. My predecessor had been killed by a Negro K. P. the week before.'

Last summer Mr. and Mrs. Callahan took a Mediterranean cruise. On it, Mrs. Callahan said, she enjoyed herself immensely. She won first prize at a masquerade while on board the Red Star liner, attained the top of Vesuvius with only her husband's arm for guidance, and, at regular intervals, danced and swam to her heart's content.

'People, commonly, take themselves too seriously,' she said. 'I know that that sounds terribly trite—but I mean it. Certainly I enjoy myself at all times—or, at least, nearly all times. Why can't persons with *all* their faculties do the same thing?'

The Callahans were approached on one subject which, to them, is a trifle delicate. 'Isn't it so,' Mrs. Callahan was asked, 'that you urged your husband to marry somebody else when you knew you were to be blind?'

The beautiful young woman pursed her lips. 'Well, yes,' she confessed. 'I did. But I'm darn glad he didn't take me up. You know, though, he does cheat at radio.'

Housekeeping in Havana

(*Continued from page 15*)

One night in the Cosmopolita—a café I liked very well indeed—I was with Cubans, and we all spoke Spanish. For this reason I think the Americans in the next small, semiprivate inclosure were less careful than they would have been about their orders to the waiters. But perhaps they belonged to the shouting clan—who knows? Anyway—they ordered—those fortunate people who could be in Havana—Martini cocktails, bean soup (and it was a hot night), champagne, potato chips, fish and—beer. How they ended up, I do not know, but I should judge on an undertaker's table.

Juan, who was my host, grinned cheerfully at me, having lived in the States and having learned English. I pretended I was of the country that I had learned to love so from living, really living in it! And I said, 'Well, thanks to God—(and 'thanks to God' is very easy to say in Cuba) I am a Cuban—tonight anyway—'

And a friend of Juan's who was of our party was kind enough to put in, 'That way you have seen Havana, the real Havana that too many miss.'

Great Figures in Fiction

(*Continued from page 9*)

tention he adds a detail that lessens somewhat the hazards of the venture.

'Do you see these papers?' he asks her. 'Well, they are evidence that I have taken up Seventy-five Thousand Acres of Land in this county—think what an enormous fortune it will be some day! Why, Nancy, enormous don't express it—the word's too tame.'

* * *

'I've been secretly boiling and fuming with this grand inspiration for weeks, and I *must* talk or I'll burst. I haven't whispered to a soul—not a word—have had my *countenance* under lock and key, for fear it might drop something that would tell even these animals here how to discern the gold mine that's glaring under their noses. Now, all that is necessary to hold this land and keep it in the family is to pay the trifling taxes on it yearly—five or ten dollars—the whole tract would not sell for over a third of a cent an acre now, but some day people will be glad to get it for twenty dollars, fifty dollars, a hundred dollars an acre.

Decoration by GERALD VAN DER HEYDEN

* * *

'Even you and I will see the day that steamboats will come up that little Turkey River to within twenty miles of this land of ours—and in high water they'll come right *to* it. - - - There's a bigger wonder—the railroad. - - - Some day when you and I are in our graves, there'll be a railroad stretching hundreds of miles—all the way down from the cities of the Northern States to New Orleans—and it's got to run within thirty miles of this land. - - - They've quit burning wood in some places in the Eastern States. And what do you suppose they burn? Coal! *There's whole worlds of it on this land.*'

Sellers contributes an even warmer enthusiasm for the possibilities of the immediate present. 'I've got the biggest scheme on earth,' he writes. Hawkins assures himself that the land in Tennessee takes care of the future, packs his goods, and four months later sets out for Missouri.

It may be a narrow margin that separates the man of vision from the visionary, but Beriah Sellers is on the wrong side of the line. His magniloquence in the cause of the eyewash for which he never finds the last necessary ingredient is a triumph in the art of persuasion. It does not lower the ardor of Colonel Sellers that the eyewash fails to produce a fortune. He enters sanguinely into the project of making a great city out of a bit of swamp land known as Stone's Landing, rechristened Napoleon. The railroad is to make Napoleon; a congressional appropriation has been secured for the improvement of the Columbus River. Colonel Sellers has boomed Napoleon with all the powers of speech at his command, and his 'tongue is a magician's wand.' For a few weeks he seems triumphant in the almost secure possession of a fortune. Then the neighboring town of Hawkeye subscribes for large blocks of the stock of the promoting company, succeeds in diverting the railroad so that it will pass through Hawkeye, and reduces the future of Napoleon to the vanishing point.

Dreams chase one another across the kaleidoscopic field glass of the Sellers imagination with a frequency and an urgency almost irresistible. With the definite failure of the scheme for making a metropolitan center out of Napoleon, he turns to something else.

He manages to secure transportation to Washington as a lobbyist in the interest of the Government purchase of the Hawkins lands in Tennessee. The Washington atmosphere stimulates him. His exuberant vitality, his imperturbable good nature, his gifts as a raconteur keep him on the crest of this new wave that is to carry him and Laura Hawkins to affluence. His devotion to the project is not wholly selfish. Congress provides that the government shall expend three million dollars in erecting a university on the Hawkins lands and furthering there the industrial education and uplift of persons of the colored race. In the expansive warmth of his nature, Sellers believes genuinely in the benefits that are to flow from the success of his ventures. In Washington he is part of its corruptive activity, but he is also apart from it. When Washington Hawkins tells him that if people knew him well enough he would be made a congressman, he says with grave sincerity that there has never been anything in his conduct to justify the young man's saying anything like that. Finally, having seen escape into thin air the bubbles of all his dreams, he decides to practise law. Here his buoyant volubility may find an outlet.

Colonel Sellers suggests Micawber, in *David Copperfield.* But Micawber is hopeful and relaxed, while Sellers is eager and alert. The American has before him the greatest body of undeveloped resources ever spread out before the human imagination. He is unique, but he is to a certain extent the product of a boom period of 'The Gilded Age.'

CHATS WITH OFFICE CALLERS

'Our state is not the despised Cinderella you have pitied and laughed at,' said the ***Man from Arkansas.*** 'Arkansas is California minus the advertising.

'While she is old in years and rich in resources, there is a vast difference between potential wealth and applied or surplus wealth. For this reason, perhaps more than any other, Arkansas is looked upon as a poor relation. She has failed to open a savings account by building for the future.

'There are causes for this. A lot of people rushed to Arkansas from the north as well as the south. These people slashed her fine timberlands and turned them into half-baked farmlands and then went away, leaving their harm behind. As one result, there are now many parts of Arkansas which have neither timber nor tillage.

'About seventy-five per cent of Arkansas' residents were born in the United States, but not in Arkansas. They, not their parents, emigrated from Michigan, Wisconsin, Illinois, Iowa, Missouri, Tennessee, Mississippi and Texas. It is a meeting ground for the North and the South—neutral territory where *ante bellum* antecedents are given the hook, and where Michigan weds Texas and is glad of it. Their children are just now reaching the age of their finest patriotism and love of native heath. They believe in Arkansas as a part of the United States and to them will fall the task of putting their beloved state in the front rank where she belongs.'

* * *

We had been talking of optimism—and of our hopes of the future. The ***Young Man*** was glorying in the opportunities of the present day. Slowly, the ***Elderly Man*** broke into the conversation.

'Even if all you say is true, you will never see your best days,' he stated. 'They will always be in the future. You will never stop expecting something better than you have had up to that time. Such is life—no matter what age or century you may decorate.

'And it is a blessing for us that this is true,' he went on; 'we couldn't endure existence otherwise. Certainly we couldn't, if we thought that sorrows and trials were our permanent lot. We always feel that somehow the sun may break through the clouds.

'So, if you will look over the pages of history, you will find that most of the greatest achievements have been accomplished by men who acted on trust.'

* * *

'I sometimes look on myself as standing at the end of a line that has been erased,' said the ***Naturalist from California.*** We asked him to elucidate.

'I mean,' he explained, 'that every stream of life has many unknown tributaries. No one can trace all the currents that flow through the human being—any more than we can trace the springs, rills, and snowdrops that make up the river.

'Again, sometimes I look on myself as having an outer and an inner court to my life—one common, the other private and individual. In the inner court are some things only one's heart and one's God can understand.'

* * *

'For some time I have been asking myself—Does it pay to be a Jill-of-all-trades?' said the ***Business Girl.***

'It has been brought more forcibly to mind by the story of a neighbor—Lina, she is usually called. Lina is past middle age, but has always appeared young and capable.

'When very young she began "doing things" which most children never think of. Three sisters became teachers, the youngest was in high school, and Lina, the stay-at-home girl, was Jill-of-all-trades. Her father developed a nervous disorder which made him an invalid, so she became his nurse; and because she loved to see her pretty sisters dressed up-to-date, she sewed and sewed.

'Lina's two brothers married, and one of them settled near the old home. His wife then added her bit to our Jill's already heavy burden of sewing. Two sisters married, and in a few years she was "auntie" to several babies. She helped make most of their clothing, loved them with all her heart, and had them at the old homestead much of the time.

'Her mother was taken ill, and for a year Lina nursed her until she died. When left practically alone with her invalid father, she saw that he was as comfortable and happy as possible.

'Her father's death left Lina in a serious predicament. The farm had been heavily mortgaged to pay doctor bills, funeral expenses, and other necessities. It was sold, accounts settled, and the remnant of money presented to her, by the joint decision of the other brothers and sisters.

'The small investment, however, was not enough to keep her, but what was she fitted to do? She tried practical nursing—surely having served a long apprenticeship in that—but her own health was far too uncertain. As to sewing it seemed quite impossible to take it up as a trade at her age, working constantly perhaps if she filled customers' orders.

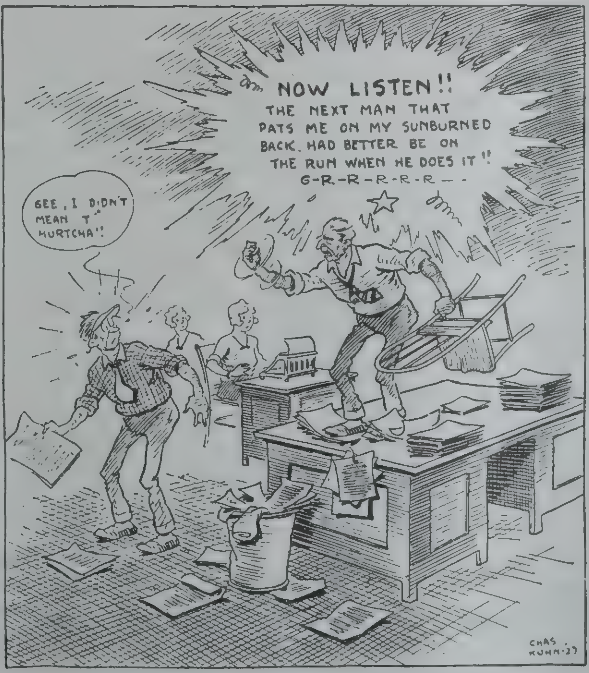
'A woman, who as a girl was considered so smart! A woman with a reputation for great capability—one that could do almost everything fairly well—has come to the humiliating conclusion that she can do nothing quite well enough to succeed in it as a paying business. She thinks herself a failure. Is she?'

* * *

'Goldfish raising on a commercial scale is far from a sinecure,' remarked the ***Fish Merchant.*** 'Vicissitudes limit production and exhaust the patience of those who embark in the business without complete familiarity with several outstanding disadvantages. Snakes, turtles, kingfishers, cranes, owls, chicken hawks and other birds and reptiles prey on the fish. Groundhogs, muskrats and crawfish also endanger the permanency of the ponds by undermining their banks. Floods and freshets cause the ponds to overflow, so that hundreds of thousands of valuable fish are washed away.

'Maryland goldfish farmers have developed a unique system of policing and patrolling their ponds to prevent depredations and despoliations by birds or animals. Each farm employs one or two armed watchmen who act as sentries and protective policemen. They walk the banks of the ponds watching the sky above and the pond-walls at their feet. They shoot all predatory birds and plug up all muskrat and crawfish holes and burrows which they find. They also cut down obnoxious bullrushes, "cattails" and other matted growth which harbor snakes.

'Another factor in goldfish farming is whether the Tom Thumb fish will color properly. Science has not yet discovered what peculiar conditions occur in certain waters which make them better for goldfish production than adjacent waters, where the ornamental fish assume raiment of ebony hue or chocolate-black shade instead of glittering golden color. Fishing Creek and her tributaries in Maryland put the golden glisten into goldfish costumes, while under identical conditions of temperature, exposure and adequacy of water expanse, fish will not color at all in artificial ponds in Virginia, Pennsylvania or North Carolina.'



NOW LISTEN!!
THE NEXT MAN THAT PATS ME ON MY SUNBURNED BACK. HAD BETTER BE ON THE RUN WHEN HE DOES IT!!

AFTER THE VACATION.

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. What is the extent of the national and state forests?

Answer. The national forests contain 158,759,210 acres. The state forests in the United States on December 31, 1925, had an area of 5,501,000 acres and there are besides about 4,600,000 acres of other state-owned forest land.

* * *

Q. How are students to the Naval Academy at Annapolis appointed?

A. The students of the Naval Academy are called midshipmen. Three midshipmen are allowed for each senator, representative, and delegate in Congress, 1 for the resident commissioner from Porto Rico, 2 for the District of Columbia, and 15 appointed each year from the United States at large. In addition 1 Filipino is allowed for each class. The appointments from the District of Columbia and of the 15 at large each year are made by the President. The selection of candidates, by competitive examination or otherwise, for nomination for vacancies in the quota of senators, representatives and delegates in Congress is entirely in the hands of each senator, representative and delegate in Congress having a vacancy; and all applications for appointment or inquiries relative to competitive examinations should be addressed accordingly. Two examinations for admission are held each year, the first on the third Wednesday in February, the second on the third Wednesday in April. In addition, the appointment of 100 enlisted men each year from the Regular Navy and Marine Corps and 25 from the Naval Reserve and Marine Corps Reserve is authorized. These appointments are on a competitive basis.

* * *

Q. Has Canada a pension system? If so, how does it apply and to whom?

A. Yes. Canada has a very comprehensive pension act for taking care of the members of her naval, military and air forces. This is administered by the Board of Pension Commissioners, Ottawa. There is also the Civil Service Superannuation Act which is a contributory system of pensioning civil servants. In addition to these, there is an Old Age Pension Act which was assented to March 31, 1927, and provides for a maximum pension of $240 per annum to any person who is a British subject (or, being a widow, who is not a British subject, was such before her marriage) who is seventy years old; has resided in Canada for twenty years; has resided in the province in which the application for pension is made for five years; is not an Indian as defined by the Indian Act; is not in receipt of an income of as much as $365 a year and who has not made any voluntary assignment or transfer of property for the purpose of qualifying for a pension. The operation of this act in any particular province becomes effective only when that province has entered into an agreement with the federal government.

* * *

Q. What measures of importance were passed during President Wilson's first administration? What was the vote on the Federal Reserve Act?

A. The Underwood Tariff Act signed by the President on October 5, 1913, reduced the tariff from a general level of 45 per cent to 25 per cent and greatly enlarged the free list. This act also contained the first federal income tax provisions, the 16th Amendment having been declared in force on February 25, 1913. The Owen-Glass Federal Reserve Bill drafted on lines approved by the President and Secretary McAdoo was passed in definite form by the House, December 22, 1913, by a vote of 298 to 60 and by the Senate on the following day by a vote of 43 to 25. The act creating the Federal Trade Commission was approved September 26, 1914, and the Clayton Anti-Trust Act on October 15, 1914. The Jones Philippine Bill approved August 29, 1916, declared in its preamble the purpose of the United States to recognize the independence of the islands as soon as stable government should have been established, and provided, among other things, for a bicameral elective legislature for the islands. The Porto Rican Civil Government Bill signed March 2, 1917, by President Wilson conferred full American citizenship on Porto Ricans and called for the creation of a senate of nineteen members to be elected by the people. The Alaskan Railway Act approved March 2, 1914, provided for the Government ownership and operation of railroads in that territory. Treaties with Nicaragua and Haiti were both ratified in February, 1916, and a treaty with Colombia was signed in 1914 but was not ratified by the United States Senate until the Harding Administration.

* * *

Q. Who holds the record for around-the-world travel at the present time?

A. Edward S. Evans, a business man of Detroit, and Linton Wells, a newspaperman of New York, established a record for encircling the globe when they reached the Pulitzer Building in Park Row, New York City, in an automobile at 4:6:51 p. m. on July 14, 1926. Vilhjálmur Stefánsson, the Arctic explorer, was the official timekeeper, and announced the time of the trip as 28 days, 14 hours, 36 minutes and 51 seconds. The journey covered 20,100 miles over land and sea by steamers, fast trains, motor cars and airplanes.

* * *

Q. How many aliens were admitted into the United States during the year of 1926?

A. During the fiscal year ending June 30, 1926, Secretary of Labor James J. Davis, in his annual report, claimed 496,106 aliens admitted and 227,755 departed, resulting in an increase of 268,351 in the alien population of the United States.

* * *

Q. What is the arrangement between the United States and Switzerland whereby an American citizen can vote in that country and not lose his United States citizenship?

A. There is no agreement between these two countries to this effect. However, United States Federal Acts governing the loss of citizenship make no provision by which voting in a foreign country may in itself constitute the loss of American citizenship. It is advisable that citizens of the United States do not participate in the political life of the foreign countries in which they are residing as, in doing so, the question whether or not the protection of this Government should be extended to them for residence abroad is necessarily raised. It may be stated that taking part in the political life of the country in which they are residing, such, for example, as voting therein, coupled with other facts in the case, might justify the Department of State in declining to extend its protection. However, in the absence of an oath of allegiance to that country or naturalization in that country, it would not constitute an actual loss of American citizenship.

NOW LEMME SEE — I'VE LOOKED IN ALL THE CLOSETS, THE ATTIC, AN' THE TRUNK!! DON'T BELIEVE I'VE OVERLOOKED A PLACE IN THE HOUSE BIG ENOUGH T' HIDE A MATCH BOX, LET ALONE A BOX O' FISHIN' TACKLE!! WONDER IF IT'D BE CHEAPER TO TELEGRAPH HER OR BUY A NEW OUTFIT? —

WHEN THE WIFE HAS GONE FOR THE SUMMER.

BRIEFLY TOLD

Because of the belief that the souls of ancestors are transferred to children, Eskimo natives do not punish their offspring.

The half-cent stamp is the lowest denomination of all adhesive postage stamps issued by the United States and the five-dollar stamp the largest.

According to Arthur Koehler, specialist in wood structure of the Department of Agriculture, there are more than sixty different species of timber that have at one time or another been put on the market under the name of mahogany.

The flag of Alaska was designed by Benny Benson, a 16-year-old schoolboy.

Many hostesses of London hire the entire decorations of their homes, such as art works, tapestries, beautiful old furniture and ornaments, from antique dealers for their social affairs. These loans are often made free of charge with the hope that some wealthy guest will make a purchase.

American women spent four times as much last year for permanent waves as the United States Government did in building new ships.

From fifteen to twenty tons of waste paper are gathered weekly from some of the large office buildings in our cities, two to three tons daily from hotels of the large type, ten to twenty tons daily from metropolitan newspapers and 17,000 tons weekly by the street cleaning department of New York City alone.

In despair when the drought continued into what is supposed to be the rainy season, the peasants of Changsintien, China, dressed two men up as fish and marched them down the street pouring water on them all the way as a prayer for rain.

In New York on the grave of a soldier of the War of 1812 is a wild flower unknown to the State of New York but native to Connecticut. It is believed that the flower sprang from a seed carried in the clothing of the soldier.

Among the dishes that are considered delicacies by the different peoples of the world are: Crocodile meat, salmon eyes, jellyfish, octopus, seaworms, seventeen-year locusts, moths, caterpillars, grasshoppers, ants, earthworms and fruit bats.

Buddhist priests in Japan encourage the doll service, in which thousands of children pray for their broken dolls in the belief that the spirits of their favorite dolls will be comforted, because they think it teaches the children tender sentiments and kindliness.

There are about 620 muscles in the body of the normal man, one-fourth of which are in the neck and face.

By drinking 35 cups of coffee and smoking 6 packages of cigarets every 24 hours, Roger O'Mallia, 40-year-old insurance salesman of San Antonio, Texas, has established a record of 150 hours without sleep.

John Matthews, Presbyterian minister of Glendale, California, who 'over preached' while delivering a recent sermon, is the first church employe to apply for state industrial accident compensation in California. Gesticulating to emphasize his sermon, Matthews strained a muscle, necessitating an operation.

In the good old days, a graceful lace scarf was the official Chinese calling card. Then came the rage for red visiting cards, often as large as eighteen inches square with the name in gilt letters. Today printed white cards are the fashion but they are still typically Chinese, carrying the name, city, county, province, present occupation and address on one side, and on the other a list of all the owner's achievements and claims to distinction.

Katharine Ott of Oberlustadt, Germany, claims ownership of the oldest grapevine in the world. The stem of the vine has a circumference of 47 inches, its roots reach 250 feet into the ground, and it bears luscious grapes every year. Experts believe the vine was planted about 1500.

There is a truck horse in London that sits down on his haunches and takes a rest when a traffic officer turns the signal against him.

THAT BACK YARD AGAIN.

Tornadoes south of the Equator move in a clockwise direction, while those north of the Equator always twist counterclockwise.

A new berry, known as the Union Dewberry, has been developed in Chino Valley, California. A cross between the loganberry and dewberry, the new vine is said to be very hardy, bearing readily and requiring little care.

Under our present calendar, no century can commence on Wednesday, Friday or Saturday. October begins always on the same day of the week as January; February, March and November commence on the same day of the week, while May, June and August commence on different days. The year always finishes on the same day of the week as it began. These rules, of course, do not apply to leap years.

A telephone which works on the principle of a phonograph and will take the message on a sensitive roller when the owner is out has been invented in Sweden.

Waterproof paper is being used to make aprons, raincoats, slip covers, beach slippers and other articles.

To prevent their barking and howling, Birmingham, England, has a canine curfew law to keep dogs off the streets after dark.

Oil was first utilized as a motive power 230 years ago by an English inventor named Street.

Fires have been caused by sun rays passing through goldfish bowls, the globe acting as a magnifying glass.

According to the National Dental Technicians, only 20 per cent of the 100,000,000 people of the United States use toothbrushes and there are only twenty sets of perfect natural teeth in the country.

The distance between points near Charleston, South Carolina, and San Diego, California, 2,150 miles, is the shortest from the Atlantic to the Pacific.

Dr. William H. Sheldon, psychologist of the University of Chicago, has announced that bulkily built men though more companionable are dumber than lean, slithery ones but that there is no relationship between height and intelligence.

Forty-six inches of rainfall in twenty-four hours is the world record for a rainstorm and was established in July, 1911, at Baguió, Philippine Islands.

On the theory that the dinner table is a battle ground which leads to many divorce courts, the French Society of Vegetarians is trying to encourage marriages of people of similar appetite.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses difficulties and the joy of battling them.

* * *

Stanley Woodward, who drew the sketch on this week's cover, is an outstanding New England artist. A number of his works were recently exhibited in New York City.

* * *

The Colorado River problem is capable of solution if approached as three distinct questions instead of one, says Huston Thompson in the third and last of a series of articles. Politics will prevent an early settlement, he fears, if the diverse interests are not segregated and satisfied separately. Some new suggestions are advanced by him. As former chairman of the Federal Trade Commission, his views merit thoughtful study. (p. 1)

* * *

No record is safe, says H. G. Salsinger, nationally known sports writer. More than two hundred records in various branches of athletic competition were smashed last year. The only popular track mark to withstand the challenges of the last decade is the quarter-mile. A weight record still unbroken is that of the 16-pound shot, which has stood since 1909. Salsinger's explanation of why so many new marks have been established is interesting. (p. 4)

* * *

Patriotism, sacrifice and steady advancement mark the history of the 'Old North State,' one with which too many persons in the United States are unfamiliar. Although a humorist recently declared—'What North Carolina needs is a press agent'—the residents of that community prefer visitors to publicity. The motto of the state—'*Esse quam videri*'—freely translated—'To be, rather than to seem to be'—sets forth their ideals. Their record in the Revolution, War Between the States, and the World War, is inspiring. (p. 5)

* * *

Where are the influential editors of yesteryear? laments one writer in tracing the pathway of American journalism. He describes the Sunday supplements as 'time-killing, forest-slaughtering monstrosities.' But—'it's the features that sell the newspapers'—and that is why the modern reader, instead of turning first to the editorial page, seeks the comic page to see what Andy Gump is doing. (p. 7)

* * *

Because a farmer boy watched his mother tie a granny knot, we now have the self-binder to expedite work in the grain fields. How the binder was invented, and the prejudices it had to overcome in the minds of the farmers, form a noteworthy page in pioneer history. But the idea germinated from the desire to have a mechanical device that would tie a knot. (p. 8)

* * *

Two strong though opposite types in fiction are Turgenev's Bazarov and Mark Twain's Colonel Beriah Sellers. The former has reduced life to a uniform colorness—with no values worthy to be accepted and maintained. The Colonel bubbles over with enthusiasm; he has the 'biggest scheme on earth.' Magniloquently, he names his proposed city in Missouri 'Napoleon.' But the neighboring town of Hawkeye secures the railroad, and Napoleon barely emerges from the dream stage. The contrast between Bazarov and Sellers is enlightening. (p. 9)

* * *

Drury Lane Theater in London in 1856, with the Grand Christmas Pantomimes, forms the introduction to Julian Hawthorne's recollections of the drama of two generations ago. It was in the Boston Theater in 1863 that he first saw the great Edwin Booth. Booth, says Hawthorne, possessed 'magnetism'; he was master of stagecraft and while acting avoided the clumsiness of fact. When Booth played his engagement with Sir Henry Irving in London, society asked—'Which is the better actor?' Booth's American accent was one thing that detracted from his popularity. (p. 12)

* * *

Tiled floors, darkened windows, high ceilings, and flat roofs are some of the delights of the Cuban housekeeper, according to Katharine Haviland Taylor, who writes from personal experience. But, she adds, 'let no one think Cuba a place to economize.' She gives us a taste of travel not found in the Cook Tours. (p. 14)

* * *

Hugh Walpole describes his 'most romantic adventure'—the kidnapping of a dyspeptic critic on a lonely island. The hero, Everard Tallboys, enticed to the Cornwall coast by a flattering admirer, finds himself marooned with a much-abused victim, an able accessory, and—'Jim.'

* * *

With such companions, the critic's vacation may be imagined. The plot was originated by a maligned writer of popular romantic fiction, who was seeking revenge on the critic. Tallboys had attributed this writer's popularity to 'naïveté, love of platitudes, and execrable English.' At first, the writer had demanded swift mayhem, but had finally concluded that the real trouble with the critic was his stomach. The episode on the island was to cure the dyspepsia. Tallboys gets a number of interesting surprises—as do his hosts. (p. 16)

REMARKS BY OUR READERS

Chicago, Illinois.

Permit me to hand you at the same time a bouquet and a little rebuke. First, the bouquet. I do enjoy the articles you have been publishing by H. G. Salsinger on different sport themes. This writer seems to approach his subject from a different angle than the ordinary sports writer. He does not resort to extravagant phrases or the slangy dialect affected by so many. His articles are always thoughtful and pleasant. They seem to get away from the commercial side of sport.

Now for the rebuke. I wish you would publish more cartoons. Recently I have observed that you use one or two on the department pages, but not nearly enough. I think a touch of humor enlivens every magazine and a good selection of cartoons on timely topics should please all your readers. At least, I vote for them.

D. R. RIDEOUT (M. D.).

St. Paul, Minnesota.

There have been so many pleasing articles in THE DEARBORN INDEPENDENT that I dislike to write this, my first letter, about something that has appealed to me as unfair. I refer to the little office chat you published on the Big Bend country in your issue of July 23. I fear that the casual reader will assume this to refer to all of eastern Washington, and thereby may do an injustice to a very fruitful and prosperous territory.

In the same mail that the magazine arrived, I received a clipping from a Spokane newspaper stating that this year's crop in the Big Bend will be good. Of course, that is what your article stated, but you give the impression that all of the Big Bend has suffered during the past nine years. This is not true.

Perhaps I should explain that the term 'Big Bend' means the big bend which the Columbia River makes as it flows southward through the state of Washington. East of the river, there is a stretch of country which some years ago was farmed extensively, but which in late years has been deserted. However, some of the farmers still hang on, hoping to see the country 'come back.' Some crops have been raised but not equal to the great yields in the richer sections of the state.

There are portions of the Big Bend country itself which have always been good farming; and it seemed to me as I read this 'Chat' that it gave the impression all of the Big Bend country was an arid desert and most forlorn. I know you did not mean to convey any such picture, hence this letter.

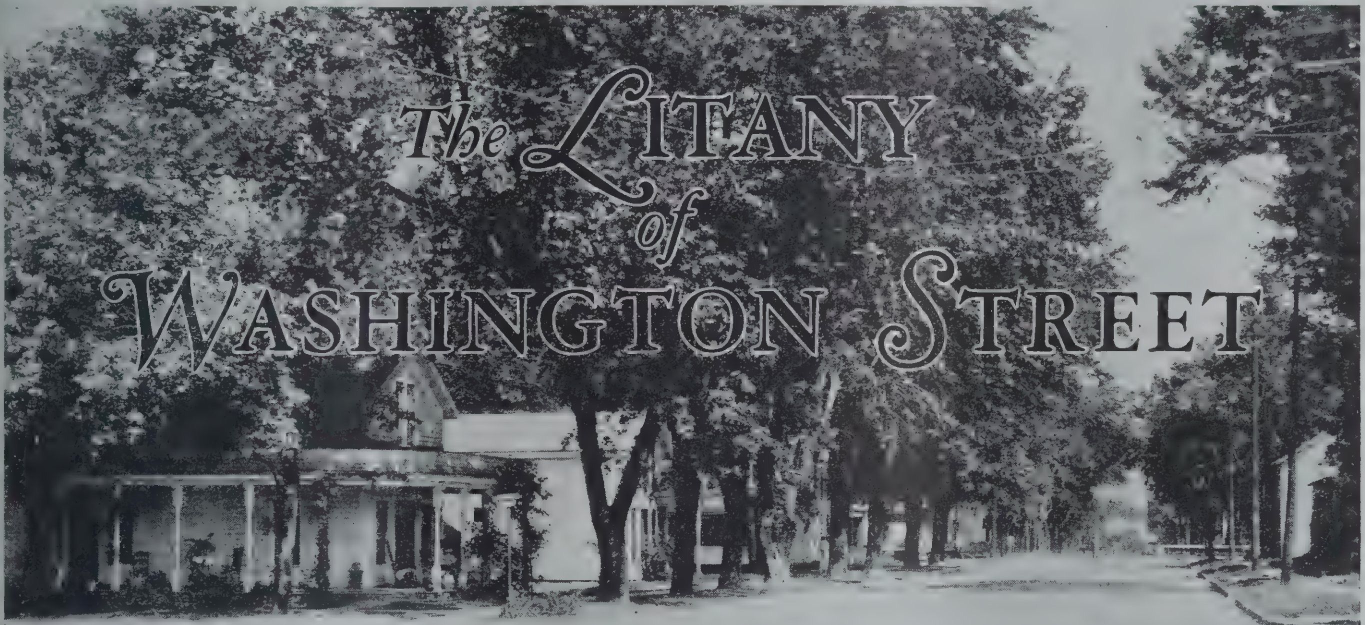
The LITANY of WASHINGTON STREET



By VACHEL LINDSAY

THE smallest town on the map may have fourteen well-named streets. Running one-way, they are likely to be First, Second, Third, and Fourth streets; then Main Street, then Fifth and Sixth streets. These might be said to be mere numbers and conveniences, not streets in the way I want to talk about them.

The other seven notable streets of any village are likely to be named for the first seven Presidents of the United States: Washington, Adams, Jefferson, Madison, Monroe, Jackson, Van Buren. Few towns get so far as Harrison no matter what their size. They then name local settlers. We have here either whimsicality or the infallibility of tradition, according to your philosophy. Certainly a town without Washington, Adams, and Jefferson streets is a freak in American geography. I like to investigate those historical characters who have streets named after them. Necessarily we must begin with Washington Street.

Main Street has nothing to do with resounding history. When a village not even incorporated has only one artery, for a generation that is called 'Main Street.' The rival of Main Street in American geography is Washington Street; and so we have reached our theme. It crosses Main Street at a right angle.

Perhaps the realist may discover that in many a town Washington Street has grown dim and dingy and leads out to the silliest road in the county; but when it was named, it was with a magnificent intention, as the Via Appia was named for Appius Claudius. Let us construct an imaginary Washington Street in a composite town made of all the towns of America that have a Washington, an Adams, a Jefferson street. Let us build it in this hour out of those imperishable mists which are our only realities, in the light of the very latest books on Washington, and the earliest dreams of our forefathers when they named Washington Street in love and reverence.

This Washington Street, drawn in imagination from the Atlantic to the Pacific, is a great wooded and residential highway, the song and poetry street of every American town. We have met the darlings of our hearts on Washington Street. When it enters a grove, or passes through national park or national forest, as we go on with those who are the dearest to us for companions, we are in our own land indeed, a million miles from Babbitt or Main Street or from any disturbers of the Old Virginia grand style.

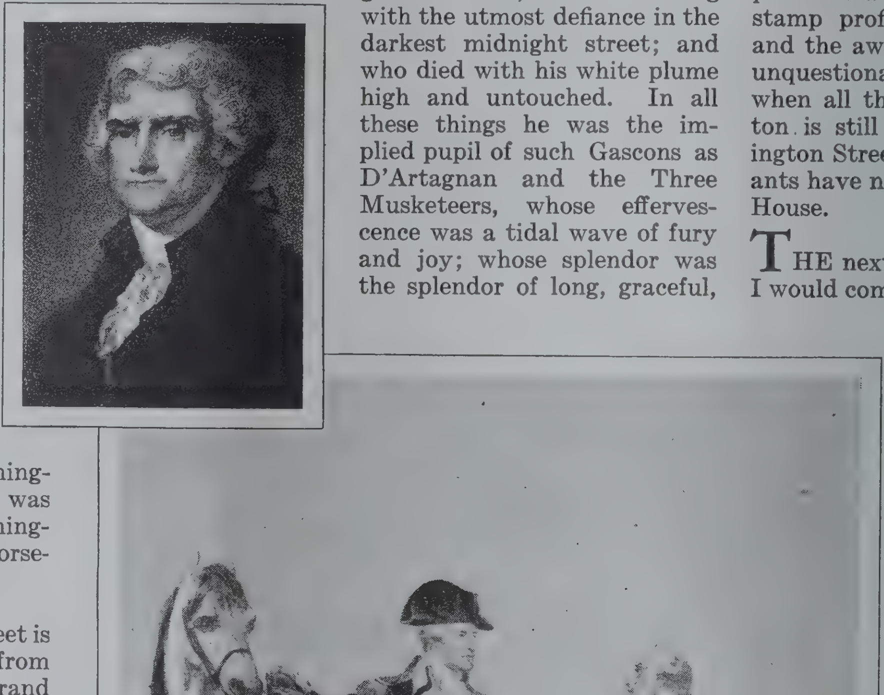
The street may pass through old battlefields or new and treacherous regions which promise slaughter or storm; but it is as far as the human soul may get from the trivial, the puffy, the snappy, the cheap; as far as possible from the world of the smart aleck and the go-getter, the cynic, the liar, and the wise guy.

In an article in *The Saturday Evening Post* a year ago, I said, 'There were three great Virginia poets in the very beginning—George Washington, Patrick Henry, and Thomas Jefferson.' All three have made Washington Street. Their names and thoughts have been so blended that on Fourth of July or Washington's Birthday, quotations from any one of them sound like quotations from the other two so far as the wandering romancer on Washington Street is concerned, whether he is a pop corn vender or a member of President Coolidge's Cabinet.

I am very grateful for the relentless realists who have been at work of late proving to us beyond a shadow of doubt that these three men, Washington, Henry, and Jefferson, differed from one another so much that it was a wonder there was any possible coöperation at any time. Also I hear the derisive laughter of the judges of poetry poultry, when I say that Washington was a poet.

It can be proved that he was not, by his endless diaries and account books, by his interminable surveys, as exhilarating as a complete railway guide; by the fact that most of the books he read without strain had to do with the breeding of horses and livestock, and with experiments on grain. He could not spell. Alexander Hamilton taught him his grammar. He received some of his formal education in the English language from subordinate officers who wrote his dispatches in the Revolution.

I welcome all evidence to prove that Washington was not a reader of our best magazines, nor yet one of the twelve apostles. I welcome all evidence that he was neither Daniel Webster, Noah Webster, nor the obscure author of that famous poem 'The Star Spangled Banner.' But let me add at once that 'The Star Spangled Banner' would not be waving on Washington Street nor anywhere else, if it had not been for this mysterious and inaccessible mountain of a man, George Washington.



*—Prints from Culver Service.

First meeting of Washington and Hamilton. Insert—Thomas Jefferson.

Only a poet working long before, writing in blood and not in ink, could have made such a poem as 'The Star Spangled Banner' possible. It was written years after Washington's death. It was dreamed by Washington the silent, on horseback, about 1776.

Washington Street is in the grand style from end to end. The grand style has destroyed whole generations of European artists. So I have only sympathy for those who mistrust the grand style. Yet on mature reflection, I think they had better leave the United States; they are going to suffer here. There are so many things in our past and in our present that are grand that, work and expose as busily as the realists may, they will die in the end like ants that try to carry off the White House, and only get away with a little sugar and sand. To abolish the grand style in American history and in the human imagination because it has been faked by second raters, is like abolishing all the joy of sun, moon, and stars by a little chatter about mathematical astronomy.

It takes a kind of mathematical astronomy to prove that Columbus was right in declaring that the world was round; but mathematical astronomy does not abolish Columbus because he thought that he had reached India, not America.

WHEN I think of the grand style of George Washington of Virginia, I think of two other types of plumed chiefs whose valor was unquestioned and whose names resound. The first plumed chief is that composite picture of all Gascons who will march forever on the French stage, Cyrano de Bergerac, who was true to his white plume; who was never afraid of the grand manner; who walked along with the utmost defiance in the darkest midnight street; and who died with his white plume high and untouched. In all these things he was the implied pupil of such Gascons as D'Artagnan and the Three Musketeers, whose effervescence was a tidal wave of fury and joy; whose splendor was the splendor of long, graceful, incredible speed in the gesture, th sword thrust, and the bow to th audience when the battle was over Not one of these Gascons was afrai to wear dazzling ribbons or to make deep double bow with a tremendou hat that swept the ground. Alien a this type may be from those who hav come to our shores with ideas inimical to our welfare, incredibl as its gallantry and high-heartedness may be, George Washington' greater Virginia manner, action and record is to them still mor incredible, for he accomplished hi work with an immobile dignity, quiescence beyond that of the Roman stoic, and a long-legged, watchtowe quality which makes the jumping Gascon look like a baby whirlwind People rage at the Gilbert Stuar portraits and the supercilious postage stamp profile of George Washington and the awful lies told to illustrate hi unquestionable impregnability; bu when all the raging is done, Washington is still our first poet, and Washington Street our Appian Way, and the ants have not run away with the White House.

THE next type of chieftain to whom I would compare General George Washington of Virginia is the opposite of the Gascon in the whole history of mankind, the plumed Indian leader of the western borders of Virginia with whom Washington carried on incredible wars through his entire military apprenticeship. More graceful and long-legged than a Gascon, Washington was sterner and more straight-backed than Powhatan or his descendants who raised hell in the western woods. A man is made by his enemies. He thinks like his enemy to conquer him. The leading American families had been on American soil almost a century by the time the Revolution was on; and most of that time they had been trying to think like Indians to get the best of the Indians.

In conference and in war, the Indian chiefs maintained a dignity which taught an unforgettable lesson to the best blood of Europe. This blood was now fighting Indian wars in the western woods of

LOW WAGES in France

The True Source *of* French Economic Difficulties

By LOUIS C. KARPINSKI

THE apparent financial rehabilitation of France is based upon a standard of living of the workers, the producing class, which absolutely prevents the real economic welfare of the country. Before the war and at the outbreak of the war the prevailing wage in France was far below any standard which would permit of decent living. This condition has remained practically unchanged since the war. Too little attention has been paid to this unhealthy state of affairs by French political leaders. French industrial leaders have doubtless made great profits since the war, but few of them have allowed the workers to participate in their prosperity. However, at the first approach of economic difficulties manufacturers have hastened to reduce the pitiful wages. Herein lies the real source of French economic and financial difficulties.

Statistics are dry things, but back of the figures which tell the aggregate wage of French workers lies a story of misery and grinding poverty such as has not been known in America for fifty years. In America the woman worker earns enough to keep herself decently and to provide for herself some amusement. Comparatively few French women workers receive enough to provide decent clothes, food and habitation, let alone recreation.

The facts which are here given about average wages are absolutely authoritative, being taken from the January to March issue, 1927, of the quarterly *Bulletin de la Statistique de la France*, the official publication of the French Ministry of Labor and Hygiene. The figures are based upon official reports made to the Bureau of General Statistics by officials of the different departments of France. This is the third year in which a complete survey has been attempted.

THE average daily wage of manual workers in cities of more than ten thousand is placed as a result of this investigation at 26.93 francs; the average daily wage of women workers is placed at 15.29 francs. This means that the ordinary male worker has a wage of one dollar and eight cents, while the woman worker receives approximately sixty cents a day. In 1911 the male worker received 4.61 francs per day, then equivalent to ninety cents, whereas the woman received forty-five cents per day—at that time a day of ten hours or more.

In one respect the worker is better off in that now the eight-hour day is to a large extent recognized. However, on the basis of world prices, on the basis of effective purchasing power, the French worker has made no progress from 1911 to 1927. Therein lies the indictment against French industrial and political leaders, and against the workers themselves.

While these wages do not involve the same misery which such figures would mean for America, yet the difference is largely in degree. Meat, butter, eggs, and milk are quite as high in France as in America; clothes are slightly cheaper; rents are lower, being regulated, but fuel is higher. These wages spell misery, and misery for the great majority of the population.

THE official inquiry as to wages was accompanied by inquiries as to the price of food and lodging for a single man, as well as for the price index of some thirteen standard foods. The investigation shows that 422 francs, about seventeen dollars, is the prevailing monthly charge for room and board. This price of room and board would leave to the single man some two hundred francs, eight dollars a month, for clothes, recreation, and higher life, as the statisticians are fond of saying. However, the woman worker paying this amount would have in several months of the year an actual deficit; fifteen francs a day over twenty-seven working days gives 405 francs. Where is the margin?

Of manual laborers, carpenters and stonemasons receive the highest wages, being paid, in the cities excluding Paris, fourteen cents an hour. In Paris these workers receive twenty-two cents an hour. Quite a large number of workers in Paris receive as much as two dollars a day, but the frequency of this rate is not so great as twelve dollars a day in New York City.

It is to be understood that these figures given correspond to the wages most commonly, most frequently, paid. There are always abler workmen who receive more than the wages mentioned; there are many who receive less. In a city like Alençon in Normandie hundreds of men get along somehow with a pittance of fifteen francs for a day's work. In the railroad stations in this same district an advertisement in April, 1927, called for casual laborers at twenty francs a day.

WOMEN who go out by the hour, for washing, cleaning, and the like, receive less than eight cents an hour. In domestic service the cook, almost invariably a man, receives the highest wage, usually six hundred francs a month in addition to board and room. The chauffeur receives five hundred, while the coachman (an ancient institution) receives four hundred. Note that in no case does this amount to a dollar a day. The maid-of-all-work gets as much as eight dollars a month; and who can wonder that there is difficulty even in France in finding maids.

The rise of the franc created some difficulties for manufacturers who depended in any large measure upon export trade. In consequence there have been in 1927 readjustments to reduce the wages from the levels mentioned above. Mine workers, with the bogey of the English strike failure held before their eyes, have been compelled to accept a reduction of approximately ten per cent. In the textile trade a reduction of fifteen per cent has recently been announced.

THE white-collar workers fare little better than the manual laborers. Clerks in the large department stores receive between fifty and seventy-five cents a day. Stenographers may get as high as a dollar a day.

When the franc was at its worst the legislators took that opportunity to increase the pay of a deputy, a member of the Chamber of Deputies,

In the Track *of the* Mountain Goat

By DOROTHY E. PILLEY

CAN a Rocky Mountain goat climb where man cannot go, or can man hold his own even on the gaunt, gray precipices?

We were to test the matter pretty thoroughly that afternoon. All day we had been toiling up an abandoned trail that leads through upper Red Eagle Valley in Glacier National Park. We had come out at last on to the open grasslands, only to find the way we had hoped to make barred by a steep 500-foot cliff all the way from Logan Peak to the summit ridge of Almost-a-Dog Mountain.

An old story, without much backing, referred to a 'chimney' somewhere, by which the cliff could be scaled. We had been looking for the 'chimney' all afternoon. Now we lay at th base in a thoroughly bad temper, sure that no easy way was to be found and wondering what to do about it. We already knew that we would have to pass the night out 'under the lovely stars,' as the French say. But there would be no stars. A thunderstorm was brewing. Our choice lay between seeking a sheltering rock, with hope of better luck in the morning, or making a last effort to find a way up the precipice before darkness. There was a chance that we might have to pass a tempestuous night on some airy ledge poised above the abyss, with not even room to sit down. We had already tried this experience and did not wish to repeat it.

Rocky Mountain goat.

As we lay there gazing rather hopelessly at the crags, a faint crying like the whining of an infant kept coming to us. It was an irritating noise. Without caring what it was, we wished it would stop. In the light-headedness that comes with great weariness, we thought vaguely that some one ought to smack it and put it to bed. Suddenly the crying grew louder and linked itself to a tiny speck of white that began to bob about, ever so high up, in the middle of a great face of bare rock that seemed, from where we lay, to be entirely sheer. This was exciting. We got up and stared through the field glass and soon made out the main lines of a horrible little drama that was going on five hundred feet above our heads.

A nanny goat, huge, awkward-looking and active, had somehow made her way almost up the whole height of the precipice. She had been followed by her tiny kid, only a few days old. The plaintive notes we had listened to were the protests of the kid at the desperate task now ahead. The mother stood on the ledge above, anxiously looking down at her offspring, who was running up and down a ledge hardly more than a handbreadth wide.

LITTLE ESSAYS *From a* NORTHERN COTTAGE

On a PERSONAL TASTE in LETTERS

By HUGH WALPOLE

THE old lady sitting next to me at Wimbledon was brave in her persistence. As the rain drove in great gusts over the tarpaulin that covered the courts she maintained courageously to the supercilious young man that in her opinion Rhoda Broughton had been a delightful novelist. Rhoda Broughton! What memories her name brings back to me, memories of her sharp, sarcastic kind-hearted self, commanding the table in her little London flat; Henry James on one side of her and adorable Lady Ritchie on the other; myself, young and eager, sniffing up every word that I could catch and believing that all the literary dogmas flying about the room were immortal judgments. Certainly nobody was spared; James, half-humourous, half-ironic, with his lifting of the hand and his 'poor, poor Conrad' or his 'poor, poor Kipling' and Rhoda Broughton like a little bright silver bodkin piercing the follies and eccentricities of her own sex; yes, all the reputations went tumbling to the floor one after another. So it was then, so it is now, so it ever will be, and one of the blisses of my northern cottage is that all the literary dogmatisms of the day rumble down a road that runs far away from my garden wall. When I was twenty-three what James or George Moore had to say seemed to me gospel; now I know that there is no gospel of the individual; only let your natural taste grow and good things will come.

IT WAS last year when I was writing a little essay on Reading that I discovered for the first time where my natural taste truly lay. I was sitting in my library one fine autumn evening wondering whether I should draw my curtains and shut out the amber light suffusing the long naked line of hill above my garden; I moved to the window, stood there looking out at the chrysanthemum clumps, the two cockers stationed at the edge of the lawn watching excitedly the household cat, the light advancing in a great sweep of yellow in the very heart of which a few birds were answering one another calling across the dark-shadowed woods. Feeling all this beauty in front of me, conscious of the warm intimacy of the books behind me, I drew the thick curtains, I switched on the light, I wondered what *were* the books that in all my reading life had come to belong to *me*, not because of any literary propriety nor because the pundits said that they were the things to read nor because they were the fashion of my time. Names stole towards me out of the amber light—Scott first and foremost, beloved of my heart beyond all others, then Wordsworth in spite of his flat old age and his desperate lack of humour; then Keats more in the letters perhaps than the poems, then Fielding burly and jolly and careless of consequences, John Clare with his beautiful face and brave pathetic story, Hazlitt that passionate savourer of every kind of life, and then my own contemporaries, De la Mare, more assured perhaps of a certain immortality than any English writer alive today save Hardy, Hardy himself with the starlight of *Two on a Tower*, the green forests of *The Woodlanders*, the gleaming dairies of *Tess*, the hot sunshine of the harvesting of *Far From the Madding Crowd* to keep him always with us when his bodily companionship has passed on, Edward Thomas whose poetry is at last coming into its own; these and others behind them not definitely chosen by me but moving lightly, easily of their own free will, came down from the hill, crossed the garden path and entered my door.

Considering them I realised that there was no law about their choice. They had grown up with my life and belonged to me because after forty years sojourning in this dismembered world I had learned to love the things that they also loved. They had not written their books for me, I had not led my life in such a way that I might like the kind of books they wrote; it had happened unconsciously, springing from my own tastes and nature just as I had chosen this house because I love hills and lakes and woods and even, when there is not too much of it, the cooling intimacy of rain. No changes of fashion nor custom, no sudden pronouncement by Mr. Arnold Bennett in the *Evening Standard*, not even the brilliance of a Bradley or a Raleigh will ever move these creators from my hearthstone; no weakness of execution on my own part, no discontent of theirs at the company they are bound to keep, can rob me of them; they are mine; I am secure in their friendship.

BUT when one examines one's taste, asks oneself why out of all the others these have been chosen, acknowledging for instance that of course *The Brothers Karamazov* is a greater novel than *The Woodlanders*, that Scott often wrote abominable prose, that superior critics like Mr. Aldington have decided that Wordsworth is of no use to any one any more, what is it that makes these men so dear to one? First, I am afraid I must confess, it is because they are so English; I say afraid because we are nothing now if we are not international, although there, in spite of Mr. Aldington, I must confess that I find it perfectly possible to care for modern French poetry although I care for Wordsworth, to enjoy Marcel Proust and to find Francis Brett Young's *Portrait of Clare* one of the most beautiful of modern novels, to delight in the country poetry of Edward Thomas and yet to enjoy *The Waste Land* of T. S. Eliot. But these others that I have first named are so personal for me that criticism in considering them must take second place. Of course I wish that the conclusions of Scott's stories were less huddled, his heroes less anemic, the coincidences of Hardy's novels less amazing, the poetry of Clare less monotonous, but these faults, if faults they are, could be exaggerated a thousandfold and still I would love these criminals.

And there is another quality I find as I look that is common to them all. Arthur Machen in his splendid and too seldom read essay 'Hieroglyphics' has

(Continued on page 26)

Memory—*the* Association *of* Ideas

By JAMES RUSSELL CARRUTH

WHATEVER the faculty of memory may be and however scientists may define the way in which it functions, its vagaries, defects and powers are of important interest to those of us who have to make our memories more or less serviceable in our daily lives. It is not alone the wicked liar of the proverb who has need of a good memory. An absurdly honest man may need such a memory not less than his deceitful brother.

Therefore it was natural that when man had reached the stage of civilization in which material profit lay in remembrance and loss in forgetfulness, he should seek to know what memory was. It was also but natural that men should invent methods that might serve as memory aids. The tying of a string around the finger was not of long extended usefulness because of the strictly limited number of fingers. Life grew so complex that some men needed to remember more than eight things at once. Some had to if they would live.

Simonides, who flourished some five hundred years before Christ was born, was the first to teach a system of artificial memory. He was the founder of the art that in our day has developed various methods of mnemonics. Undoubtedly the memory can be strengthened. Many agencies profess, more or less truly, for a larger or a smaller fee, to make every patron's memory leakproof.

The methods originated by Simonides still are favored in some schools of mnemonics, but it is to be said of many of them that anyone able to remember the methods devised to enable him to remember, has a memory sufficiently retentive not to require artificial aid.

ALL these systems are based on the law of association of ideas and more or less successfully make the act of remembrance automatic. In every day's experience we are so habituated to the kindred law of association of actions that we accept its operations as a matter of course. You delicately thrust a piece of meat into your mouth (vegetarians obligingly skip to the next paragraph) and forthwith your jaws operate. You do not consciously instruct them in their labors, chew upon chew, but you may be certain that there is a specialized faculty, to which your mind had delegated its authority, that sits on the job. So with a great number of highly important processes.

Your car having sneezed out from under the hood some vital part of its interior works so that you have to walk, you sally forth. You do not consciously direct your obedient legs to move at each successive step. The order once given by the mind to the nervous and muscular systems, you can forget all about it. You know that while they have health to function they will render automatic, faithful service, by lifting up one foot and setting down the other until you call a halt.

It is the application of the law of association of action to the processes of industry that utilizes human effort in coördination with machinery. The productive capacity of each has been so perfectly adjusted to that of the other as to create in our own days a new system of industrial economics. This law of association of actions rests its every root in the law of association of ideas and of that law memory is the very life and maintenance.

MANY men have been endowed by nature with memories so retentive that they have no need of the training given by artificial aids. Had Simonides depended upon them as subscribers to his system, he would have starved to death. Macaulay was such a man. So was Samuel Johnson. Boswell wrote of Johnson: 'His memory was so tenacious that he never forgot anything he either heard or read.' Mr. Hector remembers having recited to him eighteen verses, which after a little pause he repeated verbatim, varying only one epithet, by which he improved the line.

It was said of the poet Shelley: 'His powers of memory were extraordinary, and the rapidity with which he read a book, taking in seven or eight lines at a glance and seizing the sense upon the hint of leading words, was no less astonishing.'

Napoleon's memory was marvelous. Abbott writes: 'He received all letters, read them and never forgot their contents. So retentive was his memory that scenes over which he had once glanced his eye were never effaced from his mind. He recollected the respective produce of all taxes through every year of his administration.' Themistocles sought popularity by 'charging his memory with the names of the citizens, so that he readily called each by his own.'

Some men have themselves originated aids to memory that proved of service. In Raymond's *Lincoln* it is said that Lincoln wrote out 'a synopsis of every book he perused, so as to fix the contents in his memory.' Samuel Johnson, when strangers were introduced to him, used not only to repeat their names distinctly, but, says Boswell, took the trouble of spelling them. Thereafter the name was graven on his mind.

A less reliable memory help was that adopted by a schoolboy whose superior standing in class filled Walter Scott with envy and chagrin. His memory would not function unless he clutched the while a certain button on his coat. Association of ideas failed unless promoted by that curious stimulus. The story is told in Hutton's *Life of Sir Walter Scott:* 'Scott noticed that whenever a question was asked of his rival, the lad's fingers grasped a particular button on his waistcoat, while his mind went in search of the answer. Scott accordingly anticipated that if he could remove this button, the boy would be thrown out and so it proved. The button was cut off, and the next time the lad was questioned, his fingers being unable to find the button, and his eyes going in perplexed search after his fingers, he stood confounded, and Scott mastered by strategy the place he could not gain by mere industry. "Often in after life," said Scott, in narrating the maneuver to Rogers, "the sight of him smote me as I passed by him: and often have I resolved to make him some reparation, but it ended in good resolutions."'

It is not remarkable that Scott should have remembered that episode of his childhood more clearly than many more important events that happened in mature life. To go back, for a moment, humbly, to the experts, Smith Ely Jelliffe accounts for the sharper memories of childhood thus: 'The fixity and enduring quality of the memories of childhood are proverbial, and are due to the great plasticity of the youthful nerve cells, as well as the intensity of the early pictures.'

THE memory of the child is comparable to a fresh, smooth, soft surface upon which deep impressions can be etched with ease. As age steals on what was soft and impressionable becomes hard and resistant. Maturity catches at intervals recollections of early youth that come to the surface of consciousness quite unbidden. No special cause evokes them. Often of no importance in themselves, submerged for all the intervening years, they suddenly present themselves as sharply accented as if they related to some event of yesterday.

A woman, busied with her sewing, without a thought of her childhood in her conscious mind at the moment, sees herself again a little girl, in a particular room on the evening of a certain summer day. As

(*Continued on page 26*)

The ISLAND Where Women Never Grow Up

By L. H. SMITH

Along the coast of one of the slands in the Balearic group.

—Publishers' Photo Service.

Oval—Natives who make their living by fishing the waters around the Balearics.

JUST about breakfast time to my unutterable relief, our good ship *Valencia* rolled into mooth water. It was hen that I had my first ong look at the white houses traggling steeply up above he sleepy harbor of the town which gives its name to the island. Crowning them all, the one benignantly urveying her flock, the other a grim, battered relic of less happy days, towered the cathedral and castle. Clusterng thickly round the jetty head were what seemed to be the bulk of the inhabitants, come to welcome the stranger. They stared with frank, though riendly, curiosity at the ship's one visible passenger—though not one whit more curiously than the passenger reurned the gaze, I am afraid.

For this was Iviza, quaintest of all he sun-drenched Balearics! Only one hundred miles from up-to-date Barcelona, but it might well be a thousand or all the modernity that its nearness has imparted. From the moment you et foot in this delightful island it eems as though the centuries have lipped back and left you in the midst of life in its old-time simplicity. Only one sign of what we call progress did I ee during the whole course of my stay—need I say that this was the motor car, which has now almost entirely replaced the ancient *diligencia* in linking the outlying villages with their capital town.

Everything else reminded me vividly of a comic opera. To begin with, the women, who incidentally seem even more conservative than the men, one and all have their hair down their backs in a pigtail! Practically without exception they wear today the style of clothes that has served the Ivizan woman for hundreds of years—voluminous, brightly colored petticoats; an amazingly wide skirt, reaching to the ground and covered with what seemed to my masculine eye to be yet another skirt, looped up at the back; a bodice so tightly laced that the very sight of it made me catch my breath; in fact, the whole costume reminded me of nothing so much as one of those Swiss figures that one used to see a good deal in the china shops at the end of the last century. Every woman wore a scarf round her neck despite the intense heat. The colors evidently depend somewhat, at least, on the lady's age—reds and yellows for the young girls, blues for their elder sisters, toning down as age creeps upon them until the years call for black. Then, surmounting the whole, is perched an enormous straw hat some two feet wide, made in the island by hand, the crown of which very ingeniously pulls out to make an air chamber when the sun grows especially hot. And of course, the pigtail—always this youthful plait of hair down the back from which I could never take my eyes. Incidentally, this flapper-like custom of the Ivizan women seems to be very beneficial to the hair, for I never saw the most venerable grandmother but what she sported locks of hair of a most respectable length.

The men of the island are not quite so picturesque, but their baggy trousers, often patched almost beyond endurance and with a striking disregard for the harmony of the color scheme, their brilliant scarfs and big straw hats set off the women very effectively, although no one would be more surprised than they if you told them so.

The one trouble of Iviza rests in the vast number of curious sights that arrest the attention and demand some mention, though, if they were all to have a place, a book would be needed. The town is fortified, which is scarcely surprising when one hears of the unfriendly visits that were paid to the Ivizans by the Phoenicians, Carthaginians, Romans, and Barbary Corsairs, to mention but a few! It was just outside the main gateway of the old city walls that I discovered the well to and from which there is a steady stream of women all day long, bearing away the precious fluid in tall jars which they rest in the most casual fashion on their heads. The gossip that takes place round this well must be most intriguing if noise be any indication of its interest. In fact, on my first acquaintance with this section of Ivizan society, the atmosphere was so lively that almost instantly there began to steal over me that uneasy feeling which so often attacks a man when he blunders innocently into the midst of a heated feminine discussion. But I need not have worried. It was merely an animated conversation. Indeed, I don't know, judging by Ivizan standards, that one could really call it particularly animated. They were just having a friendly chat—that was it!

I didn't find that the Ivizan ladies' power of conversation had deserted them at the washing pool either. Here I witnessed the entrancing spectacle of dirt in full flight from the entire family laundry under the compelling influence of much pounding by stones—a most effective method, this, to judge by the truly dazzling whiteness of the clothes when they emerged from the water. I cannot conscientiously advise anyone to see the process through, however, for it is lengthy, not to say tedious. Evidently the washing cannot be considered really clean until the last arrival, Maria, has heard of the latest exploit of that rascal Benito, 'who actually had the audacity—the Saints preserve us from such—to take a walk alone with . . . '—a chorus of shocked surprise unfortunately drowned the highly interesting divulgence of the indiscreet lady's name—'when it was well known that they were not even married!' I retired here, overcome by this sinister revelation of the laxity in Ivizan morals. But you will see that washing, in Iviza, is a serious business.

In the fruit and vegetable market in the center of the town, to which almost every Ivizan contributes his quota, there is a truly prodigious babel. How any business is ever transacted I cannot imagine, bearing in mind both the noise and the intensity of the bargaining. But, of course, without the latter none of them, being true Ivizans, would feel that they had concluded a successful sale or purchase, as the case may be. Almost every kind of fruit seemed to have its place there, but oranges and apricots predominated. The prices it would be sheer unkindness to mention to those inhabiting this land of opulent tradesmen.

—Publishers' Photo Service.

In a sun-drenched village on the Balearics.

But although the glimpses of Ivizan life that one catches in the towns are very fascinating, I was particularly impressed by the remarkable simplicity of the life led by the people—and these the great majority—on the farms outside. For instance, if you walk along one of the innumerable lanes as I did you will see in the first field of wheat a row of most peculiar figures. They look like nothing so much as a heap of clothes dumped on the ground and surmounted by a large flounce. It will be some time before you realize that they are merely the Ivizan women and girls bent almost double. And even then you will never guess what they are doing. They are *picking* wheat! This is one of the most familiar sights of the island at the right season. In every farm these women, from small girl to ancient grandmother, pick, pick, pick from sunrise to sunset. They never seem to tire of their unnatural position. They would be surprised if you told them that stooping all day to that extent could not do them anything but harm. They would be incredulous if you told them that there was a machine that would cut and bind their wheat as it went along, in a fraction of the time they take, and without any effort on their part whatsoever.

For of course I need scarcely say that there is nothing like that in Iviza. Indeed, I doubt very much whether there are half a dozen plows on the island; I saw only one, and that a very antiquated affair. Incidentally, it did not seem to have lost its fascination for the Ivizan children, for I saw a group staring intently at this peculiar thing that left a deep groove behind it in the earth! So it is easy to see that anything in the nature of a threshing machine, a reaper and binder in Iviza is a thought approaching the ridiculous. What would an Ivizan want with a newfangled thing like that? He has his circular floor and his blindfolded mule going round and round, trampling the ears of corn and wheat into the ground. His women's hands are his reaper and binder; his mule's hoofs, his thresher; the air his winnower. He would, with exquisite politeness, rate us as fools for spending unnecessary money on such things.

And this brings me to the one black spot of Ivizan life—the blindfolded mule. These wretched (Continued on page 24)

A Refuge For an EMPEROR

By WILFRED W. STONE

DOWN at the corner of Chartres and St. Louis streets in the French quarter of New Orleans stands a massive three-story stone, brick and concrete house, the only remaining witness to one of the most interesting international plots ever concocted—and almost carried through—in a city famed for its bilingual population and its many-tongued conspiracies. The men who conspired in this house, the other men who were to have carried out their plans, the swift-sailing sloop which was to have borne them across the Atlantic and back again, all are dust. And the building, though it still stands, is fast passing to join them.

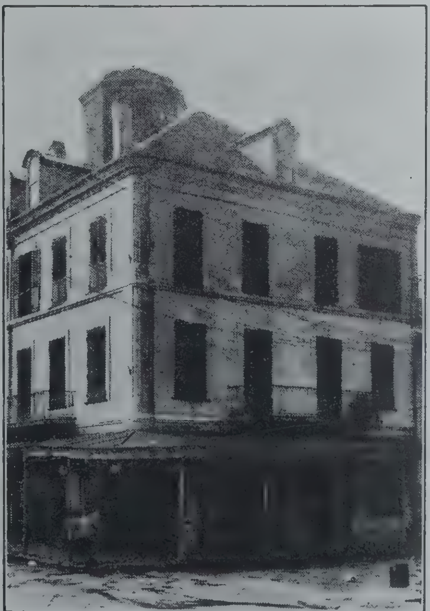
The house, its lower floor devoted to a grocery store of sorts, and its upper floors untenanted, was built as a home for Napoleon Bonaparte. The plot, details of which were perfected within its walls, involved the rescue of the Little Corporal from his place of exile on 'Saint Helen's granite bleak.' The sloop was the *Seraphine*, designed to be the fastest deep-water sailer of her day, and built especially to carry a band of chosen adventurers to the rescue of the Corsican, and to bring him back from under the very guns of all the British men-of-war, safe to his friends in La Nouvelle Orleans.

THE man who first proposed the plan and who financed the expedition up to its end was Nicholas Girod, a millionaire who had been mayor of New Orleans, and a Bonapartist to his death. The commander of the *Seraphine* was to have been the justly celebrated Dominique You, smuggler and pirate, but for some reason of which history leaves no record, this choice was abandoned, and one Bossiere, retired sea captain, whose first name appears to have been lost, was made leader in his stead.

This seems to have been one of the few conspiracies the records of which have become public. It was kept a secret despite the number of men involved, until the death of Napoleon on May 5, 1821, made secrecy no longer necessary and the project worthless, and plunged the Bonapartists of the Paris of America into a long period of mourning. Charleston and to some extent other southern cities contributed to the funds collected for the plan to bring Napoleon to the New World, but of more than $500,000 estimated to have been spent on the project, it is claimed that M. Girod supplied at least $450,000.

The famous death mask of Napoleon, in which historians claim to see a close resemblance between the emperor and Julius Caesar.

During his term as mayor, from 1812 to 1815, Nicholas Girod had been a figure worthy of the best traditions of old France. He had surrounded himself with the aristocracy of La Nouvelle Orleans; he had received Jackson on the latter's entry into the city in 1814, and he had borne himself with such gallantry and distinction that the general gave eloquent testimony to the mayor's character and activities in his general orders. He was a sturdy, patriotic and philanthropic gentleman, according to the chroniclers of his time, a man who, while he held his loyalty to this new America first, brought just behind it an intense and unswerving affection for Napoleon Bonaparte and an undying sympathy with the latter's plans for control of all Europe.



The house built as a permanent home for Napoleon Bonaparte in New Orleans.

With such a background, it was not difficult for M. Girod to rally to his plot the older French families, not only of New Orleans and Louisiana but of other cities in the Louisiana Territory as well. First of all, he built the house in which Napoleon Bonaparte was to live in comfort and safety the remainder of his life. Then he employed Captain Bossiere to build the *Seraphine*, and to build her the fastest thing afloat, and capable of carrying seventy men. Some investigators declare her crew was to have been fifty; others one hundred, but the figure nearest fact appears to have been seventy. All were capable of acting as crew; all were picked fighting men; at least half had taken part in the wars in Europe and in America; seven were competent navigating officers; three had held commissions in various armies; some had worked in mines and knew how to run tunnels and operate hoists; at least two knew what was then to be known of explosives, and, if the truth were told, the majority of these picked adventurers had been involved at some time or another in the smuggling and piratical operations of You, Lafitte and others along the tricky Gulf of Mexico coast of Louisiana and Texas.

There was, in other words, a man for every occasion which might arise in the voyage to and from Saint Helena, and a man for every operation connected with the rescue of Napoleon from that island. The *Seraphine* was of about two hundred tons, clipper-rigged, though in reality she was a sloop. She carried no cannon, but was abundantly provided with arms and ammunition, cutlasses

Two Hindrances to Success

A SATISFACTORY life is one that fulfills to the highest measure one's capacity for achievement, and then widens and deepens and develops that measure so that the man shall become better and bigger than his success. The only value of success is that it has made the man bigger, and anything that makes him bigger in power of mind or keenness of insight has been a success. This, of course, will differ with different people. We can only have the experiences we are able to receive and make use of; the rest slip by us.

The first thing to do is to get the material aspect of the question out of the way. We are rapidly moving out of that stage of human experience where success meant that a man had enough food and comfortable furniture. We get a side light on human nature when we remember that these were once thought the prizes of life. All that is changed: we believe that these creature necessities and comforts are the rights of *all* who work; and the steady readjustment of industry, wherever its leaders are awake, is toward the guaranty of these things. We are approaching a stage where success will be measured by something besides the fact that one man has a comfortable chair to sit in and the other hasn't. When both have chairs, because they both ought to have them, then the measure of success will be based on something higher.

> *THE wrong kind of pride has wrecked many a career. It usually roots in the wrong thing. Observe for yourself and see whether it is not so, that a man given to pride is usually proud of the wrong thing. Some men are so proud of their method, their system, that they think it is more important than the job itself. Touch their method and they bristle with indignation, although it may be that their method is ruining the job. The job is the thing. Become more job-centered and less self-centered and there will be less friction, less personal 'touchiness' in business. Be ready to revise any system, scrap any method, abandon any theory, if the success of the job requires it.*

So, with that taken care of, what are the chief hindrances to men's finding that satisfactory adjustment between work and their own minds which is the essence of happiness? The chief hindrances are Fear and Pride. We hear a great deal about fear; almost everyone has learned what a corroding influence it is, and everyone condemns it—but how many have succeeded in getting from under it?

Nothing is easier than to tell a man to get rid of fear. To tell him how is another matter. No one can tell him anything about it; but it always happens in the good providence of things that when a man has come to the point where it is possible to liberate him, some person or some idea is there waiting for him, to help him accomplish the emancipation. Those are emancipated who are ready and willing.

Pride is something of the same thing. Men are constantly getting out of the cowardice they misname fear, but pride presents another problem. Half the opposition to industrial reorganization comes from Pride. Go into a shop and try to put it on a basis of successful operation and you will find nine times out of ten that the things you have to change are the very things in which someone takes an inordinate pride.

The instances where pride has proved the hindrance in business are so numerous that one could quote them without end.

Ah, that mighty obstacle—pride. And the man takes pride in his system! Touch that, and you touch his life! He will be blind while you show him that his system does not reach farther than the four walls of his office; he will be deaf while you tell him that achievement must show elsewhere than on paper—the obstacle of pride is there, and another clash is imminent.

We have just spoken of pride as the obstacle, but that should be explained: it is an obstacle only to the man who lives on it. Its weakness is that anyone can wound it, and only a little authority can completely overthrow it. Its weakness is that it usually roots itself in the wrong thing. Practise a little observation and see whether it is not the case that a man given to pride is usually proud of the wrong thing. He plants his pride where he cannot defend it, where it cannot defend itself.

Now, in business the job is the thing. When men are job-centered they are less self-centered and there is therefore less soil for the interference of personal likes and dislikes, personal prides or personal prejudices. If there is any pride, it is centered in the job. If there is any prejudice, it is with reference to the job. The job is the thing.

Any method is willingly revised or abandoned, any cherished theory is immediately scrapped, any personal element is completely sunk, in the great central importance of the job. If a job isn't big enough to command this sort of allegiance in a man, he should make it big enough, and if he can't do that he should find one that is big enough.

The wrong kind of pride does not contribute. It deceives the man who harbors it and hinders everyone within the radius of its malign influence. It has wrecked careers that might have been useful. When a man falls in love with his way, his method, his system, and exalts them to the place of chief importance; when he resents competent criticism and change designed to focus his attention and efforts on the central job, he is on the down grade.

EDITORIALS

OF THE DEARBORN INDEPENDENT

Ten Million Links

NEARLY ten million words a week are now knitting the two sides of the Atlantic together.

That's really significant.

About four hundred million amiable words were exchanged with Europe this last year—business, personal messages, news. The latest cables are of a new alloy and much faster than the old ones. Wireless is being tuned up to higher speeds. Shortly, experts say, long messages will be 'photographed' across the ocean, just as halftones are now transmitted.

All these things mean cheaper communication, an increase in our knowledge of one another and a consequent decrease in sectionalism. The American North doesn't quarrel with the South, or the East with the West, since the motor car has shuffled us up and made out the distances we learned in our geography classes to be gross exaggerations.

No doubt wars have been waged for trade; but commercial relations are much more likely to prevent wars. And the war fever cools when you know your man.

The exchange of ten million amiable words a week reduces war risk.

The City

IS THE American city falling down? Has it passed the limit where efficiency is possible? Other units, especially in the commercial world, have collapsed because of their very size. There comes a point where expansion turns from contribution into drain: what was formerly an assistance becomes a burden. In municipal service this is the general rule. Telephone companies begin by advertising service and end by demanding curtailment; the load becomes too heavy. Recently one of our largest cities was incapacitated because it rained for one day. In most large cities the people are drinking doctored water. Police protection has broken down everywhere. Municipal politics, while more respectable outwardly, has scarcely changed from the old days, as municipal scandals everywhere testify. And yet there is a tendency on the part of all great cities to stretch their boundaries.

City conditions have already driven millions beyond the city limits into suburban communities. City governments seek to reclaim these emigrants by including them in greater 'metropolitan districts.' It is possible for one with a sunny philosophy to believe that this too may be an excellent step, since it may tend to drive millions still farther into the country beyond the utmost reach of municipal inclusion acts.

The American city has passed the point where it can teach anything further about community living. All its benefits may now be established in the country districts, where most of its disadvantages can be prohibited.

Medical News

TRADITION is an excellent guide when it is founded in principle and not in interest. Too much tradition, however, represents narrow interests of wealth or caste or profession. The British Medical Association still feels the chill of outraged propriety when one of its members writes on medical or health subjects for the people. It is a tradition that the profession should keep itself cloistered so far as the arts of publicity are concerned.

But that it should be forbidden to share its saving knowledge with the public is quite another thing.

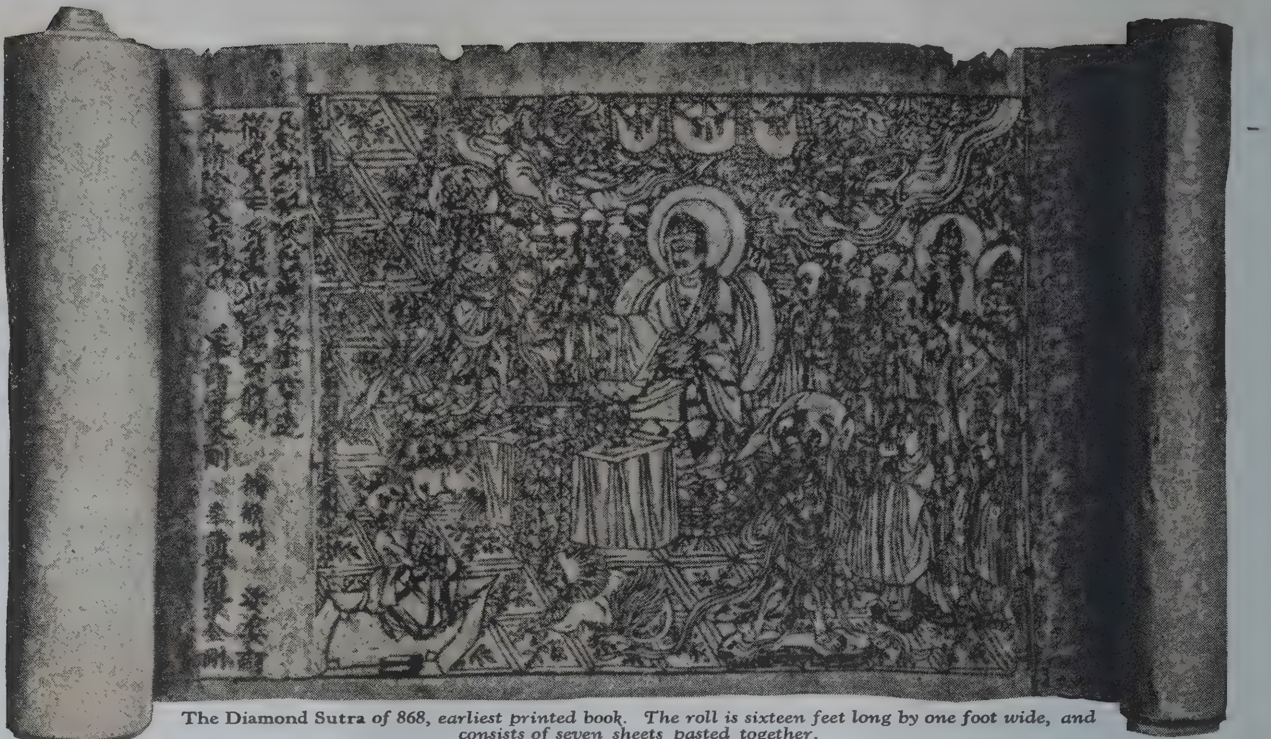
In America we have shot that hidebound tradition to pieces; or, to state it more elegantly, we have outgrown the state of mind which it represents. Medical knowledge is given freely to the public through the public prints, and if an occasional charlatan gets in, the fault is not with the practice.

Much of the most interesting reading to be found in newspapers and magazines is based on expert medical men's observations of life in sickness and in health.

Our Thoughts and Others'

THE secrets of life are open to the thinker. Thinking is the work of digging to the foundations and has the aid of higher lights. Merely having ideas is not thinking. Our minds, when they are not focused on a worthy work which engages every faculty, become the playground for ideas, but they are always other people's ideas; they are not our own, and they are not usually worth anything except the momentary excitement they cause.

We prefer the swarm of other people's ideas to our own thinking, because thinking is the hardest kind of work a mortal can do. And just because it is hardest, the higher rewards are reserved to it. Thinking calls for facts; facts are found by digging. He who has gathered this wealth is well equipped for life.



The Diamond Sutra of 868, earliest printed book. The roll is sixteen feet long by one foot wide, and consists of seven sheets pasted together.

The Invention of PRINTING in CHINA

By RANDOLPH C. ADAMS

AMONG the neglected truths of history, few are so frequently or so flagrantly ignored as the fact that printing was not invented by the white man. A copy of the Gutenberg Bible was sold in New York for $106,000. This event was followed by its quick resale for $124,000. The volume was advertised for sale in a prospectus which called it the first book printed.

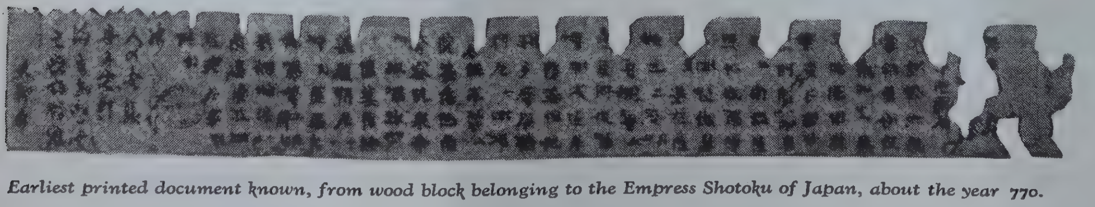
Metropolitan dailies have been commenting on an extraordinary collection of incunabula (books printed in the 15th Century) which was exhibited first in Chicago and then in New York. The newspapers have agreed with the writer of the description of these books in calling them 'the earliest printed books' and in talking about Johannes Gutenberg, who printed the celebrated 42-line Bible of 1455, as the inventor of printing. Shelves of volumes have been written on the same subject and with the great increase of interest in book-collecting now the vogue in America, these books are being reread and reëdited. They all discuss printing as though it were a thing which was invented in Europe sometime in the 1400's. Reams of paper have been used in the discussion of whether it was invented by Johannes Gutenberg of Mainz and Strasburg, or Laurens Coster of Haarlem in Holland, or Procopius at Avignon in France. But all seem to agree that the first printed book came from the press, and that the inventor of printing lived sometime in that magical 15th Century which also witnessed the discovery of America.

What are the real facts as to the origin of printing? Recently a small but very weighty volume by the late Dr. T. C. Carter of Columbia University came from the press of that institution. Its full force has not yet been felt—nor can it be until the facts ascertained are understood by writers of both popular and technical history.

The story is exceedingly simple. About the year 1900 a Chinese priest, who dwelt among the ruins of the Caves of the Thousand Buddhas far off in the central part of China, was investigating one of the caves. Back of it he found a walled-up secret chamber. The little room was about nine feet square, and it was packed to the ceiling with old manuscripts and printed books. In 1907 a representative of the British Museum got into that room and carried off about three thousand of these. In the following year a representative of the French National Library got away with a similar number. Research upon these materials began at once and the results are now made public.

From among the papers has been produced a book, in roll form, like the books of ancient Rome and Greece. It is made of rag paper. It is printed with ink upon that paper in Chinese characters and it contains in addition one woodcut picture. Its text is that of a favorite Buddhist canonical writing, *The Diamond Sutra.* It bears the name of its printer, one Wang Chieh, and it has a date which corresponds in our chronology to the year A.D. 868. Gutenberg, Coster and Procopius never saw the light of day until more than six hundred years later.

But this is not all. The researches of the English and French scholars have now determined beyond peradventure of a doubt



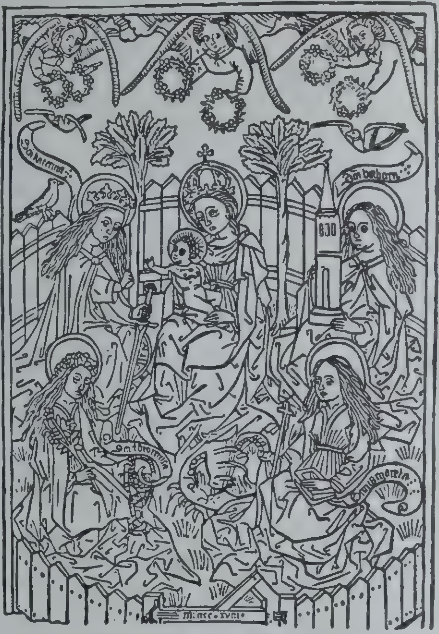
Earliest printed document known, from wood block belonging to the Empress Shotoku of Japan, about the year 770.

that the Chinese were taking impressions from stone inscriptions as early as A.D. 175. They have further ascertained that the next step—that of using cut seals as stamps (like our rubber stamps)—was being done before the fall of the Roman Empire. They have further discovered that the Japanese made actual wood-block prints in A.D. 770. This last fact puts to confusion the fight which has been raging these twenty years between a great English and a great Belgian library as to which possessed the earlier wood-block print. The English library has contended that *its* printed picture bore the undoubted date of 1423, while the Belgian library has insisted that *its* printed sheet bore the date of 1418.

The first printed book, above referred to, was printed evidently from wooden blocks; that is, the entire page was printed from a single plate, just as our stereotype plates are today. But this does not mean that Europe can even claim the distinction of having invented movable types. Chinese records show plainly that in the year A.D. 1045 one Pi-Sheng was investigating and experimenting with movable types, each bearing a single character. These were set in an iron printing frame, which is precisely what is used in the year 1927.

Individual movable wooden types were being used in China in the 14th Century, and in A.D. 1403 the government of Korea established a department of books to cast type and print books. These types were of bronze. A copy still exists of a book printed by movable metal types bearing a title-page dated in a year which in our chronology is 1409. Europe cannot even claim to have invented printing with movable or with metal types. This was not widely adopted in China, because the printer would have to keep on hand a font of 40,000 characters as against an alphabet of twenty-six letters in Europe or America. So the Chinese early went back to printing from wooden blocks, or plates, in which an entire page could be printed at once. In the 19th Century Europeans and Americans got back to that principle also.

The contribution which Gutenberg (or whoever is supposed to have invented printing in Europe) really made to civilization was probably the invention of a mold, in which to cast individual types, and the screw printing press. On such slender foundation must rest Gutenberg's claim to be the 'father of printing.' In fact, the word printing does not even imply a printing press. Yet people will go on buying incunabula on the theory that they are buying books printed in the first century of printing, and will go on talking about the 42-line Bible of Johannes Gutenberg as the first printed book.



The Virgin of Malines, at the Royal Library, Brussels, which has long contested with the St. Christopher of England the title of being the earliest printed document. It is dated 1418.

Part of a page from the Gutenberg Bible, printed in Germany in 1450-1455. It has been claimed to be the first printed book, and recently a copy sold for $124,000. It was printed 587 years after the first recorded Chinese printed book.

Another Fine McIntyre Book

Slag, by John T. McIntyre, pp. 249, Scribners, $2.

In this novel Mr. McIntyre enters a field which is quite different from that of *Shot Towers* and *Blowing Weather*, but brings to it the same insight into human motives, the same appreciation of deep backgrounds which an increasing number of readers have learned to look for in his work. *Slag* was a daring title to be taken by an author who had limned such unforgettably pleasant pictures as readers of his work remember. It is a title which would seem to warn off those who like green fields and flowing seas, those who were enabled by the honest magic of McIntyre to feel the atmosphere of the taverns and tollgates of old Philadelphia. Cinders, it seems to say, after meadows, dregs after deep draughts of freshness. But there it is—*Slag*—a challenge to follow McIntyre into modern times, into hot and noisy rooming districts, among alien populations of factory workers, and the street-corner gang going rapidly to the devil. Although that last is not quite true. There is no happy ending, but the devil doesn't have everything quite his own way.

> 'In the mud and scum of things
> Something alway, alway sings.'

McIntyre certainly did not have Emerson in his mind when he wrote, because this is not a book that neatly *places* a song in the mud and scum, but really *finds* it there, because it naturally and indubitably is there. Minnie and Cochack and Rush do not know they have the song, but they are singing it just the same. Amid all the stupidity of crime and police, of industry and poverty, of idleness and greed, these people have an instinctive something that does not let them go—Cochack the consumptive cigar maker, Rush the pickpocket, Minnie the flapper, Groloch the burglar, and Father George, the priest of St. James—these are living people.

Of course, there is action. There always is in McIntyre's stories. Although the book deals with a period of about thirty-six hours, it stages one of the most intensely exciting burglaries that this reviewer remembers, with its swift police nemesis. No other burglary has ever been described from so many angles, and yet no one saw it. If the other elements of the book were not so important, if the events were not enacted against so deep a background of significance, the book could be 'blurbed' as a great story of exciting action. And it will probably be that to some. It is one of those books which one just naturally recommends.

OLD CONCORD

By JULIAN HAWTHORNE

BOSTON grew out of a Plymouth root, and Concord out of Boston—all in the forepart of the 17th Century. By the old Boston road the two places are twenty miles apart, or sixteen by the turnpike, which runs up-and-down hill in a bee line from Harvard Square to Emerson's house, where it joins the older thoroughfare. During my college years I came to know both of them well, often walking home on a Saturday to spend Sunday with my family at The Wayside; and back again Monday morning early, for I must be in the chapel, listening to old Dr. Peabody's prayer, by six forty-five, which meant being up by four a. m., bolting breakfast, and away. If I arrived at my pew too late to hear Old Peabo's (so we called the good man) opening exordium, 'O Thou!' I would get a demerit, in spite of the fact that I had been awake and coming two or three good hours before my fellow worshipers were done snoring. This prompted me to moral reflections, not included in Peabo's prayer.

'The Wayside,' home of Nathaniel Hawthorne, Concord. Detroit Publishing Co.

I was going to say that in 1630 or thereabout there may have been an Indian trail out Concord way, but no white man's road. Nevertheless, an insatiable pioneer—I'm sorry I can't recall his name at this moment—adventured through the forests at this juncture, in quest, I suppose, of that seclusion and peace with which the place has ever since been associated, and which its name suggests. It may have been he who, instead of bothering to build himself a hut, simply excavated a little hollow in the steep hillside on the northern side of the way, which would be warm in winter and cool in summer. I like to think that it was he who put together the framework of the little dwelling which two centuries afterward was to bear the name of The Wayside, and to be occupied by the author of *The Scarlet Letter*. It is as likely as not.

Legend says, too, that this little one-room shack—the nucleus of the edifice which succeeding generations gradually constructed upon it—was lived in at one time by an Hermetic philosopher, or Rosicrucian, engaged in the search for the elixir of life. And what more probable than that this student was also the very man who journeyed from 'Trimountain' westward to escape troublesome neighbors? It is from such hints that history is builded; and it is a mistake in judgment to doubt a good story, which is generally nearer the truth than is that poor naked illusion itself.

My father no doubt had heard the legend and used it when he came to write his *Septimius Felton*, the romance of immortality which was published after his death. But I must go on to say that before Hawthorne took possession, the house, already enlarged somewhat from its first estate, had been adopted by Bronson Alcott, his wife and his daughters; at the instance I think of Emerson, who lived half a mile farther westward along the highway. But between 1850 and 1853 were written *The Scarlet Letter*, *The House of Seven Gables*, *The Blithedale Romance*, and the *Wonder-Book* stories for children; and it was thought wise to move nearer Boston, then the authentic Hub of the Universe, as Oliver Wendell Holmes had proclaimed it. Not that Hawthorne was addicted to hubs, and had he not been married and begotten offspring, I suspect that he might have preferred to stay in the little red house in Lenox. But then, had he not been married, there would have been no *Scarlet Letter*, and so no money with which to buy The Wayside.

So far as I know, the money that bought The Wayside was the first discernible concrete money that Alcott had ever seen or handled; and he promptly transferred it to the owner of the property next door—the venerable structure which Louisa dubbed 'Apple Slump.' 'Next door' meant then and there, an interval of two or three hundred yards round the spur of the hill. So there we all dwelt, side by side, but out of sight and sound of one another, in an ideal intimacy: for intimacy should always be what we want, when we want it—never at the mercy of mere physical propinquity.

With Emerson, Alcott and Hawthorne on the stage, and Thoreau intent upon cultivating his personal dignity and independence beside Walden Pond, only a couple of miles away across the meadow and among the pines, Concord had taken its place on the map. But it was not Concord's first appearance there. Men were alive in the 1850's who had heard the shot fired across Concord Bridge in 1775. And I liked, as a boy, to think of that insolent and outrageous troop of lobster-backs, with the blood of Lexington already on their hands, tramping past The Wayside on that April morning, confidently intent upon further excesses: and then, the same afternoon, tramping back again, disordered, scared, bewildered, with twenty miles of angry Yankee farmers to run the gauntlet of. And I hope the Alchemist was still sojourning in his hut at the time—and was able to account for one or two of the fugitives as they stumbled breathlessly by, with his old flintlock musket. As a boy, I was bloodthirsty against Britishers, being rather encouraged therein by my deep-rooted Yankee father.

So WAR was the first child of this ancient abode of peace! And on the same day of the month, eighty-six years later, I was privileged to stand with the crowd on Concord Green and see the marshaling of the first company of Concord volunteers, enlisted for the Civil War. Dear old Prescott, a village tradesman, was chosen colonel on the spot, and deprecatingly unsheathed a sword that had been procured for him from the nearby armory, unopened since 1787, and paced to and fro before the two lines of stern young farmers, grandsons of the heroes of the past. And there stood the mothers, sisters, wives and sweethearts, tearful but smiling, more heroic than the heroes; and the ancient grandsires, stoically trying to hide their emotions. But the train to convey the company to Boston on its way south was nearly due: there was no curt, Teutonic pretense of mechanical discipline, but—'All ready, boys! Shoulder your guns and let's be off'; out broke drum and fife, and to the hallowed tune of 'Yankee Doodle' they marched away. Most of them came back, bronzed and bearded veterans, four years after; but not a few of them did not. And so once more the offspring of Concord was war!

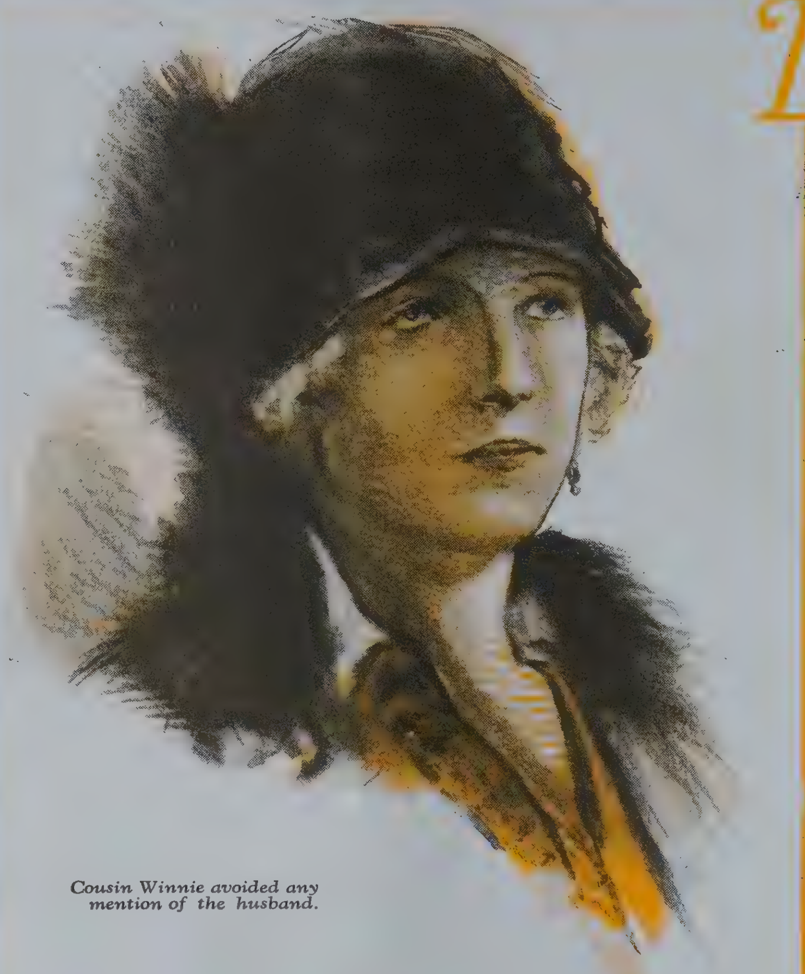
But no doubt history pays more heed to the advent of the Transcendentalists. Emerson forsook his Boston pulpit and emigrated thither about 1835; Thoreau was born, lived and died here; Alcott obeyed the Emersonian urge betimes; Ellery Channing, the wayward and peculiar, could find no other refuge, and he held on there till 1891, when he died at Sanborn's house at the age of seventy-three. But Ripley, who was I believe a relative of Emerson's, is credited with being the founder of the Transcendental cult in this country—of course it had its origin in Germanic minds—and was functioning all along, and he founded *The Dial*, which Emerson edited and wrote much of, till it died for lack of readers other than its contributors, who were choice but few. Margaret Fuller was also an egregious priestess of the movement; but her real cult was herself.

It has all passed away. One can't imagine such a thing as existing anywhere else than in Concord. But the real Concord folks, though they amiably accepted the queer comers as being an indirect compliment to the charms of the town, had but a moderate estimate of their intrinsic value. They liked Emerson—everybody liked him—but they thought him a little off. They were diverted at Thoreau's oddities, and not a little tickled when he insisted on going to jail rather than pay taxes on the Walden shack; and they chuckled outright when Emerson insulted Thoreau's dignity by paying the tax himself. It was a funny period all round—people really believing that they believed in something above sticks and stones! However, most of the sages admitted two sides to the argument, and drew the line at jail; but Thoreau was as one-sided as a silhouette, and couldn't turn round.

Hawthorne, when he came to The Wayside, was not a stranger to Concord; he had lived for a couple of years at The Old Manse, when he married Sophia Peabody. But although thus neighboring the Transcendentalists, and friendly with them, he was never of them; he had simple ideas of his own, many of them very radical, but except as he hid some of them in his stories, he was as mute as Fanny Ellsler. 'Hawthorne rides well his Horse of the Night,' remarked Emerson, smiling, after Hawthorne had sat through an evening, listening to the others talking 'about it and about,' as Omar says, but saying nothing himself. He was a good, even a stimulating listener, an uncommon quality in sages. But there was always a little uneasiness among the talkers as to

(*Continued on page 21*)

Old North Bridge over Concord River, with the 'Minute Man' Monument in the distance.



Cousin Winnie avoided any mention of the husband.

DEVOTED COUSIN WINNIE

By E. M. DELAFIELD

'LET me do it, Val.'

It seemed to me that Miss Keynsham said these words more often in one day—and one of the interminable days of board-ship life, at that—than anybody else could have said them in ten years.

Sometimes she said, 'I'll go, Val' instead. That was when the baby cried, or when Mrs. West, Val, had left something below, in their cabin. Mrs. West and Miss Keynsham and Mrs. West's one-year-old baby, all shared a cabin and I heard Miss Keynsham explaining to people that she'd arranged it that way because then Nannie could be sure of a good rest, and she herself could 'help Val with Baby' in the night.

I, Dr. Page, as a bachelor, couldn't really follow any of it. Why a nurse paid to look after a child should turn it over to her employer just at the most inconvenient moments, and how it had to be dealt with in the night, I couldn't imagine. But Miss Keynsham—Cousin Winnie we all called her, because little Mrs. West used the name so often—came on deck, as often as not, looking fairly washed out, and telling everybody that Val hadn't had any sleep at all, because Baby had needed so much attention.

Cousin Winnie had been born helpful, not a doubt of that. In the odd way that one does learn all about one's fellow passengers, we knew how she'd taken Val, as an orphan of sixteen, to live with her, and had been a good deal more than most elder sisters to her ever since. At one period or another, in the course of the following ten years, Val must have married—but about that, nobody succeeded in learning very much. The people who'd got on board at Rangoon said that the Wests had only been out there sixteen months, and that West had a job somewhere right up country, in the police. Cousin Winnie had come out with them, and nursed Mrs. West, who had been very ill before the birth of the child. Now she was taking Mrs. West and the baby home for good.

There was a general idea that the marriage hadn't been a great success, and this was borne out by the way in which Cousin Winnie avoided any mention of the husband.

Mrs. West, on the other hand, spoke of him sometimes, but I noticed after a while that she only did so when Cousin Winnie wasn't there. It looked to me, even then, as though Robin West and Cousin Winnie hadn't appreciated each other—and Cousin Winnie had won.

Valerie West was a very gentle creature, looking scarcely more than a child, with big brown eyes and a complexion that became like a roseleaf directly we'd left the heat of the Red Sea behind.

SHE must have been about twenty years younger than Miss Keynsham, who was already gray-haired, and handsome in a haggard, rather fussy sort of way. But Cousin Winnie waited on her hand and foot—or would have done so, if there hadn't been plenty of men on board who didn't give her the chance. Val was the type that men like to wait on. So Cousin Winnie had to concentrate on the baby.

'Poor little thing, her teeth are worrying her dreadfully just now,' said Cousin Winnie, pushing the pram round and round the deck, and getting tangled up with the quoit players, and the deck chairs, and the people taking constitutionals, and telling them all how sorry she was, and how Baby ought to be having her midday nap but wouldn't go to sleep.

'Why not just push the pram near the rail somewhere and leave her alone?' suggested one experienced mother.

But Cousin Winnie couldn't do that, because then Baby cried, and that worried Val, who'd had rather a bad night.

'Couldn't the nurse get her to sleep?'

'Nurse is making her food,' said Cousin Winnie. Everybody on board knew about that food.

It was in tins, in a special packing case, and the case was just too large for the cabin. It had had to go in the hold, and every two or three days there was a panic that the current tin had 'run out' and Cousin Winnie had to find the fifth officer, and plunge into the hold and unearth the packing case and extract from it just about two more tins than she could safely carry, and totter off, overladen, to the cabin.

'It's five minutes to twelve now and the stewardess hasn't brought the boiling water—it won't be cool enough for Baby to take it at twelve, and you know how impatient she gets . . . '

Mrs. West — 'Val'

'Shall I go—'

'No, let me do it, Val. You're tired. Nannie, could you take Baby for just one minute, and I'll dash to the kitchen, that'll be much the simplest really.'

But it wasn't the simplest. That was just it. The activities of Cousin Winnie produced complications, rather than simplifications, always. She was apologetic, and grateful and obliging, and painstakingly explanatory, and it was always all for the sake of Val and the baby. It all took up a great deal of other people's time, as well as the whole of her own.

Everybody said: 'Miss Keynsham *is* so devoted to little Mrs. West. It's quite wonderful.' So it was in a way.

It was wonderful, to my way of thinking, that any woman should have the audacity to say what Winnie Keynsham said to Major Adeane.

'Oh, Major Adeane, would you mind not asking Val to dance tonight? She simply can't resist it, you know, and it *is* so bad for her to stay up late. She doesn't get very good nights with Baby, and she's one of those people who can't make up for bad nights in the daytime.'

'But we shouldn't keep it up late, you know,' the poor Major protested. He was far and away the best dancer on board and his step suited Mrs. West's to perfection.

'It was past twelve when Val came to bed last night, and this morning she woke with a headache,' said Cousin Winnie reproachfully.

'By Jove, I'm sorry. She's not very strong, I'm afraid.'

'Not at all strong, though she hates me to say so. And of course she doesn't dream that I'm talking to you like this, Major Adeane. But I knew that if I told you how it was, you'd play up.'

The Major, reluctant and disconsolate, played up. What else could he do? And Cousin Winnie maneuvered Val down to the cabin, on some pretext or other, before the dancing began. My cabin was exactly opposite theirs, and I could hear them talking in the jerky sort of whisper that women do employ when they don't want to wake a child.

As I opened my door to go up on deck again—I'd only come down for tobacco—I heard a dozen words in Mrs. West's voice, and it sounded as though she was crying.

'Winnie, it feels just as though it had all been a dream. If it wasn't for Baby, I shouldn't believe I'd ever been married. The time that Robin and I——'

I got out of earshot as quickly as I could.

But the words haunted me, because they seemed to lend color to that suspicion that had already crossed my mind, about the West marriage. A woman whose marriage has been wholly unhappy doesn't say that it feels as though it had been a dream. A nightmare, perhaps, but not a dream. And there'd been something, besides, in the tone of that 'Robin and I——'

The next day I waited for an opportunity that I felt pretty certain would come.

Miss Keynsham and Mrs. West were in deck chairs, side by side as usual. It was eleven o'clock in the morning, and the nurse—for once on duty—was watching the baby as it crawled up and down by the side of the rail.

The great heat had been left behind us, but it was warm enough to make everyone welcome the sight of the deck stewards, with trays of ice creams. Each lady took a dish, and of course Cousin Winnie, the ever-thoughtful, exclaimed: 'I must take one to Nannie.'

Up she jumped, and put her own plate down on the deck and hurried over to the nurse. And as I had foreseen, the nurse immediately turned over the child to Miss Keynsham—I didn't hear on what pretext—and disappeared below, ice cream and all. Cousin Winnie went down on her knees, and began to be a bowwow, or a baa lamb, and the baby, who'd been fairly quiet before, playing by itself, got restless and noisy and incoherent, and finally had to be carried all around the deck by its devoted guardian. Meanwhile, I sat down in Miss Keynsham's deserted chair.

I had talked to Mrs. West before, and danced with her on evenings when Cousin Winnie hadn't told her that she was tired and ought to go to bed, and it was easy enough to begin where we'd

The Major, reluctant and disconsolate, played up.

left off. I asked about her plans when she got to England.

'We're going to pay some visits first, and then we want to find a tiny little house near London, somewhere—Kent or Surrey.'

'We?' said I.

'Cousin Winnie and Baby and I,' she explained meekly.

'I see. Till your husband gets his leave, I suppose.'

I didn't look at her, but I felt her start, and a woman who was less gentle would almost certainly have snubbed me for the impertinence.

But I held a trump card.

'Do you know, Mrs. West, I'm almost sure that I know your husband. I was on the China coast five years ago, and there was a Robin West sharing a bungalow with three other fellows—one of them, Sandy McCall, was a pal of mine.'

Dr. Page.

'I've often heard of Sandy McCall!' she exclaimed. 'Of course it was Robin. He was out there in 1920 to '21. But I don't remember—'

'Oh, no,' I interrupted. 'I was simply one of the older men, I expect, to him, and not particularly interesting. But we've played poker together many a time, and polo, too.'

'He's had to give up polo now,' she sighed. 'Too expensive.'

Her eyes strayed toward the baby, who had by this time compelled Cousin Winnie back to its original corner of the deck, and was amusing itself by clawing at her hair.

I, also, looked at the baby and then back at its charming mother.

'He must be very proud of little—er—Mary.'

'Margaret—' she corrected gently. 'Margaret Winifrede.'

'I meant Margaret, of course. Is she like him?'

'Yes, very.'

'She'll have altered, I suppose, by the time he sees her again. Don't babies of that age alter rather quickly?'

'Very quickly,' she conceded.

'Bad luck for poor old Robin, seeing you both go off and having to stay behind.'

There was a silence.

I was almost sure that she was trying to make up her mind to say something.

It came at last.

'I—I'm supposed not to be able to live out in the East any more. They say I can't stand the climate.'

They!

'Do you mean never?'

She nodded, looking at me very miserably.

Now the Far East is trying for many women, and not exactly rejuvenating for any. But a doctor knows very well that the woman who can't live out there—given reasonable spells of leave, of course—is one in, perhaps, ten thousand. In the other 9,999 cases, for *can't* read *won't.*

'But what about West's job, then?' said I slowly. 'Will he have to chuck the force?'

'It isn't a very good moment for chucking jobs, is it?' she said hesitatingly. 'I mean, everybody says there's absolutely nothing to be had in England. I know simply heaps of men—married ones too—who'd take any job in the world, and can't find one.'

'So do I.'

There was another pause.

'And Robin gets leave at the end of five years?' I said at last.

'Yes.'

Her voice was very low, and she wasn't looking at me.

'Burma is a bad country for a man to live alone in, Mrs. West,' I said at last. 'Too much drinking, and too many third-rate women about. Please forgive me, if you think I've no right to speak like this.'

'I'm not angry,' she said in the same low voice. 'It's what I've often thought myself. But what can I do?'

'You can go back to your husband,' I suggested rather brutally.

But I was beginning to see that what she wanted was someone who would give her the courage to put her own inmost conviction into words.

'Many women stay at home to look after their babies and let their husbands go to the East alone,' she pointed out.

'Not till the children are four or five years old, though, and in your case that needn't be considered yet.'

'I know.'

'You could have the next three and a half years—four and a half, if he's due for leave then—with your husband and your child, all together.'

'We were all together before—he and Baby and I, and Cousin Winnie. Out there.'

'Miss Keynsham was living with you?' I tried to keep my voice colorless.

'Well, practically. It was supposed to be a long visit, but she's been such an angel to me always, and we're such friends—'

There was a splintering sound beneath me. Major Adeane, briskly returning from deck quoits, had stepped into the little glass plate that held Cousin Winnie's neglected ice.

'It's all my fault!' she cried, hastening up to us.

'No, Val, let me—don't touch it—you'll cut yourself.'

'Miss Keynsham—I'm so frightfully sorry—I say, *please* don't spoil your handkerchief—' The Major was in great distress.

I called to a passing steward, and asked him to clear up the mess.

Mrs. West's baby arrived on its hands and knees, and Miss Keynsham interposed herself frenziedly between it and the broken glass. And she tried to wipe the ice cream splashes off the Major's white shoes with her handkerchief, and she implored Val not to move, and was just going to beg me not to disturb myself when she looked up and saw, presumably, that I wasn't going to.

On the contrary, I left them to the fuss, so typical of Cousin Winnie's devotion.

(To be concluded in an early issue.)

Sunspots *Are* Caused by —— *What?*

By ARVID REUTERDAHL

AT ONE time it was believed that the dark sunspots were of a higher temperature than the lighter colored portions of the sun's mass. About a half-century ago, however, Secchi and Langley made measurements of the radiation of the sunspots and proved that the old assumption was wrong. It is now a well-established fact that the radiation power of a sunspot is less than the lighter colored portions of the sun. Dr. See, Director of the Mare Island Observatory, concludes that sunspots are not due to eruptions from within but are caused by conditions existing in the region outside of and beyond the sun. If sunspots are due to the descent of cooler matter into the interior of the sun, then Dr. See reasoned that the sun's temperature, in the zone of a sunspot, should increase toward the sun's center. Dr. See's conclusions and careful calculations indicate a rapid increase in temperature when we consider ourselves progressing toward the sun's center of gravity.

AFTER Dr. See abandoned the idea that sunspots were caused by internal eruptions, he looked for a tangible source of influx of material into the sun from without. The periodic showers of meteors precipitated by Jupiter and Saturn were finally shown to be the primary cause of the phenomenon. A study of the orbits of Jupiter and Saturn in connection with their relative gravitational ability to throw meteors upon the sun brought out the fact that the period of this meteoric bombardment is 11.178 years. This means that every 11.178 years the sun is subjected to a meteoric bombardment by the planets Jupiter and Saturn.

We find the sunspot lagging behind the meteoric-bombardment period by a few years. The work of Sir George Airy on the phenomenon of the tides cast a further light on the sunspot phenomenon.

The next step in Dr. See's brilliant deductions is logically unavoidable. We recall the unusual high temperature which prevailed during the summer of 1921. In reference to this fact Dr. See states: 'A maximum of meteors had fallen into our sun, under the action of Jupiter and Saturn, which were in conjunction August 22, 1921, right in midsummer; the result was that every country of the Northern Terrestrial Hemisphere was scorched and had its vegetation burnt up to an almost unprecedented degree.'

We have seen that the average sunspot period is 11.178 years. The periodic recurrence of high temperature on our earth, however, depends, according to Dr. See, upon the relative positions of Jupiter and Saturn in relation to the Sun. Every 9.92945 years—or ten years, lacking twenty-six days—the sun will receive the downpour of meteors from these two planets. See concludes that 'the sun ought to be heated up to unusual temperatures about every ten years.' The droughts of 1881, 1891, 1901, 1911, 1921 are yet remembered and testify to the correctness of Dr. See's theory. He predicts another drought equal in its intensity to the one of 1921 for the year A. D. 2061 In the interim droughts will be less intense.

Constructing *the* PERFECT MAN

By WILLIAM A. McGARRY

DR. R. TAIT McKENZIE, professor of physical education, and director of that department at the University of Pennsylvania, is given credit by scientific trainers of men for placing their work on a professional basis in which knowledge takes the place of guesswork. He was the first physician and surgeon to see in this field an opportunity for constructive health betterment work.

Art was always a hobby with Dr. McKenzie. In his leisure he had learned to model and to draw, solely, at first, for his own amusement. Then, when he had become interested in physical training for the prevention of disease and the increase of day-to-day efficiency, he suddenly realized that sculpture offered the same opportunity of inspiring men and women of today that it did two thousand years ago in the great days of Greece.

Dr. McKenzie had been a specialist in anatomy, and he now renewed his studies, scrutinizing the details of the human body with the eye of an artist. He was born in Ontario, Canada, in 1867, and was educated at Ottawa Collegiate Institute and McGill University, Montreal, with postgraduate work at the Harvard Summer School in physical training methods. In 1894 he became medical director of physical training at McGill. Seven years later Dr. McKenzie had won international renown as a sculptor and in 1901 he was asked to give a course on artistic anatomy before the Montreal Art Association. Later this series was repeated at the Harvard Summer School, and in 1904 he delivered the Olympic lecture course at St. Louis. Painters and workers in clay and bronze who were considered masters of their art came to these lectures to learn the why and the wherefore of the human system. And just about then the world awoke to the fact that a new sculptor had arrived with a technique that has been compared to some of the noblest examples of the ancient Greek masters. 'The Sprinter' and 'The Athlete,' by Dr. McKenzie, both came to public attention in 1902, winning him world-wide renown.

His work has been exhibited at the Salon, the Royal Academy and elsewhere ever since these first notable successes.

W. P. Ogilvie describes how the first two works were produced:

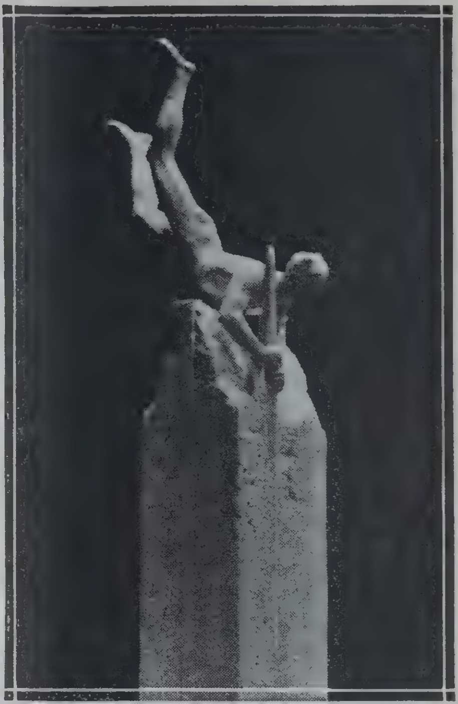
'The Sprinter statuette is one-quarter life-size and, in proportion, is an exact mathematical reduction of the average obtained from the measurements of about one hundred runners who could cover their hundred yards in ten and two-fifths seconds or less. The measurements were supplied by Dr. Paul C. Phillips of Amherst College, and include those of many great sprinters of recent years. The figure may be said to represent the type that has been most successful in trials of speed—long-limbed, small-boned, well-muscled, and square-chested.

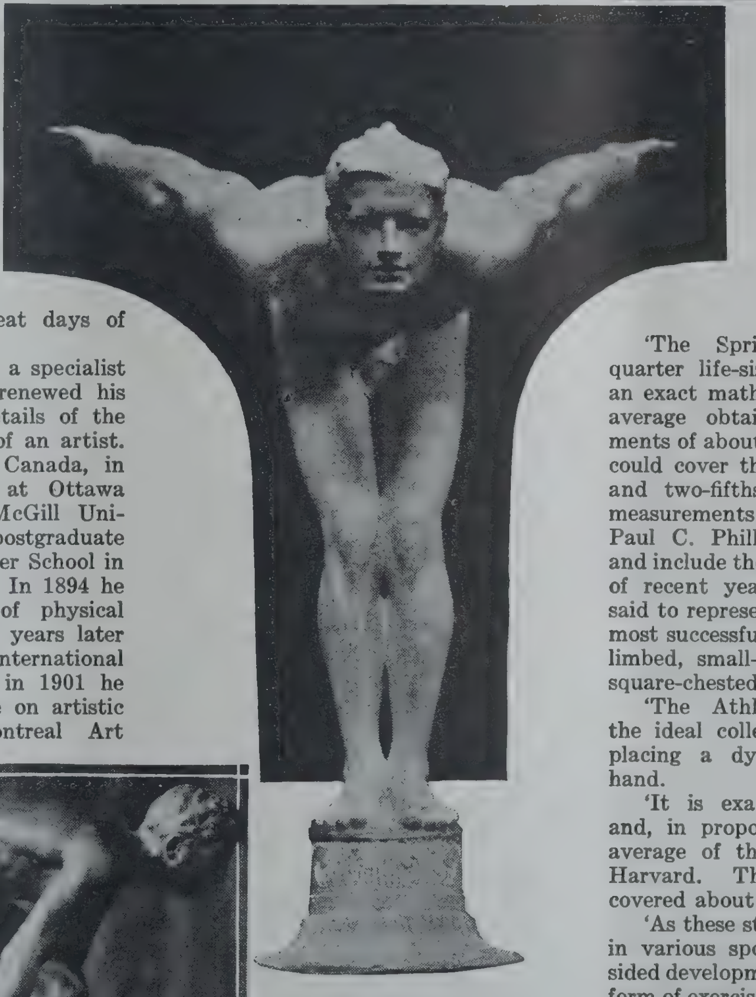
'The Athlete statuette represents the ideal college athlete in the act of placing a dynamometer in his right hand.

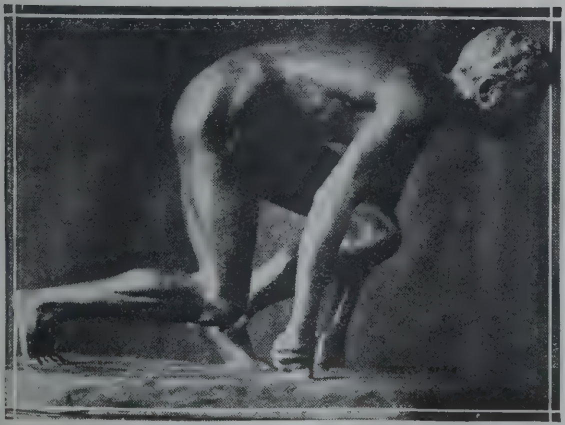
'It is exactly one-quarter life-size, and, in proportion, corresponds to the average of the fifty strongest men at Harvard. The necessary observations covered about four hundred men.

'As these students were distinguished in various sports and games, the one-sided development resulting from any one form of exercise was avoided, and the all-round athlete type was thus obtained.

'The work occupied one year, and it was found necessary to refer to five different models, the strongest points being selected to attain the greatest possible power, grace and beauty.'







Three of the McKenzie bronzes, picturing the ideal in various lines of sport, which have been reproduced by the thousand. The originals, as a rule, are made one-quarter life-size. At the top is 'The Pole Vaulter'; center, 'The Plunger'; and at the bottom, 'The Sprinter.' The details are so painstakingly worked out that one model required a year of daily work.

The old manse of John Knox in High Street, Edinburgh.

Where JOHN KNOX *Preached*

By WILLIAM L. STIDGER

EDINBURGH is another Holy Land to Protestants.

Here, it was that many of the great theological battles were fought.

Here, the Free Church movement had its birth. And John Knox is a name that reverberates among the hills and vales that environ this fair city. Here the voice of that great thunderer echoes from castle to castle, from crag to crag, from heart to heart.

Here, one walks amid the hallowed memories of this great Protestant pioneer's home. Here one stands in the little alcove which is called 'The Preaching Window,' from which John Knox used to stand and address the crowds that thronged the street below, after following him from St. Giles' Cathedral to his home.

Here, in this house, one may stand in the study where Knox's great sermons were dreamed and formulated. Here, one may stand in the very room where he breathed his last. Here, in this house, may one walk through low passageways, under dwarfed ceilings and feel that John Knox still lives.

One may read great sayings of a great soul, and, as one reads, it seems the voice of the reformer still speaks.

On the outside of this house, carved in old English lettering is an ancient trade guild motto:

'Lvfe . . God . . Abvfe . . al . . and yi . . nychtbovr . . as . . yi . self.'

John Knox occupied this house from 1559, when he returned from his enforced banishment in Geneva, to his death on November 24, 1572. On the walls a statement by Thomas Randolph, in a tribute to John Knox which reads:

'I assure you the voice of John Knox—this one man—is able in one hour to put more life in us than five hundred trumpets continually blustering in our ears.'

Phrases like those that John Knox spoke still resound through the years. His controversy with Mary Queen of Scots is well known. We stood in the room in Holyrood Palace where Mary Queen of Scots gave her audiences to John Knox when the reformer was trying to convert her from Catholicism to Protestantism; and when he was fighting for fairer treatment of the newborn Protestant church. Mary was trying to hush the voice of John Knox and to influence his preaching. His replies to her are immortal classics. One such rings out in these pregnant words: 'I am in the place where I am demanded of my conscience to speak the truth and therefore the truth I speak. Impugn it who list!'

In one of the famous conferences with Mary the following episode took place:

'By your grace's will I am here now, and what will men say of me that I am away from my book waiting at the court?'

St. Giles' Cathedral.

'Your book! Your book! Ye will not be always at your book,' replied the queen.

As Knox left the room, one of the lords-in-waiting said, 'A bold knave! he is not afraid!'

Knox turned and replied, 'I have looked in the faces of many angry men and not been afraid; why should the pleasing face of a woman frighten me?'

St. Giles' Cathedral, and Edinburgh Castle share honors. They loom like mountain peaks against the sky when seen from the vale below.

I sat within the great cathedral and heard the music of the organ roll and reverberate through its venerable walls just as once boomed the voice of John Knox.

There is a memorial to Robert Louis Stevenson within these portals and one feels that it is fitting, for Robert Louis Stevenson has endeared himself to all Scotsmen. His roots were in this wonderful city, and memorials of him are on every hand.

The original church of St. Giles was erected as early as 854.

The famous Lantern Tower was built in 1495, three years after Columbus discovered America. As one watches this tower from Princes Street gardens, sitting by the memorial to Sir Walter Scott, this lighted beacon shines out through the night like a brilliant planet.

In 1559 John Knox preached for the first time in this ancient edifice.

In 1650 Cromwell's troops used St. Giles' in which to worship, and members of the general assembly were expelled from it by the great commoner.

One of the chief features of the long transept of St. Giles' is the collection of Scottish flags. The flags of every Scottish regiment from the year 1790 are here.

Forty beautiful stained-glass windows form one of the most striking features of the edifice, and a statue of John Knox, with cap, gown and Bible stands in one of the naves. His long beard, his flashing eyes, and right hand pointing to the Bible which he holds in the left hand, seem to sum up the passion of his life: that of interpreting the Book to men.

Somehow, in the dim cloisters of this great cathedral this statue seems to live and move in immortal life.

The great organ is a symbol of his preaching voice. The pulpit as the symbol of his theological throne, still stands in silent tribute. The aspiring arches and pinnacles symbolize his visions of immortality.

St. Giles' Cathedral is one of the truly great worshiping places of the wide world.

Old Concord

(*Continued from page 15*)

whether Hawthorne's genial silence mightn't have a touch of irony in it—some covert criticism. So unusual is silence, and so difficult to interpret! I don't know. I suppose my father didn't always agree, and didn't enjoy argument; he had spent twelve years of his young manhood, after leaving college, in almost complete solitude in the old house in Salem; his gifts and aptitudes were not forensic. He perhaps surmised that when thought attires itself in speech, it is apt to miss the way, or to step on its own feet.

Ever since I could remember, however, he had been abundantly eloquent to me, during our daily walks abroad, on the subjects of giants, fairies and magicians; and of patriotism, which I early learned to understand as warlike indignation against England for her tyrannous attempts to enslave us. But there was always a smiling stream of humor running brook-like through these harangues or tales; so that my animosity against the English was akin to my resentment against Giant Despair and the wicked enchanters; it was all in a world of the imagination, and inexhaustibly delightful; and so when we lived in England, I defied and would destroy the English as a race, or in the abstract, while liking very much such individuals as I was brought in contact with. The education he gave me was spiritual, though it was many years before I recognized that.

NO sooner had we begun to domesticate ourselves in The Wayside, and had given it its name—as standing almost within arm's reach of the highway, which however was almost as free from traffic as a squirrel track—than Hawthorne's old friend Franklin Pierce, then become President of the United States, nominated him for the consulship at Liverpool, England. It was an opportunity not to be missed to see Europe, and still more to make it known to us children. So off we all went, in the little steamer *Niagara* of the Cunard line, paddle-wheeled and hardly two hundred feet long. During the seven years of our absence, our Uncle Nat Peabody occupied The Wayside and kept it in good order. Upon our return we began promptly to domesticate ourselves again. But my pleasure in my repatriation was a good deal dampened by the fact that I was to become a pupil in Frank Sanborn's famous school.

Theretofore, all I knew I had been taught at home: and Charles Dickens' account of Dotheboys Hall may have inflamed my natural aversion for alien instruction. Perceiving this, my father, with a peculiar arching of his right eyebrow, drew an imaginative picture of the terrors and tortures to which I was to be subjected by Master Sanborn—there would be a birch rod hanging up beside the pedagog's desk, to be daily applied to negligent or unintelligent pupils. Master Sanborn was six feet three inches in height, and he had victoriously engaged emissaries of the United States, who had been sent to arrest him for confederating with John Brown against the peace of the realm. As for the other pupils, I would probably have to fight my way through them; they would be incensed at my European culture—should a group of them attack me, 'Be sure to pick out the biggest of them, and go for him!'

I put on a D'Artagnan air, but I suffered in secret. It was all right for my father to make fun, but the matter seemed to me to have its serious side. I thought I might be able to make good against my fellow pupils, but I couldn't hope to overcome a man of the range and reach of Master Sanborn. I looked forward to school as to a sort of shambles. 'Can you fight?' asked my cousin, Benjy Mann, a malign little imp of mischief. 'Yes'; and I recounted some of my exploits against English boys. But Benjy shook his head ominously.

BEFORE the fall term began, Sanborn called at our house: an appalling figure, far overtopping my father, whom I had supposed to be the tallest man in the world. Oh, he smiled and bowed and was very silky and polite; he even addressed me with a suave smile; but I saw through him! When he got me alone, it would be a different story!

On the appointed morning, I set off alone, my father watching me off with a heartless smile, making gestures as of chastisement. 'If I'm killed, perhaps he'll be sorry!' was my reflection as I strode onward.

It was a beautiful, sunny September morning; the maple leaves were beginning to turn gold and scarlet, the great elms for which Concord was renowned casting their shadows along my path. I should have quoted Burns:

'Oh, birds, how can ye sing such songs,
And I sae weary, fu' o' care.'

I passed Emerson's bland white house, standing foursquare amidst its trees: soon I had reached the village meeting-house, with its sharp spire and high steps, the little acclivity on which it stood glowing with maples. Now through the village main street, short but wide: the post office facing Walcott and Holden's grocery store across the way. Now, bearing slightly toward the left, I could discern the school itself on the right of the peaceful street. A great moment!

'Fourscore and five years ago, that British regiment marched here to its doom, and now, I!'

SANBORN'S famous seat of learning was of dimensions and architecture identical with hundreds of others scattered over the United States. Most of the latter, however, were painted red; Sanborn's was gray; the dungeons of the Inquisition were gray; and the doorposts were studded with the initials of captives and victims—the recent paint failed to obliterate them. The building filled the small lot in which it stood, the façade being separated from the street by a space of some five feet only and a low rail fence. On the top rail, as I approached, half a dozen boys sat, chatting together with seeming cheerfulness; they were dressed in short jackets and trousers. I had trousers, but a coat instead of a jacket, and a hat instead of a cap. The cold looks they cast upon me as I paused before them made me regret my divergence from the local fashions—they probably thought me a Britisher. But I put on a mien of good fellowship, and perched on the rail beside the last of the row. There was silence for a while and then one of them made a remark which I didn't catch, but it may have been funny, because they all chuckled. Perhaps it would be followed by a direct insult, and then the fight would begin. I glanced at the biggest boy, two or three removed from me down the line. I thought I might lick him, if the others didn't mix in. Just then the door of a house on the opposite side of the street opened, and out came a long-legged, black-clad figure, down the path to the gate, across the road—long slack-kneed stride, shoulders stooping a little, preoccupied air—Master Sanborn himself! As he passed through the rail fence and up the four steps to the school door, he gave a slight, pleasant nod to the boys on the railing—we had already got off—and we followed him into the school. The clock on the wall marked eight forty-five, and school had opened.

It is sixty-five years since then. What followed is dim in my memory, but I know that as he took his seat at the high desk in the south end of the room he must have assigned me—beckoning me to him—a place somewhere provisionally. I went to it, and became all eyes, curiosity, and apprehensions, although the latter were somewhat allayed. I was being carried over Niagara in a wheelbarrow, but it wasn't so bad as I had expected.

THERE were about sixty pupils in the wheelbarrow with me, of whom twenty were girls. I hadn't realized till then that it was a boy-and-girl school—the first of that kind indeed; we were pioneers. I feared girls, not with hostility, but somewhat as saints fear the Lord. The other boys appeared to treat them as a special kind of boy, not amenable to boy rules, but tolerable in their rather futile way. The girls were very girlish, but nice—little ladies; the boys were (at least in the rough) gentlemen.

I was in love often—all the time perhaps—with one or another of these pretty maids, but I never reached the point of telling my love, still less of kissing the girl; that would have spoiled the romance. The truth is, that young folk in their teens (if not sophisticated and soiled by the meddling of too sagacious and profane elders) are in love with ideals, imaginary creations that they have found in some story or picture. As they happen upon some concrete person who, by effort and ingenuity not too violent, can be masqueraded for the ideal rôle, the music of love plays sweetly for awhile—until some discord betrays the hallucination, and, after a period of pleasing despair, a fresh masquerader is chosen. I was in love with Tennyson's 'Maud,' for example, and also with his 'Guinevere,' and his 'Gardener's Daughter,' and with the proud Señorita in Mayne Reid's *The White Chief*, with the portrait of the Duchess in an illustrated copy of *Don Quixote*, and with the girl in Millais' picture of *The Huguenot*, and . . . there were many others. I could discern any of these heroines through the disguise of Maggie Plumley, Grace Mitchell, Lizzie Simmons, Lily Nelson: they never suspected my passion, for I had discretion enough to keep aloof, except perhaps for a waltz or polka mazurka or schottische at a school dance. The music played: those were divine moments! And for a week or a month, I would, like Shelley, awake from dreams of her. But the spiritual ideal would wait all the while beneath the show. The secret knowledge that that supernal ideal can *never* become actual is the most delicious emotion of all!

'Coeds,' then, are a good thing in principle, and if treated right. The nickname, Coed, had not been invented in 1860, and perhaps the institution itself has never prospered so well as in those first golden-age years of Sanborn's school. It is said that our school girls and boys are as good as they were in mid-Victorian times, or better; I can only say that few persons are now living who were living then, and are thus qualified to deliver judgment. We are in the game, to play it out, and some remote posterity shall pronounce the final verdict.

I will go back to the school to remark that my expectations of battle and torture were never verified; there was never a stand-up fight between any of the boys, and Sanborn never but once inflicted physical chastisement upon a pupil. The youth had brought in a pocketful of snuff that morning, which he disseminated covertly, and soon Sanborn awoke to the realization that his whole school was at sneeze!

AT THE sneeze, however, the lion was aroused. The pupil responsible for the outrage was invited, quietly but terribly, to arise and declare himself. Silence; then, up stood the culprit. He was rather a favorite with the rest of us; good-humored and entertaining; he bore himself at that tense moment with a somewhat pallid smile. Another silence, the master seeking self-control. Then, in quiet tones, he set forth the enormity of the offense. That done, he arose, took up a ruler from the desk, and motioned to the condemned to follow him into the little hat room off the lobby. The two disappeared, and the school sat fearfully expectant, some of the girls whimpering softly, but hardly a whisper broke the stillness. Nothing of the scene of the execution could be seen, but its invisibility but rendered it all the more impressive. To our ears, for the first minute, only the sound of Sanborn's voice came through the partition; he was perhaps telling his victim that what he was about to do would hurt the administrator more than the receiver. Then, 'whack! whack! whack!' Grace Mitchell moaned and hid her lovely face in her hands.

The procession presently returned, Sanborn first, his face flushed and agitated but stern; then the snuff dispenser, also flushed but contriving to grin, and carrying his right hand gingerly. To him Sanborn said, after resuming his desk, 'You are excused for the rest of the afternoon session,' and then, 'The class in *Horace* may recite.'

That was all, during my three or four years at the school. We discussed the episode fully and decided that on the whole it was right enough; we pardoned the executioner, while by no means withdrawing favor from the victim.

The schoolroom was filled with desks and stools in two sections, with an aisle down the center, and two narrower ones at the sides. In the middle of the room was a big stove with a funnel up through the roof. The walls at the sides and end were paneled with blackboards, on which our attempts at arithmetic, algebra and geometry would be set forth. Utensils shaped like wooden ladles, with thick felt in place of bowls, hung at intervals beside the blackboards; at first I thought they must be weapons of chastisement, until I saw Asa Collier rubbing out his addition sum with one of them. With the single exception of the studies, I came to like the school very much, though I never could quite feel that I liked Sanborn, while conceding his merits. But when, fifty years after my school days, I visited Concord on a sentimental pilgrimage, and he and I, two white-headed old men, sipped a light beverage and talked over past times, I felt a great affection for him. He was a good man and had always done what he deemed right; he had backed John Brown and defied the United States, but the war had vindicated him. He was an ingrained rebel, however, and when I last saw him, though he was more than eighty years old, he was prosecuting a vigorous warfare against the village selectmen, who tried to make him pay for the drain which passed by his house. He would appear at the meetings, denounce his oppressors, and walk out, declaring that he was too old, and had too much useful work to do, to submit to such nonsense. He was the last survivor of the ancient régime—the Grand Old Man of Concord, *vice* the others deceased. 'Shoot, if you will, this old gray head; I'll pay no tax for drains,' he said. And he died triumphant a few years later.

Thoreau had passed away in 1862; his was the first dead face I had ever looked upon, waxen-like and dark-bearded in his coffin. Twenty years later I saw Emerson to his grave, near my father's, on the hill of Sleepy Hollow. As the coffin was lowered, I thought to myself, 'There goes Concord!' Alcott, however, was still functioning, and took to cover only in 1888, I think; he was the benign apostle at the meetings of the Concord School of Philosophy, on the little elevation back of his own Apple Slump. Louisa, the beloved, died almost on the same day as her father. So, as the loftier mountains subsided, Sanborn, still holding out, naturally succeeded to their halos. Time brings reward as well as revenge, and the black-haired young Harvard graduate who had directed my boyish studies chatted with me as a contemporary two generations later. The perspectives of life are queer!

But there still is Concord, older than ever, but up to the passing day, spreading out in its shallow, fertile valley, between the low ridge of hills on the north and the pine woods and Walden on the south; a brook, dear to my boyhood, runs through the valley to Concord River; Emerson's house is where it was, and so is The Wayside. The sons of the heroes of 1775 and of 1861 are doubtless there, too, and would say that, after all invasions and vicissitudes, they are the real Concord.

Well, why not? But I recall Emerson's 'Earth-Song':

Why am I theirs,
When they hold not me,
But I hold them?

When I heard the Earth-song,
I was no longer brave:
My avarice cooled,
Like lust in the chill of the grave.

Low Wages in France

(Continued from page 3)

corresponding to our congressman, to the munificent sum of forty-five thousand francs a year; this is about eighteen hundred dollars a year. Hardly a newspaper in France has refrained from making remarks about the legislators who are trying to reduce the budget, and begin by increasing their own salaries.

The professional classes have one resource which is not so commonly found in America, namely family inheritance. There are hundreds of officials in libraries and in museums, as well as hundreds of professional men, who are able to maintain a decent standard of living due to income received from inherited *'rentes'* or bonds. The French custom of the *'dot'* which the wife brings to her husband is connected with the attempt to maintain a decent standard.

SOME difficulty is being experienced in keeping European workmen content at wages such as those mentioned above. It may be stated that these wages are not peculiar to France and are quite similar to wages paid in Spain and Denmark, countries not directly affected by the war, as well as in the other countries with depreciated currencies. The American motion picture contributes one way and another in contrasting the status of the European laborer with that of his brother in America. While this is done by the films incidentally, even accidentally, and not as propaganda, the effect is of sufficient seriousness that efforts are being made to counteract the influence. To the European workman the notion that a carpenter or bricklayer rides to work in his own car seems fantastic. But this is the type of information which the film spreads, and when supported by other evidence the European worker will finally believe it. It will not serve to make the worker more contented with his lot.

Note that the facts given about wages refer to cities with more than ten thousand inhabitants. While it is true that wages are less in the villages and in rural districts, the actual economic situation is better.

The peasants are really thriving since the prices of farm products are largely determined in the cities. The peasant long ago learned to do without things.

ONE result of the economic situation in France is that the great majority of women engage in some gainful occupation. Unfortunately this includes thousands of mothers who should be at home taking care of the family. The laborer leads a drab kind of existence with little to stimulate him to a complete interest in his work. For the great mass of workers there is no escape, either for them or for their children. The low wages occasion a fundamental disrespect for human beings, shown particularly in the attitude toward women.

Some day a great industrialist may arise in France willing and able to try the experiment of a living wage for the factory worker. But unless that day does come soon the workers who are now voters may realize their power and may endeavor by political effort or by revolution to achieve a decent standard of living, a fuller measure of life, to which the real worker is entitled.

'PREXIES' Who Are Collegiate

By SAM CARR

Left—Dr. Alfred H. Upham, selected to be the next president of Miami University.

Below—Dr. Raymond M. Hughes, the retiring head of the institution.

IN CASE the Ask-Me-Another craze has overlooked it, let us put this question:

Who, what and why are college presidents?

Vox Populi himself, who can name a dozen football coaches, their pet gridiron formations and team records, will nod dubiously, as if the question were unfair, and pass on to the next one.

But there are college presidents, authorized to control the formative period of thousands upon thousands of men and women, to whom are intrusted millions of dollars for annual expense and 'plants' (buildings, equipment and the like) worth many more; not to mention campus customs which must be cherished and kept untarnished.

To know the type of men chosen for college presidents it might be well to stop at Oxford, Ohio, a typical college town of not many more than two thousand population, excluding students and faculty families, whereas the 'college population' will go to three thousand.

There is located Miami University, a coeducational institution, supported by the state. Dr. Raymond M. Hughes has recently resigned and Dr. Alfred H. Upham will soon take his place. Both are graduates of Miami University.

Dr. Hughes was graduated in 1893, being one of a class of eight. Dr. Upham was graduated four years later and he was one of a class of eleven.

Trustees at Miami University knew Dr. Hughes before they made him a college president. He had been a student four years. Then he was recalled to teach chemistry and physics five years later, after he had taken postgraduate work at Ohio State University and Massachusetts Institute of Technology, and had taught two years in a high school.

Trustees knew him so well that he soon was given added duties with the official title of registrar, an executive post. He was made dean in 1904 and served as 'right-hand man' to Dr. Guy Potter Benton, then president, until 1911 when Dr. Benton resigned, ultimately to become president of the University of the Philippines, at Manila.

Dr. Hughes, intent on his chemistry experiments and teaching, balked when asked to become acting president. He served, however, and so well that he stuck and now he has a call to the presidency of the Iowa State Agricultural College at Ames, Iowa.

The case of Dr. Upham, to be his successor, is similar. Without foresight, perhaps, he was storing up knowledge of his job while compiling data for a book reciting some events in the history of Miami University. Some day he may show he has learned a lesson from the reign of Erasmus D. MacMaster, a one-time president of his alma mater.

'Erasmus D. MacMaster was a leader among the old-school Presbyterians,' so the book recites. 'As they used to say, he was a very painful preacher, and his ponderous antitheses and periods searched the heart of weighty questions as they rolled deliberately from his tongue.

'He had remarkable success later teaching in a theological seminary; but he could never understand or reach the heart of a tow-headed graduate. That particular phase of original sin was too much for him.

'Not the least of Doctor MacMaster's troubles was his tendency to take prompt and decided stands on mooted questions, and then express himself freely. The Mexican War came rather early in his administration. He didn't believe in it, and said so plainly in a chapel sermon.

'The local recruiting officer was in the congregation, exuding patriotism at every pore. Naturally the sermon gave him a chill, and he retaliated with martial methods.

'With a band of fellow patriots he pulled a cannon down by the doctor's home that night, and fired it there, shattering all the glass in the windows and rudely disturbing the doctor's musings on predestination. Indignant friends of the president afterward secured the cannon, dragged it down in the campus, burned the running gear and threw the barrel into a cesspool.

'Unfortunately, there were days to follow when you could hardly have mustered enough friends of the president, indignant or otherwise, to drag a medium-sized popgun.'

Dr. Upham has just concluded a successful term of seven years as president of the University of Idaho. Another paragraph from his book might serve to illustrate his knowledge of college boy psychology, if there is such a thing:

'Nowadays we parade in our curricula various stilted but imposing courses in public speaking and debate. Under pressure of a sweat-box ordeal in the classroom, students painfully construct briefs and plan forensics, grumbling at every step and subconsciously meditating on the recent junior prom. We argue the power of the spoken word and prate much of human personality; while the student body, going out to sway the world, is calmly balancing the probable incomes of a mining engineer and a well-to-do curb broker.'

Dr. Upham has served as a faculty member at his Alma Mater. He took post-graduate work at Harvard, then became instructor in Latin and Greek at Miami. He left to complete studies at Columbia and returned to be professor of English literature. He left again, this time to teach English at the Agricultural College of Utah, returned to Miami again for three years, resigned to become associate professor of English at Bryn Mawr College, was recalled to Miami and taught English for six years. During this latter period he was called upon for executive counsel time and again, and his judgment and ability disclosed in these conferences had much to do with the call to a college presidency.

Appointment of Dr. Hughes and Dr. Upham, at least at Miami University, marks a tendency to seek elsewhere than in the ministry for college presidents.

Each is gifted with the ability to teach, but skill in holding attention of students in the classroom and the art of imparting knowledge is not necessarily synonymous with good preaching.

Three institutions most affected by the shifting of these two men—Miami University, State Agricultural College of Iowa, and University of Idaho—are supported by taxation so that neither the presidents nor faculty members are required to devote a large part of their efforts to the obtaining of endowments, a necessary job for many college heads of a former decade, and today.

Too little credit has gone to college presidents to whom are intrusted a large responsibility of the future of thousands of men and women. The product of the college walks in when alumni reunions are called, to present the results of his college training in person. Maybe the result is good, maybe bad. The college president judges whether he has helped or hindered and most of them are conscientious. No wonder the job begets a serious mien.

Refuge for an Emperor

(Continued from page 9)

and pikes, for all the crew. There can be little doubt that the plot was known to and approved by at least some of the most influential members of Napoleon's staff. Some years after the death of Bonaparte, Dr. Antommarchi and Marshal Bertrand admitted as much while on a visit to New Orleans. Marshal Bertrand in particular, who in company with the younger Ney, Prince of the Moskva, spent some time in the city, often referred to the plot, which he believed would have been successful, and quoted Napoleon as having expressed a desire to spend the remainder of his days in America.

While the *Seraphine* was being built, equipped, manned and tried out in all kinds of weather on the Gulf of Mexico, M. Nicholas Girod erected the house which was to have been presented to Napoleon. Once completed—and its building required nearly a year—it was furnished in what must have been sumptuous style for those days. Though its purpose was not then known (it was generally believed to be merely a new home for the Girod family), the large three-story mansion proved itself in both fact and name the finest house in New Orleans. In all probability, with its furnishings, it constituted the best home in America south of New York, and probably one of the best in the entire country. Yet it was destined never to shelter the famous son of the Isle of Unrest. Today efforts are being made to preserve it from the ravages of time and the elements as a worth-while historical monument of the days when French influence was still strong in North America.

Within this house when it was completed, the details of the plot were concluded. Bossiere's heart and soul, as well as his undoubted courage and his skill as a seaman, seem to have been thrown into the plan with an intensity almost equal to that of Girod himself. The captain was a Frenchman whose father had been an officer in Count Rochambeau's army, which coöperated with Washington's army at the siege of Yorktown. It is recorded, indeed, that it was the elder Bossiere who led the French force which, with a column of Americans, scaled the principal fort defending Cornwallis' position. Bossiere's mother was of French descent, an immigrant to Louisiana from the island of Santo Domingo.

Stories still told in New Orleans reveal that Bossiere and Girod gave up all other interests in the last months of 1820 to devote all their energies to the completion of plans for scaling the rocky heights of Saint Helena, overcoming the guard around Napoleon, and lowering the Little Corporal in a swinging chair to the deck of the *Seraphine.* They had such close information of conditions on the island prison of their hero that they had measured the ropes to be attached to the chair, fixed the latter in its place at one end of the tackle, and slung the necessary pulleys wherever needed, ready to be hung on steel crowbars which were to be stuck in the crevices of Saint Helena's cliffs.

They had even taken the calendar into consideration, and had timed their sailing from New Orleans so that the *Seraphine* would arrive off the island in the dark of the moon, when she could the more easily elude the guardship posted by the British. In order the better to do this, the *Seraphine* was to have been painted black while on the way across the Atlantic, and she had been provided with a set of black sails for use on the eventful night.

With the Bonaparte once on board, the *Seraphine* could show her heels to anything likely to pursue her, and, once arrived in New Orleans, with the Stars and Stripes waving over him, and with the friendship of General Jackson for M. Nicholas Girod standing firm, Napoleon would be safe to spend his life among friends in the city Bienville had founded. What a day that would have been for the Bonapartists when Napoleon stepped across the levee from the deck of the *Seraphine* to the cobblestoned streets of New Orleans!

But though man may plot and plan, there is a destiny which disposes of those plans without reference to man's desires. Three days before the date definitely decided on for the sailing of the *Seraphine,* late in 1821, a clipper ship, direct from France, brought news that on the fifth of May of that year Napoleon had left this world forever.

Where Women Never Grow Up

(Continued from page 8)

creatures are to be seen on every farm, when not on the threshing floor, ceaselessly drawing water from a well by means of a long pole attached to a wheel on which there are a number of small pails, working on precisely the same principle as that of the little toy dredgers that most of us have had in our youth. Day after day you will see these mules at this endless task, for water is a problem in sunny Iviza, and the farmer finds constant irrigation essential. But there do seem signs of effort to relieve the mule. I actually saw a windmill pump!

Just one more picture of this delightful island. I paid a visit to the Salinas—a series of vast salt-water pools.

It was very difficult to tire of such a journey as this, and all too soon I found myself standing with the Salinas spread out at my feet. Wide, silent pools they are, with the salt heaped out in vast pyramids at one end. The stillness was rather depressing, and I was not sorry when I found myself sipping a glass of anise—a very strong liqueur tasting like our aniseed—in the house of the priest of the tiny church nearby. He told me that much of this salt is sent to England.

The Ivizan is far the most hospitable soul I have ever had the pleasure of meeting. The innkeeper at San Antonio, who told me with great pride that he had actually spoken to three English people—quite a feat, in these little visited parts—who, after a truly enormous lunch—commencing with a small sea of soup, with an entire fish hidden beneath the waves—at a very nominal figure, treated me to two drinks at the town's sole café, and would not permit of any return on my part; the man in the mule cart who was honestly pained to see me walking; who, after many minutes of earnest explanation on my part, could not be persuaded that I was actually doing it because I liked it and not from necessity; the fisherman who showed me his much cherished lobster hole—where hundreds of these creatures were to be caught with the greatest of ease; who offered me two monsters—which would bring no less than twenty-five pesetas in Barcelona I was proudly assured—for the sheer pleasure of making my acquaintance, but which I regretfully had to decline, as to have brought them back to the Fonda would have hurt the feelings of the landlady, who prided herself upon an intimate knowledge of precisely what an Englishman expected to see upon his table—these are just a few of the memories which accompanied me when I left Iviza.

There are many delightful things to be seen, many a kindly being to be met, many a wonderful week to be spent in this enchanted isle. But for me there stood out above everything else that one peculiarity—the way in which the Ivizan woman retains her youthfulness by the proud display of her chief glory. And being at best a mercenary creature, I came away obsessed with a single thought—what an opportunity for an enterprising hairpin manufacturer!

In the Track of the Mountain Goat

(*Continued from page 4*)

Between them was a wall of rock twenty feet high with one or two flanges of rock jutting out like a mantel shelf, but not so wide. Nanny had somehow bounded up but the jumps seemed quite beyond the little kid's powers. He would make a desperate effort and charge at the wall, the tiny sharp toes of the fore hoofs scratching at the flanges. Then he would fall off, somersault sickeningly backward, land miraculously, all four hoofs together, and totter back precariously to safety. A dozen times we were sure he had done this once too often.

We were just wondering what nanny could do, since plainly she could not come down to him, and how they would get out of the difficulty, when the kid altered the line of his jump. Another sickening second, as he clawed desperately at the overhang, and he was up! A couple of zigzag bounds and they vanished over the brow of the cliff. After this glimpse of a mountain kid's training, our opinion of goats as mountaineers went up.

NEXT, we had to decide whether we should follow the route so unexpectedly revealed. We looked at one another questioningly. About an hour of daylight remained. The face they had scaled looked most unpromising in its upper reaches, but we were certain that it must be easier than it looked. A human climber does not need much to hang on to—but he must have something. Until the antics of the kid drew our attention we had considered this particular place hardly worth trying. After some discussion we looked at our watches again and at the sky, now very leaden and lowering, agreed to go up and look at it but to turn back and come down at once if any real difficulty arose.

As we tied the ends of the 60-foot climbing rope round our waists and scrambled up the preliminary reaches, we wished we felt fresher. The day had been exhausting. We had set out from Red Eagle Camp before daylight. Just as dawn was breaking, the old, long unused trail we were following had dipped down to a wide river. The bridges that used to take the traveler over in comfort were gone! There was nothing to do but ford it. Waist-deep we waded its icy, glacier-fed waters, noting the enormous tracks of a bear which had evidently gone that way during the night.

A little beyond, we halted to eat. Already we were feeling the heat of a day that was to end in thunder. As we sat, glad to rest from our packs, a stirring in the bushes ahead made us look up. Were we about to meet the grizzly whose tracks we had seen? Breathlessly we waited. Then suddenly the bush parted and an immense elk stood looking down. He had almost walked on top of us! The thunder of his hoofs as he dashed away and the sweep of his spreading antlers through the branches told us that he was as much startled as we.

By good fortune we contrived to keep the old trail, even when it vanished in a swamp under a dense growth of luscious vegetation. And it proved very useful when it emerged again upon the upper slopes. After an hour of struggle with trailing jungle which sent up a thick, suffocating hothouse reek, we found the switchbacks grateful to the feet. They led us at last to open country and our first sight of the crags with which we were now to grapple. The old trail bore away to the south to Nyack Creek and Lake MacDonald. Our course was to the west, for our aim was to test the possibility of a new trail over to Blackfeet Glacier and Going-to-the-Sun Camp.

We looked about, and it was plain enough that there would never be a trail here. Except for stray ledges, not more than a foot wide, the whole 500-foot cliff was sheer. There were not many ledges either, and they tilted up. You had to wander about on them until you found a point at which you could pull yourself up on to another ledge, and so on, zigzagging to and fro across the whole width of the cliff.

We came in time to the scene of the kid's adventures. It must have had iron nerves. Or perhaps only an utter lack of imagination! The ledge from which he had made his wild leaps led out sideways across a bulge in the cliff. Standing on it and leaning back against the wall you could look down between your toes, which stuck out well over the edge, and see nothing beneath you but the slopes five hundred feet below.

The mantelpiece-like flanges by which the goats had scrambled up jutted out in a most awkward way. What the goats had done was to jump as much sideways as upwards.

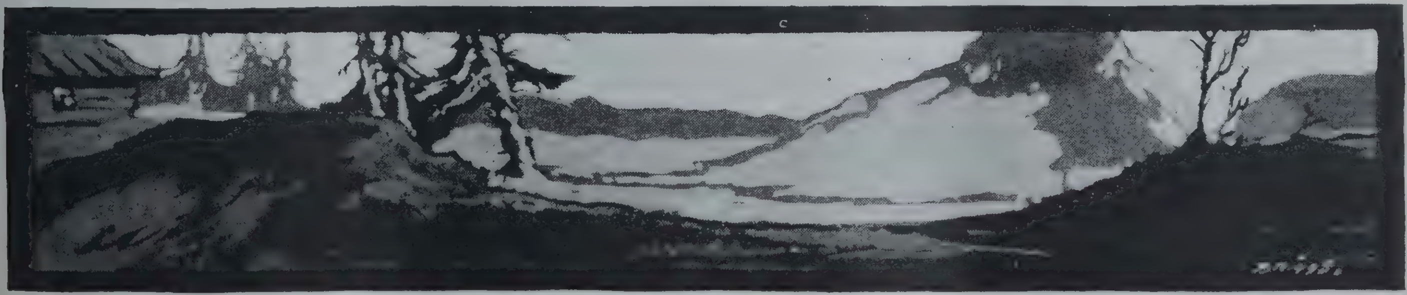
We stowed the awkward bundle of axes and sacks safely away in a cranny. Then, crouching at one end of the ledge and hoping that I could hold on if a jerk came, I watched the 'leader's' movements with anxious eyes.

He began by doing something that no goat could do. A vertical crack two inches wide split the wall on one side of the lowest flange. Into this he put his toe sideways, forcing the nails of the boot to bite by a twisting of the ankle. His hand felt above in the crack and seemed to find something fairly satisfactory to grasp. On these holds he moved smoothly upward gaining more than a foot in height. His other hand, when stretched out, could now press down on the flange. A moment later I could see that the main part of his weight was not on it. A touch of his other toe on a little roughness below the flange seemed to have worked the change. His foot moved up to the crack, bit into it again with the same twisting action and then he was kneeling on one knee on the flange, his face pressed sideways against the wall above and both hands feeling carefully about for holds.

IT WAS one of those positions in which one must take care not to breathe too deeply, for one's chest by expanding pushes one out! I was reminded suddenly of a famous place on an English mountain. There, just out of reach in a similar tense position, is a glorious handhold, widely known—from the pious exclamations of many climbers when they at last reach it—as the 'Thank-God-Hold.' In this case too there was a hold in sight which would mean the end of the difficulty. If the 'leader' could stand up where he was kneeling he could get it. After a series of those slight deliberate movements which show that the balance is being adjusted, I saw him bring up the other knee and pivot gently round upon both, turning first his head and shoulders. A moment later he was standing up, the hold of salvation under his fingers. All I saw of him now, till he vanished from my sight over the brow of the cliff, was the soles of his boots as he stepped up from one inch-wide ledge to another.

A great contrast to the slapdash methods of the goats, I thought, as I prepared to follow. But first the ice-axe bundle had to be sent up. It caught viciously as it was dragged out of sight. The rope was drawn in to safeguard me, a call came and I prepared to repeat these evolutions. I had hardly got my breath again on the crest before the storm broke.

As we dozed beside the flames we decided that we had scored about even with the goats. It is true that we had failed to follow exactly in their footsteps but on the other hand they would have failed in ours! Still we probably got more fun out of it than they did. As we planned our journey for the morrow, reading the map by the flickering firelight, we felt grateful to the little kid. Dimly, the great white fields of Blackfoot Glacier were glimmering across the valley along the skyline. In the morning we would explore them.



Memory—the Association of Ideas

(*Continued from page 6*)

clearly as another could have seen her at the time, she now sees herself beside her dolly's bed hushing her waxen baby to sleep. That swiftly passing moment of time is revitalized in her mind as sharply as if all the years between were rolled back and as if she, a woman now, and old, it may be, looked as another person might, with seeing eyes, upon the little girl she was.

So a grown man, not moved to remembrance by the occurrence of any related circumstance, while seated at his desk, perhaps immersed in work, finds himself quite suddenly looking into the face of the little barefooted boy he was. He sees the freckled countenance that was his, and in the eyes he sees that long departed light of candor that illumines only the eyes of youth. Acting of its own volition, memory may range the years and thrust their long forgotten pains and pleasures upon a mind that gives no conscious aid to memory's activity.

When youth has gone and maturity has known its prime and age has come in kindness or severity, then it is with men as it was with Cato on the one hand or Themistocles on the other. The way in which life has been lived determines what the memories of age shall be. Plutarch relates: 'When Simonides offered to teach Themistocles the art of memory, he answered, "Ah, rather teach me the art of forgetting; for I often remember what I would not and cannot forget what I would."'

Cato's memory, in his declining years, was the servant of a happier mind. He declared to his friends that 'the greatest comfort of his old age, and that which gave him the highest satisfaction, was the pleasing remembrance of the many benefits and friendly offices he had done to others. To see them easy and happy by his means made him truly so.'

MEMORY proves again and again its truly amazing tenacity. It shows power to function of its own motion without regard to the volition of the individual upon whose life it confers life's only recognizable continuity. May it not, then, be possible that it is building up in each of us a record that some day may be all that remains of all that we have been—a record by which, some time, somewhere, somehow, we shall each severally be weighed and measured?

The suggestion is purely speculative, but science does not object to theory as theory, for theory often leads science on to fact.

Assume, then, that man's memory makes record of every thought and speech of his whole life, operating with the continuity of a motion picture camera loaded with endless film. May it not be that there is filed away automatically in the cells of his brain an exact record of everything he has ever done, said or thought, heard or seen? There is to be found in everyone's experience reason to suspect that, quite independently of the will of the individual it meanwhile serves well or ill, memory is busy compiling an enduring, truthful, mercilessly intimate and complete record of his whole physical, intellectual and moral life.

Consider how often memory surprises man by bringing unbidden to the surface of his consciousness recollection of a trivial fact or unimportant experience submerged many years before and kept in submergence. Is it not fair to assume, that as that long 'forgotten' fact or inconsequential experience had been treasured by memory, so, no cause for discrimination appearing, has memory maintained an exact, complete record of every experience that has befallen? If so, then the cellular storehouse of the brain may hold in keeping films as continuous as the life they register, all in readiness to be projected in their entirety upon the screen of ultimate full disclosure.

Consider that all that memory retains it holds quite without the command and often without the consent of the individual. It does its work, often enough, without his coöperation, without his conscious or permissive knowledge. How frequently it startles him by exhibiting proofs of its retention in the 'subconscious' (to use a popular term for a lack of a more definitive phrase), of acts, words, and even thoughts, that had passed from the keeping of the conscious brain itself!

Nature, indifferent though she is to the costs of her operations, does nothing without a purpose, hidden or disclosed. Of what avail, then, this record memory builds up minutely, moment by moment, hour by hour, day after day, through all the years, of every act and thought, if that record is not somewhere, somehow, sometime to be put to a use compensatory of, and commensurate with, the thoroughness of the work?

The concurrence of experience offers proof that such use does not develop in this life.

Might not that fact supply reasonable support whereon to build the possibility and even expectation of a life to come, in which continuity of personal identity alone could make such a record worth memory's keeping in the life that is?

On a Personal Taste in Letters

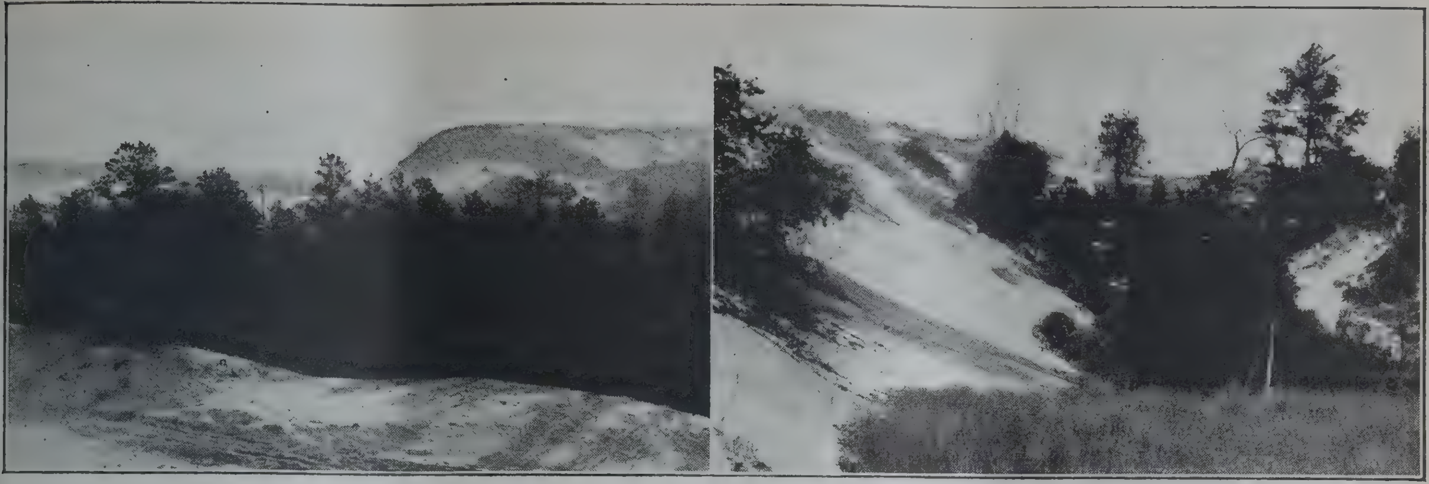
(*Continued from page 5*)

named it Ecstacy. He says there: 'I said my answer was the word Ecstacy; I still say so, but I may remark that I have chosen this word as a representation of many. Substitute, if you like, rapture, beauty, adoration, wonder, or, mystery, sense of the unknown, desire of the unknown.' Of course the answer to this is that what is ecstacy to one is not ecstacy to another. I think that a truer term is one that he afterwards chooses, 'sense of the unknown, desire of the unknown'; that is the supreme thing that my natural taste demands of all literature and I think that all the authors that I have named here possess it. Of course a true mathematician may find ecstacy in the fifth problem of Euclid; in talking of personal taste one is personal, but what for me is ecstacy in literature is the letter that Keats writes when he defines the meaning of poetry, John Clare's poem 'Recollections After an Evening Walk,' the moment in *Henry Esmond* when Beatrix comes down the stairs, De la Mare's *Listeners*, Hazlitt's *On Going on a Journey*, the closing pages of *Red Gauntlet*, Quilp among the marshes of the Thames, Marty South's lamentations for her lover. These may be many of them hackneyed things but when the ecstacy is there no repetition however constant can tame it away.

I can explain it more nearly perhaps if I take two novels that have been especially popular during the last year in England; the *Jud Suss* of Feuchtwanger has, in its last pages at any rate, exactly this quality; the *American Tragedy* of Dreiser lacks it, for me at least, entirely. I will not deny that *An American Tragedy* absorbed me while I read it; here was a human story made convincingly true by a marvellous accumulation of detail, appealing to one's pity, awakening one's uneasiness at modern justice, but behind it nothing; I have had the same sense of life, of truth, of unfairness from the columns of my daily newspaper.

But one cannot emphasize too frequently that these things are personal. I am sure that there is far too much in modern-day criticism of scornful laughter at other people's preferences; it is a crime in certain critical circles that this or that author should be admired; there is far too little positive criticism today; the creative critic scores quite as heavily when he produces his admirations. But after all these personal tastes have little to do with criticism; if it is dangerous to be too catholic in one's likings it is equally dangerous to lose one's savour of one good thing because one is hunting after another. Does Mr. Aldington, for instance, really think it is to his credit that he has ceased to care for Wordsworth because he has become a minor prophet of modern French poetry? Is it necessary, as another young critic seems to think that every novelist today should write like Marcel Proust, and is Dickens of no value to the world any more because Mr. Arnold Bennett has found it impossible to finish one of his novels?

BUT here I am venturing into just that world from which my cottage has saved me. I don't care a hang for the opinions of Mr. Aldington or Mr. Arnold Bennett although I shall read, I hope, every word written by Mr. Bennett in criticism until he is tired of the game because his energy and vitality are worth a multitude of less violent if more considered opinions. In my life at least and the life of many others I suspect there has been too much talking about books to the neglect of the books themselves. I can look across the lake and watch the shadows flash and go across the sturdy shoulders of Blencathra; Blencathra stands whatever the shadows may say and I fancy that in the literary Olympus Scott and Hazlitt, Fielding and Keats, Flaubert and Proust are too busily engaged upon their present creative business to care the flip of an angel's wing as to whether in the past they have written well or ill.



The SAND DUNES of INDIANA

Where the Birds Love to Congregate

By E. L. McCOLGIN

FOR many centuries before the coming of Marquette and La Salle, the Indian trails from Mexico City; the land of the Iroquois in what is now upstate New York; Wisconsin and Dakota, and the Southeast all converged amid these Indiana dunes. This was also the location of the Calumet portage between Lake Michigan and the Illinois and Mississippi rivers. Traces of the deep-cut, ancient trails are still visible in the dunes country. Messengers would come to the dunes country from the 'Sandy Country,' Arizona and New Mexico, in four or five days, almost as fast as modern trains, by relays of swift ponies.

The sands of the dunes are washed up from the bed of Lake Michigan where the glaciers deposited the quartz that they had pulverized under foot on their advances and retreats. The current of Lake Michigan concentrates these submarine sands upon the southern and east coasts and storms toss them high upon the shore where the wind transforms the material into dunes.

The dunes country embraces a zone one mile in width from the strand. First there is the sandy beach, then the highest dunes in the form of single mounds and immense ridges.

There are two varieties of dunes, the so-called fixed dunes of gray, weathered sand, and the shifting dunes, whose surfaces are of clean, white sand. The fixed dunes, which predominate here, are kept in place by several forces, but principally because they are covered more or less with grasses, vines and trees that form a protective mattress. They are locally termed mountains and many of them have remained in position for hundreds of years. Sometimes a fixed dune is breached by storms and converted into a shifting dune.

The irresistible, engulfing movement of one of the shifting dunes can only be compared with the quiet overflow of lava from a volcano. Forests, houses and fields and swamps are overwhelmed. Shifting movements sometimes continue until the sands move on and expose the skeletons of forests that were buried generations ago. The best specimen of a resurrected forest is to be found in the eastern or Furnessville part of the new state park.

Orpheus M. Schantz, the president of the Illinois Audubon Society, has called attention to some features of general interest:

'Nowhere on the North American Continent and probably nowhere else in the world does there take place a greater movement of bird life than in the region tributary to the dunes. Thirty years ago, it was a paradise for the sportsman and the market hunter. Today much of this wonderful bird life is gone never to return, and where once could be seen thousands of ducks, geese and waterfowl, small flocks of game birds are a novel sight. Nature had been very kind to the dunes in providing a peculiarly favorable climate for the propagation of plant and bird life.

'The abundance of fruit-bearing plants in the dunes makes them attractive to the thousands of smaller migratory birds. The list of birds regularly visiting the dunes and adjacent regions is a very large one, well over 300 varieties, and the list is often swelled by wandering visitors who are attracted by the wonderful food supply and the favorable climatic conditions.

'While there have been set aside vast bird havens in the South and West and on the Atlantic seaboard for the protection of our larger waterfowl, there is no large area in the Middle West or Mississippi Valley where the marvelous throng of land birds whose annual migrations are among the most wonderful phenomena of nature can find secure resting and feeding places while passing through the Chicago zone.'

The Prairie Club has been prominent in the movement to have the dunes made into a state park and this moving statement of T. W. Allison on behalf of the club should persuade the public quickly to enlarge the new park area until it includes all of the desired features:

'When you think of the foreign people who come from countries where natural conservation has been a part of the law for many generations—when you think of them, as I say, coming from such countries to this country, and going into our modern cities, it is just as if they were put into vast prisons.'

The Litany of Washington Street

(Continued from page 2)

Virginia. There was no middle ground with the red man. It was the scalp or the peace pipe with him. In war or in peace he is to the last hour of his history as a statesman, all the way to Chief Joseph of Idaho, a better man at pure dignity than George Washington himself. Man to man, the red Indian is a better warrior and a better statesman than the European. There is strong evidence that young George Washington, a fox-hunting tidewater lad of sixteen, formed his style on the transplanted British squire Lord Fairfax, who owned more land than is in the whole state of New Jersey, and who was the squire complete. But I cheerfully reject this evidence and say that George Washington, like all other Americans, was more influenced by red Indians than by anything brought over from Europe, be it a squire or a book.

If his grand manner is incredible to you, my friends, do not think of him as a super-Virginian, think of him rather as a super-Indian chief in silk stockings and velvet pants. Washington actually wore plumes in his hat at his formal receptions after he was elected President. Think of him as an Indian. Then his magnificence and immobility will not be so unaccountable to you.

This thesis of the Indian in the American stock might lead us far afield. Go into what details you may, the British were astonished at the American attitude in 1776 on every question. They remain so today. The British talent for compromise between the bitterest radical and the most rock-ribbed conservative has completely gone from us. It is the scalping knife or the peace pipe with us, and there is no intermediate story.

Dear friend, have you ever considered the grand manner of a red Indian before battle—at Tippecanoe or in the Custer Massacre? Indians have often held long and solemn ghost dances for weeks and months before entering on the warpath. Those displays of splendor were far more important to them than any secrecy. Just as an Indian chief would put on his war paint and walk into a council that was debating peace or war, knowing he was the best fighter there, so this tall George Washington stalked into the Continental Congress in uniform, the only man in uniform there, and indeed as silent as an Indian. John Adams nominated him for commander in chief, thoroughly and rightly impressed by the plumes and the silence.

There is a lot about Chief Joseph of Idaho that makes one think of George Washington. The right was all on Chief Joseph's side, as even *Harper's Monthly Magazine* of that time testifies; but the main characteristic of Chief Joseph was that he was the entire army and navy of the Nez Percé Indians.

I have just been reading the very profitable work of a new historian who says that George Washington was a poor general, but that he held the Continental cause together by his 'force of character.' In this, earlier 'historians' concur. Like Chief Joseph, he was his entire tribe and people; if this was not generalship, make the most of it. Certainly there were many times when the Revolution consisted of George Washington on horseback riding toward the enemy slowly and magnificently, and looking impregnable; shot at a thousand times and always missed; while the patriots were somewhere back there in the nearby woods, invisible but bushwhacking according to the Indian code.

I have ventured in this connection to revise the old British epithet about George Washington: they called him 'The Old Fox.' He was a fox, in that he was something that came out of the woods, out of the very deep woods; but he was in plain sight often enough too, as foxes seldom are. When the British called him 'the old fox,' they meant that his men were recruited from backwoods sharpshooters, trained only in Indian forest warfare; and with every one of them, it was the scalping knife or the peace pipe; as an individual matter; and every separate tree was a new entrenchment. Any hypothesis can be overproved; but remember Franklin's coonskin cap which he wore at the court of France; remember John Marshall, who in his old age became a shelfful of long, long, weary law books; in his youth he was a free soul, and marched with a company of Revolutionary patriots dressed in Indian jackets, leggings, and moccasins; and on the breast of every jacket was embroidered a rattler with the motto, 'Don't tread on me.'

One might shoot an Indian without warning; one would not venture to tread on him while he was still alive. Washington advocated in the beginning the Indian costume for his men; and the Boston Tea Party, which has lately become so elegant that it almost floats away on pink clouds, was actually at unity with all this argumentation. Not only were the men dressed as Mohawk Indians, but the thought of the Indians as friends or enemies was still in the back of every American mind.

Even in 1790, almost all settled, middle-aged citizens and householders lived on tidewater or within fifty miles of it; but mark you, I say 'settled citizens.' Patrick Henry had his youthful days of wandering in the west with squirrel rifle and coonskin cap. Peter Jefferson, the father of Thomas Jefferson, was a surveyor who pushed away to the west, tracing the Randolph lands or surveying the southern border of Virginia—a kind of Daniel Boone forming forever Jefferson's fundamental concept of the final unit of democracy. Peter Jefferson was as near to a red Indian as possible, as deep in the woods and as independent.

With all their talk of 'Coke upon Littleton' and of Blackstone, and their clatter of the legality or the illegality of the Revolution that our fathers worked out slowly in the courts before men finally went to war, the fundamental thing was that an American was not an Anglo-Saxon; this soil had given him its special vitamins, the blood of its wild animals; he was acquiring a tomahawk, skull and cheekbones, a face that distinguished him forever from the Englishman, and a tomahawk way of thinking that distinguished him forever from Europe.

In all this, George Washington was the great chief, disguised at Mount Vernon in silk stockings and velvet breeches, in carefully powdered hair and a three-cornered hat, in Virginia greatcoat, and Virginia high boots.

(To be concluded in an early issue.)

The Violin Maker *of* Monona Lake

By ROBBIE TRENT

YOU can't make violins in the city. There is too much noise and bustle. When I left Chicago to come to Lake Monona, my friends said I was hiding myself in the forest. But people find me without any trouble; they come from all parts of America and Europe.'

Knute Reindahl.

The speaker was Knute Reindahl, first president of the American Academy of Violin Makers, and winner of the gold medal at the Exposition Universelle held in Paris in 1900. He began his career whittling bows and arrows, an art which he acquired from Wisconsin Indians. When he had saved up $700, he returned to Norway and for five years studied wood carving. He then came back to the United States, and worked in the Pullman shops, executing decorations, working at his art in spare time.

One day the young Norwegian brought a shiny new instrument—his first—to one of Chicago's violin masters, and requested that a pupil practise on it. The violin was so good that the pupil, Edgar Bernard Gordon, later professor of music in the University of Wisconsin, wanted it. He bought it for thirty dollars. Years later he traded it to the violin maker for a thousand-dollar instrument, because Mr. Reindahl wanted to get back his first violin.

Reindahl is recognized today throughout the world as a producer of fine violins. The honors awarded him at Paris and at the World's Fair in Chicago were bestowed for beauty in tone, for artistic workmanship and for excellence of varnish. So nearly does this artist produce the 'Italian tone' that several Reindahl violins have been passed off as Italian instruments. Francis Macmillen came across one of them in Europe and even he thought it was a Cremona. Eventually an enterprising dealer did pass it off as a genuine Cremona, selling it for $5,000. Its original price was $500.

Practically every inch of the walls of his studio, near Madison, Wisconsin, is utilized. There are violins, old and new, of many models and designs. There is a reproduction of the Stradivarius which Mr. Reindahl made for the State of Wisconsin to present to Fritz Kreisler. There are violins with shadowy suggestions of Indian folklore and Grecian myths.

Between twelve and twenty violins a year is his output. For some years musicians have urged Mr. Reindahl to make a Norwegian violin, a type which has been only imperfectly modeled in America. This instrument, in some ways similar to the *viola d'amore*, has eight strings instead of four, the four lower strings being sympathetic. On that model the artist is now working. It is his 556th violin. The head used is similar to the dragon head of Norway, but to the average American it will probably be more suggestive of an old Indian charm.

CHATS WITH OFFICE CALLERS

'For the ordinary observer—which means about all of us—it is hard to realize that around and within the body there is being waged a relentless guerrilla warfare,' said the ***Bacteriologist.*** 'It is between the body tissues and certain organisms which live a parasitic existence; that is, they live at the expense of the being they infest. These parasites vary from several inches in length to minute organisms much smaller than the point of the finest needle. Some are animal, some are vegetable.

'Our defenses are varied and more or less efficient. A few of these enemies are able to penetrate the unbroken skin. Others secure entrance through bruised or chafed skin, or through wounds. But the skin, because of its many layers of dried, horny, epithelial cells, is a most efficient protector against the entrance of most of them.

'Some gain entrance via some passage, particularly the food or air passages. Against these intruders we have certain defenses: the hydrochloric acid in the stomach and the little epithelial cells in the air passages. Likewise the healthy secretions of the nose. The small lymphatic glands, or nodes, in the neck seem to be set there as sentinels, destroying many germs which otherwise would slip past.

'Among our reserve defenses are the white blood cells which under certain circumstances swallow germs and digest them. There is also some germicidal principle in the serum, or liquid part of the blood. Moreover the body, when threatened with a germ invasion, reacts by forming antibodies.'

* * *

'The increasing daily mention of index numbers reminds us that world-upsetting events brought them into use,' said the ***Statistician.*** 'The first index, an extremely simple one, was devised by Giovanni Rinaldo Carli, an Italian, in 1750, to measure the effect upon the prices of grain, wine and oil of the discovery of America.

'Sir G. Schucking-Evelyn, an Englishman, hit on the idea in 1798. Trade was then held in such disdain by people of social standing that he remarked: "However I may appear to descend below the dignity of philosophy in such researches, I trust I shall find favour with the historian at least, and the antiquary."

'Bishop Fleetwood, an earlier writer on prices, felt the same way. In 1707 he said: "As the world now goes, the greatest (tho' I will not think the best) part of readers will be rather apt to despise than to commend the pains that are taken in making collections of so mean things as the price of wheat & oats, of poultry and such like provisions."

'But business came into its own in England despite aristocratic snubs. The nation of shopkeepers that humbled Napoleon turned to the study and the use of index numbers in dealing with the hiatus in values resulting from the wars, from the growth of the modern system of public debts, and also from the inception of steam power and new industries.'

* * *

'In spite of opinion to the contrary, the early West Virginian was a pious man,' said the ***Native Son.*** 'As far back as 1803 the grand jury of Harrison County, for example, returned two indictments, to wit: Samuel Pugh, for swearing seven profane oaths within two months past; Evan Pugh, for swearing nine profane oaths within two months past. During the development of this young state, a development apparently overlooked, especially as that of a background for the cultivation of exceptional ability, West Virginia and her native sons have contributed factors of acknowledged importance to the nation.

'Out of this environment Newton D. Baker and John Barton Payne became members of President Wilson's Cabinet. Judge Payne is president of the American Red Cross. Another West Virginian, William L. Wilson, was Postmaster General during President Cleveland's Administration. Mr. Wilson is author of the Wilson Tariff law, and originator of the Rural Free Delivery system. From West Virginia James Farley was drawn by California and sent to the United States Senate; Iowa took Jonathan P. Dolliver, senator; Ohio gained four of its greatest governors; and a governor each was won by Alabama, Kansas, Maryland, and North Dakota when West Virginians became residents of these states. Missouri was particularly fortunate to claim Champ Clark, late speaker of the House of Representatives. John W. Davis left his home in West Virginia to become Solicitor-General of the United States, later, Ambassador to Great Britain, and eventually Democratic candidate for President.

'Joseph Ray wrote the arithmetics that have been standard in our schools for forty years. Booker T. Washington was the outstanding leader of the Negro race. James Rumsey built the first boat propelled by steam. Ten years before Fulton fulfilled his dream, Rumsey wakened the waterways of the Potomac with his new invention.'

AFTER THE WEEK-END.

This might save you a little time.

* * *

'In the designing of currency one point that must be borne in mind is that of making the bill difficult for the counterfeiter to reproduce,' said the ***Secret Service Operative.*** 'A steel-engraved portrait can be made to have relief, to seem to stand out from the paper like a cameo. Our men feel that the steel-engraved portrait is our major aid in combating the counterfeiter. For this reason the Government has come to the conclusion that it should use a portrait as the dominant element in the design of each of its bills.

'Selecting these faces is naturally a ticklish job. There seems to be little reason for retaining Michael Hillegas on the $10 bills. Thomas Benton, Daniel Manning, John Sherman, an Indian chief, a woodsman, whose pictures have recently graced the currency, have little hold on the modern consciousness. Better known faces, also, would be easier for the public to remember and associate with the proper denominations.

'The accepted view of the experts seems to be that places on the currency should be given only to Presidents. The dozen outstanding men of the nation have probably been Presidents. Their faces are better known than any others.

'The most prominent post in currency portraiture, it seems, is on the bill of lowest denomination, the modest one-dollar note. The Treasury Department has already assigned that denomination to the first President, George Washington. The choice will undoubtedly stand. The post of second importance is the five-dollar bill. That denomination is used most next to the one-dollar. Lincoln has already been appearing on most of the five-dollar bills. He probably will be chosen to represent that denomination.

'The note of next importance is the ten-dollar bill. Congress at its recent session assigned the third place among Presidents to Jefferson. It gave him the remaining post in the axis of the Mall in the Washington development plan. Jefferson seems the logical man for the third post of honor on the currency. Politically he would seem to be entitled to it as the first two posts have gone to Republicans. The Democrats in Congress would undoubtedly demand one of the three prominent bills.

'The twenty-dollar bill might go to Grant, the fifty to Jackson, the hundred to Wilson, the five-hundred to Roosevelt, the thousand to Cleveland, the ten-thousand to McKinley. The two-dollar bill, might be assigned to Garfield.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. Are there any nonsectarian theological schools in the United States?

Answer. Yes, the theological training schools listed below are undenominational: Biblical Seminary in New York, New York City; Gordon College of Theology and Missions, Boston; Harvard Theological School, Cambridge; Temple University School of Theology, Philadelphia; Union Theological Seminary, New York City; Vanderbilt University School of Religion, Nashville, Tennessee; Yale Divinity School, New Haven, Connecticut.

* * *

Q. I would like to get some information on the 'unknown soldier.' Who chose the body? Have any other countries honored their soldiers in a similar manner?

A. At the City Hall of Châlons-sur-Marne, France, on October 24, 1921, Sergeant Younger of the Fifty-Ninth Infantry chose the body to represent America's 'unknown soldier' from four coffins which had been brought, one from each of the four American military cemeteries at Belleau, Bony, Thiaucourt and Romagne. The coffin chosen was placed in a casket which bore the inscription 'An unknown American soldier who gave his life in the great war,' and was then taken to Havre and placed on board the *Olympic*, which conveyed the remains to America, arriving at Washington on November 9. The casket was removed under a guard of honor to the rotunda of the Capitol where it lay in state until the morning of November 11, when it was taken to Arlington Cemetery. A broad white ribbon was placed on the casket by Mrs. Harding, and President Harding pinned to the ribbon a silver shield on which were forty-eight gold stars. Wreathes were placed on the casket in tribute from a host of foreign nations and at the cemetery decorations were placed on it by Marshal Foch, General Diaz and other representatives of foreign nations. Secretary of War Weeks and President Harding delivered addresses at the ceremonials at Arlington, and as the body was lowered into the grave taps were sounded and a battery gave the national salute of twenty-one guns.

The memorial services for the French and English unknown soldiers were held a year earlier, on November 11, 1920. The British soldier was buried at Westminster Abbey with King George as chief mourner, the funeral cortège stopping on its way at the cenotaph in Whitehall, designed by Sir Edwin Lutyens as a permanent memorial, where impressive ceremonies were held. The grave in Westminster Abbey is in the pathway of kings, for not a monarch can ever again go up to the altar to be crowned but he must step over the resting place of the man who died that his kingdom might endure. In France the ceremonies for the 'unknown soldier' were coupled with the celebration of the fiftieth anniversary of the French Republic, in commemoration of which the heart of Gambetta, the noted patriot who had proclaimed the French Republic, was transferred to the Panthéon, the repository of France's great dead. The ceremonies centered around the Panthéon and around the Arc de Triomphe de l'Étoile, where the unknown French *poilu* was laid away in one of the great buttressed pillars of the gigantic arch. A feature of the French observance was the thirteen stained and tarnished flags which the Germans had captured in 1870, and which they had been forced to return by the Treaty of Versailles.

Q. What surnames are most numerous?

A. Howard F. Baker, in his book *American Speech*, estimates the numbers bearing the ten chief family names of this country as follows:

Smith	1,305,300
Johnson	1,024,200
Brown	730,500
Williams	684,700
Jones	658,300
Miller	625,800
Davis	537,900
Anderson	477,300
Wilson	422,300
Moore	363,400

Q. What is the area of the earth?

A. The superficial area of the earth is 196,940,000 square miles—139,685,000 square miles of water and 57,255,000 square miles of land.

* * *

Q. What is the trade union membership in the United States?

A. According to the annual report of the Executive Council of the American Federation of Labor, dues-paying membership in the unions affiliated with it during the year ending August 31, 1926, was 3,303,996. This number does not represent the actual membership in that members out of work or on strike do not as a rule pay dues, though they continue to hold membership cards. Outside American Federation of Labor there are organizations of workers with an estimated total membership of 600,000.

* * *

Q. Can you tell me anything about Peter Browne of the Mayflower Company?

A. Peter Browne, a carpenter, came over in the *Mayflower* to Plymouth, Massachusetts, with Bradford, Carver and Winslow and died in Duxbury not far from the house of Miles Standish in 1633. His son, Peter, born in 1632, removed to Windsor, Connecticut, where he married and left a large family from one of whom John Brown, the Abolitionist, was descended.

* * *

Q. Was the Red River valley a part of the Louisiana Purchase or did the United States get it at the time the 49th parallel of north latitude was established as a boundary?

A. The treaty with France dated April 30, 1803, for the cession of Louisiana contains no definition of the boundaries of the property transferred; when the American commissioners insisted that the boundaries be defined they were informed that the boundaries were the same as they were when in the hands of France according to her treaty with Spain. This territory roughly extended from the Mississippi to the Rockies and from the Lake of the Woods to Mexico, but it was not till 1842 that, through the Webster-Ashburton treaty, the United States gained the valley of the Red River of the North. For this she had to sacrifice to Great Britain that portion of the Louisiana Purchase which was watered by the head streams of the Missouri. This treaty settled the northern boundary question as far west as the Rockies, and the treaty of June 15, 1846, established the 49th parallel of north latitude as the northern boundary of the United States from the Rockies to Puget Sound, and thence a conventional line through Puget Sound and the Strait of Juan de Fuca to the Pacific Ocean. However the location of this line through the strait was not finally settled till 1872.

BRIEFLY TOLD

The states of Kentucky, Louisiana, Maryland, Mississippi and Virginia permit the marriage, with the consent of her parents, of a girl of twelve.

The name bridegroom, signifying one who serves the bride, is believed originated from the old custom that at the wedding feast it was the duty of the newly married man to wait upon his bride.

A kitten forsaken by its mother in an attic of a store in Finsbury Square, London, has been adopted and cared for by a family of rats.

It has been reported from Dundas, Canada, that a 'water dog' or 'pup fish' having four legs and barking like a dog has been found in the Desjardins Canal.

The menu of Billy, the world's largest pig, consists of four cases of apples, eight or nine buckets of milk, two bushels of bran, 16 or 18 cabbages, and a few extra dishes daily.

A 'sunlight lamp,' in applying artificial sunlight, is used by a London restaurant to refresh sickly plants and bouquets of patrons while they dine.

Possession of a personal taste in letters is something to marvel at in these days of higher criticism, of weekly book reviews and lists of best sellers. It is also something to be envied. Hugh Walpole's 'northern cottage' houses a host of 'friends' in whose possession he glories.

One of the 'blisses' of his cottage is that 'all the literary dogmatisms of the day rumble down a road that runs far away' from his garden wall. He knows now that 'there is no gospel of the individual, only let the natural taste grow and good things will come.' How many books, he asks, really 'belong to one' of all that one has read? Of such, 'there was no law about their choice.' Like Topsy, this taste seems just to grow up; he boldly declares them his; he is secure in their friendship. (p. 5)

* * *

In view of the comparatively recent advent of memory schools, few realize that the first system of artificial memory was taught by the Greek Simonides in the year 500 B.C. He used the law of association of ideas—just as is done today. (p. 6)

* * *

Only one hundred miles from Barcelona is the island 'where women never grow up.' Here the centuries slip back and the only sign of what we call progress is the taxicab. The sun-drenched Balearics are quaint and interesting.

It is in the style of hairdress as well as in the clothes that the women of these islands retain their old fashions. They all have their hair down their backs in pigtails, like the gingham sweethearts of the little red schoolhouse; every woman has a scarf around her neck, regardless of the weather or the heat. The weekly washing is done by much pounding of stones at the common washing pool. (p. 7)

* * *

In the French quarter of New Orleans stands a three-story house that was to have been the refuge of the great Napoleon. The boat was ready to sail for Saint Helena to rescue the Little Corsican when word came of his death. (p. 9)

* * *

Who invented printing? The real incunabula of the world are not the volumes published in the 15th Century but those of China. Comparatively recent discoveries in Cathay have added to our knowledge of the origin of this art. One manuscript has been found dating back to A. D. 868. Stone inscriptions were used to make printed impressions in this same mysterious land as early as A. D. 175. Cut seals were used while Rome was still an empire. The Japanese made prints from wood blocks as early as A. D. 770. Individual movable types were used in China in the 14th Century. Bronze types were cast in Korea in A. D. 1403. One book has been found having on its title-page a date corresponding to our year A. D. 1409—among the earliest to have been printed from individual movable types. (p. 12)

* * *

Few boys have grown up in a more interesting town than the Concord of Julian Hawthorne's youth. With Emerson, Thoreau and the Alcotts for neighbors, what youngster could ask for more? The boys' school of early days, the historical setting of the town, are described by one who knew them intimately. (p. 14)

* * *

Everyone knows 'Devoted Cousin Winnie,' the well-meaning relative who goes along on the honeymoon and finally manages to wreck the marriage by convincing the bride that it's all a big mistake. E. M. Delafield's whimsical story discloses how a medical man came to the rescue of a bride in such plight on the boat home from Burma. (p. 16)

* * *

Two sons of Miami University who have risen to direct the destinies of their Alma Mater and who have won distinction as educators are Dr. Alfred H. Upham and Dr. Raymond M. Hughes. An Ohio newspaperman tells of their careers. (p. 23)

REMARKS BY OUR READERS

Los Angeles, California.

Julian Hawthorne, in his article on Oliver Wendell Holmes in your issue of June 25, does not agree with the facts as related by Holmes, in his references to the story of Holmes' search for his wounded son after Antietam. On page 20 Mr. Hawthorne says that Holmes went 'searching through a train in which he was riding, on the remote chance that his beloved son might be on it.' He tells of the Doctor's 'not letting himself hope too much after so many disappointments,' that 'he entered the last car, and proceeded slowly down the aisle, scanning *with fearful intensity* each face of the shattered men who were lying or reclining there'; and 'then, looking forward, he found himself gazing on the wasted features he had sought.'

Dr. Holmes' very full account of that journey, complete, at times to tiresomeness, in prolixity of detail, is in his book *Pages from an Old Volume of Life*, Vol. VIII of the Riverside Edition of Holmes' writings, pp. 16-77, under the title '*My Hunt after "The Captain."*' The Doctor states in that story that while in Harrisburg he received, on the evening of September 24, just a week after the battle, a telegram from a lady in Hagerstown, Maryland, saying, 'Captain H. still here leaves seven tomorrow for Harrisburg Penna Is doing well'; and that a note from Dr. Cuyler, chief army hospital inspector, to the same effect came soon afterward to the hotel. Dr. Holmes writes,

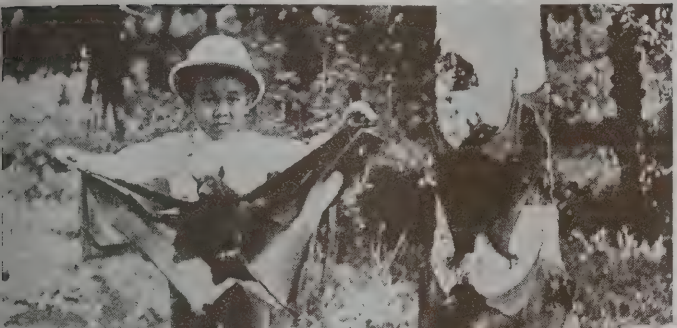
'The train from Hagerstown was due at 11:15 a. m . . . The time approached for the train to arrive from Hagerstown, and we went to the station . . . The expected train came in so quietly that I was almost startled to see it on the track . . . In the first car, on the fourth seat to the right, I saw my Captain.'

That was all; no melodrama, no 'searching through a train in which he was riding,' no 'remote chance,' no 'wasted features,' since his son had been enjoying entertainment in the hospitable homes of Union families, as the Doctor relates with gusto and much particularity, specifying 'gentle cares, and unasked luxuries, and pleasant talk, and music,' and 'angelic ladies whose charming attentions detained him from Saturday to Thursday, to his great advantage.'

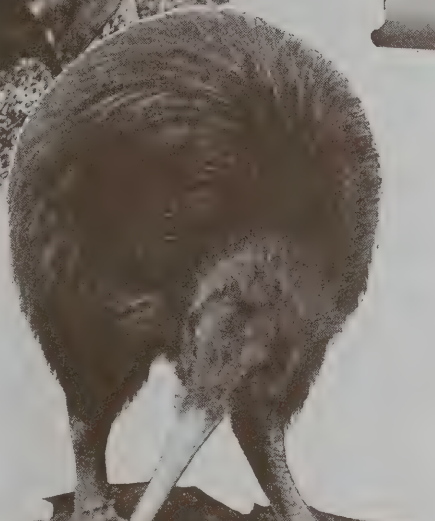
CHARLES J. BLISS.

Outlandish Creatures *on* Earth Today

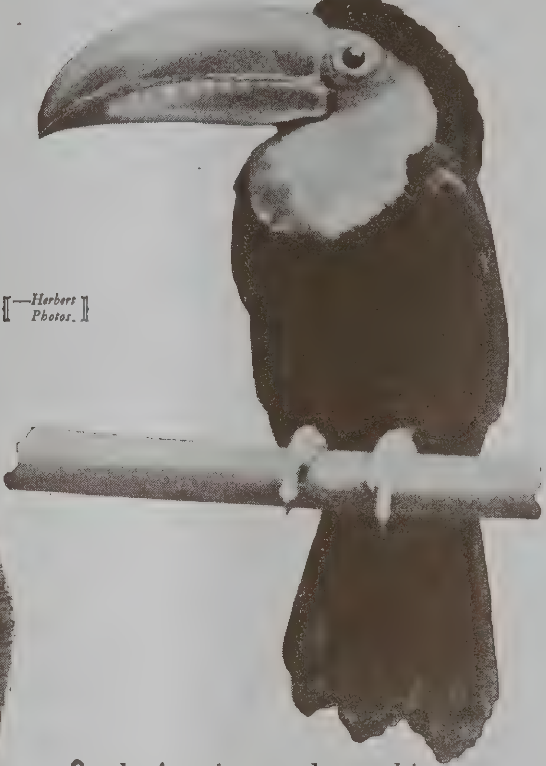
Hark Back *to* Ages *When the* Earth *Was* Young



Young native of Singapore displays a morning's bag of a unique animal, the flying fox, found in the Straits Settlements and in no other section of the earth. It is larger than the bat, both as to body and wings. The one he holds has a wing spread of slightly more than three feet.

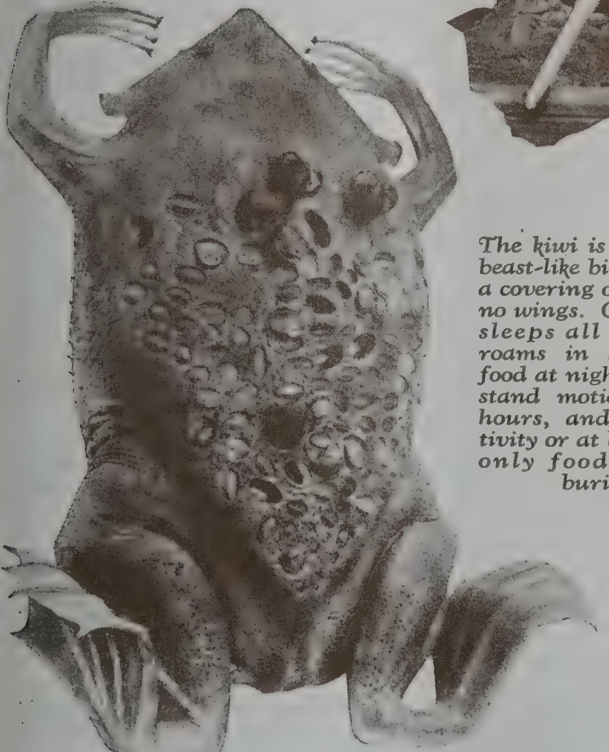


The kiwi is a curious beast-like bird having a covering of fur and no wings. Owl-like, it sleeps all day and roams in search of food at night. It will stand motionless for hours, and, in captivity or at large, eats only food that is buried.

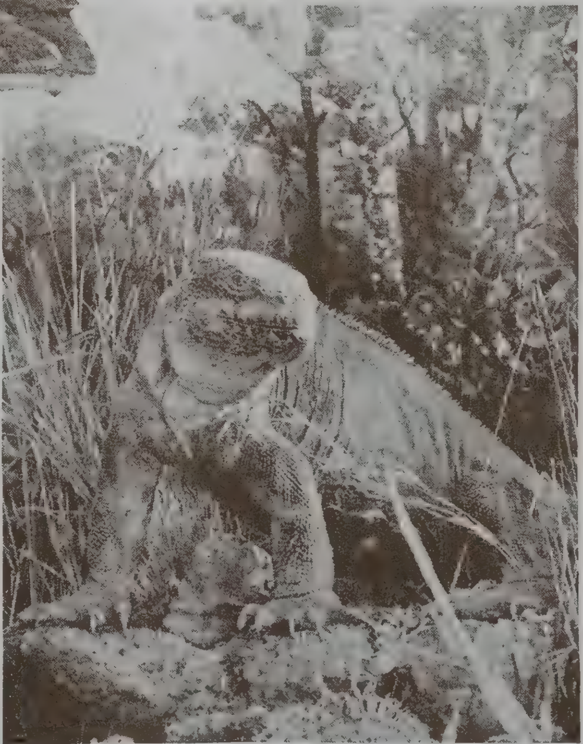


—Herbert Photos.

South America produces this curious species called toucan, resembling in the matter of beak that funny bird, the pelican. His beak is extremely long, heavy and of many hues. Otherwise, in form, he resembles the owl. This toucan is at Franklin Park Zoo, Boston.



Another South American native, the Surinam toad. Its head is depressed and triangular, its skin covered with small tubercles. Females carry the eggs in pockets in the skin of the back until they hatch.



The iguana, denizen of Galapagos Islands, harks back to the age of saurians. He is the largest member of the lizard family. His scaly hide and spike-ridged back help explain ancients' conception of dragons.

HARD knocks have place and value, but hard thinking goes further in less time. There is a high road and a low road to wisdom. Those who only plod may plod and come upon a little wisdom by the lower road, but those who take the high road will come upon wisdom in larger degree and earlier. Men live too far below their possibilities.

Mirrors of the World

EARLE C. REEVES

HOUSES

By FRANCES HOLMSTROM

The houses in town huddle up together
Like flocks of frightened sheep,
Hiding from loneliness, hiding from weather,
All in a smothered heap.

But the country houses are pioneers,
They camp by untraveled trails,
They laugh at loneliness and fears,
At winter-time and gales.

They light their lamps and fires, and wait
Beneath a sparkling sky:
The town house has a locked gate
Its chosen enter by.

And whether I dwell by a crowded mart
Or very far from there,
Within my house must beat the heart
That country houses wear.

SUCCESSFUL DICTATORS

By MORGAN D. E. HITE

IN A previous day and generation when the rising oil industry was in process of shaping and when it was beset by a multitude of conflicts and disabling uncertainties (which are the natural concomitants of new and vast industries a-borning) it created out of its own ranks a dictator of high intelligence and forcefulness. Because of the rough conditions in existence at that time, and because, perhaps, no other means would suffice under the circumstances, there was finally molded and hammered out by the dominating figure in that industry a form and direction by which this enormous entity might safely proceed on its way to the destiny which awaited it.

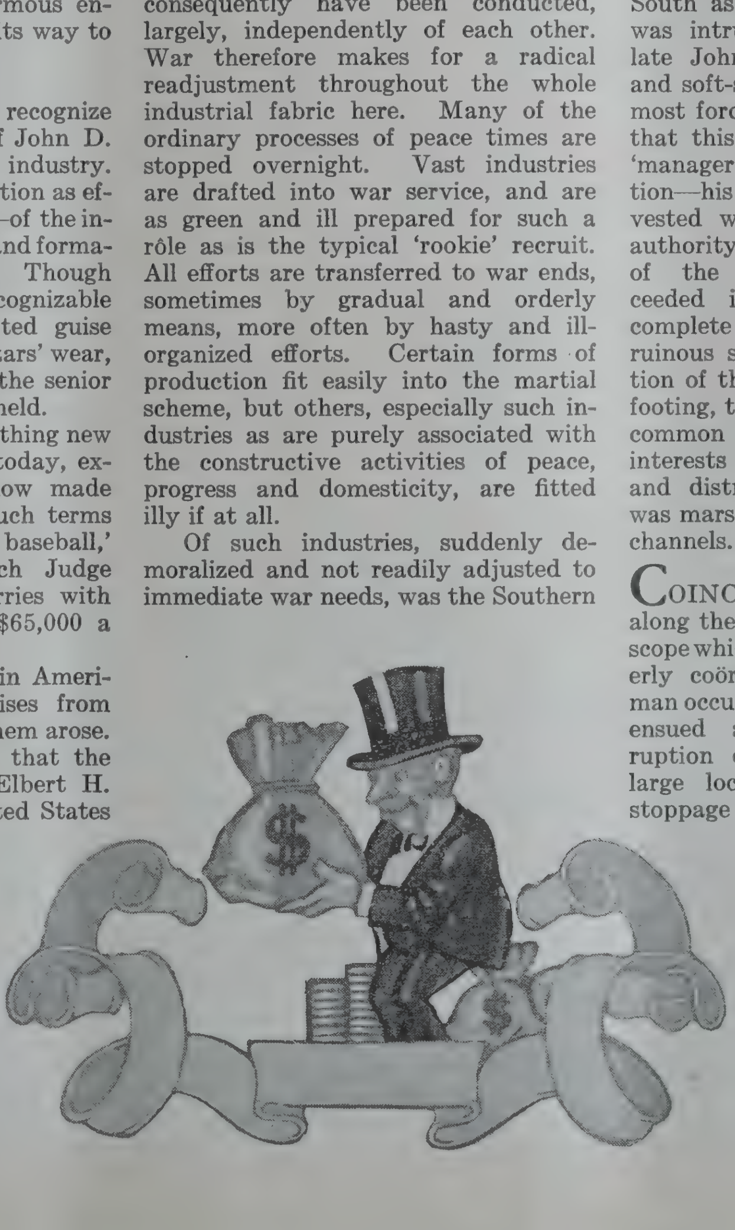
SOME persons may not recognize the personality and genius of John D. Rockefeller as czar of the oil industry. Nevertheless his supreme position as effectual dictator—as autocrat—of the industry in its early uncharted and formative period is unquestionable. Though unofficial and without the recognizable insignia of office, the accepted guise which present-day business 'czars' wear, this is precisely the position the senior Rockefeller made, took and held.

Fundamentally there is nothing new in the idea of our 'czars' of today, except that the position is now made official and is dignified by such terms as 'high commissioner of baseball,' the title for example which Judge Landis bears and which carries with it a salary approximating $65,000 a year.

Dictators have appeared in American business in various guises from time to time as the need for them arose. There is no reason to deny that the position of the late Judge Elbert H. Gary as chieftain of the United States Steel Corporation was nothing less than a benevolent despotism over the entire steel industry, or that Judge Gary was the dominating figure of 'steel,' vested with enormous powers.

The war period produced another sort of dictator—unsettlement ever raises the type. One of the differences which distinguishes American from European business is that the one is organized on a peace-time basis having little or no connection with possible war programs of the nation, while the other is an integral part of the war machine and the plans of the respective European political divisions. Hence sudden war finds European industry and trade prepared to meet the shifting of emphasis from peace to war, but in America there is a serious transition moment of extreme shock. In this country industry hitherto has not been integral with government, and the two consequently have been conducted, largely, independently of each other. War therefore makes for a radical readjustment throughout the whole industrial fabric here. Many of the ordinary processes of peace times are stopped overnight. Vast industries are drafted into war service, and are as green and ill prepared for such a rôle as is the typical 'rookie' recruit. All efforts are transferred to war ends, sometimes by gradual and orderly means, more often by hasty and ill-organized efforts. Certain forms of production fit easily into the martial scheme, but others, especially such industries as are purely associated with the constructive activities of peace, progress and domesticity, are fitted illy if at all.

Of such industries, suddenly demoralized and not readily adjusted to immediate war needs, was the Southern pine lumber industry. This is a business of great magnitude comprising a multitude of small and widely separated units. The State of Missouri had only a short time before instituted legal proceedings which had thrown this industry into confusion, broken it into small bits and left it organized loosely if at all. The conditions were ripe to produce the fruitage of disintegration from within—a dictator or 'czar' for the lumber industry. The man was found, and at this juncture the task of stabilizing and reorganizing the partially wrecked basic business of pine production, then dominated by the South as the greatest producing area, was intrusted to the discretion of the late John E. Rhodes; mild-mannered and soft-spoken, he was yet one of the most forceful executives and far-seeing that this country has developed. As 'manager' of the Southern pine association—his official designation, although vested with extraordinary diplomatic authority and many of the prerogatives of the genuine dictator—he succeeded in a short time in bringing complete order into what had been a ruinous situation: the lumber production of the country was put on a war-footing, the various units brought to a common task, variant and conflicting interests reconciled, and production and distribution on a gigantic scale was marshaled into regular and orderly channels.



COINCIDENTAL with this effort along the line of a situation of national scope which was thus stabilized and properly coördinated by the genius of one man occupying a despotic position, there ensued a disorganization and disruption of lumberyard conditions in large local centers. The enforced stoppage of building and the complications connected with the drafting of labor for war requirements created widespread dismay in the retail lumber trade, which carried over into the period of peace days. The retail yards form a vital part of the lumber production industry as a whole—they are the marketing and distributing branches, the takers of the product from the producing mills. At this time appeared the figure of another modern 'dictator,' J. Cameron Cremer, an Englishman by birth, conversant with the subject of lumber from all angles, who had been closely associated with Rhodes. This czar of the retail field, not devoid of ruthless force on occasion, but profoundly versed in the underlying nature of the industry, has exercised for years a mild despotism which has brought order out of disorder and has assured the status of those on whom rests the responsibility for lumber distribution to the ultimate consumer.

While on this subject of American business in its great and magnificent silhouette, its grand dimensions against the bright background of modern events, will it be denied that American *finance* has also had its unofficial czar?

When things are running smoothly there is no call for, no need for, dictators, czars, tyrants. Such men appear only in time of stress when all accustomed means and resources, all the usual expedients of usury and ordinary finance, are exhausted—whether in political, social or industrial spheres. These men bring to the scene something new—perhaps it may be rightly termed intellectual prescience, the sweeping view. They are artists, as it were, who work with brushes made of the tails of comets. Ordinary men and expedients fail when brought before the extreme maladies which confront the gigantic aggregations characteristic of the greater businesses of the modern world.

AND, therefore, if it comes about that a great national industry enters a period when cohesion breaks down, disruption threatens, production is unbalanced or, what is worse, an unbalanced product ensues; when tension and uncertainty appear arising from mysterious—because new—problems, with symptoms of internal disintegration, of conditions seemingly beyond control—it becomes necessary to cope drastically and promptly with such an impasse by agreement upon a central authority invested with radical powers. Such an industry is too gigantic in its sweep and of too urgent necessity to the times, to be permitted for a moment to be imperiled. A dictator—possibly a tyrant in this contingency—with autocratic power to make, unmake and remake vital adjustments throughout the entire massive structure from foundation to top, in the interest of the safety and preservation of the *whole* and without thought merely for any *fractional* part alone, would be the logical outcome.

It is not known to many that Grover Cleveland's name properly belongs in a list of American czars, not politically but in business. This came about when the great life insurance scandals of 1904-05 rocked the nation, and when Thomas F. Ryan, having bought the Hyde family's shares, emerged as the majority owner of the Equitable, and decided upon a new form of government for that great organization. A board of three trustees, in effect, would dominate the $400,000,000 trust fund for the benefit of the policyholders. Grover Cleveland, then in quiet retirement at his home in Princeton, was asked to assume the premiership of this board, his associates being Morgan J. O'Brien of the New York Supreme Court and George Westinghouse, great inventor. Cleveland's name and word were, in effect however, to be the new law of the Equitable administration.

Out of the life insurance revolution which at that time so profoundly stirred this country and Europe thus arose the figure of Grover Cleveland—in what was his one business venture, it has been said. It had been plain from the first day that the policyholders were reassured when they knew that Mr. Cleveland had accepted the responsibility for the future management of the society. It is almost without precedent that a panic should be so quickly allayed merely by the knowledge that a given man had thrown himself into the breach; I am quoting here from his personal secretary at that period, George F. Parker.

So it was that the practical dictatorship of the vast insurance business, the categorical voting power of the majority stock, as it were, of one of the giants if not the key company of the situation then existing, was conferred on the man who had been President of the nation. The public's confidence was satisfied that the emergency had been properly met.

The successful dictator must ignore the clamorous *minority*, must discriminate in favor of permanence and against all superficial aspects. And just as a chieftain or a king heading his particular tribe or people is selected as such because of being strongest and highest born of his kind, so a modern business czar is similarly chosen for being strongest in his own field. Among monarchical nations the dictator is merely the embodiment of the monarch, replacing him only temporarily because the king is not for the moment strong enough to cope with the popular demoralization. The dictator acts in the name of the king, not in his own name or self, and *not* in the name or interest of a selfish minority; he retains his power only as he fills the voids of the king's own nature, the king being unable or unwilling to resolutely act in his own right.

IT IS the nature of new and hugely expanding industries-in-the-making to come inevitably on perilous times in the course of their natural evolution. New and vast collective businesses meet new and vast problems in their process of adjustment in connection with shifting world-wide conditions. The infiltration of the dictator idea into modern business denotes a growing bulk and a decided newness which is characteristic of a new age which has brought unprecedented features, dazing the average human mind. So great is the vastness of the new business edifice that its rulers must assume the powers and prerogatives heretofore not possible except in the sphere of government itself and among nations.

During the World War there came an hour when internal dissension among the Allied armies in Europe reached an acute stage, when coöperation was tending to become fatally deficient and a hopeless feeling was engendered among the various leaders of the nationals, on the side of the Allies. Our own armies were then in the field trying to associate with a program which would have a successful objective. The only thing that saved the situation for the Allied forces was the fact that conditions soon became so threatening that it was necessary to agree on reorganization under a single head, under a generalissimo, in undivided authority, of all the Allied forces. By right of ability, position and experience, Marshal Foch was the man agreed upon, and he was granted unexampled discretionary powers for the disposition and movement of the huge Allied resources of men and materials. The result is of course history.

So, at intermittent periods it appears that in vast undertakings of present-day war, government, industry, the great new and unprecedented combinations of capital, equipment, men and organizations, reach a point where to retain their effectiveness they must pass under the iron rule of a single forceful personality.

(Another article on Dictators will appear in an early issue.)

Your Mirror of the World

By EARL C. REEVES

THE press association is the mirror of the world.

It trails a foreign prince for you and gives interesting, if trivial, facts about him; it undertakes the staggering task of bringing you all salient facts regarding a great war. If a British cabinet falls, the chances are that you will read of it as soon as do the people of the British Isles. You are interested in a great intersectional football game: it is coming to you so fast that the reporter never even thinks of stopping to write—he dictates into the ear of a telegraph operator *as it happens*. A world series baseball game is on, and the swish of the bat and the arrival in San Francisco of the words, 'strike two,' are as nearly simultaneous as it is possible for two things to be. You may live in a great city in which there are big newspapers, whose most expert reporters have been sent to cover a national convention for you; but the editor knows that the press association will give him the big news of the convention faster than his best and highest paid men can get it to him. Regardless of apparent 'impossibilities' a Japanese earthquake, which has created chaos and destroyed wires and other methods of communication, *must* be covered. If persons more interested in golf than in news about it decide that a British Open Championship shall be fought in some inaccessible spot in northernmost Scotland, you can count upon it that press association men are going to have to get the news to you somehow.

THE President has two shadows wherever he goes: one the protective secret service cordon, and the other the watchful press association squad. Let a kaiser slip into an obscure Dutch village, and a press association man camps at his gate for months; let an Irish patriot starve himself to death and you may be sure a Yankee has become almost a member of the watching family. Shoot an Irish viceroy in London, and Dale Crittenberger and Ed Toner print a better story about it—and a faster one—in Anderson, Indiana, than Beaverbrook or Hulton print in London. (This is no exaggeration: it happened.)

These things are not cited here in deification of the press association worker. It isn't spectacular individual play but teamwork that makes your telegraphic news agencies serve you so well. The men who do it are not temperamental stars. One of their favorite stories is that of the Ashtabula, Ohio, correspondent who received an Associated Press order to rush details regarding a wreck, and who wired in reply: 'Too much excitement. Can't get details.'

IN THE days when the newspapers were devoted so largely to opinion and news was news when and if it reached the office—and if there was room for it—the reporting of national and world affairs was exceedingly haphazard. Pony relays carried Washington dispatches to Philadelphia and New York, but the editor's chief interest in that may have been that it gave him something fresh to use for denunciatory purposes. But when the telegraph came along in the forties it began to make a difference in our newspapers. In 1848 New York newspapers 'pooled' telegraphic expenses by forming the Associated Press. Later a similar organization sprang up in the West, and in 1882 the two were combined, so that the present organization is more than forty years old. The A. P. is coöperative, in that it aims at no profits and prorates cost; but western publishers charge that it is controlled by certain great eastern papers, while competing associations say that as regards small towns the coöperative assessment theory breaks down in favor of a policy of selling 'election to membership' to publishers at yearly rates low enough to stifle competition. It is, of course, the largest news agency.

Incidentally, it might be remarked here that the 'press association war' is one of the unadvertised modern business romances. It is a war that is fought around the clock, and through the calendar, from the first sheet to the last. I speak not only of the battle of the 'news front,' which would be expected; but of the more bitter battles of the business office. In that fight for expansion, throats are cut and bombs exploded, opponents watched and tripped up, and the dirk always is ready for wielding.

Several years ago, through some error, the United Press killed the Pope prematurely and stood by its guns when the Associated Press said he was not dead. The A. P. used this in the trade war, discrediting the U. P. with editors and the public; but found the incident something of a boomerang because, again through some freak error, a bulletin had gone out over A. P. wires telling how the Pope's sister had died of the shock of learning that the Pope was dead.

The United Press was the second great association to come upon the field. This was about twenty years ago, when three sectional associations were united. The backbone of the service, from the start, was the chain of newspapers of the late E. W. Scripps, who had shown a genius for turning secondhand plants into valuable properties in about two dozen cities, but who never seemed able to break into the big key cities of the country.

Into the job of general news manager of the United Press, not long after its formation, came a very young man named Roy Howard. It is said that when he had been selected for the post and had gone to the Coast to be appraised by 'the Old Man,' Scripps took one look at his extreme boyishness, and Howard then and there had to sell himself the job all over again. He did the selling thoroughly—the newspapers are known now as the Scripps-Howard chain.

THE Scripps newspapers grew as 'people's papers,' penny papers, progressive. The United Press was similarly tinged, and that fact made a good sales argument with such editors as said the A. P. was too conservative. As it grew bigger and bigger, the editorial slant was wiped out gradually by Howard; but the U. P. remained 'more progressive' in that it paid more attention to features and bright copy than did its older brother.

The United Press, on a budget that was a fraction of the A. P. gross turnover, always made money —paid dividends.

The third great press association has cost a great deal of money. It is the International News Service. It was formed by

(Continued on page 23)

The MOULDING of the FAUN

By JULIAN HAWTHORNE

IN ONE of those dictionaries which bridge the gaps in our minds, I found an appendix, giving names of noted authors and among them, this line for Hawthorne:

Hawthorne, Nathaniel. 1804-1864.
Scarlet Letter.

Supplied with that, you may go as far as your means allow, or as the afternoon-tea chat requires.

'Hawthorne? Oh, yes: he must be dead over sixty years: he wrote *The Scarlet Letter*, you know.' The lady ponders:

'Didn't he write something else, too?'

'Yes, come to think of it: wasn't it *The Stone Age*—or something like that?'

'Wait a moment—I remember now! —it was *The Marble Faun!*'

Although Hawthorne is best labeled by *The Scarlet Letter,* I am inclined to think that his *Marble Faun* has been read by more people, and perhaps understood less. It has been read because of certain information it contains, but the story which accompanies that information is passed over as obscure.

Another cause of its popularity was that even before copyright on the book expired, a quarter of a century ago, it was possible to get it cheap. It had been reprinted in the Tauchnitz edition, brought out by Baron Tauchnitz who sold about a million copies of it. People bought it as a guidebook to Rome.

THE book is much the longest of Hawthorne's, but it was, in a way, the least premeditated. After the publication of *The Blithedale Romance* in 1852, he stopped writing stories for the next seven years. He had been appointed United States consul at Liverpool, England, which kept him busy on unromantic matters for four years: then he went to France and Italy for two and a half years more. During the latter months in Italy, however, he had made a rough sketch of a story, the theme of which had suddenly seized him in Rome. It looked to him, at that time, like a short, fantastic tale of no great importance. But it rapidly grew upon him, enlarging its significance, till he felt he could hold it back no longer.

It supplanted temporarily the elaboration of another romance, the seeds of which had been sprouting in his imagination since far back in his youth, and had continued to appeal to him throughout his sojourn in England; so that the diaries or journals that he kept there had been written partly with the purpose of using them as background and side scenes of this projected story. Indeed he had gone so far as to make a brief outline of it during his stay of six months in Florence. But, on his return to Rome, the serious illness of his daughter Una with the so-called Roman fever (a malarial disease, often fatal), caused him so much and so prolonged anxiety that he definitely gave the thing up.

THEN, more as a diversion, he began to play with the idea of the humanization of the faun of classic legend. It gave him a sort of outlet for sad thoughts. It became for him a sort of anodyne, a deliverance from the pressure of forebodings on his mind. The ineradicable instinct for art came to his aid, and the rounded romance was the result. But I think his own final estimate of it was not high; and though its sale was gratifying to his publishers, the attitude toward it of the public was not what he would have wished. He feared that his hand had lost its cunning, his imagination its elasticity. The fact that some serious critics put it above anything else that he had written did not reassure him: he regarded it from a standpoint more interior than theirs.

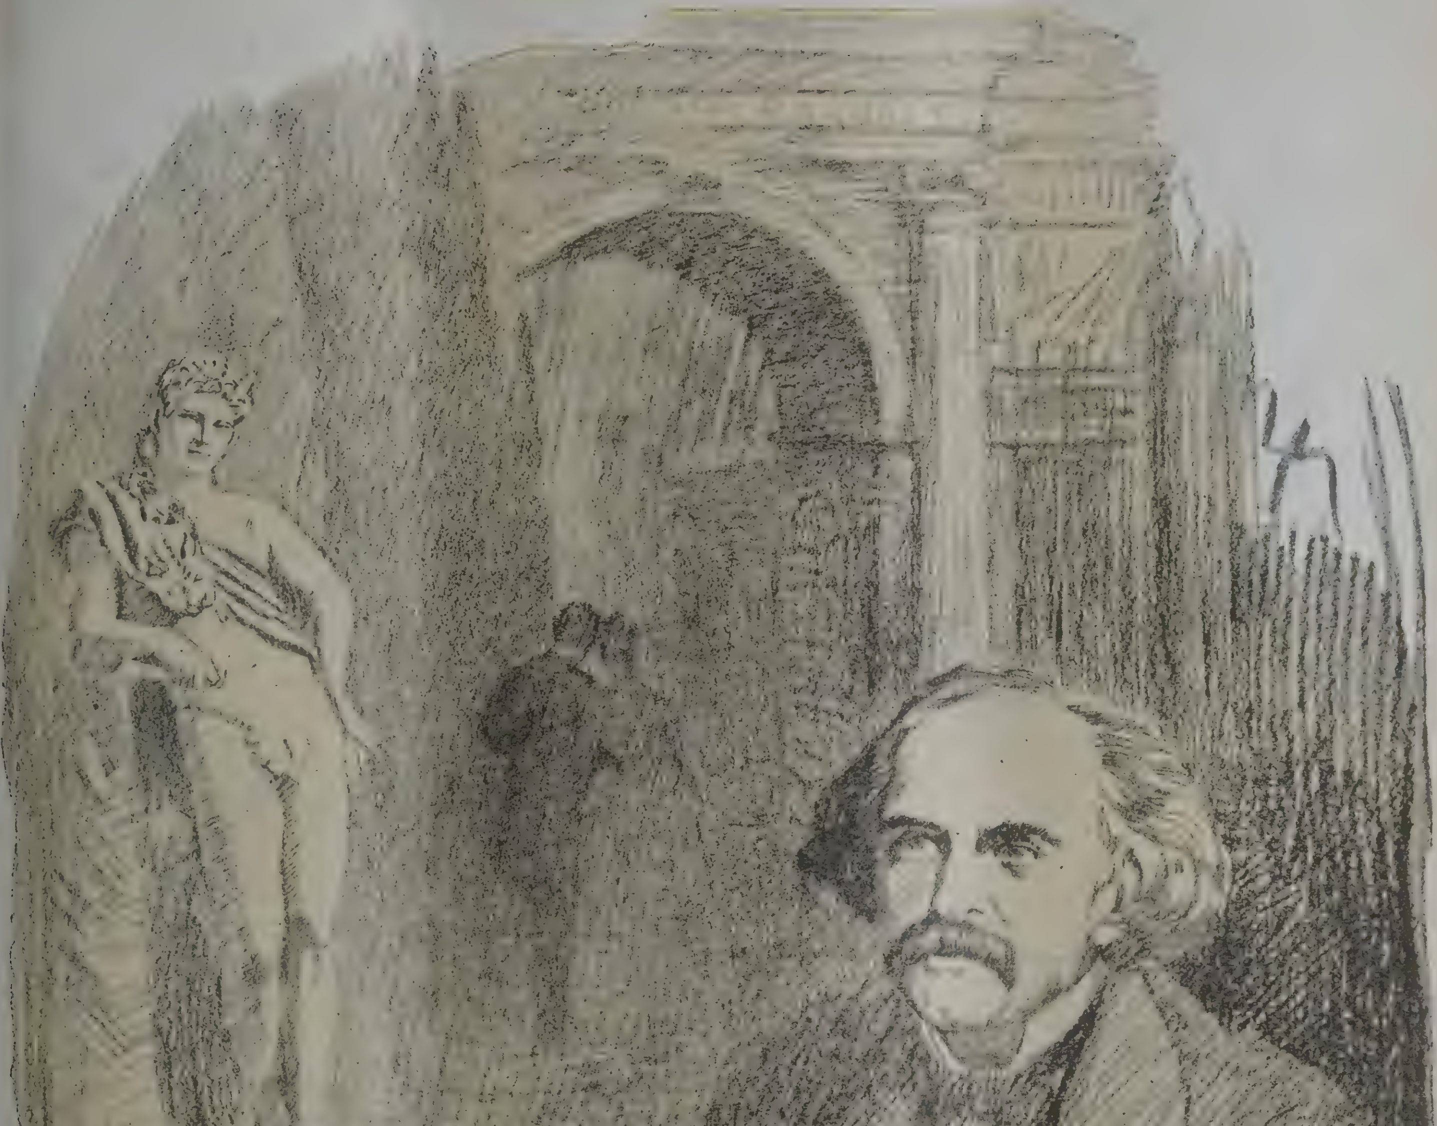
But now, gradually, the conception, long relinquished, of that Romance of Immortality which had lured him in youth, loomed powerfully upon him once more, and he could not reject the invitation. Again and again he attempted it, was not satisfied, and tried again. But his health was failing rapidly; so that when, in the last year of his life, he finally found the authentic clew, it was too late. He wrote a few of the opening chapters and, at the urgency of Fields, the publisher, allowed them to appear in *The Atlantic.* In the opinion of sound judges, he had never before done work so fine. But he felt that he was dying, and he did not live to read the chapters in the magazine. His Romance of Immortality was not to be finished here. After his death, two or three of the abortive efforts were found and published—*Septimius, Dr. Grimshawe's Secret,* and another. But what was to have been the development of *The Dolliver Romance*—as he had provisionally called the fragment in *The Atlantic*—can never be known. The few notes he left were obscure and ambiguous.

Hawthorne was a writer and a poet, though he wrote no verse. The rhythm of emotion permeates his romances. His works are art, and the art of literature had been his preoccupation all his life. In a degree, therefore, he had gained an insight into the other forms of art, and an understanding of their principle. He was neither sculptor nor painter, though I have seen him take up a lump of clay and rapidly shape it into an animated human head; with a brush and a few paints he could design roughly very telling little figures. His wife was a painter and a sculptor; neither of them was a musician, and Hawthorne professed not to care for music. But when he came in touch with the art of Rome, France and England in painting, sculpture and architecture, he could appreciate it and express his reactions. That he was not often wholly in sympathy with what he saw was due less to the technical demerits of the work he might be looking at than to his own lack of technical knowledge of processes and limitations. He got jaded in the interminable galleries, and was more aware of shortcomings than of achievements.

Several American sculptors in Rome were friends of Hawthorne, and he visited their studios, where they might talk him into admiring their work. He and William Wetmore Story were intimate, and Story was finishing his design of Cleopatra. In the original clay, in Story's studio, back in 1856 and '57, it was noble and beautiful, and Hawthorne devotes some pages of eulogy to it in *The Marble Faun.*

But for one antique statue in Rome, and for one painting, he felt unstinted admiration. In both cases, however, the thoughts and feelings they aroused in his mind rather than the work of the artists moved him. The painting, ascribed to Guido, was the head of a girl, supposed to be Beatrice Cenci, on her way to execution; the statue was the figure of the faun by Praxiteles. It makes no difference that experts now question the painting and the sculpture. They touched Hawthorne profoundly; he made the statue his symbol in the story, and imagined a sisterhood between Beatrice and his Miriam. So one art received the others.

HAWTHORNE often visited the Capitoline Museum, and the Barbarini, and pondered upon the statue and the painting. The problem of evil had been before him in all his stories from the first: Beatrice and the faun represented two sides of the mystery. In the legend, the girl had committed parricide, but for a cause that seemed to justify the act. The faun, on the other hand, was incapable of sin, because he



Then, as a diversion, Hawthorne began to play with the idea of the humanization of the faun of classic legend.

was an animal not yet become human. Could the girl be forgiven? and could the faun become a man? Might not a story be written in which these two should be chief actors, and, through their mutual interactions, solve the enigma? The theme grew and put forth branches. It was worth attempting.

Except for the faun's pointed ears and tail, he was physically nearer man than animal. But he had never come under the rule of conscience; he was unable to discriminate between right and wrong: he was kindly and affectionate, but entirely unmoral. Should such a conflict arise for him, he would cleave to what seemed to him good and not evil, but good to him would appear as gratification of his desire as an animal; evil, as deprivation of it. The idea of voluntarily depriving himself of it would be inconceivable to the animal instinct. He would then commit what we regard sins—robbery or even murder—free from hesitation or remorse.

Still, animals are capable of affection: the female for its young and transiently for its mate; and the higher animals, when tamed, for their tamers. A dog will not only follow its master faithfully, but will face danger for the master's sake. The faun would doubtless be capable of such affection. But such affection does not uplift dog into man: would it suffice for the faun? Affection is not love in the higher meaning of the word; passion is not love. Love is self-sacrifice in the supreme degree; it gives all to its object, and retains nothing to itself except that power to give. Its only satisfaction and happiness is in making its mate happy; it perishes when it seeks any gratification other than that: it is degraded into the mere lust of possession for its own senses' sake—the lust of the animal. But the felicity of pure love is indeed supreme, and the more it is gratified, the stronger is its flame. It is lifted above the flesh, and penetrates to that higher region which we call the soul. Yet we cannot say that it creates the soul: it awakens the soul to consciousness of itself; but the soul must have been present to be awakened. But this is a paradox—in truth, the mystery of mysteries.

Such considerations perhaps passed through Hawthorne's mind, as he meditated on the faun, but he was too sound an artist to admit them into his story except by inference. He would assume (for the end he had in view) that the beautiful creature, though it had no soul, yet might undergo experiences that would beget one in him. He might fall in love with a woman; but would love, as a faun loves, be enough?

What other influence, then, could awaken him? What, for instance, would be the effect upon his nature of committing a deadly sin? Would murder, done in a passion of hatred, serve the purpose? Hardly; since the destruction of what disturbs its comfort is natural to an animal, and appears to it good and not evil. Yet there are no ministers stronger than love and sin.

AND, of course, if the faun were mere animal, the quest would end there. But on Hawthorne's assumption of the germ in him of a soul, the outlook was better. And it was here that the thought of Beatrice came upon the stage.

The faun, as a faun, is infatuated by a beautiful woman, and manifests for her an affection which is more than childlike, but not as yet fully mature: he does not think of the future, he is filled with the joy of the present. The woman, on the contrary, is mature in every way except in years; she has lived in the world, and she has not only committed one deadly sin but been the victim of another. She is partly amused, partly annoyed, by the faun's devotion. The gloom and terror of her secret thoughts remove her far from the desire or the possibility of love. What shall be the next step?

LET the faun, for love of his mistress, and to save her from some danger or peril, do murder. In other words, let sin and love combine to create manhood in him—to give him a soul. Grant the existence in him of the seed of a soul, would not that combination suffice to tear it forth and fertilize it?

In the story, the conditions would be so set as to favor this result. The being who is the source of the woman's trouble appears associated with her as artist's model; the fetters of their crime compel it. What their crime was remains unrevealed. There are brazen pens today that might state it in plain terms, but the art of Hawthorne, by leaving it in shadow, does but add the more to its horror.

As the pressure of immensities dissolves rock into vapor, so the passion of that moment kindled the faun into a man. None (they think) has seen it; it is their secret. But what will be its effect upon them? At first, while the vibration of their act still shakes them, it is that wild sense of freedom which accompanies a broken law. But when that delirium passes, they awaken to a vital change in their mutual relations. Miriam (the woman) recognizes that the innocent faun, in becoming man, has murdered not her enemy alone but his own innocence and peace: love has brought forth guilt and death. And he, feeling the loss of the faun nature, and not yet competent to understand manhood, is lost in the darkness of the abyss; the faun love which prompted the deed is gone; the higher love can as yet find no foothold in him.

The outcome appears as blank indifference—in reality a paralysis of faculty. In Miriam, on the other hand, remorse and compassion engender the love which all her lover's entreaties could not stir in her: her existence henceforth is consecrated to his help and comfort.

The figures of Kenyon and Hilda serve only to carry on the action. In the end, the problem itself is left to the reader's consideration. Is sin 'the cloudy porch oft opening on the sun'? Is evil necessary to good? Is the fall of man the unavoidable condition of his resurrection?

The delicacy with which the difficult theme is handled has its disadvantages. To keep the picture in harmony the artist is compelled to remove the whole scene with the characters that enact it into a region apart from reality; with the exception of Miriam, and of the faun at the moment when his crime is committed, none of the figures is convincing. But that moment on the brink of the Tarpeian Rock is rendered with a power almost intolerable, and it makes what precedes and follows pallid by contrast. The physical deed blanches the color out of the metaphysical preface and consequence.

The dramatic effect of the story suffers from the impossibility of solving the problem; we think that the balance disturbed by evil should be restored by the penalty. The murder of the model, however, does but augment his disastrous influence upon the course of events, and had Miriam and the faun been brought to the scaffold for their crime, it would only have emphasized the futility of human justice. They must heal each other of the hurt which they have inflicted upon their souls, but that operation is spiritual, and banishes the actors from the material arena; they become invisible, and the audience is left in doubt.

The inference seems unavoidable that the story of the faun should have ended on the Tarpeian Rock. The rest is another story. And it is possible that Hawthorne, in his first vision of the tale, may have so intended, but then he felt himself drawn on into the realm of consequences, and he did not resist the invitation.

Such at any rate is my private view of the matter, and my grounds for forming it are no better or no worse than those of any other critic. The story was written when I was thirteen years old; my father died when I was seventeen, and I hardly need say that he and I never discussed the matter. I didn't read the book till long afterward, and then I didn't understand it, though, like others, I was charmed with the pictures of Rome and the Florentine valley. Perhaps I don't understand it yet; but I submit my guess.

THE manuscript of the story which he brought with him from Italy for the purpose of rewriting it in England, and thereby securing the English copyright, was probably little more than a brief summary of the final work. He had kept up full journals of our Italian sojourn, and parts of these he used in the story. After his death, my mother, in copying the journals for publication, left out all passages which he had thus taken over—though it would have been interesting to compare the first versions with the refinements of them in the book. He had not decided upon the names of the characters, and he used to talk them over with the family. Hilda was suggested by the saint whose story was somehow connected with the old Yorkshire town

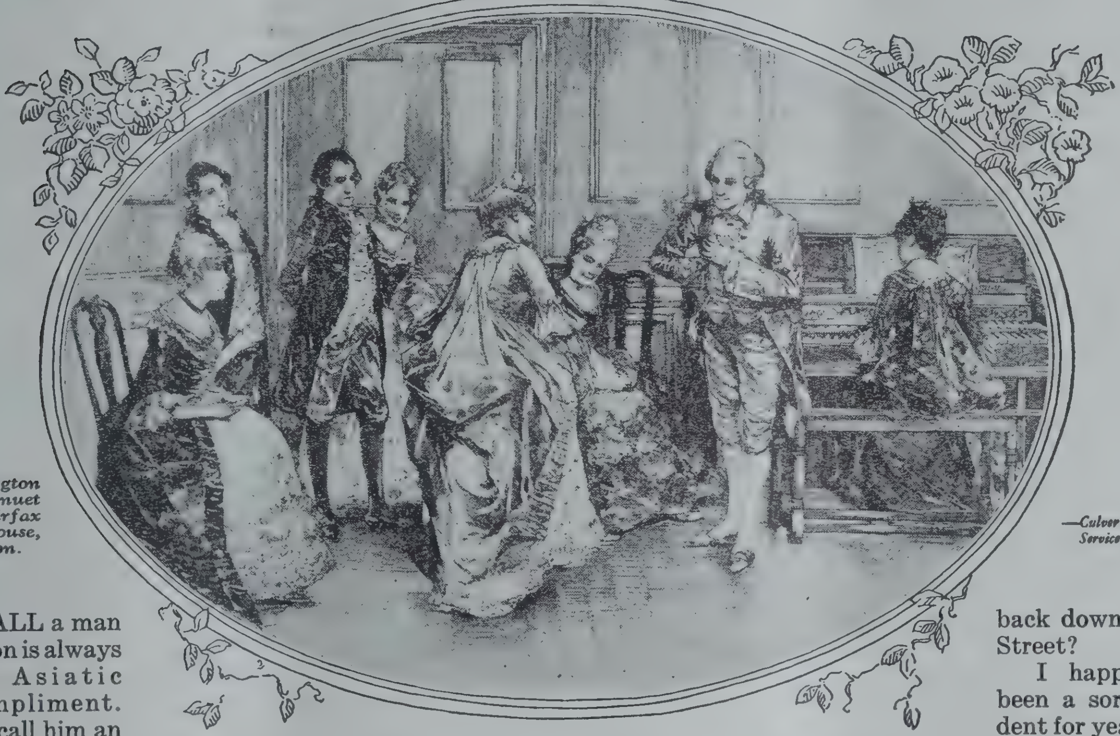
The LITANY of WASHINGTON STREET

By VACHEL LINDSAY



George Washington dancing the minuet with Sally Fairfax at the Carlyle House, Mount Vernon.

—Culver Service.

TO CALL a man a lion is always an Asiatic compliment. To call him an eagle is a European compliment. These are accepted metaphors of oratory; but the Indians did not hesitate to venture far afield in their complimentary names. They would call a man Chief Angry Bear, Chief Big Elk, Chief White Buffalo; or a woman, Lady White Bird.

Turn to Dean Swift who, long before our American Revolution, in *Gulliver's Travels*, was hunting through all the races of mankind for a man like George Washington and found him not. He was hunting, not for a vague general demagog made of clouds and cotton batting, but for a person of certain simple attributes worked out to their very highest logic till they became a delight as well as a very definite personality. If we read Gulliver, we find that he wanders through the kingdoms of the pigmies and the giants; but it is in a kingdom ruled by magnificent Houyhnhnms that he seems to have pleased himself most. His master is not a horse. It is as though a sign of the zodiac had turned into Pegasus himself.

This tremendous, high-stepping master, this steed greater than any centaur, this picture made of stars, is a dim step toward what I would like to say when I name George Washington 'The Great Red Indian Chief, White Horse.' Edgar Poe's story *Metzengerstein* is a mystic story of a sort of steed that was a demigod, capable of gigantic justice; it might lead the mind to what I mean by this Indian name. When Washington was a young man fighting and surveying on the western frontiers, the Indians were always naming him fancy names after some fashion; and until we name him, we cannot know him.

The best steed is more imperturbable than a man, more faithful than a man, more direct than a man, with a more fixed countenance, with a body so powerful that it becomes in itself a symbol of inexhaustibility; is graceful beyond any human grace, prefers dancing to walking, arches its neck without loss of dignity or imperturbability, goes straight to its goal, can find its way home without lantern or guide when the rider is asleep on the longest, blackest night through the muddiest road, holds no grudges, remembers no enemies, and can overtake and pass any man afoot in the world.

So when the smart boys all get themselves together and prove Washington slow thinking; fond of farming; a British fox-hunting squire; by accident, our commander in chief; surveyor; accountant and mathematician; a pacer off of paces; one with a passion for acres and rivers, one to whom a book was a bore, an argument an irrelevancy, why are they then so angry when, their life work done, General George Washington of Virginia still rides on horseback down Washington Street?

I happen to have been a sort of art student for years and years, and to have lectured on Gilbert Stuart portraits of unknowns. Gilbert Stuart painted the notables of his time in an inimitable manner that was genius, but which fits only Washington. The others look rather curious painted in this manner. Any Gilbert Stuart portrait is on canvas, in oil; but looks as though it were painted on glass, in water color; the whites are transparent or translucent; the powdered wigs seem like spun glass. The dignity is red Indian; all the rest is a curiosity of the art gallery. But when he painted Washington, he was dealing with a mystery; and this mysterious manner for once found its infallible subject, and mountain-dignity.

Most of the efforts of the new Washington scholarship seem to be to destroy the meaning of the Gilbert Stuart portrait; but if you pile up evidence roof-high, and prove beyond a doubt that the subject of this portrait was a human being, it still remains an inevitable portrait of our great red Indian chief, White Horse. Thus it comes about that Gilbert Stuart is the only human being who ever painted a portrait of a red Indian chief. All other attempts are art calendars and railroad advertisements.

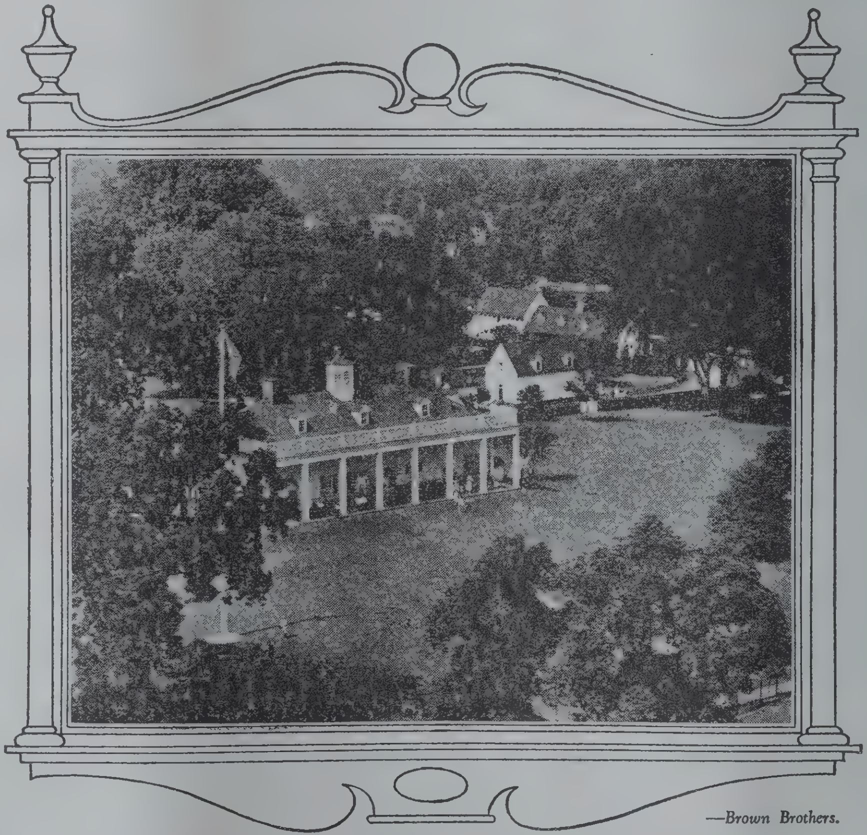
I have named Washington, Jefferson, and Patrick Henry as three poets of our beginning. But for purposes of this essay, I would speak of another triumvirate: Washington, Jefferson and Hamilton, the New Yorker.

George Washington is a mountain between the Jeffersonians and the Hamiltonians who still carry on merry war throughout the length and breadth of this country. The only thing that separates them is that, at the height of the battle, this Gilbert Stuart portrait seems to float between them like the mist and smoke of some medicine man's camp fire. The only national-commission form of government that the United States ever had was in Washington's first administration, when Hamilton and Jefferson were both in one cabinet.

I am a Jeffersonian; and Hamilton makes me as impatient as he ever did any fair-minded Democratic Party man. But just as I open my mouth to rail, The Great Chief, White Horse, rides between me and the object of my impatient invective. It is with some pleasure that I observe that the same thing happens to the Hamiltonians. I have read page after page that tried to prove that Jefferson was a bigger man than Washington; or that, on the other hand, Hamilton was a bigger man than Washington. But Jefferson and Hamilton can never desert their chief; he always towers over them. I have recently read a very able and commendable book on the part of Jefferson by a zealous British partisan who is straining, straining, almost to a shriek, commanding George Washington and Alexander Hamilton to get off Washington Street and let Jefferson ride there by himself.

Now these three gentlemen, Washington, Jefferson, and Hamilton, expressed for one another at certain rare propitious moments the highest 'esteem.' It is too deep a matter for the hasty student to discover what in their private capacities they meant by 'esteem.' As far as Washington Street is concerned, they are bound together in an irrevocable fate. We cannot talk them out of existence. We would be like a geologist who tries to talk the scenery out of existence, who does not see the mountains, but the strata, while the other tourists see the splendors of a Turner sunset.

Always on Washington Street I see those three superb horsemen, Washington, Jefferson, and Hamilton, riding abreast. Washington in the middle on a much bigger, higher horse, never looking to the right or to the left, except when he has a direct question from Jefferson or Hamilton. Not one of them can be outmatched in superb pride, though each has a pride all his own; not one of them can be excelled in horsemanship by the others. But if Jefferson must address Hamilton, he has to look around the General, and lean forward, which is difficult to do; or lag behind the General, which his pride will not permit. Thus I deride my favorite hero. I will let Hamiltonians say that if Hamilton wishes to address Jefferson, he must peep around George Washington's horse, even to get a glimpse of the red-headed 'Sage of Monticello.' With Hamilton or with Jefferson, it is the tomahawk or the peace pipe. They both had Indian training. But they are both so mindful of the General that they dare not stop for a personal encounter. So as they ride with the great red Indian chief, White Horse, it is the peace pipe forever on Washington Street, an enforced truce, but truce of a sort.



—Brown Brothers.

Mount Vernon, built in 1743 by George Washington s elder brother, Lawrence.

What is the scenery of Washington Street? First, Mount Vernon, the incarnation of George Washington. Perhaps the old Raleigh Tavern of Williamsburg, where Jefferson danced, and played his violin by the fire. Surely there is a bank and an army post, with regulars drilling hard, or Hamilton would not have occasion to ride down Washington Street. Hamilton looks the young Napoleon suppressed. Washington watched him, watched him, watched him; and he became what was practically the supreme military commander of the United States only when Washington was ready to die.

And is Jefferson close to Washington because Washington deems it safer for the country to have him there than somewhere in the woods? I rather think, in spite of the deep deductions of new and old historians about Washington's stupidity, that there is a medicine man's reason for Jefferson and Hamilton's having to ride abreast of Washington, down Washington Street, and not down Hamilton Street or Jefferson Street.

THERE are endless clubs and whole shelves of books trying to give Hamilton the middle of the way. There are whole shelves of books, there is even a great political party, expressly determined to give Jefferson the middle of the way. To that paradoxical party I find myself belonging; but watch the three men riding yet, straight toward the sunset. Jefferson keeps near the southern curb, Hamilton near the northern curb; and I say that the three horses will move abreast till the day of doom, with the great plumed chief in the middle, dressed beyond the nerve of the other two in silks and fine leather, in spurs so glittering and with a hat so dazzling that even the patrician Hamilton would not have the courage to ride so bedecked through a nation where no grown man dares dress up. It has long remained a problem and an almost ineradicable mystery how such a glittering man could be the father of so middle-class a country. But we are at last taking on his grand style. Concerning this dawning 'grand manner' I wish to write many new essays for my friends.

It is always 'the kings and the commons against the lords'; and it is our commonest people who keep this king on horseback and who are beginning to take on his manner. Our lords have not the courage of their apparent power; so it is not real power at all. Washington was our first and last king, though there were four near kings besides him in the

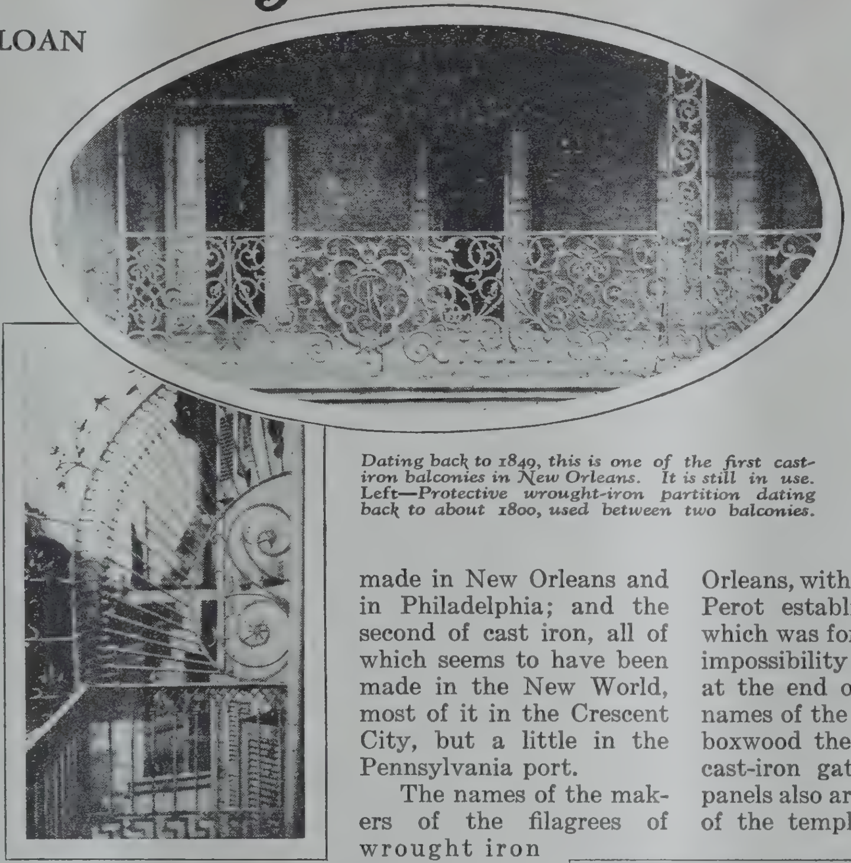
The IRON GATES of New Orleans

By JOHN SLOAN



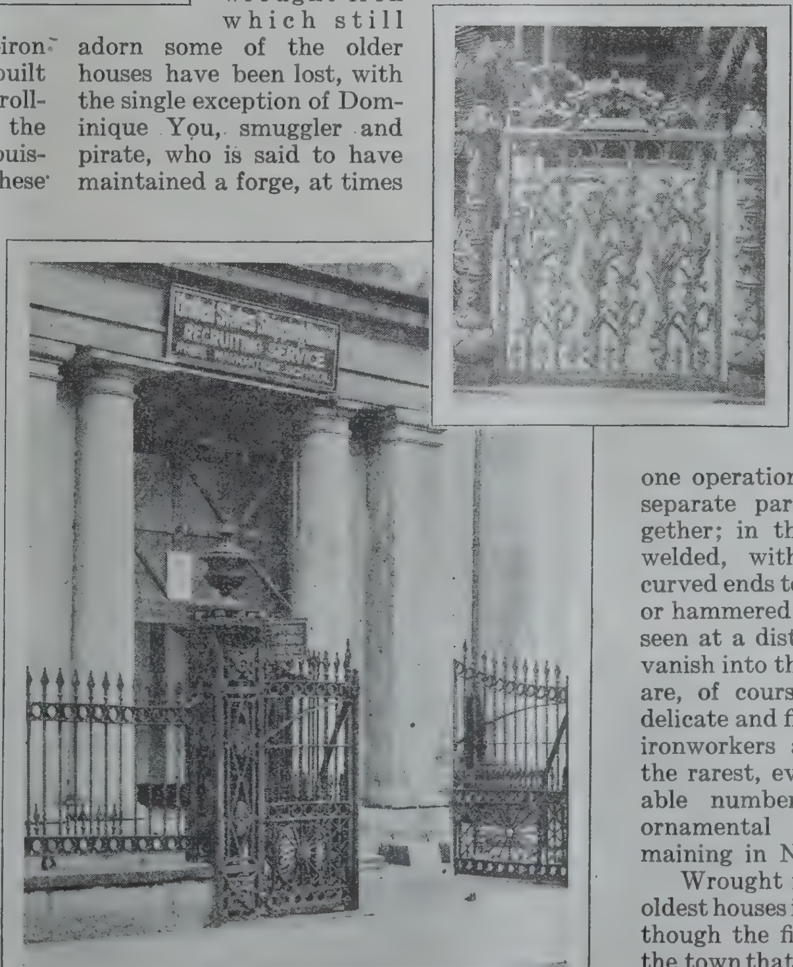
Dating back to 1849, this is one of the first cast-iron balconies in New Orleans. It is still in use. Left—Protective wrought-iron partition dating back to about 1800, used between two balconies.

IN THE city which has the honor to have been founded by the famous adventurer, governor and representative of the king of France, Jean Baptiste LeMoyne de Bienville, more than two hundred years ago, there remain to this day, as the most permanent reminders of the contribution of France to the New World, some of the finest iron workings in existence. Filmy wrought-iron balconies, delicate panels for the long *ventanas*, slim frames and brackets holding far-flung verandas, all seeming so fine that they must fall by their own weight; massive cast-iron and wrought-iron gates, and combinations of both, built for protection and ornament, and scroll-work doors, hammered red-hot on the anvil by slave labor before the Louisiana Territory was purchased—these are the remnants of an art which very nearly passed from existence with the hard days following the Civil War in New Orleans.

Only now, a century later than most of this work was done, an effort is being made by Tulane University, through the art school of Newcomb College, to preserve as it is the wrought- and cast-iron art of another day. An attempt also is being made to bring back the hand-manufacture of these delicate yet enduring things of iron.

This ironwork, which added so much to the external appearance, and not a little to the protection of the internal affairs, of the houses of the one-time French capital of America, will be better appreciated from photographs than from any written description. Its development, however, was divided rather sharply into two periods—the first, and oldest, of wrought iron, some of which was brought from the ancient smithies of France and other of which was made in New Orleans and in Philadelphia; and the second of cast iron, all of which seems to have been made in the New World, most of it in the Crescent City, but a little in the Pennsylvania port.

The names of the makers of the filagrees of wrought iron which still adorn some of the older houses have been lost, with the single exception of Dominique You, smuggler and pirate, who is said to have maintained a forge, at times when he was not pirating, and to have produced from it some of the finest and most delicate examples of the smithy's art. Even this, however, is somewhat of legend, and, as none of these artists in iron 'signed' their productions, we can only appreciate the result and regret that we cannot name the maker. Most of the cast-iron molding was done at the plants of Leeds and Company, and the Shakespeare Iron Foundry, in New Orleans, with a little at the old Wood and Perot establishment, in Philadelphia, which was forced out of business by the impossibility of collections in the South at the end of the Civil War. But the names of the men who carved from soft boxwood the models of those precious cast-iron gates, fences, balconies and panels also are lost forever, though some of the templets remain, as perfect as when they were first made, fifty to seventy-five years ago.



Artistic wrought-iron fence, built a century ago primarily for protective purposes. Inset—Gate with cornstalk motif.

There are two types of wrought iron—that which was made in separate figures, comparatively small and easy to handle in forge and on anvil, and that in which whole panels with every figure in them were wrought out at one operation. In the first, the separate parts are riveted together; in the second they are welded, with the spirals and curved ends terminating in disks, or hammered down so thin that, seen at a distance, they seem to vanish into thin air. These latter are, of course, the much more delicate and finer examples of the ironworkers art. They are also the rarest, even in the considerable number of examples of ornamental wrought iron remaining in New Orleans.

Wrought iron appears on the oldest houses in the Crescent City, though the fire of 1788 so razed the town that few of the really old buildings are left. The wrought-iron work

The True Economy

TIME, energy and material are worth more than money, because they cannot be purchased by money. Not one hour of yesterday, nor one hour of today can be bought back. Not one ounce of energy can be bought back. Material wasted is wasted beyond recovery. These things are in the front rank of values. They are the precious elements out of which all wealth is made.

It is worth noting that these precious values are not of human creation. We have done a great deal with our human intelligence and energy, we have accomplished much by the manipulation of natural material and forces, but the severely modifying fact remains that ourselves and all we have worked with, and the very intelligence we have worked by, were not our own creation. And so, while mankind may be pleased, and even thankful, it ill becomes it to be boastful.

> *EVERYTHING was given us to use—time, energy, material. There is no evil from which we suffer that did not come about through misuse. There is no function which human beings can fulfill that is not good. But we have all about us the spectacle of whole nations having to make laws against things, not bad fundamentally, but bad in their misuse. The worst possible sin we can commit against the things of our common life is to misuse them. 'Misuse' is the wider term. We like to say 'waste,' but waste is only one phase of misuse. All waste is misuse; all misuse is waste.*

All our values were given us. Mind-values, power-values, material-values, were all here. And we, the human race, have simply been cutting our eyeteeth on some of the elementary problems. The tree makes apples, mankind makes engines and philosophies—the tree cannot boast itself to be very original and powerful; it does what it was given power to do.

But mankind always has promise of being permitted to do still greater things. If trees bore different and finer apples every succeeding year, we should say, 'Well, there is progress in the apple kingdom, and some day those apple trees are going to develop into beings of wonderful powers.' But we don't see that. We see, however, mankind putting out different and better fruits age by age, and even helping the tree bear better apples, and the bush better berries; and therefore we say, 'Well, there will come a time when this wonderfully endowed and protected race of beings will work in some finer material than steel, and by some finer force than electricity or gasoline explosions. Its present progress has every sign of being only preparation.'

The waste which we practise upon the original store of wealth is always repairing itself. That is to say, the time we waste is wasted for *us*, not for Time. It is the same everywhere. Wasted material is replaced; the earth never ceases making what we need and is prepared to fill future needs of which we have not now the slightest foreknowledge. If men waste energy, it is lost to them as individuals—the great reservoir of energy on which all life draws is not exhausted.

Therefore the great word of life is Use.

Some would say Economy. Not so. The word economy represents a half-idea born of fear. Its history is something like this: the great and tragic fact of waste is brought home to the mind by some circumstance, usually of a most materialistic kind; or there comes a violent reaction against extravagance—for even nature rebels against our unwise courses (which is the reason so many people break down from 'overwork,' which is not overwork at all); and as a sudden revulsion against it all, the mind catches hold of the idea of 'economy.' It flies from a greater evil to a lesser one; it does not make the full journey from error to truth.

Economy is the rule of half-alive minds. There can be no doubt that it is better than waste, neither can there be any doubt that it is not so good as Use.

Persons who pride themselves on their economy sometimes bristle when it is attacked, as if one of the virtues had been denounced. It is principally in the interests of the economizers that this attitude is taken. For if there is anything more pitiable on earth than a poor, pinched mind spending the rich days and months pinching at a few pieces of metal, or paring the outer necessities of life to the very quick, where is it?

Indeed, there are two kinds of waste: that of the prodigal who throws his substance away in riotous living, and that of the sluggard who allows his substance to rot from nonuse. In the precious things of life the strict economizer may be classed with the sluggard.

The beauty of the principle of Use is that it obtains all the advantages of economy and at the same time gives healthy expression to all the instincts of which wastefulness is a diseased symptom. Most people's extravagance is a reaction from severe suppression of expenditure. Most people's economy is a reaction from extravagance.

Under the principle of Use the expansive experience of expenditure is obtained, as well as the self-control and economic discipline of 'economizing.'

Giving the Doctor a Chance

AMERICANS cannot fairly term themselves the most efficient people until they stop the present loss of three billion dollars' worth of human values through preventable disease.

Infection, acute or chronic, by bacteria or parasites, is probably the most potent cause of disease, old age and death. Fortunately most of these infections can be dealt with if a physician is consulted in time. However, this doesn't mean waiting for signs of illness. The apparently healthy should occasionally be examined by physicians to detect departures from the normal, so that the tendency may be checked at once and illness obviated.

The whole thing is merely overcoming the present universal disposition to begrudge the doctor his fee unless he has remedied real illness. Doctors cannot work miracles upon people who have let disease get a real hold; but they can repair the leaks if given the opportunity.

We are nearing the period of the year when the disease and death rate climbs upward simply because most people regard colds, grippe and sore throats as unworthy a doctor's attention. Several generations hence the sound common-sense doctrine of prevention will be practised generally. Meanwhile some people will shorten their lives merely to save a doctor's bill for early and effective examination.

Why Progress Is Slow

IT IS not so much the speed with which things are done that counts but the steadiness. An essential of all kinds of progress is that it be continuous. There must be no standing still. The rate of progress may, for one reason or another, slacken at times, but the movement must always be forward. A man's pace may be comparatively slow, but if he pursues it steadily and with his eyes wide open, he makes more progress than one who rushes along blindly for a time, and, exhausted by his exertions, stumbles frequently and sometimes loses the path altogether. Choose your goal, keep steadily on. Whatever occurs, you will find yourself farther forward than if you had never begun.

A Feast for All

THERE is on this continent almost every variety of scene that the wide world can furnish. There are mountains which for majesty and grandeur cannot be equaled, stately rivers, magnificent lakes, boundless woods, mighty waterfalls. To the enjoyment of these wonders of earth and sea and sky there is no limit. They are there for the seeking. Modern transportation has made it easy to reach all parts of the country.

Strange as it may seem, it is frequently those who have the grandest works of nature at their doors who are blindest to their beauties. It is but natural that people in inland towns, sometimes hundreds of miles from the seacoast, should wish to see the ocean and enjoy the opportunity of inhaling its bracing breezes. It is also to be expected that those who have been brought up within sound of the sea should long for those scenic wonders which lie for many miles inland. Tastes in scenery differ as they do in almost everything else. Some love the rugged mountains, others the quiet, peaceful valleys.

That 'distance lends enchantment to the view' may be a trite phrase, but it is a true one. The landscape always appears more beautiful when it is viewed through the haze of an autumn day, or in the mellow rays of a glowing sunset. That thing is always the most desirable which for the moment we cannot reach.

Our Job

THERE was once a man, says tradition, who worried himself to death because he read that the fuel supply would be exhausted in so many million years, and there are people today who give themselves no end of trouble about things equally remote.

There are parts of the earth's surface not even known to civilized man, whose potentialities for development are unfathomed. In Brazil, for example, there are immense unexplored regions, the possibilities of which cannot yet be gauged. In The Argentine and in Mexico, countless acres, which are at present given over to the grazing of cattle, will in time be put under crop; and in Peru it is asserted that vast stores of copper lie hidden in the Cordilleras, millions of tons of timber stand in the forests awaiting the axe, while great quantities of oil are still untapped.

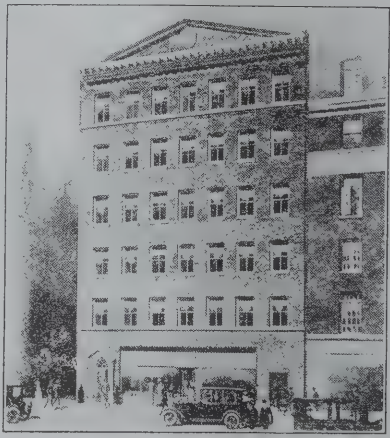
The great continent of Africa is without question a land of the future.

It is increasingly being recognized that a more equitable distribution of the human race is desirable, but this must come about in a gradual and natural manner, not by any sudden disturbance of present conditions. The untapped portions of the earth will be opened up in time. Meanwhile mankind has an important job developing the resources that are known.

A Day Among the NEW YORK PUBLISHERS

By THOMAS L. MASSON

EVERY morning between eight and ten o'clock fully thirty thousand persons, or jacks-in-the-box, pop out of the depths of the Hudson River into the lower part of New York. At nine-thirty on a bright autumn morning, flanked by flappers and snappy-looking clerks, I emerge with the rest. As for that much-maligned spot, Manhattan Island, it is shaped very much like a pancake that has gone wrong. If you pour out your batter on the griddle in a thin stream, instead of making it go round, it will look like an elongated almond with jagged outlines.



Harper & Bros.

At the lower end enormous skyscrapers bunch themselves together. I come out of the depths of the rectangular Hudson Terminal Building, with its twenty thousand inmates, and go south to the New York Evening Post Building at 75 West Street, facing the river. Within a stone's throw is the spot where Henry Hudson first landed and where also Washington stepped ashore for his first inauguration.

I wander back to Trinity Church, patronized by the biggest broadcasting station in the world. There in the churchyard is the headstone of William Bradford, New York's first printer and the father of all publishers. On the other side of Broadway, on the site of the present Cotton Exchange Building, was the office of Bradford's Printing Press, 'At the Sign of the Bible,' established in 1693, where the first New York newspaper, the New York *Gazette*, was published November 1, 1725. This, in Hanover Square, was known under the British as 'Printing House Square.'

It was a little more than a hundred years later that Horace Greeley, that weird journalistic genius, set up the Bible quicker than it had ever been set before, and in 1841 established the *Tribune*. Now it seems strange that the publishers have all moved uptown; they are scattered over the island. Before going uptown, however, I pause for a moment to look in on my friend, Robert E. Sherwood, active member and former president of the New York Booksellers' League, who has a book place on Beekman Street.

Mr. Sherwood, you may remember, was once one of the most distinguished clowns in the country if not in the world. After he had lived his life as a clown, he decided to go into the book business. He tells all about it in a recent book about his life under the big tent, entitled *Here We Are Again*. Mr. Sherwood's bookshop is a frightful jumble of books. He sits in the rear, the quintessence of geniality, surrounded by handsome girls, dictating things about books. He knows books not as a bibliophile, but as a human being.

And so I plunge once more below the discordant surface with its ten-ton trucks and near-Americans, and emerge on the edge of Greenwich Village, walking thence to Fifth Avenue, where the stern, almost pure-white new granite building of the Macmillan Company rises. The largest wholesale bookshop in the world (Baker-Taylor) is on the opposite side, near the famous Salamagundi Club.

Miss Rose Hutchinson greets me. Here we have a type of woman—scholarly, intelligent, and businesslike—which to me is the most genuinely interesting of that species which has been declared by Rudyard Kipling to be so deadly. Miss Hutchinson, of the Macmillan Company; Miss Caroline Parker, of the Century Company, Miss Reid, of Dutton (far up on Fifth Avenue); Miss Cooper, of Doubleday (down at Garden City); and Mrs. Alfred Knopf—here are women representing the highest feminine intelligence in this country.

Miss Hutchinson and I discuss Masefield's latest novel, *Odtaa*. I tell her that it charmed me on account of its style, but that some of my critical friends did not like it, thinking that John Masefield is so much better as poet than as novelist and should stop his lurid adventure stuff. Miss Hutchinson is neutral about Masefield. These publishing women, however, are not neutral except on the surface; I have often seen them pour their vials of wrath out on some of their own publications.

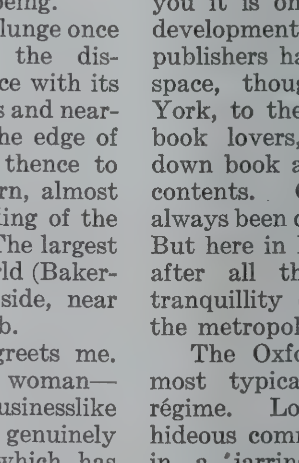
Miss Hutchinson hands me Lewis Browne's book called *This Believing World*, which tells us at first hand how religions got started, and I promise to review it. (Later I sit up half the night reading it and looking at the charming pictures of camels.)

But here we sit in the lobby, looking out on the broad pavements of sunny Fifth Avenue, while at the right, with its dim religious atmosphere, is the open library (a kind of circular affair), where anyone may stop in and browse among books, the latest and presumably the best.

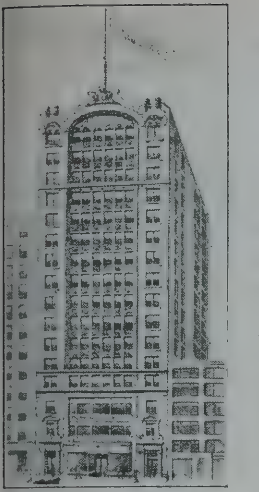
This leads me to wonder why this browsing movement first started among the New York publishers. I assure you it is one of the most interesting developments in the book world. Many publishers have quite recently allotted space, though so valuable in New York, to these browsing nooks, where book lovers, undisturbed, may take down book after book and extract the contents. Of course the thing has always been common enough in London. But here in New York! It shows that after all the haunting craving for tranquillity cannot be crushed out of the metropolitan heart.

The Oxford Press is perhaps the most typical instance of this new régime. Located on 32nd Street in hideous commercial surroundings, it is in a jarringly commercial building where trucks unload and leave huge packages blocking the sidewalk. The Oxford people, however, moving up a floor, have succeeded in making a room which is redolent of learning.

Here are no novels. But here are all the classics, all the philosophers, all the historians. And in the next room are all the Bibles, for the Oxford Bibles are known the world over. Here in one of the cases is a copy of the first Bible printed by the Oxford University Press in 1675—octavo size, prefaced by The Book of Common Priar and having the words on the title-page 'Printed at Oxford at the Theatre.' This theater was the Sheldonian. There are also on display



E. P. Dutton & Co.



G. P. Putnam's Sons.

copies of the first folio Bible of the Oxford Press of 1701 and of the first printing on India paper (1842).

My old schoolmate Mr. Lewis is here to greet me. He introduces to me a young Oxford man who has just come over to take charge of the company's publicity. Think of that: Oxford graduates becoming American publicity men! This young man has a book of Professor Robinson's, an advance copy. He tells me that it has given him a bigger 'kick' on religion than any before. He has only the advance copy but promises to send me another later. We go into the officers' room where in one frame have been collected the portraits of the four men who founded the American branch—John Armstrong, first general manager; William W. McIntosh, secretary; S. C. Skepmoes, associate secretary; and William Oliver, treasurer.

Charles Scribner's Sons.

I go back into the browsing room, and find here a young Columbia student whom I had noticed before eagerly scanning the shelves. He now has a group of books. He insists on paying cash for them and on taking them away himself. I select a Greek Testament, and Mr. Lewis informs me that there is not much demand for other translations of the Bible than the King James Version. He shows me a part of the great Murray Dictionary, upon which they seem to have been working for a hundred years. I think this part is a section on the letter *A*. It will be in untold volumes. I swoon with humility over my ignorance, and dropping down to the street level, leap into a taxicab and rush to a huge, up-to-date office building where, on the seventeenth floor, I meet Russell Doubleday.

He wastes no time on me but immediately escorts me into the Doubleday browsing room. This is quite different from the Oxford atmosphere. More modern. All the Doubleday books are here. Russell tells me they now have sixteen bookshops scattered all over the country. I ask him to let me start one in New Jersey. He shakes his head dubiously: New Jersey prefers applejack. Nevertheless I knew a woman who opened such a shop during the war and supported her husband on the proceeds.

Russell shows me Edna Ferber's latest book, *Show Boat*, and tells me they sold a hundred thousand copies before it came out. I tell him it falls short of *So Big*, and he says it is better in parts. (Later my wife tells me it is as good if not better. I have not read it.)

The Doubleday books, as is the case with so many others, are manufactured out of town, and if you are willing to take the trip down to Garden City, Long Island, you will find a huge plant, flower beds surrounding it, a private dining room—and, best of all, Mrs. Robbins and Miss Cooper. Miss Cooper is a publicity woman. You would never suspect it.

Russell is busy. He has a far-away look in his eye. He is thinking of Booth Tarkington's next. And so I leave him and go down Fourth Avenue to meet Miss Parker, of the Century Company. Miss Parker invites me to luncheon at the National Arts Club, which is on Gramercy Square nearly next to the Players' Club. Here all the publishers have their open exhibitions of books every year. On the way out we meet Barry Benefield, who, a year or so ago was—singular to say—one of the Century Company's publicity men, a quiet, almost self-effacing chap, and yet the author of some of the best short stories. His new book, *Short Turns*, is just out.

Miss Parker has charge of the religious publications and knows all the theologs. We meet a Yale professor and I tell him a joke, at which he looks very sad. I ask Miss Parker later if the man has a sense of humor and she replies, Oh, yes, that he will revel in my joke for days, but will keep it to himself (the New England idea).

We have talked too long, I rush into another cab, and go to East 33rd Street, to the modern house of Harper, where Gene Saxton, who for so long was with George Doran, greets me with his old-time courtesy. Here again is the browsing room, rather dim, up several flights; indeed, you go right into it from the elevator.

You know, it was the house of Harper which had its ancient place on Pearl Street near the present Brooklyn Bridge. All those old volumes of *Harper's* and *St. Nicholas* that we pored over in our youth, and the *Harper's Bazaar*, with its jokes in the back—all these came out of Pearl Street.

Gene Saxton and I talk about the radio. He thinks it might be a good thing.

Later he tried it and they got someone to talk about their books. I ask him why he doesn't print a dollar novel. He tells me that it can be done in only one way—perhaps—on cheap paper with a thin cover. It costs five thousand dollars to print 25,000 copies; and suppose then you do not sell them! After all, the public will not buy cheap-looking books; and then again the mechanical cost of printing and binding is high. So there you are.

The Macmillan Co.

Shuddering with sympathy and meditating meanwhile upon the wrong ideas that some people entertain of the inhumanity of publishers, I hurry once more to Madison where, at 244, I rise to the literary splendor of the Doran Company.

There is no browsing room here. But—I was going to say as far as the eye can reach—there are shelves and tables of books. And here is such contrast, for side by side with so many religious books are the most flippant best sellers—Hugh Walpole, Irvin Cobb, J. S. Fletcher, and so on.

I ask the flossy brunet beyond the rail if Mr. John Farrar is in. He is. I congratulate him on his matrimonial venture and give him some advice about domestic matters, which he takes in good part; but I know he doesn't believe me. He calls Allan Rinehart, the handsome son of one of our most distinguished novelists, Mary Roberts Rinehart. Allan conducts me through the book aisles in the side, for the long tables of books in the main room are 'just the latest.' He tells me of forthcoming books. I pick out Don Stewart's *Mr. and Mrs. Haddock in Paris*. I admire

Seagoing LIBRARIES

By FREDERICK K. HOWARD

Some of the crew of a Pacific freighter at the reading table.

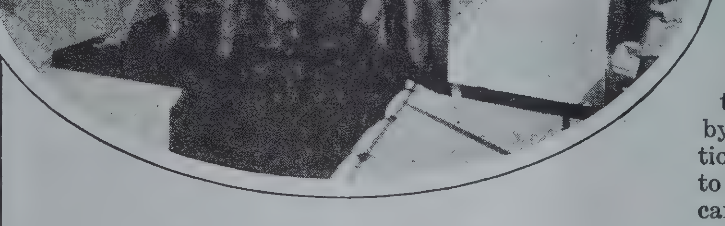
UNTIL America entered the war there was an assumption that the public library, like the public school, was the common heritage of all Americans. Then with the creation of a new Merchant Marine, the American Library Association was asked to provide books for merchant as well as war vessels, a new field for library service. These libraries on ships proved so worth while that various agencies undertook to provide them after the American Library Association quit the field at the close of the war.

The California Library Association in 1922 appointed a committee to see about supplying books to the merchant ships touching at California ports. This same year the Seamen's Church Institute of San Francisco undertook the supplying of libraries to vessels in the San Francisco Bay region on a large scale. Subsequently the California Library Association chairman, Miss Mary Barmby, librarian of Alameda County, and myself, as chaplain of the Seamen's Church Institute, arranged for a coöperative ministry to the merchant sailors on ships. The California Library Association, being long on production, undertook to supply the books, and the Seamen's Church Institute, being long on distribution, agreed to put the books in library boxes and place them on the ships. The county and city libraries agreed to send discarded books throughout the year. Eventually the plan was evolved of also asking the people of California to give books from their private libraries. This plan was started with Book Week for the Merchant Marine in 1924. People were asked to give books which they had read and liked to the Merchant Marine Library. These books were sent to the Seamen's Church Institute for library placement. The following statistics show the interest taken by Californians in supplying books for the seamen and the number put upon the ships during the ensuing years.

Library Placements

	1924	*1925*	*1926*
Ships	727	921	1,002
Books	34,681	49,814	68,023

Delivering magazines and books to the S. S. Osiris of Hamburg.



Sailors on board the S. S. Wanda inspecting a new consignment of books.

Donations Received

1924—8,000 to 10,000 books
1925—18,000 to 20,000 books
1926—23,161 books.

Books are supplied to American vessels in the name of the American Merchant Marine Library Association so that the libraries can be exchanged in any port where the association has a dispatch office. However, the Seamen's Church Institute, being a church institution, knows no limit on its ministry to seamen; so libraries are supplied to ships of all nations entering the Golden Gate. British, Scandinavian, French, German and Italian vessels appreciate the courtesy that supplies their crews with large libraries and numerous magazines. These services help weave a few threads in the strand binding nations in international friendship.

Besides circulating libraries placed on American vessels and those of other nations, cartons of discarded books are furnished to vessels which for any reason do not desire to carry a circulating library. These discards are given away to other ships, hospitals, and anyone desiring reading matter. Ships touching at some ports and especially in out-of-the-way places are boarded by English-speaking persons famished for something to read. Such books and magazines, bearing the label 'from friends in California—compliments of the Seamen's Church Institute,' are eagerly sought by such readers. In addition to these donations to readers in South American ports, the islands of the Pacific, and the Oriental places, thousands of books and tons of magazines are sent North every spring on the fishing vessels. These books are left by the returning fleet for the delight and edification of the Alaskans who remain for the long winters. Fanciful tales are brought back of miners waiting, with dog teams, the arrival of the fleet to obtain a supply of reading matter for people in the interior. In sober truth, however, the generous

The SERVANT PROBLEM in CHINA

By L. M. CRAMER

I CAME to China when too old easily to adjust myself to a Chinaman's idea of what is clean. I have kept my eyes too widely opened and have seen too much not to feel impelled to stay in my kitchen when food is being prepared.

Because I have stayed in a hot kitchen to see that the cook did not fry the chicken's head and windpipe in the skillet with the rest of the bird for the family 'chow,' I have frequently found myself alone in that hot room after a few minutes of the cook's company, and I have turned the broiler or basted the roast, while sounds issuing from the cook's quarters adjacent to the kitchen have borne it in upon me that the Celestial is an easy and a noisy sleeper, and that my cook was sleeping the deep and contented slumber of the East while I toiled in the kitchen. Occasionally he has not slumbered while I toiled; there were times when by sounds of the click of bone tile on bone tile I have known that he and others were gambling their last month's wages or mortgaging their future ones over the mah-jong table. This much I soon found out: the Chinese cook does not want his 'missie' to come into his kitchen. It's bad enough to have her hanging around the rest of the house, but the kitchen is his own domain, and if she will not keep out, either he leaves and she gets another cook, or else he steps out and lets her do the work.

Many a Chinese joins the army for food and not for fighting.

MOST foreign families keep at least three house servants, and more if there are children. There must be other servants, coolies, to take care of the lawn and the garden. If you have a dog, that necessitates another servant, a dog coolie—a man whose whole time is supposed to be devoted to the care and welfare of that dog. Dogs can't talk, fortunately for the coolie, else they could unfold many a tale of interest to their masters.

The 'boy'—you never call him anything else in China unless you are an American, and then you call him by his name and spoil him as a servant—is the head of your ménage. In the beginning you may think you are the head, but after a reasonable length of time you change your mind about it, or else he 'catchee one other job.' Dressed in his long white coat, seemingly immaculate, he is an imposing figure. He it is who takes your orders in the morning and sees that they are executed—provided you leave it to him. He hires the other servants and dismisses them if they do not suit him. Whether they suit you is another matter—usually they stay provided they suit the boy. Through him your orders are passed on to cook and coolie.

The boy is a cross between an English butler and a man's valet. He presses the clothing of the male members of the family and sees that they are kept brushed and mended. The manner in which he appears at your drawing-room door promptly at eight o'clock at night, and announces, 'Please, missie, pay chow,' is every bit as impressive, when you get used to it, as the proper English butler's, 'Madam, dinner is served'; it means the same thing.

A cook is a cook the world over, and the Chinese cook is just the same as Judy O'Grady back home—except that he gets along with fewer utensils and has no thought of complaining. He insists however that 'missie' stay out of the kitchen; if she does not, she will find herself, as I did, alone there baking, brewing and broiling as she pleases, the while he takes time for a beauty nap—which heaven knows he generally needs—or indulges in mah-jong, which he dearly loves.

A boy or a cook demands wages from eighteen dollars to thirty dollars (Mex.) a month. The boy has the best of it, for he gets a cumshaw (tip or percentage) each month of the wages of all other servants whom he hires; this arrangement lasts as long as all the servants he has hired keep their places. The coolie, lowest menial of them all, does nine-tenths of the hard work, and gets from eight to twelve dollars a month pay.

OUR first cook came to us with splendid recommendations. The chicken curry that cook could set before you! His chicken in tomato sauce was a close second. His cookies would melt in your mouth, and his bread was fairly good, while his macaroni and cheese were the best I ever ate.

The Chinaman's idea of cleanliness and ours are as far apart as the poles—yet he is clean according to his conception of the word. He will dump all sorts of garbage and decayed matter into a pond or a canal, and will then go to the selfsame spot to wash his chicken or his vegetables. He will also bathe himself in that pool or at the same spot in the canal where he has dumped the refuse of a household, and will scoop up the water in his hands and drink while he bathes. I forbade our servants bathing in the canal that flowed past our home in Su-chau, because of the filth dumped there by the community.

The coolie was the only one who did not protest against my order. One morning I discovered why. I had gone to great pains to teach him how to wash dishes in proper foreign fashion. I had shown him how to use water of the right heat, and soap to make a little suds. I had shown

DEVOTED COUSIN WINNIE

By E. M. DELAFIELD

Synopsis

Cousin Winnie meant well, but her devotion to 'Val'—Mrs. Robin West—compelled 'Val' to leave Burma and Mr. West and return home to England to seek a legal separation. It was either that, or break Cousin Winnie's heart. On her way home with the baby and Cousin Winnie, 'Val' meets an old bachelor who feels a grave mistake is being made.

IT WAS a pity, I thought, that my talk with Mrs. West had been broken off. I wondered whether I should be given a chance of resuming it.

To my surprise, it was she herself who gave me the opportunity of doing so, that evening after dinner.

(Cousin Winnie had left the dining salon just as a plate of roast chicken had been put down in front of her, because she 'thought she heard Baby,' and hadn't reappeared.)

'Isn't it a lovely night?' said the soft voice of little Mrs. West at my elbow, as I leaned over the rail.

'Beautiful. And in England, we shall find east winds. There's a lot to be said for the tropics, after all.'

'England is much healthier. I'm thinking of Baby,' she added.

'Children who are born in the East, generally do very well there, in my experience.'

The sudden vehemence of her answer startled me.

'Dr. Page, I know what you mean. You were trying to say the same thing yesterday, too. You think that I ought not to have left my husband. Well, I'm going to tell you what nobody else knows, yet. My husband and I are going to get a legal separation.'

'I'm very sorry to hear it, Mrs. West.'

'Why should you be sorry? Robin wasn't a special friend of yours, and you don't know what our marriage has been like.'

I remembered how she had said, 'It seems as though it had all been a dream,' referring to her marriage, and I ventured a shot.

'I remember enough of Robin, and may I add, I've seen enough of you to know that your married life wouldn't have ended in failure at the end of less than two years if you, both of you, had been let alone.'

She might have been angry—she might have burst into tears—or have abruptly changed the subject—but nothing could have surprised me more than did her actual reply when it came.

'Sometimes I've thought that too. It—it was a mistake.'

I KNEW very well what she meant, of course, but it seemed better that she should put it into words herself.

'What was a mistake?'

'To think that Robin and—and Cousin Winnie—that they could ever—that he—Oh, I can't tell you what it was like!' she burst out. 'I'm devoted to her. I always have been—and no words can describe her goodness and devotion to me, ever since I was a child. But she, poor darling, didn't exactly realize that I'd ever grown up, and she still wants to shelter me, and take care of me, and prevent my having any responsibility at all. I can't tell you the difficulties and miseries there were, when Robin and I first got engaged.'

'She didn't want you to marry?'

'Oh, she was sweet about it, poor darling, and most unselfish. But it was a dreadful blow to her that I should marry a man who had to go abroad, and she frightened Robin so much about my being delicate, and how much I should miss everything and everybody in England, that he—he offered to break off our engagement. Only I wouldn't.'

'Then you did care?'

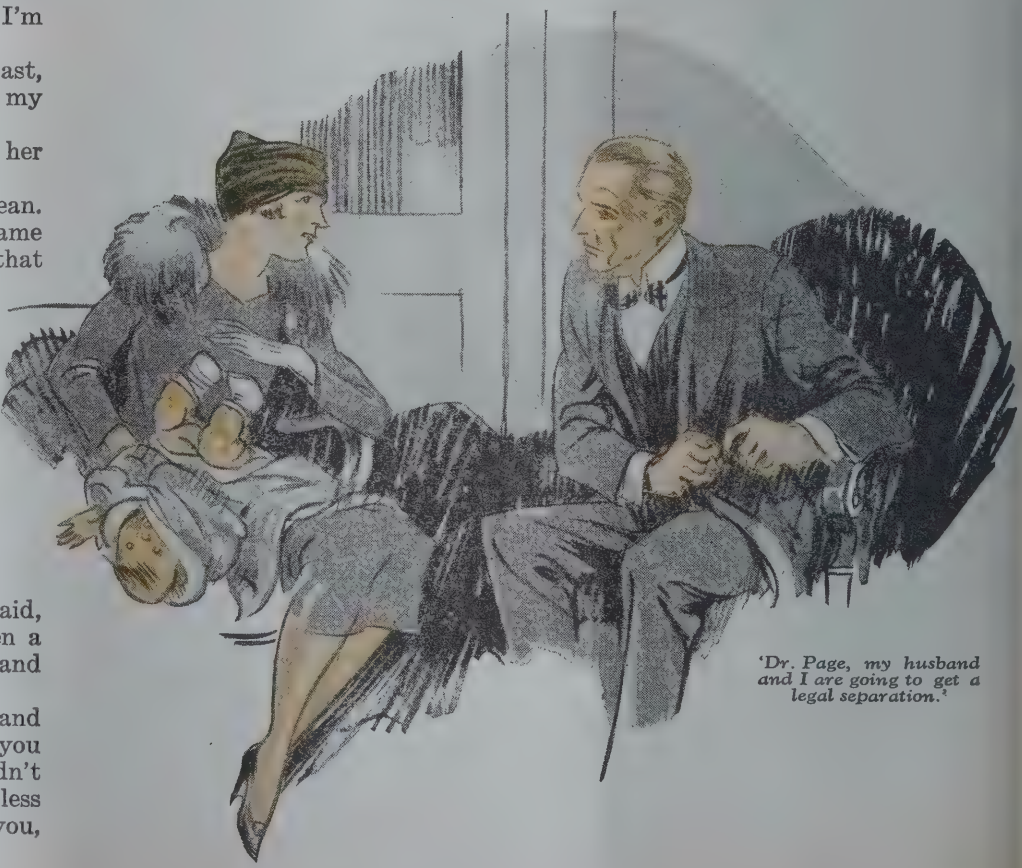
'Oh, yes, I did. But about a month before the wedding—well, we actually did break it off. At least, I did.'

'How did Cousin Winnie manage that?'

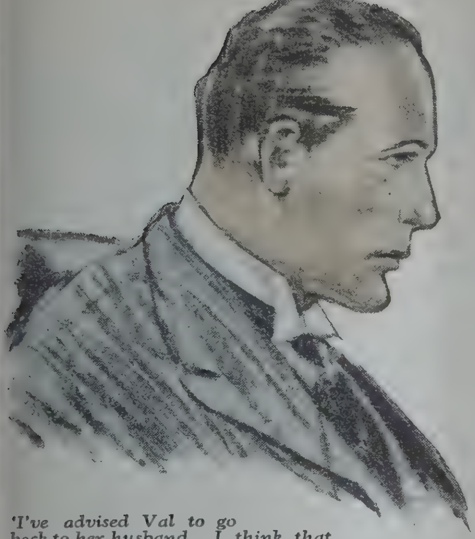
'Oh, don't! It was all because she's so fond of me. But she talked to me and somehow I felt when I listened to her, that I wasn't really the right wife for Robin—not clever enough, I mean. She was so afraid we shouldn't have enough in common, that it made me afraid, too. And so I told him I'd made a mistake, and that I couldn't marry him. And then I was frightfully miserable. And so was Cousin Winnie. We used to talk half the night sometimes, and cry—and Robin used to write me letters—oh, it was miserable.'

I could believe it. And I could just *hear* Cousin Winnie, talking, and worrying, and making herself and Val wretched, to say nothing of poor Robin West, and then being more wretched than ever because Val was wretched, and because crying all night was bad for Val . . .

'In the end, she said perhaps I'd better marry him, if I was so unhappy



'Dr. Page, my husband and I are going to get a legal separation.'



'I've advised Val to go back to her husband. I think that not only does her duty lie with him —but her happiness.'

without him, and she asked if she should come out to Burma with us just to begin with, so that I could have another woman with me, in case I did get ill or anything.'

'Robin agreed to that?'

'He'd have agreed to anything, I think, if he'd thought it would make me marry him. And we had such a perfectly happy six weeks at Avignon, before we sailed. Cousin Winnie wouldn't let me bother about anything. She did all the packing, and took all the trouble, while we just enjoyed ourselves.'

'Well, it was your honeymoon.'

'I know.' She sighed. 'When it was over, and we came back to London, Cousin Winnie was absolutely knocked up by all she'd had to do. You know how thoroughly she does things—I mean, what a lot of trouble she takes.'

'Yes, I know.'

'She sailed with us from Tilbury. And—oh, I do so hate myself for feeling it, but it's true—things were never really the same after that.'

'How could you expect them to be?' I asked her. 'A man and his wife aren't meant to have a third person planted on them like that, in the very first year of marriage. It's against nature.'

'She was an angel to me when I was ill. Though it made things worse, in a way, having her, because she was so terribly upset when Robin couldn't get the things she thought I needed, and that made him more anxious than ever. But I don't know how I should ever have managed with Baby, if Cousin Winnie hadn't been there.'

'Other mothers have managed with a first baby, even out in the East. And I'm sure, if you'll forgive me for saying so, that you would anyway have tried it a bit longer, if there'd been nobody to come between you and your husband.'

'I never would own that she *did* come between us.'

'But didn't Robin think so?'

'Yes,' she admitted. 'That's why we quarreled. And I was so unhappy that Cousin Winnie persuaded me our marriage had been a mistake, and that I should be happy again if she and I could go back to our old life together, and everything be like it was before I ever knew Robin.'

'One can't ever go back to what is past,' I said, sententiously enough.

'I know that, now. And *I* can't go back to my life with Robin.'

'That is not past. It was broken into —when you left Avignon—but it's not too late, thank goodness. Leave the ship at Port Said, and turn round and go back again by the next boat. I'll help you with passports and luggage and all that part of it.'

'How kind you are!' She was half laughing and half crying. 'But it's impossible. Even you couldn't help me with Cousin Winnie. I can't break her heart.'

'Val dear!' called a well-known voice.

I had just time to get in the obvious thrust.

'But you can break your husband's?'

'It's all right,' proclaimed the kind, breathless tones of Cousin Winnie beside us. 'Baby's gone off quite quietly, dear wee mite, and I sent Nannie to get her supper while I stayed outside the cabin just in case Baby woke again.'

'Oh, Cousin Winnie! All this time?'

'I was quite all right, darling. I just stood in the passage, and made a sign to anyone who came past to go *quietly*, and I made the stewardess hang something over the electric light just outside, so now we can keep the door open and it'll be so much cooler for Baby—'

I moved away. I really didn't know what I might have said, if I'd listened any longer to the prattling stream of Cousin Winnie's officious absurdities.

THERE was no longer any doubt in my mind that what Valerie West wanted, in the depths of her silly, loving little heart, was to get back to her husband again and have him, and their child, to herself. The only thing that was holding her back was the dreadfulness of hurting devoted Cousin Winnie.

If only they would quarrel! But I felt sure there was no chance of that. Cousin Winnie wasn't the quarreling kind. She'd be grieved, and harassed, and anxious, and even heartbroken, but not angry, whatever happened. The unwelcome, altogether frightful, idea crossed my mind that I ought to tell her straight out what a lot of mischief she was doing, and how thoroughly she was managing to spoil life for Robin West and his wife, and probably the baby as well. The question was, whether she would believe me. But anyway, she'd be pretty sure to refer the question to Mrs. West, and so give her the opportunity that she hadn't courage to take for herself. I walked up and down the deck.

'If I could believe that,' said Cousin Winnie, 'I wouldn't mind so much.'

Presently Major Adeane joined me. His first remark nearly made me jump into the air.

'What a splendid sort of woman Miss Keynsham is!' he said.

WAS he being satirical—or was he thinking of the way in which she'd mopped the ice cream off his boots with her pocket handkerchief?

'Always thinkin' of other people, isn't she?' the Major went on, and his tone now left no doubt that it *was* the ice cream, or something analogous, that had moved him to enthusiasm. He was *not* being satirical.

'I don't know that I've come across a more unselfish woman, except my poor wife. Funny thing to say, perhaps, but Miss Keynsham somehow reminds me of poor Millicent. She seems to enter into other people's interests so whole-heartedly, and make them her own.'

'Yes, she certainly does.'

'Of course I admire her devotion to little Mrs. West simply tremendously but it seems to take up all her time. And really, a good-looking woman like Miss Keynsham ought to be thinkin' about her own life, it seems to me.'

'Yes!' I answered, with a fervor that should have gratified him. 'Indeed, she ought. I—I wish you could persuade her of that, Major.'

'Yes, yes. I wish I could, too,' said Major Adeane thoughtfully.

'Tell her about your daughters,' I insisted. The poor Major had been left a widower with five little girls, all under twelve years old. 'Ask her to help you about a governess, or a nurse, or whatever they're to have. Get her to recommend a good dentist for the one who's had trouble with her teeth. Ask her to go with you and take them all to the zoo when we get home. She'd simply love it.'

'By Jove, d'you think she would? But she'll be too busy for that kind of thing. She and Mrs. West are going house-hunting.'

'She won't be too busy if you can make her feel you really need her help,' I earnestly assured him. 'You know what she's like—how ready to devote herself.'

'One hardly likes to take advantage of her unselfishness,' said the Major gruffly, but I could see that the idea appealed to him. It should be no fault of mine if he didn't put it into practice within twenty-four hours, but he did, and I gave him every assistance.

I told Miss Keynsham all about the five little girls myself, and hinted that one of the poor, tender-hearted Major's chief forebodings was that of having to take the youngest-but-one to suffer at the hands of the dentist.

'It's a woman's job, isn't it—and the poor old fellow doesn't seem to have any women relations. I don't know what he's going to do.'

'Oh, I am sorry for him!' said Cousin Winnie. 'Couldn't one possibly do anything to help, I wonder? Perhaps, once Val and Baby are settled in nice quiet rooms, I might be able—'

'He wants to ask your advice, I know,' I said gently.

For the very first time on the voyage, Mrs. West's nurse was left on duty looking after the baby the whole evening.

Cousin Winnie was sitting on deck, conversing earnestly with Major Adeane, and Valerie West, with startled eyes, was allowing me to draw up details of her return journey to Rangoon, direct from Port Said.

I never actually got a verbal assent out of her, but it was implied in her words, spoken just as she left me, after more than an hour.

'But, you know, it all depends, doesn't it?'

'Only on yourself.'

'I can't break Cousin Winnie's heart,' said Mrs. West wistfully. But last time, she'd said it desperately, so I felt that we were getting on. I had not, however, expected the climax to come so suddenly as it did come.

ON THE night before the ship was due to touch at Port Said, Mrs. West mysteriously found her courage. I was destined never to know exactly how this came about, whether through some obvious preoccupation of Cousin Winnie's own, or a definite question of hers as to the future—but I couldn't avoid knowing that they were at it hard that night, in the cabin exactly opposite mine. Talking and crying and hushing each other down on account of the baby, and then talking again.

I banged my door and cleared my throat in vain. At midnight, the baby woke and cried, and then, from the sounds, I deduced that it was being rushed down the passage to the nurse's cabin. Evidently they wanted a free field. And the talking, and the crying, went on and on and on. I couldn't, of course, hear a word, but the sounds were unmistakable.

There was more of Cousin Winnie, of course, than of Val. She must have pleaded, and exhorted, and argued, and bewailed and implored. And I have no doubt that little Mrs. West, listening to her, and crying hard, gave in twenty times, and twenty times took back her words.

It was three o'clock before I could get to sleep, and then they were still at it.

It was no surprise to me when Mrs. West didn't appear at all next morning, and Cousin Winnie, who was as white as a ghost, with dark rings round her eyes, said that 'Val hadn't had a very good night.'

I found her on deck later, collecting some things that her cousin wanted, and she looked me straight in the face and said, 'Val's told me that you know all about it, Dr. Page. Why have you advised her to go back to that terrible climate?'

'I've advised her to go back to her husband, Miss Keynsham. I'm old-fashioned enough to think that not only does her duty lie with him—but her happiness.'

'If I could believe that,' said Cousin Winnie with trembling lips, 'I wouldn't mind so much.'

ODDLY enough, I believed her. She did adore Val, and she did want her to be happy, but she'd made the mistake of thinking that it is possible to live the life of another person for her. And when a woman has been making that mistake for twenty years, she isn't likely ever to realize that it is a mistake.

'Perhaps you don't understand how delicate Val has always been,' she began. 'And she's most terribly sensitive. I haven't a word to say against Robin, but he'll never understand a woman like Val—never. I can't tell you what the atmosphere of strain was like, in our last six months out there.'

Well, it wasn't any use explaining to her that there wouldn't have been any strain, if she herself hadn't been there.

I did the only thing that I could do—listened to her, and left her as quickly as I decently could. And then I found Major Adeane and said to him:

'Miss Keynsham is frightfully down on her luck this morning. I dare say she'll tell you about it, but you know what she is—the very best way to take her mind off her troubles, with a woman like that, is to tell her some of your own. Don't think I'm butting in, but she did tell me that you were going to show her the photographs of your little girls. She seemed awfully keen about it.'

'I've got them here to show her,' said the Major quite eagerly. 'Wonderful, what an interest she takes. And I can't tell you the amount of trouble she's been giving herself, looking up addresses for me—schools, and dentists, and all that kind of thing.'

Mrs. West did leave the ship with the nurse and the baby at Port Said, and I myself sent off the cable for her which told her husband that she was coming back to him. The wording of it would have removed any doubts, supposing that I had had any, as to which side of the world her true happiness lay.

As for Cousin Winnie, she played up gallantly, once she'd understood that Val really meant it. But I wasn't surprised that I had no opportunity of speaking to her again at all.

The Major said goodby to me in the crowded bustle of the boat train at Plymouth station. It was a wet, warm day, but he was throttling in the folds of a huge knitted muffler.

'Miss Keynsham says I can't be too careful of bronchial trouble—not that I ever knew I had the tendency, before, but still, I dare say she's right. She hunted up this magnificent comforter for me; had to get the box specially out from among the luggage, and gave herself no end of trouble. And, I say, old fellow, she's coming to take the kids to the zoo on Sunday.'

Seagoing Libraries

(Continued from page 14)

gifts of Californians are conveyed by merchant ships to the landsmen of many of the out-of-the-way ports. In addition to the books which men usually care for, juvenile books and women's magazines are sent to the 'school marm' for distribution in her community. The largest number circulated on water, like those on land, are of course fiction.

Books and magazines are also supplied to sick seamen at the United States Marine Hospital in this port where a branch of the Seamen's Church Institute is located.

Putting the public library upon the seas is beginning in the same way that the public library grew up in our towns and cities. A few interested persons formerly gave books and money and solicited the same from citizens in their communities. Women volunteered to keep the library open certain afternoons in each week. Finally enough residents were interested to vote support of the library from public funds raised by taxation.

American boys employed as seamen are necessarily deprived of so many privileges and opportunities which they have when on land.

Libraries placed on ships contain three-fourths fiction and one-fourth nonfiction, a United States history, a world history, a book of travel or adventure, a life of some prominent person, volumes on health, cleanliness, diet, chemistry, mathematics, geography, grammar, citizenship and other subjects and, last but not least, a Bible or a New Testament. Ships going on long voyages are supplied with encyclopedias, technical books, and primary and secondary textbooks are given to any sailor for the asking. It is thus we try to encourage seamen to make the most of their opportunities and of their abilities.

Each week day we drive along the waterfront in the Institute automobile, which is equipped to deliver the library boxes to the ships. All ships desiring books are supplied with circulating libraries or with discards, which can be given away to others hungry for something to read. Libraries form the most abiding kind of social service. The religious, educational and recreational features of the sailor's land impressions fade away as the ship puts out to sea while each book read recalls the kindness of friends in California, ministered through the agency of the Seamen's Church Institute. Modern seamen, unlike the tars of former generations, are great readers. They pronounce the library service the best thing that is done for them in the port of San Francisco.

Sailors like anything that makes good reading, mostly fiction, of course, tales of action, daring, bold adventures, detective stories, yarns of land or sea, just so the telling smacks of thrills. Sailors do not like mushy love stories and are not interested in reading complex sex problems.

From Cornfield *to* Campus

By G. H. DACY

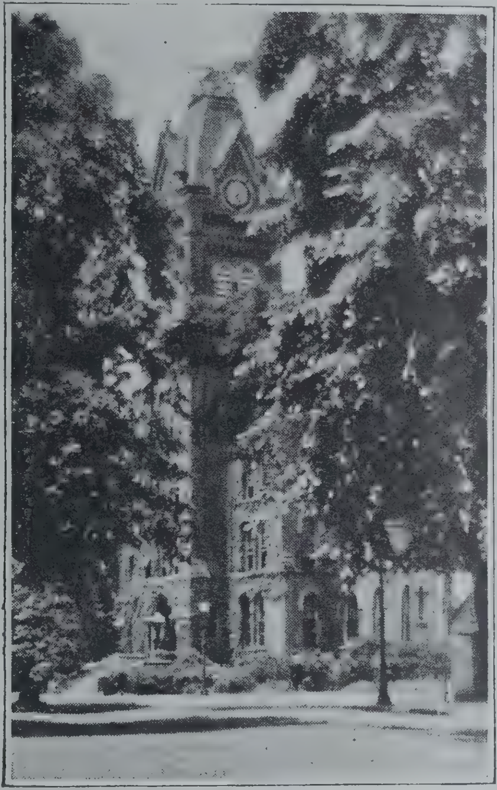
THE beautiful campus of the Ohio State University at Columbus—it covers 1,077 acres—was once the heart of mammoth cornfields; the story of the remarkable transformation which has converted the agricultural lands into one of America's finest homing grounds of state-wide education is an epic of romance and arduous achievement.

Originally a land grant college known as the Ohio Agricultural and Mechanical University, the Buckeye institution has developed from an obscure farming school with a total enrollment of but seventeen students to the fifth best institution of its kind.

A half-century ago, the Ohioan institution had but three buildings and seven professors. The total income was less than $40,000 a year. The elapse of fifty years has completely changed the perspective of the picture. Today the university has sixty-four buildings, eleven colleges and seventy-three departments of instruction and research.

The first graduating class in 1876 was composed of half a dozen students. About that period the institution began to grow. Two years later when the name was changed from Ohio Agricultural and Mechanical College to Ohio State University, the enrollment aggregated 309 students while the faculty was augmented to a dozen. From that day to this, the expansion and development has been solid and substantial. Recently, it has also been epochal in the large increases in the student body.

The university now includes every field of education and investigation. Research in agriculture, engineering, business and commerce, banking, law, science and every other educational agency is constantly in progress. Twelve years ago, Starling Medical College, the logical development of five distinct and separate schools of medicine, was absorbed by the state university. During the last decade the departments of commerce and journalism have made surprising growth and now rank among the foremost in America.



University Hall Tower.

A noteworthy educational conference convenes annually at Ohio State University. Four thousand school-teachers flock to this center of learning to familiarize themselves with the most modern achievements of educational effort. The Bureau of Educational Research is constantly delving into the problems of the country and small town school, the community high school, the grade and grammar schools. All the invaluable information gathered from this investigation is immediately circulated to every village and hamlet so that the state-wide system of schools may benefit.

During the last thirteen years, Ohio State athletics have experienced the most meteoric rise and expansion recorded by any school of similar size during the last half-hundred years. The culmination of this athletic success was the erection of a mammoth stadium. The huge concrete amphitheater seats 63,000 and cost $1,433,000.

The Ohio State Alumni Association with 6,500 active members is one of the largest organizations of its character in the country. The first Friday in December is celebrated as 'Ohio State Day' in all sections of the United States where graduates of the university reside.

A Day Among the New York Publishers

(*Continued from page 13*)

Don Stewart as one of our most provocative humorists.

Allan Rinehart tells me of others, of *The Flying King of Kurio*, by William Rose Benet—'a kingdom of joy, nonsense and adventure,' written for Mr. Benet's own children; of *Love in Greenwich Village*, by Floyd Dell; of a serious book, *American Villagers*, which I discover afterward is statistically absorbing. But he does not mention his own mother's latest book. I leave him, and make my way to the Fifth Avenue that extends beyond 42d Street.

Here, in their order, on the left are the publishing houses, G. P. Putnam, Brentano's and Alfred Knopf, with Scribner and Dutton on the right. Putnam's is an open shop (I mean without a browsing corner); everywhere there are books and one can lean against a salesman without his noticing it and read to one's content. Brentano's, the largest retail bookshop, strange to say has no browsing corner. It is highly ornate, very modern, decorative, and classified. But some day they will have a secret nook where book lovers may hide themselves from the vulgar. Across the way on the other side, Scribner's is the same—with a whole lower floor devoted mostly to fine bindings. Years ago, when Scribner's was on lower Fifth Avenue, they told me a story something like this:

A certain man was in the habit of coming in there and buying rare books. He always came with a kind of secret, mysterious air. Paying for his books, he would sidle out. One day they had a first folio Shakespeare the price of which was five thousand dollars. For a long time the man came in and viewed that book. One day he succumbed and bought it, paying the price. A few days afterward a woman came in. Her face was stern, her manner forbidding.

'Did a man who looked like'—describing her husband—'come in here several days ago and buy a certain book?' she inquired. The clerk, discreet, was not for saying, but she pressed him. Finally he admitted it.

'And did he pay $200 for that book?' she asked.

The clerk went into conference in the rear. He came back.

'Yes, madam, that is right.'

'Well,' she exclaimed, 'I knew he was a fool but I didn't think he was that bad.'

The three big publishing houses either on Fifth Avenue or just off are Putnam's, Scribner's and Dutton's, and none of these houses has a distinct browsing room; one may step into their shops and survey vast collections of books, without interference. But at Knopf's there is an inside browsing room which you don't see from the outside. Their specialty, you know, is foreign stuff.

This is as much as one can do in a day, although there are many more publishers in New York, all of whom are interesting folk—Harcourt Brace and Company, Appleton's, Boni & Liveright, Simon and Schuster. But I am already exhausted and go to hide for a few brief moments in the library of the elder J. P. Morgan.

Inside, the atmosphere and charm are indescribable. Miss Green, the librarian, told me of Mr. Morgan's dinner to the mathematicians of both continents, and of how his old German professor rose and said that if Mr. Morgan had only stayed on there, 'he might have had my place.'

In conclusion, I should like to ask as Sir Gilbert Parker so recently asked, What are we going to do about so many books? Who is to read them? And if we do read them, who then is to read the old ones?

Not only is it true that we are a reading people, but it is also true that we read better and better books all the time; and this along with the other fact that we seem to be flooded with worse and worse ephemeral literature. The two movements go side by side. Our newspapers and periodicals are the best, and the worst, in the world. The young man who came in yesterday to fix my telephone told me there was nobody like Zane Grey 'because he tells the truth.'

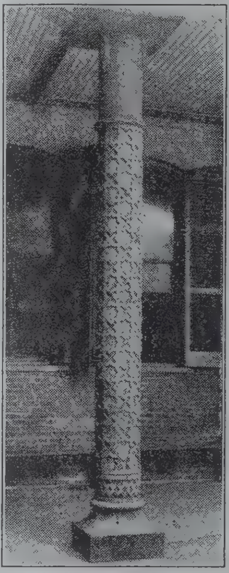
So there you are!

Gates of New Orleans

(Continued from page 9)

on the Convent of the Ursuline Nuns, erected in 1733, is probably the oldest still standing, while that on the Cabildo—the ancient Spanish council building—put up in 1795, is the second. The balconies, gates, brackets, panels and fences of the oldest period are all of wrought iron, the very earliest being welded at the joints and tapered at the ends, and the latter riveted and not tapered.

Cast iron came in at a date not definitely known, and was introduced partly because of the greater ease with which it could be made in many patterns and partly because of the lower cost as compared with wrought iron. The Pontalba Building, claimed to be the first apartment house erected in the New World, and the first to contain stationary bathtubs, was built in 1849, and it shows probably the finest examples of cast iron of any structure in the city. Up to the time of the Civil War, cast-iron ornamentation was considered almost indispensable on every building erected in New Orleans. With the coming of the war, and for a long period afterward, the people of the Crescent City were not in a position to erect new buildings, either commercial or residential, far from adorning them with any sort of expensive ornamental work. Thus, as the wrought iron had yielded to the economic factor of greater cheapness of cast iron, so the latter, in turn, passed out because of economic conditions brought on by the war.



Old cast-iron pillar of Moorish characteristics.

For this reason, there is little of either of these forms of art coming down to us from a later date than 1865, and none from later than 1870, so far as present investigations have developed. One of the remarkable attempts to use cast iron was the construction of a hotel, on the present site of the modern building occupied by the *Times-Picayune*, entirely of cast iron. The exterior of this structure was completed just as the Civil War opened, and it never was completed. It stood unused for many years and then was taken over by one John Gauche, who used it as a headquarters for his business of importing china. Some twenty-five or thirty years ago, this building, probably the only one of its kind in the world, was destroyed by fire, notwithstanding its metallic exterior and frame. Only one pillar remains, and that is preserved in actual use in the arcade of one of the buildings of Loyola University, the historic school of the Jesuits, in New Orleans. As will be seen by a glance at the accompanying photograph of this pillar, its design was Moorish, rather than either Spanish or French, and the general design of the building of which it was a part also was Moresque. The castings for this structure were made at Crystal Springs, Mississippi, by the same foundry which, during the Civil War, made most of the ordnance for the Confederate Army.

Another outstanding example of cast-iron work is the fence surrounding the residence of A. Britten, at Fourth and Prytania streets, New Orleans. The uprights of this fence consist of stalks of corn, each bearing several ears, all life-size, and each stalk entwined with vines of the wild morning-glory, whose delicate blossoms are well reproduced in the heavy metal. The top and bottom bars are cornstalks, without leaves or vines, around which the upper leaves of the uprights are twined. The section, corner, and gatepost show four stalks of corn, those on the sections and gates terminating in ears of ripened corn, with the husks thrown back to reveal the finely cast kernels. The corner posts, which are larger and four-square, also show the cornstalk and morning-glory theme, but end in four sunflower blossoms, surmounted with a basket of plantation products.

This is probably the finest and most involved example of cast-iron fencing in the New World today, and is rivaled only by a few examples in France, Spain and Belgium. Its owner has refused a number of offers each far beyond the original cost of the fence, and is keeping it painted and otherwise protected from the elements. The exact date of its manufacture is unknown, but it was probably either immediately before, during, or very shortly after the Civil War.

The cast-iron fences, doors, panels and similar ornamental work were intended to give the idea of permanence, and were accordingly massive. The much earlier wrought iron, on the other hand, was made light as gossamer in an attempt to add something of airiness to the otherwise somewhat stolid exteriors of the French- and Spanish-type houses of the period. The design of this hand-wrought iron was made differently for each house, with due regard to light and shade, position of windows and doors, character of walls, and so on, so that one looking at the house through this filmy ironwork would get a clear picture of the pattern wrought by the smithy at his forge.

IN MANY instances, as shown in some of the photographs, the initials of the owner of the building were worked into both the wrought- and the cast-iron balconies and gates. This was done notably on the old Louisiana State Bank and on the Pontalba Apartments, where the 'A-P' of the old Duke de Almonaster y Pontalba appears plainly in the cast iron. In some of the wrought-iron work on the more obscure houses, the initials remain, but the names of those to whom they belonged have been forgotten for half a century or more. Incidentally, some of the finest and most delicate of the balconies, as well as some of the most artistic patterns, are on these half-forgotten houses, once the residences of leaders in the society of La Nouvelle Orleans.

Combinations of cast- and wrought-iron were achieved with very beautiful results in a number of instances, one of them being the ancient gates of the Cabildo, the Spanish council house, erected in 1795, and still a sturdy structure, good for two or three centuries more. On the old Broulatour Building remains a protective partition between two houses, which forms the end of a wrought-iron balcony. This partition, quarter oval in form, shows on the outside a number of blossoms of the tiger lily, but with the points of the petals so sharpened that they present a well-nigh insurmountable obstacle to the thief of those days who might seek entry by way of the balcony.

Probably one of the primary reasons for the installation of this wrought-iron work was protection to house and chattels in a day when the police powers of the city were by no means adequate to cope with the adventurers in its streets. With the admiration for the beautiful usually present in the heart of the Frenchman, these home builders combined the ornamental with the useful, with the result that we have today in New Orleans a collection of old-time works of art possessed by no other city in the New World, wrought in the hardest and most unimpressionable of metals.

The Moulding of the Faun

(Continued from page 6)

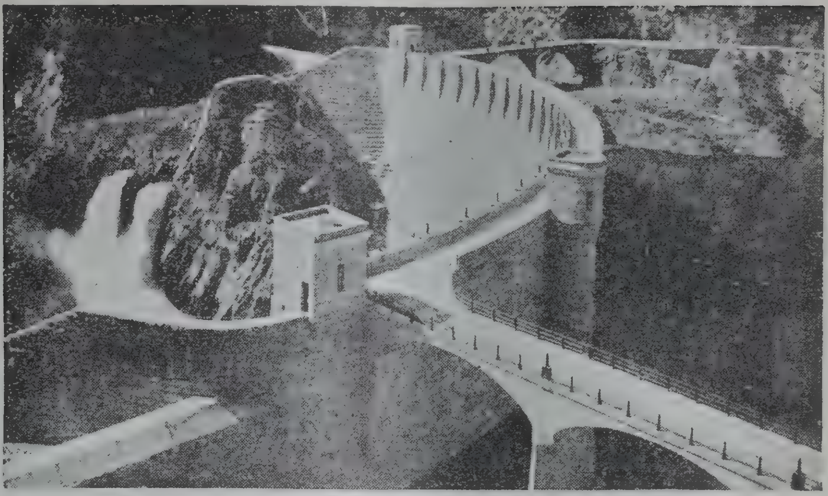
of Whitby, where we were staying for a time; and he was long in fixing upon Kenyon as the name for his sculptor. (The title of the romance itself was still longer delayed, and indeed was never settled to his own satisfaction. After the manuscript was in the hands of Smith and Elder, the English publishers, he sent them a list of names to select from. Among them was 'The Transformation of the Faun.' They liked 'Transformation' by itself: my father did not, but he yielded, the rather since Ticknor and Fields preferred *The Marble Faun*, which he was willing to accept in lieu of a better. 'The Romance of Monte Beni,' which had been one of his suggestions, they appended, the custom of alternative titles being at that time still in fashion.

All that was near threescore years ago—to be accurate, fifty-eight years in this year 1927. Critics of weight wrote admiring letters to the author; he was especially gratified by the comments of John Lothrop Motley, the erudite author of the *Rise of the Dutch Republic*. Henry Bright, one of his dearest English friends, was enthusiastic, but wanted a more definite dénouement to the tale: and most of the English literary reviews had a like criticism. Hawthorne at length wrote a final chapter, in which he professes himself to be in a like inquiring frame of mind, and interrogates Hilda and Kenyon on the subject. Their answers sound like answers, but really reveal nothing; and there the matter rests to this day.

But in fact he was somewhat disappointed, because he had hoped to invest the story with an atmosphere which would make it seem half a fairy tale, and save it from the criticisms which a realistic story might incur. But such criticism was inevitable, and there is a sort of justice in inevitability.

When the WATER COMES

By GEORGE H. STRATTON



Roosevelt Dam, Sal River, Arizona.

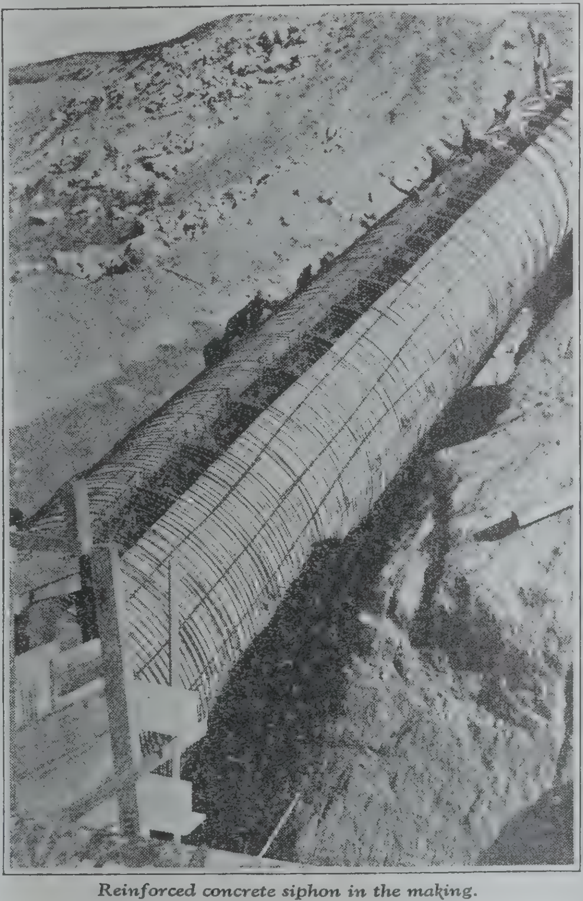
NO MATTER how tastefully arranged, a table of statistics is not a tempting picture. Curve charts of agricultural products, sharp and abrupt, arouse no interest except in the minds of sordid speculators. But figures of reclamation activities have some decided thrills; for instance, the increase of the actual cost an irrigated acre over the original estimated cost.

The settlers of these acres supposed, quite reasonably, that the engineers' estimates were correct and would cover all the indebtedness incurred in getting water to their lands. From this illusion many were rudely awakened. Coming to raw land—mostly sagebrush—with little or no capital, they were stigmatized as defaulters trying to repudiate their just debts. In view of increased costs, the settlers paid in full—or more—the total amount they *supposed* they would have to pay to get water. This additional debt or cost was forced on them without their consent or knowledge. The money was first spent, and then assessed against their farms.

WHEN they were notified that their indebtedness was three, four or five times greater than the original they protested vigorously, but the Reclamation Service authorities shook the act before them, pointing to the proviso that the total cost of reclamation must be borne by the lands irrigated.

'But why weren't we told at first what the actual cost would be?' they asked.

'Couldn't tell,' was the indifferent answer. 'Unexpected difficulties, extensions of the projects, bigger constructions and other things you can't understand caused the increase. You've got to pay!'



Reinforced concrete siphon in the making.

That was before Secretary Work's Fact-Finding commission was appointed. To the lengthy sessions of the commission at Salt Lake City in January, 1924, came delegates from each of twenty-eight projects. Many of the delegates were not actual farmers, although they were deeply interested in the welfare and good reputation of the various projects. They were representatives of loan associations, lawyers, bankers and country storekeepers, and it was clearly evident that they were more eager to uphold the reputation of their particular districts and their farming possibilities than to point to any troubles. As advertising agents, several of them were 'aces,' and frankly stated that they wanted more settlers but couldn't get them if public exposure of conditions wasn't mollified by a governmental extension of time in which to pay the debts.

Many of the delegates called attention to their excellent soil, their superb climate and the wonderful crops they could grow, incidentally bringing in the universal complaints of atrocious freight rates and wretched prices as reasons for appealing for long extensions of time to pay the reclamation costs and charges.

The farmers who came to tell of their debts and difficulties were more welcome to the commissioners than those who came to ask time while loyally avoiding any statement detrimental to their projects. Except those from two or three projects, the farmers asserted plainly that they had no wish to repudiate their debts; they would pay if they could. They related—some in pitiable detail—the reasons why they couldn't; high freight rates, low prices and, above all, the chasm of unexpected debt into which the policy of the Reclamation Service had plunged them.

It is worthy of note that although the cost ran unexpectedly high on most of the projects, it was no higher than the water was worth. It is very poor farming that cannot turn worthless

Irrigation project on a farm in Sevier Valley, Utah.

sagebrush land into a value of $100 or $125 an acre when water comes. If the settlers had been told the truth at first, if they had seen the steep rough grade ahead of them instead of a smooth easy trail, they would have been prepared.

The policy was well described by one banker: 'The business end of it—if there was any business end—figured that if they doled out the cost estimated on the installment plan they would get more settlers than if they shot in the actual cost in a lump. No doubt that has been successful in getting in poor devils who would agree to buy water for $25 or $30 an acre—on time—but who would positively have refused to come in at $100 or $125 an acre. They may call it good business, but if any private corporation did such work it would be liable to criminal prosecution for fraudulent misrepresentation and misuse of the mails.'

The only explanation of that astounding matter of costs which appeared on the surface was that after any project was decided on and work had commenced, additions and extensions were contracted for which caused extra outlay.

This explanation, however, did not brush away one fraction of the clouds of injustice. It was made by order of the Director of the Reclamation Service, and not until the additional work was done and extra cost incurred was the settler told that he owed so much more and must pay, or lose what he had already paid. It was a game of draw-poker where one player was allowed to draw as many cards as he pleased while the others were obliged to stand pat and ante-up on the first hand dealt them.

In the investigations made by the commission, the trend of opinion of all project men was that the engineering and construction work was generally most praiseworthy—the business end was atrocious.

As a result of this drastic investigation into the troubles of the reclamation policy, steps were ordered which led to improved business methods. Dr. Elwood Mead was appointed Commissioner of Reclamation under the Secretary of the Interior, an appointment which brought a decided gleam of sunshine over all of the reclamation projects, for the new commissioner had for years enjoyed the reputation of being not only a technical expert on irrigation engineering but a man of excellent business sense with ability to estimate the worth of dams, reservoirs and canals to settlers.

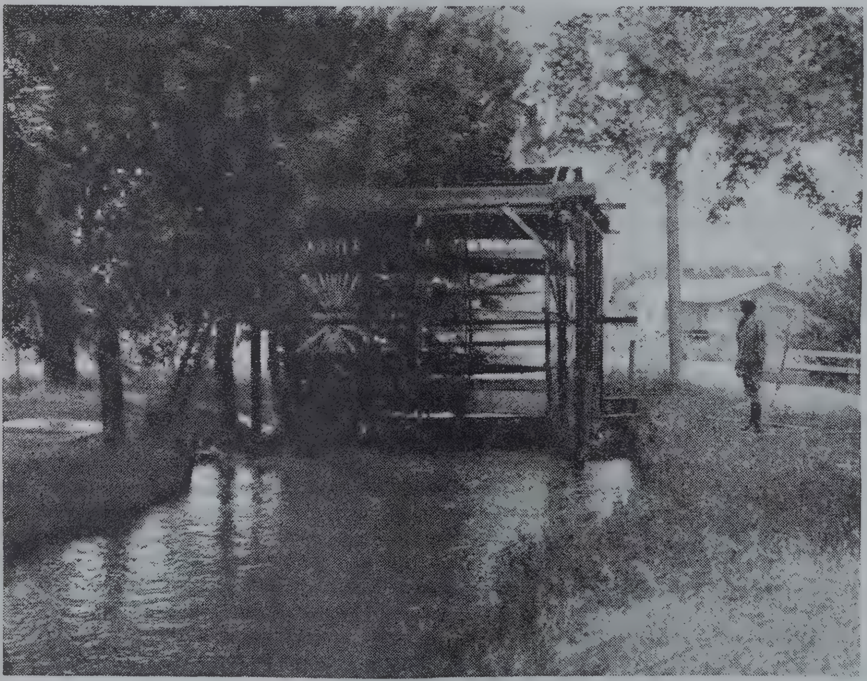
Some projects were ordered abandoned; others were resurveyed and brought to higher efficiency, while a few on which the settlers had thought they could play with the Bureau and pay or not, as they felt disposed, were notified that arrears must be paid or the water would be shut off.

A storm of protest and denunciation greeted this injunction but Commissioner Mead, upheld by Secretary Work, investigated the status of the delinquents and those who could were made to pay.

With it all, the policy of the Secretary of the Interior and of Dr. Mead, although not officially expressed, was very evidently that of slowing up on reclamation, and many congressmen expressed themselves as strongly opposed to any new appropriations until the finances of the existing projects had been put into some satisfactory condition.

Farmers generally and many men interested in some phase of agriculture have approved the policy of undertaking few new projects at present. It is generally understood by the U. S. Department of Agriculture that the present farm acreage of the United States is ample for the present needs and that improved farming methods could produce greater supply from the same areas.

The only dissatisfaction expressed has come from capitalists and land speculators who are loaded up with dry land which is worth only a few dollars an acre for rough grazing but which might, under reclamation, enhance in value to $150 an acre or more.



Water wheel north of Payette, Idaho. A flume concealed by the trees conveys the water to a higher level.

Bottles *for* Bootleggers

By A. R. PINCI

THERE exists a market, at fancy prices, for genuine empty bottles whose contents are associated by connoisseurs with their respective shapes. The most expensive bottle is the one which once upon a time contained genuine chartreuse. There are not very many of them, everything considered, and they sell at about sixty-five cents each. Before the war they would bring possibly a cent apiece from the junk dealer. Benedictine is the next highest, twenty-five to forty cents for the large bottle.

'But we don't like to sell them,' the proprietor of one place told me. 'We have a good market, and we want to accommodate only our friends and good customers. You see, we supply many restaurants and clubs. They can't pour their drinks from a stock quart bottle of plain glass. It wouldn't look right.'

'But what about labels?'

'Oh, I can furnish everything. Our trade is for completely dressed bottles. Now, take benedictine. There are four labels, the cork, the lead seal, the rubber stamp, the cap. That's what we call dressing up. And when the bottle is made up it is the real thing. Our sets are made up by the dozen, and, of course, by the gross. And my trouble is getting the bottles. The rest is easy.'

'Don't they imitate bottles at all?' I inquired.

The proprietor's face twitched. Then he smiled grimly. 'That's where I got stung,' he said. 'We do a perfectly legitimate business because we do not sell anything that is prohibited. I don't sell anything to drink and most of the one-half of one per cent cordials and other beverages you see about are just to dress up my place. The whole drinking game is a dressing-up game now, with few exceptions, and it's looks that bring the business. See those cognac bottles?'

I gazed upon a shelf with about half a hundred cognac bottles. Adjoining compartments were set aside, each for special containers, such as Gordon gin, Black and White Scotch, kümmel, crème de menthe, and a dozen other well-known brands. Then the proprietor handed me one of the cognac bottles that evidently moved him so.

The cause? Easy to discover, for there, across the face, blown in 36-point block letters, were the telltale words: CONTAINER MADE IN GERMANY.

'I bought five thousand of them, part of a twenty-thousand order. I paid for the first shipment. And then I read the bad news. I ask you, how could I sell bottles intended to contain genuine French cognac with that fool statement on the glass? And I can't give them away. I am now dickering with some people who specialize in drinks imported from Germany. Maybe they can use these bottles. I hope so. I need the space.'

For, be it remembered, the imitation drink business is not new; it is not born of American prohibition. Imitation cognacs and brandies and all other high-priced liquids were sold in this country before the 18th Amendment was ever written. Imitation drinks of this type are purveyed at every second-rate grog shop in Europe.

Your Mirror of the World

(*Continued from page 3*)

William Randolph Hearst—and very soon there was a three-cornered battle of much bitterness. Hearst needed a press association to furnish world news for many of his own newspapers which did not receive A. P. news. He could not be dependent on a competing publisher, Scripps, through the United Press. Finally, no doubt, he wanted a service of his own, to round his properties.

Today he has additional newspaper properties, acquired Associated Press 'franchises' for all but a few of his papers through purchase of additional newspaper properties, and could dispense with his news service if he wished. But it has grown more rapidly, apparently, than either of the older services in the past few years; and today stands on its own feet.

The Associated Press has, at different times, convicted both the United Press and International News of 'lifting' A. P. news, or of 'stealing' news from A. P. newspapers, and has made much ado about it. But since these discoveries, years ago, both younger agencies have grown miraculously. Editors do not seem to mind—perhaps because they themselves are ready to 'lift' a story from a competing newspaper any time they are beaten. Newspaper offices are rather busy places, offering less leisure for ethical speculation than does the classroom.

There was a time when there was justice in the charge that the A. P. took Money's side on any issue, and was dull and conservative; while the U. P. would be ranged alongside Labor; as it was true several years ago that there was likely to be a Democratic tinge to the U. P. political reports, and frequent 'Hearst policy' stories on the I. N. S. wires. But the Associated Press has been editing itself up to date; and the great growth, first of the United Press and then of the International News Service, very quickly proved to them the business office need of being square and unbiased, to be able to sell news to newspapers of widely differing complexions.

In the press association war the pot still calls the kettle black; but actually one agency is about as anxiously intent on complete accuracy as another. This is one good which competition has brought the 'ultimate consumer'—the newspaper reader.

The Associated Press operates night and day, as such. It was formed for morning newspapers originally, and the family tiffs within the organization have been based chiefly on charges that although in the United States the evening newspapers have come to outnumber the morning papers by more than two to one, and exceed in circulation almost two to one, the A. P. still pays greatest attention to its service for morning papers.

THE United Press and International News Service have ridden to success by the opposite course, that of developing news service for evening newspapers. Scripps and Hearst now operate night services, the United News and Universal Service, but these do not attempt to compete with the A. P. in its great stronghold, the morning newspaper field. They are what are known as 'feature services,' carrying the big news of the night in brief form, but devoting most of their attention to supplementary features, the theory being that the A. P. will carry to you adequately news of everything that has happened—in newspaper parlance, the 'spot news'—but that you as a reader have many interests to which the A. P. does not cater. So the United News and Universal Service lay down on the editor's desk special signed sport features, popular business and market reviews, stunt interviews, short features 'dolled up' by clever craftsmanship and more interesting than important; stories of fashion's dictates, of the theater, of movie-land, of radio; special signed articles from abroad, from Washington—and so on.

A press association is a peculiar thing. It requires years and years of grief and sorrow to build one; and when you have it built it is nothing—so far as tangible property goes.

THIS great institution which keeps you in touch—minute by minute—with the entire world, consists of:

1. A small amount of office furniture. (The writer has worked in bureaus where a couple of kitchen tables and two typewriters constituted the equipment.)

2. A contract with the telephone company leasing thousands of miles of wire for a certain number of hours a day.

3. A safeful of contracts with newspapers for the sale of telegraphic news at fixed weekly prices. (The A. P. looks upon these as 'memberships,' but that doesn't alter the case materially; except that this grants the A. P.—gratis—exclusive rights to any local news the newspaper is printing.)

4. A corps of the fastest telegraphers to be found in the country, together with operators for automatic printer machines; these to transmit the product to its destination—that is, the desks of newspaper offices.

5. That which is inside a man's head: the personal services of men who have learned how to coöperate in getting, writing, and transmitting the world's news.

In the A. P. offices men work aided by the lessons of three-quarters of a century of 'coöperation.' When the war broke, to make the point specific, the A. P. had been a national institution for more than thirty years; and it had been dominated for many years by a great editor, Melville E. Stone, who had built up a staff of veterans, and powerful foreign connections. Even so, few knew anything about covering a great war. Some few recalled precedents from the Spanish-American war, sixteen years earlier. There were a few war correspondents in the country who had skirmished in the Balkans and in China. But this one was different; and there were no precedents.

In the United Press and International News offices none was old enough to have had any war experience, except in connection with some minor Balkan troubles. At that particular moment the press associations, which began soon to make special assessments, or increase rates under certain clauses of their contracts, had 'potential ability,' rather than experience, to sell their editors.

As the telegraph caused the formation of the first press association, so, in time, the telephone came to be the biggest mechanical factor—as the war was the great news factor—causing the amazing growth of the press association in the last decade. Leasing wires for eight hours a day—or for ten or twelve, according to local needs—and manning them with telegraph operators of the highest type and highest pay, is an expensive business. The total press association bill for leased wires is well over two million dollars a year.

It isn't necessary to reach far back to recall the day when only city newspapers could afford to carry telegraphic news; and small town papers printed local news, some moderately fresh world news obtained with a pair of scissors; and 'boiler plate' or 'patent insides'—the columns and columns of 'canned' copy which filled the inside pages.

But out in Indianapolis one day a young man named Kent Cooper set out to prove that brief bulletins of the chief news of the day could be delivered to small town newspapers by telephone, in a short call and at a price they could afford to pay. This was called a 'pony' news service, or a 'telephone pony.' Within a short time all the Main Streets of the nation had their 'today's news today'—to use a slogan of one of the associations. Cooper was moved to the New York office of the United Press; and subsequently crossed no-man's-land into the Associated Press lines, where he is now general news manager, taking the job once held by Stone, and later by Frederick Roy Martin.

For a time press associations sold pony telegraphic service for a song, to 'educate' editors to the point of buying a full leased-wire report. Main Street prospered, and with it, the small-town daily. Then, along came the war, giving out-of-town news a greater importance than it had ever had in American newspaper history.

In no nation in the world is there anything like so extensive a dissemination of information as we have here. In no nation is there anything approaching American standards of integrity in the handling of news.

The rest of the world does not operate on the theory that opinions do not belong in the news columns. Bias is part of the story, abroad.

MANY men who have worked on both newspapers and press associations agree with me in the contention that not one newspaper in one hundred is as intent on accuracy as are the press associations.

Newspaper editors are quick and intelligent kickers. When a press association has grown so big that it serves six or seven hundred quick and intelligent kickers; and the opposition has a dirk in its boot and is watchful of every misstep; then there will be very little carelessness.

There will be mistakes, yes, and many of them in a year; but of important ones, not many; of avoidable ones, very few indeed; and of mistakes that are not checked up so that responsibility may be placed and recurrence avoided, in all probability, none.

Is Present Speculation Safe?

By A. R. PINCI

AN UNEXPECTED pronouncement was made by a well-known economist recently, to the effect that today the true speculator runs less risk of losing his capital than the free-lance investor.

Keyes Winter, deputy attorney-general of the State of New York, in charge of the prosecution against fraudulent and dishonest stock-selling enterprises, told the writer in an interview that the result of the application of blue-sky laws has been to materially diminish the number of fraudulent concerns and the activities of those which are still in existence though in a sort of quiescent state. Depending largely upon the comity of other states, the campaign against worthless-stock operators is extending its effectiveness to virtually the entire country. The few states which have no adequate blue-sky laws are generally considered as offering few 'suckers' to companies which would make their headquarters there.

To the extent to which the states have been able to proceed, it is believed that the campaign against worthless stocks is now attaining its greatest success. Several officials have advised the writer that the next step is preventive; that is to say, major efforts hereafter will be addressed against new fake companies.

A canvass, necessarily informal, reveals that the average person in this country today is fairly secure from the wiles of those manipulators who heretofore descended on big cities, opened luxurious offices, advertised extensively, promised lavishly, and then departed suddenly as soon as the first harvest of subscriptions was in.

According to a savings bank official, in ninety cases out of a hundred, it is now impossible for fake promoters to obtain money from the public in quantities sufficient to defray the expense of securing it, as governmental agencies are set in operation as soon as funds begin rolling in. Of the remaining ten cases, he said, at least three or four represent those who are anxious to be suckers and who therefore play into the schemers' hands.

'Now we are seeking injunctions against individuals as well as against companies,' Mr. Winter explained. 'At first the arm of the law pointed against the given company or corporation; but this did not prevent its members, or some of its members, from recasting themselves into another corporation with another name.

'At the present time there are pending about a thousand cases which the anti-fraud bureau is interested in prosecuting.'

The best illustration of the gullibility of the American investing public in recent years involved foreign currencies. As a result of the war many Americans believed that there were fortunes to be made in the purchase of foreign money. Ponzi was the first to give it a serio-comic twist. But the bulk of loss was limited to German marks. It has been estimated, according to Edward Sherwood Mead, professor of finance in the University of Pennsylvania, and Karl W. H. Scholz, assistant professor of economics, that 'nearly one billion dollars were lost by American citizens who bought depreciated German marks, anticipating their return to par.'

The Government has made repeated attempts to pass a federal blue-sky law. The Denison bill was the subject of some bitter arguments in the House of Representatives two years ago. It aimed to prevent the interstate sale of fraudulent securities, making this a separate offense from the use of the mails to defraud.

'The present laws, so far as the mails are concerned,' Postmaster-General New told the writer, 'have been put to the severest tests and they appear to be fully adequate.'

The one chief and logical objection to blue-sky laws has been that they interfere with the development of legitimate though speculative enterprises. That it is a problem to know where to draw the line between unsound and sound stock enterprises is admitted by all concerned, from the Attorney-General of the United States down to the shoe-string organizer.

According to Mr. Winter, the authorities have no intention of preventing sound enterprises from coming into being. Permission to bring such organizations before the public for funds may always be requested. A corporation is not under blot because it is speculative; the only issue that the attorney-general in the State of New York and law officers in many other principal states raise is that there be no fraud.

The more important newspapers of the country censor their 'business opportunities' advertisements, especially those in which capital is sought. Nevertheless scores of such advertisements appear daily, especially in New York, Philadelphia, Boston and Chicago.

IT HAS been said, and rightly, that several of our multimillionaire enterprises would not exist today had a blue-sky law been literally applied to them at the time of their organization. But it is pointed out that initial funds have always been obtained privately; the appeal to the public for funds comes after results have been achieved.

Private financing is easier today than public financing. The object which members of Congress have borne in mind in connection with blue-sky legislation is that the right of inventors and organizers to form their own companies and organizations, independently of related corporations, must not be sacrificed, and that legislation which would preclude public financing of purely speculative character would be unjust and uncalled for, while it would not prevent 'private fraudulent enterprise from taking its toll.'

It is quite true that 1926 proved disastrous to professionals much more than to the public; but this declaration benefits the public nothing, since professionals must get their funds from the public. Like law, which has its origin in government, professional stock operators depend upon the investing public for their funds. If they did not get them one year they got them another. And the professionals' gains are quite liable to be the public's losses.

'If I told you how much I have lost in six months,' a florist whom I know well told me early in May, 'you would call me what I have been calling myself for many weeks. With $90,000 in excellent securities in a falling market I could not borrow $10,000 to protect my margins. I had to let go of everything except one item. When I get through, the $100,000 paper profit I had last November, at the height of the bull market, will show me about $11,000 in real cash. The loss does not take into account the sacrifice of my time, the worry and tear and wear, or even the cost of running my automobile from bank to broker and back to the store many times a day for weeks.'

It was an accepted belief, until a short time ago, that 'at least a billion dollars are lost through fraudulent schemes in this country every year.' No economist is willing to admit this today. That a very high percentage of loss through fake stock deals still occurs is not denied, but what seems more important is that the regular stock markets offer greater opportunity for loss today than has been suspected.

Servant Problem

(*Continued from page 15*)

him that he must pour boiling water over the dishes afterward and wipe them dry. I had also given him plenty of dishcloths and tea towels. That morning while making a cake in the kitchen, I stood where I could look into the butler's pantry and watch the coolie wash the breakfast dishes.

I was delighted with the interest he seemed to take in getting the water at the right temperature, and in using soap enough. But my delight just oozed when I saw him bend over and with the dishcloth wash his face, his neck and his ears, taking unusual pains, it seemed to me. He wiped on the drying cloth. I watched to see what would happen next, the while forming my plan of action when the right moment should come. He started to put the dishes into the pan—that was my cue!

Unfortunately I speak no Chinese, and the coolie not even pidgin English, and so I had to press my point home by pantomime and a series of 'ah-oh's'; but I put it over at that. I registered surprise and horror at what he had done, and scowled the while, till it was impressed upon him that I was very angry. Then, taking the dishcloth out of the water with stove tongs I burned it. When I dropped that dishcloth into the fire I thought the poor coolie would cry. He begged for it—showing me by pantomime the many ways in which he could use it. But the cloth went into the fire, and the nice hot water was dumped out of the pan, which he then had to scour inside and out with cleaning compound. After that the pan had to be washed and scalded, and the dishes washed. Unfortunately I sought to impress upon him my disgust and hesitancy about trusting him to wash dishes by doing them myself, and thereby I 'lost face' with him. To have lost face in China is a sad, sad condition to find oneself in. I don't think I ever quite regained my standing with that coolie. To think that a 'missie' would so lower herself as to wash dishes—a coolie's pidgin (work)—was an offense not easily overlooked.

When Debt CLOSED the Schools

By EMERSON ROBINSON

EARLY in 1926, the people of Ohio were startled by announcements from a number of communities that the schools would be closed indefinitely; they were further startled by similar announcements that the counties themselves were in serious financial straits.

Of course, the legislature was called into session to provide legal means by which the ordinary functions of government could carry on.

Municipalities had been forced to lay off policemen and firemen; shut off street lights; stop street cleaning; throw garbage collection directly to the householder; let sewers become clogged, and halt most municipal activities.

All these evils were directly due to one thing:

The rapid increase of debt had taken so much of the current revenue and used it on maturing bonds and interest, that there was little left to operate schools or cities; and, latterly, counties.

Joseph Tracy, state auditor, sounded a warning of approaching disaster for all taxing districts which did not curb their expenses, limit their output of bonds, and call a halt on useless or, to put it mildly, unnecessary expenditures of all kinds.

He cited the fact that on July 1, 1924, the total debt for all Ohio districts was $818,920,044 and that a year later it had leaped to the amazing total of $879,143,684. Of this amount the debt on schools alone expanded from $203,920,452 to $219,600,460.

This meant that in addition to the bonds which had to be retired because of maturity, the citizens had to pay nearly eleven million dollars in interest. And eleven million dollars, even in those days of free-and-easy money talk, was not to be sneezed at.

IT HAD only been within the preceding year or two that the public school had had to pinch because of the money required for bonds and interest.

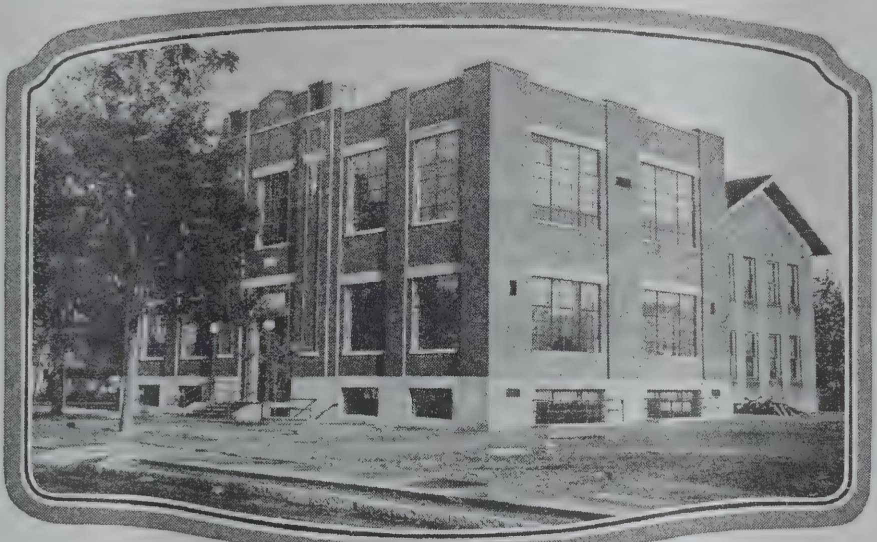
In some of the school districts nearly three-fourths of all the money raised for educational purposes was needed to pay debts.

Practically all of the financial difficulties of the Ohio school system can be traced to this one cause, with its accompanying inefficient and uneconomical administration.

The temporary closing of some schools in mid-terms, the elimination of some branches of study which had become part of the established curriculum, and, in some cases, a shortened school term, were inevitable results.

The special session of the legislature provided means for getting money, but this was only temporary. The relief was the same as that permitted the cities in 1925—an extra tax levy by petition instead of ballot vote.

Too often we forget nowadays that the teacher is the bulwark of the public school; not the ornate building to which the community 'can point with pride.' There has been fierce competition among boards of education for a 'finer, better equipped plant' than their neighbors have. Uncounted millions of dollars have been voted by the people in bonds for school buildings with little or no thought of the day when it would be necessary to meet the debt. Ohioans rejected bond issue after bond issue for general public improvements, some of them necessary; but it has seldom been recorded that they rejected a plea of a board of education for either money to build a new school or an extra tax levy to support one.



One of the modern type of rural school in Ohio. —*Pugh Photo.*

It is related that in one district the people gaily went to the polls one day and voted a bond issue with which to construct 'one of the finest school buildings in the state in a community of similar size.' When the building was completed they found out they had a wonderful plant but that it would take all of the taxes to pay interest and bonds; there was none left for operating expenses.

Of course there can be no objection to magnificent school buildings, or fine architecture in any public building. They add undoubtedly to the civic spirit; but boards of education should look first to the financial condition of their community and cut the cloth to fit the pocketbook. And they, too, should keep uppermost in their minds the fact that the building is not the principal thing.

'I would rather,' said one rural school superintendent, 'have a good teacher and a satisfactory curriculum in an abandoned barn than have the finest plant it is possible to build and poor teachers or a curtailed curriculum.'

So Governor Donahey, in one of his messages to the Ohio legislature, sounded a warning against the thoughtless expenditures of huge sums for buildings in this paragraph:

'Hundreds of thousands of dollars annually would be saved in the construction of elementary and high school buildings if the general assembly would provide a measure of state control over the caprices of overenthusiastic boards of education, which too frequently seek their advice from still more enthusiastic architects, whose fees will be high or low in accordance with the cost of the buildings to be erected.' He urged state examination by competent authorities so that unnecessary ornamentation and waste space might be eliminated.

Ohioans are proud of their schools and rightly so; their standing is second to none in America in either cities or rural sections and the most modern and approved methods of education are in vogue.

The old picture of boys and girls trudging along the country road on a blustery stormy morning with their books strapped and thrown over their shoulders and the little red schoolhouse in the offing, does not fit very well with the modern idea. Now they emerge from an auto-bus in front of a school building as modern as any city can boast. That is the ideal way, and it is the way in many school districts; but in many others, the bond and interest load has shattered the transportation system. In other instances, the one-room school still exists.

EVERY county has its centralized schools, that is, where districts combine and arrange for the erection of an especially large building of many rooms and many teachers. Every county, too, has, in addition to its small district boards of education, a county board of education, a superintendent, and under him a number of supervisors. The old school term of six or seven months has been lengthened and the school term is now fixed by law at thirty-two weeks.

Under state laws, schools are allowed a liberal tax rate within the general maximum and further are permitted, on vote of the people, to increase this by an additional levy of as many mills as people will support. In addition to this, however, there is a state fund for the aid of 'weak' districts—that is districts in which the tax duplicate with the maximum legal tax rate of $9\frac{1}{2}$ mills 8% of which must be for operating expenses, that will not yield sufficient revenue for the upkeep of the schools.

In common with the cities of Ohio, and of the nation, however, there has been an era of bond issues and competition in building which has brought an overbalanced ratio between the sinking fund and the sum raised for all purposes.

Vernon M. Riegel, state director of education, was kept busy appearing in court in cases testing the three-mill tax levy, hearing appeals for aid, and answering serious charges made public by school leaders in the affected districts. In answering one attack he made this observation:

'Extravagance means shortage of funds, and shortage of funds means lower salaries. The teachers are always the ones who have to suffer financially under such conditions. Teachers everywhere should be paid better salaries, and if educational and material wastes were eliminated from our school systems this would be possible, and the supply of competent teachers would more nearly meet the demands and needs of the children of the state, thus preventing the enormous loss resulting from poor instruction.

'You may not know that extravagances exist in school administration in Ohio but the taxpayers in many places know it. The people are becoming tired of frenzied finance in public affairs, education as well as otherwise, and boards are going to require business sense as a qualification of superintendents as well as educational qualifications.'

AFTER an extended and detailed survey of the entire situation, Mr. Riegel, in summing up his report, said:

'Heavy bonded indebtedness is responsible for considerable of the difficulty existing in school finance. Levies for building bonds are so heavy that they automatically reduce the levies that would otherwise be available for school operation. Levies for deficiency and funding bonds are so heavy in some places that a large part of the interior operating levy must be used for deficiency bond and interest payments.'

'But it's an ill wind that blows nobody good,' was the comment of the director, and as a result of the 'scare' some school officials found that there is such a word as economy to be applied to public affairs; others found a new meaning for the word efficiency, and still others found the truth of the old adage that 'where there's a will there's a way.'

The report found that, 'upon investigation it is shown that in all instances this closing of the schools resulted from failure of the people to authorize local levies for maintenance as authorized by law. In many cases the levy of less than three mills would provide sufficient funds to continue the schools for the minimum term of thirty-two weeks. In other places the closing is due to factional trouble . . .

'All the districts which are reported as being closed are one-room school sections, in none of which have proper steps as provided by law been taken by the local communities to enable them to participate in the state educational equalization fund. It is clearly seen, therefore, that the closing of the schools has been due to failure of local communities or boards of education to exercise the provisions of law for local relief and judiciously to expend the funds already provided for school maintenance.'

Thoughts *on* Psychoanalysis

By DONALD A. LAIRD

PHYSICIANS have always been puzzled by the many patients coming to their offices with complaints, in whom they are unable to find any cause for the symptoms. Some physicians estimate that as many as three-fourths of the patients who come to them are in this class.

Profound thought has been given to these medical enigmas. The case of the shell-shocked soldier who cannot walk or talk but who is discovered atop a hospital building shouting against the winds when a fire threatens the building is an example.

You know a large number of persons with analogous disorders—recurrent headaches, fainting spells, periods of poor health which appear to be greatly enjoyed, hay fever, languid semi-invalid conditions, sleeplessness, and chronic complaints; just 'shell shock' conditions of civil life.

Sigmund Freud had spent several years as a young physician in the children's clinic in Vienna. Then to Paris he went, to the drab two-story buildings of the Salpêtrière, the great mental hospital of France. Bent on the mission of solving this medical riddle of people with ailments for which no discernable cause could be found, he came to the clinic of the great Charcot.

Hypnotism was the method used by Charcot in effecting astonishing cures. In these it was also a tool for experimentation. One of the routine demonstration experiments at Charcot's clinic was the production of disease symptoms by hypnosis. In these startling demonstrations lay the germ of psychoanalysis which was discovered and nurtured by Freud.

Charcot proved to Freud and others that ideas can be made the cause of bodily disorders. And the energetic mind of the young medical graduate discerned in these unusual demonstrations a clue to many of those ailments of humankind for which anatomists could find no cause.

You will find no psychologist or physician who will deny that in many instances ailments are produced by tricks of thought rather than by germs or bodily diseases. But right about that point you will find agreement rapidly disappearing.

Psychologists are of practically one mind in believing, with Freud, that many of the things we do and say and think arise from rather hidden motives. Probably most of our daily behavior has these hidden springs of which we are not aware. Over this there is little controversy; but when psychologists begin to talk about *just what the springs are*, then you will be assured of a very hot discussion.

The way in which your daily behavior affords outlets for these springs, regardless of what the springs really may be, is extremely interesting. To the uninitiated it is rather amazing. These outlets are commonly known as *mental mechanisms*.

Take the student with just ordinary physique, for instance, who aspires, however, to be a prominent intercollegiate athlete. I am thinking of several students whose mental mechanisms I have studied. One such subject in particular is enlightening. His parents, from his earliest school days, had in mind preparing him for a prominent eastern college which is known for the 'gentlemen' it produces. With his heart set on entering this college he studied French, Latin, and literature.

Then came the turning point in his life. To a special school he was sent for the final two years' preparation. His roommate was a 'husky' who made Charles, as we will call him, appear a weakling in comparison. For some reason Charles became active in the athletic endeavors of the preparatory school, and before the year was over had completely changed his plans! He was no longer bent on going to the gentleman's college but was trying to settle on a 'he-man's' college for his final four years. He is now in a he-man's college and is active in all athletic activities—not by nature an athlete, but a student still.

I know very well another student who had by nature been athletic all his life. Upon coming to college he anticipated being on the varsity teams. But he was not quite the athlete to qualify. You will no longer find him competing on the athletic field or attending student 'pep' meetings before important games. You will find him in the library. This mechanism is that of *compensation*.

The second student is of his present opinion because he found that he was not the athlete he had appeared to be in his high school. But he must not be a quitter. So he has been pressed to find elaborate justifications for his changed attitude. And these are known as *rationalizations*.

The young married woman whose husband has been promoted starts in search of another house. 'The smoky air around here is not good for the kiddies,' she says.

So she locates a house in a better section of town where the air is good. The raise in wage is consumed in increased rent and in transportation to and from work. Was the smoky air the *real* reason for moving? Very probably not. Had the air been of the best, had there been no children, the ambitious wife would have found a reason for moving into a neighborhood of slightly higher social level than their previous neighborhood. Her reasons were rationalizations. In that psychologists will agree.

You and I are forever rationalizing and compensating. Edgar Allan Poe compensated for a feeling of ignorance by acquiring a wide but superficial knowledge of science which he wove into his stories. The undersized person sometimes compensates for his smallness by having a big show of jewelry.

Last summer a student of mine was selling automobiles during the vacation. A competitor had interested a small man in a more expensive car, and undoubtedly a better one, but it was low-hung. Using his knowledge of psychology, this student demonstrated the largest car of his line to this prospect. The sale was not consummated until the car was parked alongside the competitor's car.

'There,' said the student. 'See how big it is! Of course you want a *big* car.'

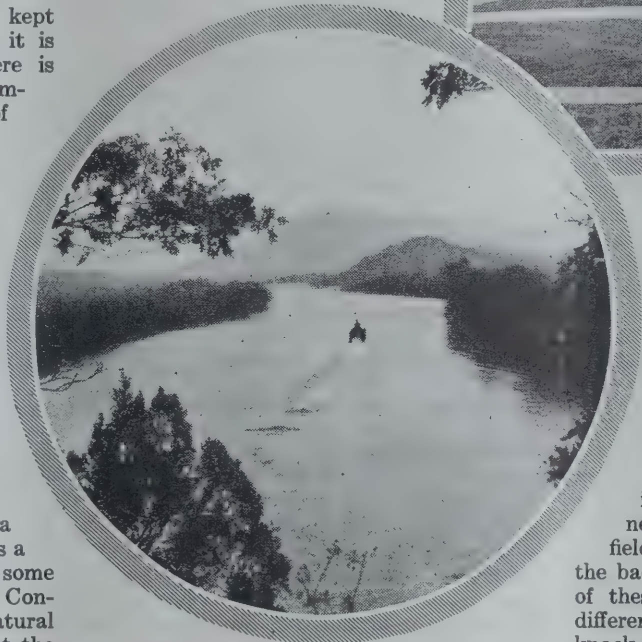
And the big car he bought, though he has to peer through the spokes of the steering wheel to see the road ahead.

Psychoanalysis, as usually conceived, is the solving of the mental mechanisms which are prepotent in any individual, without regard to theoretical convictions.

The LURE of Old Battlefields

By
HARRY E. BARNET

Below—Steamboat on the Tennessee River headed for Lookout Mountain.



The Illinois memorial. Upon the inside walls are bronze plates, bearing the names of each soldier engaged in the siege and defense of Vicksburg.

IF YOU'VE a notion that the South is a slow-poke country, where dreamy romanticism holds the biggest part of the boards, and you set out to see it in a leisurely sort of way, you'll lose the notion before you go very far. The business of trying for your particular favor is an all-southern competition. Yet it's an orderly orgy. It keeps within decent limits. Level-headedness holds the upper hand where it can do the most good. The whirl is kept honest, although the motive behind it is mostly Simon-pure selfishness. There is nothing new about this feather of competition, of course. Any other part of the country—North, East or West—will show a greater number of them, because they have more places to raise a stir about. But in these other parts of the country, the majority of the competitions travel nowhere. They work up little more than a bit of warming friction heat. In the South, such affairs are always on the 'go.' Furthermore, they're loaded with cayenne.

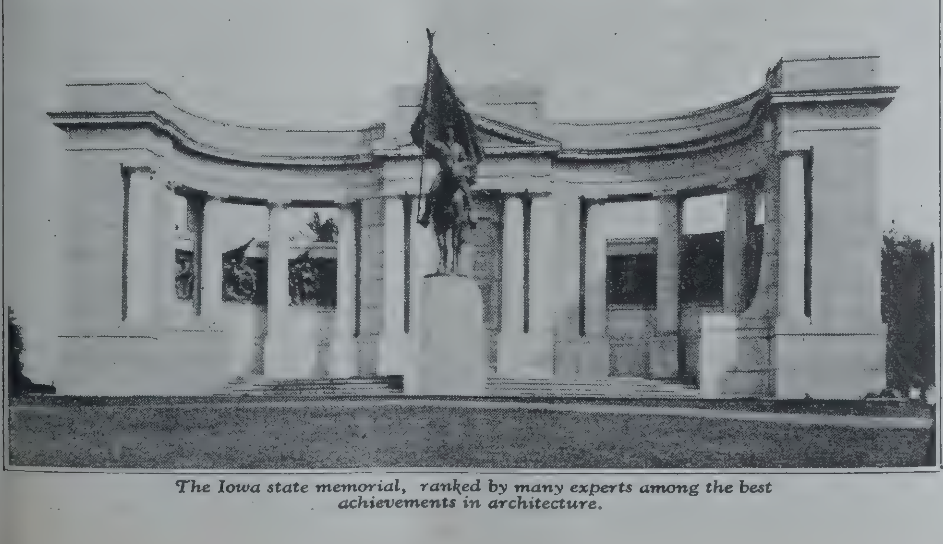
This intenseness is tremendously sustained among the big battlefields of the war between the states. Their bidding for your favor is from the ground up, inasmuch as the South has a heaped measure of scenic glory. It was a quirk of war between the states that some of the stiffest fighting of Federals and Confederates was done in places where natural splurge ran into downright flaunt. At the time of the fighting, these places blazed with physical splendor of Nature's providing. Furthermore the groundwork of none of these battlefields carries the mark of a rubber stamp. Each is something all its own—collectively they're a study in dissimilars. And the clearest illustration of what is meant is in the vicinity of Chickamauga. The latter is a prinkish valley, eastern-edged by Missionary Ridge. The western bulwark of the valley is Lookout Mountain.

Splendor freckles splendor; and distinctiveness bespots distinctiveness upon these battlefields, because they've been established as national military parks. Not national parks, for the latter lack the warfare that cut a dash in the world's affairs. National military parks, the battlefields are, whose natural splendor is undisturbed; and in which marble and bronze tell the stories of combat.

The rubber stamp comes out only as the troop positions and actions are marked and described by tablets, mortars, and cannon. Generally speaking, these are alike in all the battlefields. But this sameness is soon forgotten. The battlefields are glittering with artistry. Both the background and the foreground stories of these fighting places are a bundle of different narratives, and as far as artistic knack can do it, the narratives are plainly outlined upon monuments.

This doubled artistic splurging—that of Nature and of men—is something that smashes you at every turn you make, especially where there's wordiness, so to speak, with marble and bronze. Monuments upon which narratives have been elaborated in masses and groups of men and horses, together with the 1860's panoply and miseries of war—nothing is omitted! A profusion of narratives has been boiled down to simple shaft; and not a high spot of the narratives is missing. These shafts are not only a comfort to your overworked eyes, but they bring the biggest lumps in your throat when you stand off and look at them. Single figures spell out a volume. Incidents are recorded in massive monuments. The flourish of the raiders, for instance, which put 'Old General,' the locomotive, in its historical niche—the image of 'Old General,' done in bronze, surmounts an enormous block of stone in Chickamauga's battlefield. No inconsiderable part of the story of war between the states is blazoned upon the monuments of its battlefields.

But when you've finished your expedition, and settle back to ponder it, the scene of the siege and defense of Vicksburg scurries to the forefront of your thought. Moreover, it unwaveringly sticks there. This is because of its atmosphere, a blend of whole-hearted



The Iowa state memorial, ranked by many experts among the best achievements in architecture.

amiability with the warmest kind of personal contact.

In the first place, war between the states birthed no other battlefield like it. The Federals wrapped themselves around Vicksburg like a constrictor, and then gradually tightened the coils. The city was squeezed into surrender, despite a brilliant defense. This was done upon rolling country—hills and valleys—with the Mississippi River off to one side.

By 1863, Northerners and Southerners knew each other; and each had great respect for the fighting qualities of the other. Consequently, there were few assaults during the siege and defense. The armies didn't move around and entwine their positions. Broadly speaking, the operations were along parallel lines. The armies weren't scattered—about 1,300 acres held the battle lines and the ground between, from the middle of May to the termination of the siege, July 4, 1863.

SO IT was possible, when Vicksburg's battlefield was laid out as a national park, for the lines of operations to be marked as roadways. The inside boundary is Confederate Avenue. It closely follows the Confederate line of defense. Practically speaking, the outside boundary is Union Avenue, closely following the first parallel of the Federal Army. And there are secondary avenues and circles. In a way you see the situation from the edge of the battlefield.

More than 170 bronze portraits—statues, equestrian statues, busts and tablets—are scattered over the battlefield. And they are portraits, not idealized faces.

Pick one of them as an illustration of faithful delineation. Up to his death a few years ago, probably the most familiar figure in Cincinnati was General Andrew Hickenlooper. At the time of the siege and defense, he was a captain in the Federal Army, and his family has erected his statue on the battlefield. It shows him as he then looked—youthful. Yet, today, if this statue, unlabeled, were set down upon Cincinnati's government esplanade, no one, except the newer generation, and strangers, would hesitate to name him at first glance. The contour and expression of the general's face changed but little with the years.

The Union Navy Monument is a tremendously tall and bulky shaft. Its massiveness gives you a squashed-down feeling, as if you were a small bug under a man's big descending foot. Mounted upon stone blocks, one upon each side of its base, are heroic figures of Farragut, Foote, Porter and Davis. Each is looking off into distance. But there's nothing fixed or staring about their looks.

The bust of Brigadier General States Rights Cist, of the Confederate Army, reminds you of Hannibal. The general's father was heart and soul for states rights, and he dedicated his son to them. So he gave the general that name to clinch the dedication.

And pondering the action of the father, as well as the son's place in the Confederate Army, in this personal way you get deep into the historical significance of Vicksburg's battlefield. The decisive battles of modern times—sixteen of them—have been grouped and described by Lieutenant Colonel Whitton, of the English Army. By the word 'decisive,' the colonel intends to say, 'it could justly be reckoned among those few battles, of which a contrary event would have essentially varied the drama of the world in all its subsequent events.'

The siege and defense of Vicksburg heads the list. Small wonder! When Vicksburg gave in, the Confederacy was over and done with, although the fighting continued.

'The real truth was that by 1861,' Lieutenant Colonel Whitton says, 'North and South had resolved themselves into what might almost be called two distinct nations. Their ideals, their customs and their outlook were wholly different. The South was purely agricultural, while the most prosperous part of the North was largely industrial, with the result that in the former there was a dominant landed aristocracy, while in the Northern States, the only aristocracy which amounted to anything was that of wealth. There was little purely national sentiment. The planter of the Southern States did not say, "I am an American," but, "I am of the South." . . . More serious than the difference of views on caste and ancestry was the divergence created by the different economic conditions of the two sections of the country. To the cotton and tobacco trade of the South, free trade was necessary, while the northern manufacturers, struggling against the competition of foreign imports, clamored for protection, which they were powerful enough to secure. The feeling of dislike which had grown up in the South toward and against the things of the North was influenced by the loud threats and hysterical ravings of the demagogs . . . and these threats were interpreted as preliminary to an attack upon states rights. Southerners thought that the tirades . . . represented the true feelings of the North—the next step would be to overwhelm these states, and reduce them to provinces, and to wrest from them a freedom which they had inherited.'

Of these portraits in the battlefield, about forty have been placed there by families who had members engaged in the operations. Since the battlefield was established, about 1899, putting it in condition has been the personal life work of Captain William T. Rigby, himself a veteran of the operations, and resident commissioner of the National Military Park Board, in control of the battlefield.

The personal touch doesn't end with looking into the faces of individuals alone upon the battlefield. You're let in on the mass of men engaged in the operations—while they were in mass, and actually at work. The monuments carry bas-relief of the contest. There you have action, and plenty of it. Not idealized action, but real. It is thoroughly human.

Upon the word of a man who has studied them all, 'the scene of the siege and defense of Vicksburg is far and away the most interesting battlefield in the world.'

The Litany of Washington Street

(*Continued from page 8*)

Presidency: Jefferson, Jackson, Lincoln and Roosevelt. These all had their backwoods or their courtly magnificences. But the Constitution of the United States was cut to fit the pattern of George Washington; and it has fitted no man who has succeeded him. Whoever rides after must ride behind the cavalcade of the General and his two aides, or else go afoot.

Washington in old age was roundly denounced by all the ultra-Jeffersonians as an aristocrat, as though it were a crime. I say if he had the grand style, it was a good gift to the nation. If he had any caste ideas from the old Virginia aristocracy, it was a bad legacy, and meant that it was time for party government to begin. The first thing in his grand style, which our richest potentate dare not imitate, has nothing to do with caste—it is this red Indian self-possession and superb horsemanship. Any broncho buster can try for it. It would be mere outdoor acting if, as I say, he had not been successfully impersonating the entire American army and navy through the entire Revolution and for some time after. Meanwhile, his extreme sensitiveness to criticism from blacksmith or lord of the manor was a form of democracy. He still outbids Jefferson in the battle for the hearts of the American people. Washington's was an honest, detailed, and administrative mind, that of a sort of archangel surveyor.

Our cavalcade of three goes down Washington Street till it reaches the great West, till it passes the Blackfeet Indian Reservation with the tom-toms still beating, till the foam of the Pacific is sweeping over the breasts of the horses, and even the far-western state called Washington is behind them.

I say anything not in the grand manner is utterly out of keeping with this cavalcade; and American thinkers, writers, students, politicians, will always be torturing themselves until they surrender to the grand manner, which is a part of them because they are first the children of these three men; flippancy and jazziness in radical or conservative is merely self-immolation. We will not be a really happy set of highbrows till we admit to ourselves that Washington Street is our Appian Way; and till we are willing that our humblest citizen shall have a chance to be a king and Indian chief on horseback as much like old George as strength and sense permit.

Scorners do not get George Washington; the bitter cannot understand him; and the tiny minority of scorners who try to say a new and final word for us every six weeks miss the ornateness of the man they chirp at and patronize and despise. We need not despair of our newly growing disposition for the grand style. We have it in acres of movies, where we hardly recognize that great rainbow curve because our fathers in Europe so long ago mistrusted any great curve as the gesture of tyranny.

George Washington's very handwriting has the long rainbow curve of the grand manner; no man north of Mason and Dixon's line ever wrote willingly with such curves, or bowed so magnificently, or danced with such pomp.

Very useful scribblers with spluttery, prosy stub pens tell us the whole cynical, dirty truth about this son of the Golden Age of Virginia. They put in everything with the exception of his splendor. These men with stub pens leave out the overarching rainbow curve which was his very self, his essential signature, and which sweeps from the great deep to the great deep.

'Ere I forget thee, O Virginia, may my right hand forget her cunning!'

CHATS WITH OFFICE CALLERS

Moonshine liquor has reached the "luxury" class,' said the ***Revenue Officer from the South.*** 'The price has taken it away from the rural districts and from the poorer classes. In the old days when it was cheap, the initial purchase price was readily forthcoming. Now the price is too high for a man who must count his nickels.

'The effect in the rural districts and small towns is very noticeable. Doors of the jails in some towns are wide open and some of them have been wide open for months. One town in Tennessee had no further need or its jail with whisky "gone to the city."

'Demand for an intoxicant—and in the southern district it means demand for the corn whisky—is causing many of the old whisky element to go into the moonshining business. These men, "who have always been mixed up with whisky," form one of two classes that are doing most of the llicit manufacturing. The other class is made up of unemployed and those of no particular calling who are willing to take ong chances for the fast and huge profits.

'Oddly enough, few Negroes are moonshiners. In something like a thousand raids, not a Negro was found. We have uncovered a few black "shiners" but the plants were small, crude, and of little consequence. The Negro population in my district is comparatively large but lack of capital to compete with the big fellows and inability to turn out a grade of liquor equaling that of the more up-to-date plants has kept the black man out of the industry. However, he is used as a tool both about the plants and in the distribution.'

* * *

'Deafness is no respecter of persons,' said the ***Ear Specialist.*** 'Only one in five has perfect hearing. In adults past thirty-five, one of every three in the United States has slightly impaired hearing. The ratio of deafened people is constantly narrowing against the hearing ones.

'In another century or two, unless the spread of deafness is checked, it is predicted by Fred De Land that we shall be a race of hard-of-hearing people. By *deafened* I do not include those born deaf, generally termed 'mutes,' but people who have lost their hearing after growing up and becoming accustomed to the use of their ears.

'The hard-of-hearing people of the United States are accomplishing now what no other body of handicapped individuals has heretofore done, organizing and financing their own social-betterment work. They are not seekers of charity; they want no pity. The organizations are merely coöperative "think shops" in which, with the aid of the deaf themselves and their friends, practical ideas are gathered and tested which will enable them, with their lost hearing, to overcome the defect. The deafened may not be able to hear distinctly, but they are able to think clearly. They are deaf, yes! But dumb, no!'

'Creation of a work of art reminds me of a harvest of grain,' remarked the ***New Englander.*** 'Each represents the fulfillment of long hours of labor. I think this comparison should be emphasized frequently, because when most of us look at an artistic masterpiece, we regard it as a flash of genius rather than as the culmination of well-nigh endless toil.

'Every achievement costs its full price. Whether in writing a poem or in chiseling a statue, the human mind must strive and strain toward producing that effect which we idly admire because it is perfect. We see the stores of grain but we do not see the hours of plowing, sowing and reaping that had to be contributed first.

'If I were a genius, the joy of the service would be in the work, rather than in the culmination. I'm sure great writers, composers and artists must feel that way. It is the creative instinct that seeks expression; and once the art has been expressed the pleasure dies away and a new labor must be started. Perhaps this is one reason so many artists find it difficult to revise or improve their past work.'

* * *

'The Federal Trade Commission is not a prosecuting agency and has no powers to enforce its decrees except through a court order,' said the ***Man from Washington, D. C.*** 'It cannot proceed against individuals and its jurisdiction is restricted to cases where an unfair method of competition is practised and where the public interest is involved.

'Considerable friction has existed between the majority and the minority of the Commission on the question of dismissal of violations without publicity. In the matter of publicity the Commission is only restrained from making public "trade secrets and the names of customers." Since it cannot impose penalties for noncompliance with its orders, publicity has always been considered one of the most potent weapons at its disposal in preventing unlawful practices in restraint of trade.

'All cases involving a violation of law are cases of the People vs. the Lawbreakers. They are not longer cases of the Federal Trade Commission vs. the Respondent.

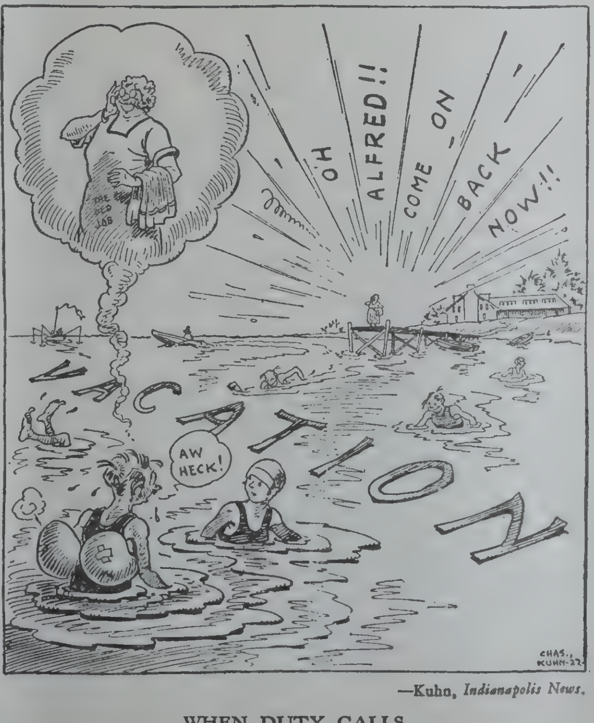
'Each and every decision of the Federal Trade Commission is important to the public welfare, and publicity of that decision is necessary in order that the public shall know to what extent their interests are being safeguarded by the officials charged with that responsibility. The public, which suffers the loss of millions of dollars annually through dishonest manufacturers, should be informed by the agency that they have created for that particular purpose without regard to "as little harm as possible to respondents" after they have been convicted of dishonesty and wrongdoing. The public may very well agree that: "I have a right to know the facts." '

* * *

'Occasionally we hear it said that the human body is an electrochemical mechanism, and electricity is the real driving power of the human machine,' said the ***Country Doctor.*** 'We hear the proposition that the cells of the human body are minute batteries, which generate the electricity to run the physical machinery. Each cell consists of a nucleus—acid in character and therefore electrically positive—surrounded by an alkaline substance, and therefore electrically negative. The two elements are separated by a filament which is said to be a minute fraction of a millimeter in thickness.

'In the living process, we are told, food is converted into sugar in solution which is deposited in the cell filament, causing oxidation and promoting electrical discharge. Thus the entire body which is composed of millions of cells becomes a battery. In response to the human will, electrical energy is carried along the microscopic wires of the nervous system, and results in muscular action. The electricity of the body moves levers by contracting and relaxing the muscles in place of turning wheels. The muscles of the body are said to be similar to an electromagnet with attractive power only when a current of electricity is sent through it.

'One interesting theory is that the brain is the positive pole and the liver the negative pole of the human battery. These two organs work together and are dependent on each other. When the great circuit between the liver and the brain is broken, and electrical discharges can no longer be carried from one to the other, coagulation and death ensue.'



—Kuhn, *Indianapolis News.*

WHEN DUTY CALLS.

CAN YOU TELL ME?

Question. What is the state flower of New Mexico?

Answer. The state flower of New Mexico as designated by an act passed by the New Mexico State legislature in 1927 is the yucca.

* * *

Q. I should like some information on Lieutenant Maughan's dawn-to-dusk flight. Did he receive any promotion or other reward?

A. First Lieutenant Russel L. Maughan, Air Corps, U. S. Army, flew from New York to San Francisco on June 23, 1924, crossing the American continent from dawn to dusk in 17 hours 52 minutes flying time and 21 hours 49 minutes including 6 stops. He flew a Curtiss Pursuit biplane with Curtiss engine. The distance was 2,850 miles. Lieutenant Maughan is still in active service. He was not promoted or otherwise rewarded for making the dawn-to-dark flight.

* * *

Q. What are generally known as the 'Fifteen Decisive Battles of the World?'

A. The ones selected by Creasy, the historian of warfare, as the 'Fifteen Decisive Battles of the World' are the following:

1. Marathon, at which, on September 28, 490 B. C., 11,000 Greeks defeated a Persian force numbering more than 110,000 men. 2. Syracuse, 419 B. C., when the besieged Syracusans turned upon the invading Athenians and almost completely destroyed their forces. 3. Arbela, the battle between Alexander the Great and Darius Codomannus which decided the fate of the Persians; October 1, 331 B. C. 4. Metaurus, at which Hasdrubal, the brother of Hannibal, was defeated and slain by the Roman army under the command of Livius and Claudius Nero; 207 B. C. 5. Teutoburg, A. D. 9, the battle at which Varus and the Romans were defeated by the Germans. 6. Châlons, at which, in A. D. 451, Aetius defeated Attila the Hun. 7. Tours, at which Charles Martel saved Europe by his great victory over the invading hosts of the Saracens, A. D. 732. 8. Hastings, at which, on October 14, 1066, Harold II of England lost his life and kingdom in battle against William, Duke of Normandy. 9. Orleans, besieged by the English during October, 1428; it was bravely defended by Goucour, who realized that its fall would bring ruin to the cause of Charles VII of France. On May 8, 1429, the siege was raised as the result of the heroism of Joan of Arc. 10. The Spanish Armada, the naval battle at which the Spanish fleet was almost completely destroyed by the British in August, 1588. 11. Blenheim, at which the French and Bavarians were defeated by the English under the Duke of Marlborough, August 2, 1704. 12. Pultusk, where Charles XII of Sweden was completely defeated by the Saxons, May 1, 1703. 13. Saratoga, October 17, 1777, the engagement regarded as the greatest check suffered by the British forces during the Revolutionary War in America. 14. Valmy, where the French, commanded by Kellerman, defeated the Prussians, commanded by the Duke of Brunswick, September 20, 1792. 15. Waterloo, at which the great Napoleon was defeated by the Duke of Wellington's forces, June 18, 1815. To these may now be added the prolonged battle of the Meuse in 1918 when the Allies under Foch turned back the German tide.

> *In this department we shall do our best to answer questions concerning Government and other matters. Write your questions clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of question.*

* * *

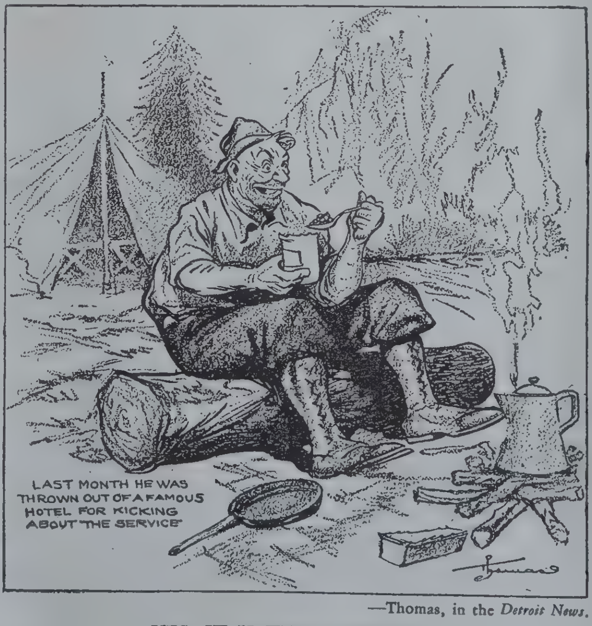
Q. What is the truth about a certain James Bird who was shot on the deck of the Niagara for desertion?

A. Lossing's *Field Book of the War of 1812* states: 'Three men were executed at Erie for desertion. One of them was a young man of some standing named Bird, who had fought gallantly on the *Niagara* (*Lawrence?*) in the Battle of Lake Erie. His offense could not be overlooked and he was shot. It was thought by some that his pardon, under the circumstances, might not have been detrimental to the public good. A ballad called "The Mournful Tragedy of James Bird" was written and became very popular throughout the country.'

* * *

Q. How wide is Egypt from north to south and from east to west?

A. Egypt extends 675 miles north and south and 500 miles east and west.



LAST MONTH HE WAS THROWN OUT OF A FAMOUS HOTEL FOR KICKING ABOUT "THE SERVICE"
Thomas

—Thomas, in the *Detroit News.*

YES, IT IS THE SAME MAN.

Q. How are the expenses of burying pauper soldiers met by the Grand Army of the Republic?

A. Rules and regulations of the Grand Army of the Republic do not make provision for the funeral and burial expenses of members, but local Grand Army Posts usually provide a relief fund from which they could by vote pay the funeral expense of a comrade. Some of the states allow funeral expenses for Civil War soldiers if they are destitute or their families are unable to pay for burial, and under the act of March 4, 1925, the United States Veteran's Bureau is authorized to pay not more than seven dollars for a flag to drape the casket, and a sum not exceeding one hundred dollars for the burial and funeral expenses of a veteran of any war, who does not leave sufficient assets to pay such expenses and when they are not otherwise provided for.

* * *

Q. What is the salary of the President of France?

A. The President of France receives a regular salary of 1,200,000 francs with as much more for expenses incidental to official entertaining.

* * *

Q. On what day of the week was July 4, 1847?

A. July 4, 1847, fell on Sunday.

* * *

Q. When was the World's Fair at St. Louis held?

A. The World's Fair at St. Louis was held from April 30 to December 1, 1904, for the purpose of celebrating the hundredth anniversary of the purchase of the Louisiana Territory from France by the United States.

* * *

Q. Can you tell me something of the history of Santa Catalina Island? How is it governed?

A. Santa Catalina was a part of the territory ceded by Mexico to the United States, and became a part of Los Angeles County in 1850 when California became a state and the counties were formed. The island was granted by the Mexican Government to Don José Covarrubias before the American conquest. He sold it to a man by the name of Packard; after a number of transfers it was purchased by James Lick who owned it for twenty-five years. In 1892 it came into the possession of three brothers, William, Hancock, and J. B. Banning. The Bannings built the hotels and developed it as a famous resort. George S. Patton also became interested with the Bannings in the development operations. Their interests were purchased by William Wrigley, Jr., in 1919. While the island is a civil township of Los Angeles County, the property is mostly owned by a few individuals including the Wrigleys who have entire control of all the enterprises on the island.

BRIEFLY TOLD

It requires a visit to 56,000 clover blossoms for a honeybee to make a pound of honey.

The grave of Betty Washington Lewis, Washington's only sister, is believed to be definitely located in Culpepper County, Virginia, and will be marked by the Daughters of the American Revolution and the Culpepper Minute Men Chapter.

Because court formalities did not permit the guard who kept watch outside the king's door to enter the king's apartment, and though the guard smelled smoke, Stanislaus Leczinski, King of Poland in 1766, burned to death when his dressing gown caught fire.

It is believed by Dr. Frank H. Vizetelly that the handkerchief in its primitive silk tissue and paper form was in use in China long before the Christian Era

Calanus, a philosopher of stoicism in the train of Alexander the Great, was never ill until he was seized with a severe stomach ache at the age of seventy-three. Believing that he had lost his health he ordered a funeral pyre and with composed countenance expired in the flames.

People in Sussex, England, once entertained the superstition that toothache could be avoided by putting the right stocking on before the left.

An eight-inch crab with labeled shell was recently captured on the Firth of Clyde, Scotland. It had been liberated eighteen months before at Aberdeen, three hundred miles away.

Felted wool was used as floor covering by the Chinese before the 18th Century.

The silkworm and the honeybee are the only domesticated insects in the world.

The Reverend Garnett Gunter, 21 years old, is the first woman minister to perform a marriage ceremony in Arkansas.

Having made considerable money from the cultivation of pearls, a Japanese firm is erecting a monument 'in memory of the oysters whose lives have been sacrificed for the pearls which have enabled the firm to prosper.'

There are nine hundred miles of silk fiber in a pound of silk. China's yearly production is 9,000,000 pounds.

The entry on October 21, 1805, in the log kept by Admiral Nelson shows that the signal sent to the fleet at Trafalgar was 'Bold Britons, follow me!' instead of the oft-repeated 'England expects that every man will do his duty.'

Because of natives' superstition that they can rid themselves of an ailment by naming their dogs for the ache, most of the dogs in the Solomon Islands are called 'Maola,' meaning stomach ache.

According to Arthur L. Adams, of the American Board of Missions at Rhodesia, South Africa, the Zulus prefer Wild West films to educational or society dramas.

There were no death sentences in Scotland last year.

Wigs nearly as well made as those of our own time have been found on the Egyptian mummies.

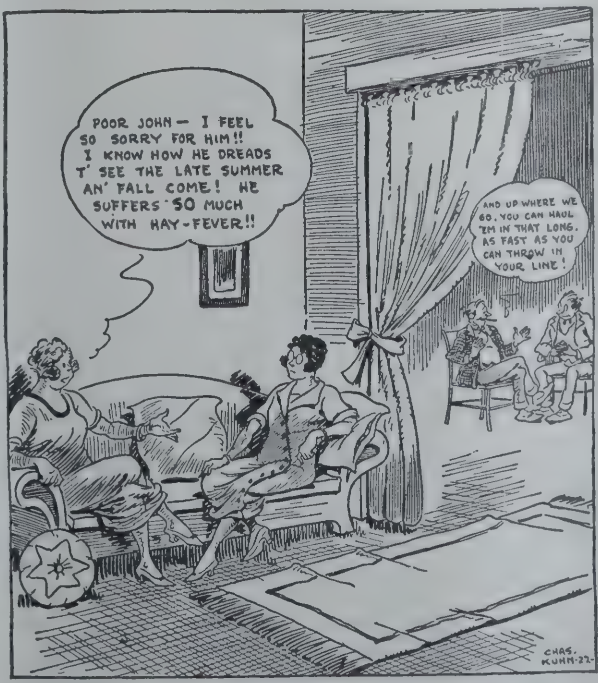
Miss Margaret Irving, the only woman tea-taster in Great Britain, tastes three hundred samples of tea every day.

Minnesota has paid $1,243,165.53 in wolf bounties in forty-nine years.

The name for the little blue berry from which Huckleberry Finn's name was derived changes so with its geographic location that had Mark Twain written his book in Devon or Somerset it would have been Whortleberry Finn, in Surrey Hurts Finn, in Hampshire Bilberry Finn, and in Scotland Whinberry Finn.

The ordinary numerals, 1, 2, 3, 4, and so forth, were derived from Hindustan by the Arabs and introduced by them into Europe.

The modern taxicab is crowding the picturesque jinrikisha out of the Japanese Islands, there having been forty thousand of them in 1897 while there are only 3,343 now.



POOR JOHN — I FEEL SO SORRY FOR HIM!! I KNOW HOW HE DREADS T' SEE THE LATE SUMMER AN' FALL COME! HE SUFFERS SO MUCH WITH HAY-FEVER!!
AND UP WHERE WE GO, YOU CAN HAUL 'EM IN THAT LONG, AS FAST AS YOU CAN THROW IN YOUR LINE!

WHO SAID SUFFERING TIME?

The executioner of the last Prince-Bishop of Bamberg was proud of the fact that he had executed 1,600 individuals.

Denmark so appreciates her poets that she places them on her civil list and pays them a regular salary from the government.

Mansfield, England, recently sent as a token of good will to its namesake Mansfield, Massachusetts, a twenty-pound gooseberry pie.

King Alfonso of Spain has a private museum which contains all the weapons and other objects that from time to time have been employed in attempts to assassinate him.

When the Members of Parliament wore swords a law was passed which forbade the speaker addressing the House to step beyond the strip of cloth which runs along the floor in front of the first row of benches, for as long as a member was behind that line his sword's point could not reach an opponent opposite. Unaware of this rule, a recent speaker was amazed at the shouts of 'Order' when he stepped beyond the line.

Hawkers sold cabbages in the churchyard of St. Paul's, London, three hundred years ago until banished by the clergy because of the noise they made.

There are enough Smiths in the United States to replace the entire population of any one of the following states: Maine, New Hampshire, Vermont, Rhode Island, Delaware, Florida, Oregon, Colorado or Utah.

Umbrellas as screens against sunshine have been used since the days of the ancient Assyrians and Egyptians, but were first used in England as protection against the rain in the time of Queen Anne.

A recently measured iceberg was found to contain enough ice to keep every refrigerator in the United States supplied for a year.

Remembering that there was a motion picture in town that he wished to see and finding his cell unlocked, Henry Laird, a prisoner at Monessen, Pennsylvania, walked out of jail and went to the show. After the show, while the police force searched the city, he returned to his cell, and was asleep when found.

The police authorities of Mexico City have passed a regulation barring burros from the street except very early in the morning and late at night, as their deliberate movements impede the modern kind of traffic.

Catherine de' Medici was the wife of one French King, Henry II, and the mother of three, Francis II, Charles IX, and Henry III.

NOTES • COMMENTS • CRITICISMS

MR. FORD'S Page this week discusses the use and misuse of time, energy and materials.

* * *

Frances Holmstrom's poem—'Houses'—appears on page 2 of the cover.

* * *

If the tree is responsible for its fruit, then industry is directly responsible for its dictators. Periods of crisis have brought them forth as a natural evolution and usually they have performed an important service in an intelligent manner. The business czar must be strong, ruthless and autocratic. Never in the history of the world has such power been concentrated in one man as in the ruler of a mighty industry. (p. 1)

* * *

The President has two shadows wherever he goes. One is the secret service cordon; the other, the press association squad. The correspondents hold the mirror to world events and flash the tidings wherever newspapers are printed. They work rapidly, dictating into the ear of the telegraph operator the description of an event while it is actually taking place. During a world-series baseball game, the swish of the bat and the arrival of the words 'Strike One' on the West Coast are almost simultaneous. (p. 3)

* * *

Hawthorne's longest tale, *The Marble Faun*, grew out of his sojourn in Italy and may have been first suggested by two masterpieces which he admired while there. One was the statue of a faun attributed to Praxiteles. The reason Hawthorne left his climax obscure, and did not terminate the book at the point where perhaps it should have been left, is explained by the author's son. This volume has met with much favor as a guidebook to Rome. More than a million copies of it were sold in one edition. (p. 4)

* * *

The smart boys have got together and proved that Washington was slow thinking; fond of farming; a British fox-hunting squire; a pacer off of paces; one with a passion for acres and rivers, to whom a book was a bore and an argument was an irrelevancy. Yet when their final words are spoken, General George Washington of Virginia still rides on horseback down Washington Street! (p. 7)

* * *

Dominique You, when he was not smuggling or pirating, is said to have maintained a forge and to have produced some of the finest filigrees of wrought iron that have ever graced the New World. The iron balconies, frames, brackets, gates and scroll-work doors of New Orleans are constant reminders of the days when France ruled Louisiana. (p. 9)

* * *

The setting aside by New York publishers of nooks for browsing among books is an interesting development, says Thomas L. Masson. It shows that the craving for tranquillity cannot be crushed out of the metropolitan heart. A day among the New York publishers, guided by this well-know connoisseur of humor, is a day of sparkling enjoyment. (p. 12)

* * *

Modern men who go down to the sea in ships from the Golden Gate take libraries along with them. Californians have found a means of spreading good cheer and good reading matter from the South Seas to the Far North. Books find new friends and even the worn and discarded volumes are welcomed, writes the chaplain of the Seaman's Church Institute. (p. 14)

* * *

The Chinese cook does not want his 'missie' to come into the kitchen. The kitchen is his own domain; and it's bad enough to have her hanging around the rest of the house! The servant problem in China has its interesting side. If you keep a dog, it must have its own 'coolie.' The head of your mènage is not a butler, but a 'boy.' And the announcement, 'Please, missie, pay chow,' is every bit as impressive as, 'Dinner is served, Madam'—when you get used to it. (p.15)

* * *

Reclamation means something more than watering arid lands, so settlers have found. They have been compelled to pay much more for water than was originally estimated, and serious hardships have resulted. Yet real estate promoters and mortgage holders protest against any criticism of methods used lest their investments suffer. (p. 21)

* * *

True speculators run fewer risks of losing their capital today than do the free-lance investors. A deputy attorney-general of New York State in an interview with A. R. Pinci explains this by the application of so-called 'blue-sky laws.' (p. 24)

* * *

The danger of too expensive school plants, particularly in communities where funds cannot be levied to meet their cost, along with interest and operating expense, is a problem for taxpayers to study. In Ohio, past experience has taught a valuable lesson. A good teacher and well-planned curriculum should take precedence over a costly edifice, says one rural superintendent. (p. 25)

* * *

'The most interesting battlefield in the world is that of Vicksburg,' it is claimed. This may be partly because the roadways are laid out along the lines of the military operations. Union Avenue and Confederate Avenue face each other. (p. 27)

REMARKS BY OUR READERS

Johnson, Arkansas.

I enjoy reading your fine publication and especially the 'Briefly Told' page. Also the page of pictures on the inside of the back cover, which I find educational as well as interesting.

I wish to call your attention to an article published on the 'Briefly Told' page in the August 27 issue, about a Maltese cat carrying her family ten miles back to a hardware store in Davenport, Iowa. If there were six kittens, and the mother cat carried one at a time, she would travel only 110 miles, not 120, as you have it. She would only have to make the round trip of twenty miles five times; and on the sixth, she would only have to traverse the distance into the city, or ten miles more.

L. H. BOSWELL.

Sunshine Valley, N. M.

Your article on Volney T. Hoggatt and the Sunshine Valley project in New Mexico has caused a large number of inquiries to be made of us here about the project. Frankly, conditions are not so favorable here as formerly and many settlers have left. I would suggest that anyone wishing to move here consult first with the state engineer of New Mexico.

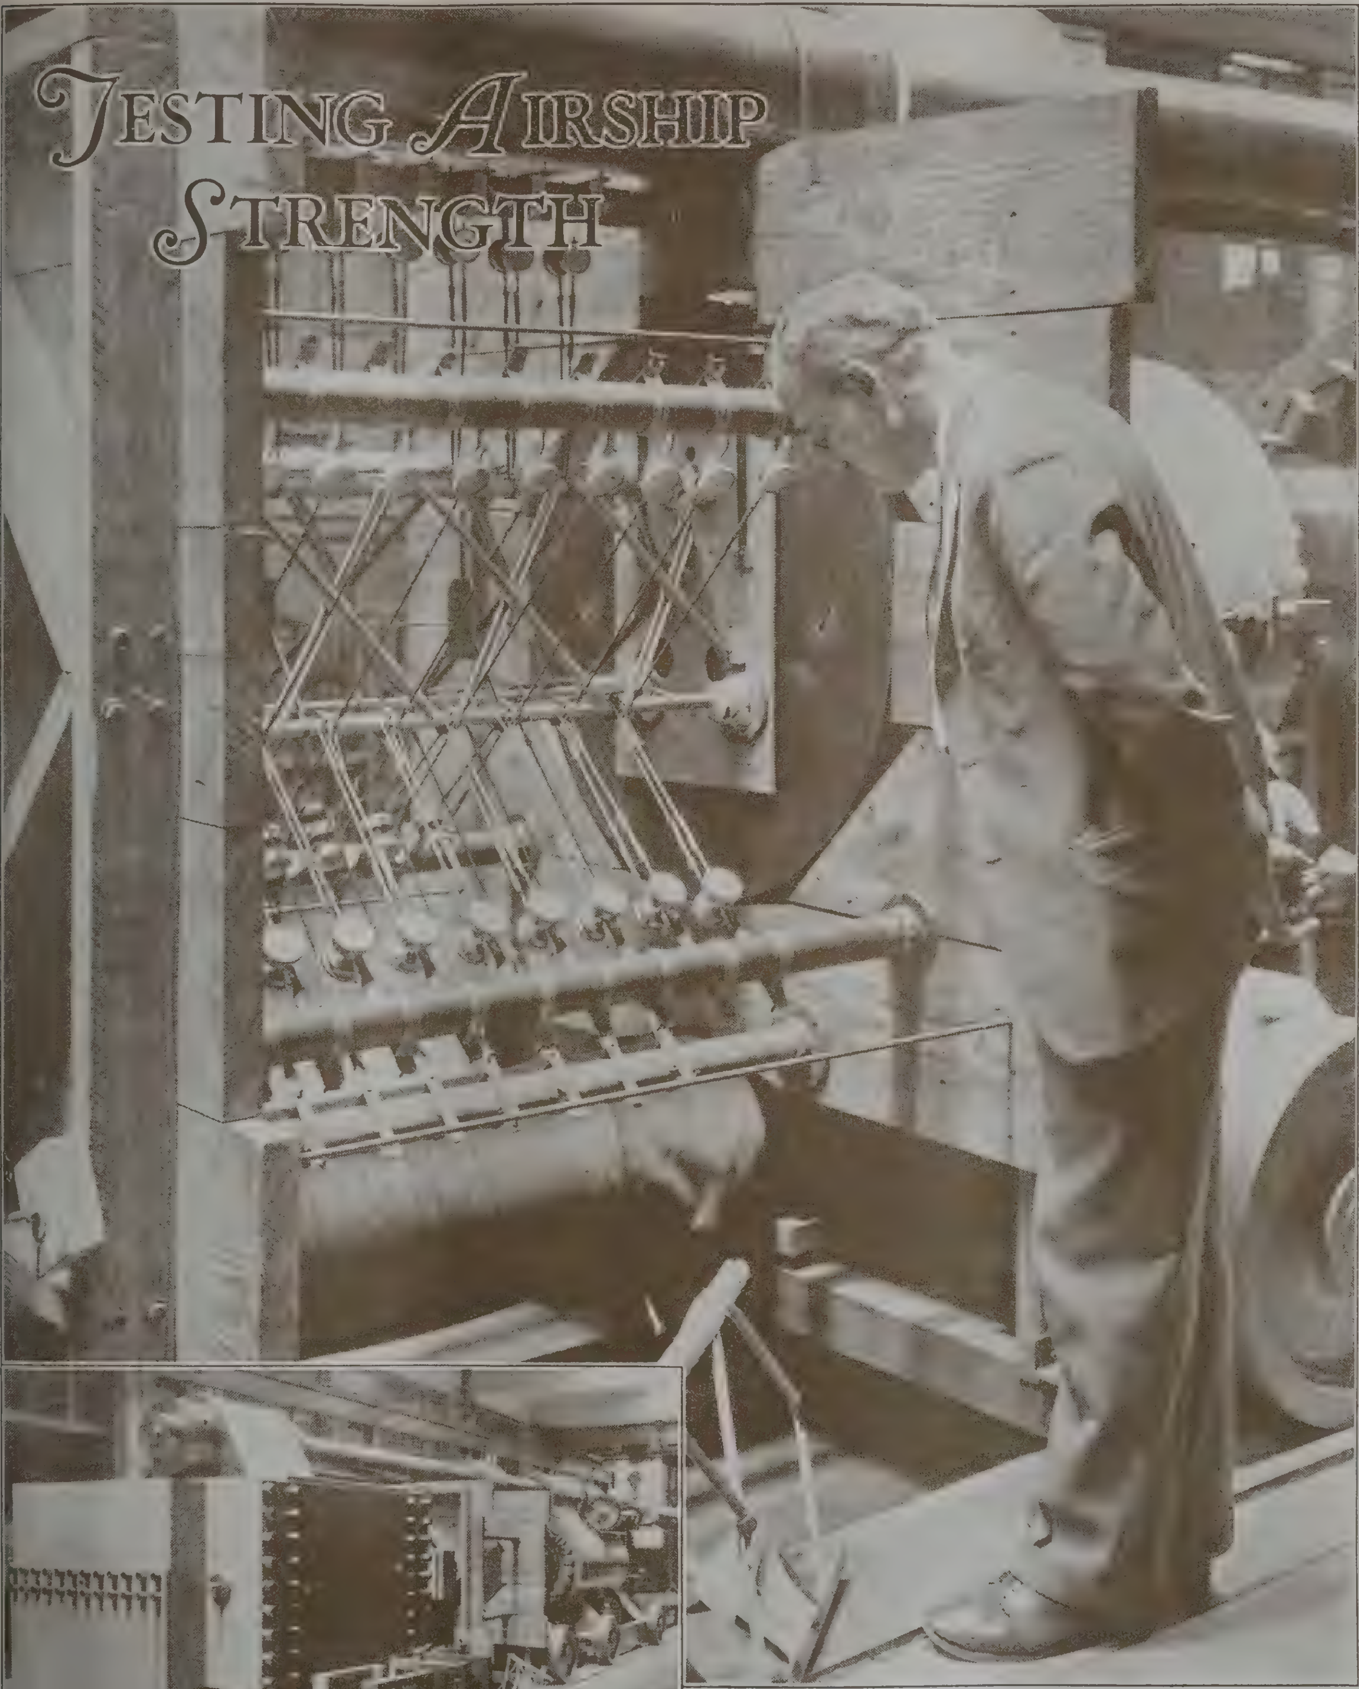
K. M. MILLER.

San Antonio, Texas.

I was much interested in your article on the 'Law West of the Pecos.' I worked on cattle in the Big Bend of Texas in the eighties. We traveled the border from El Paso to Brownsville. There are many organizations today of those pioneers, including the 'Old Pioneers of Texas,' the 'Cattle Raisers Association' and the 'Old Trail Drivers.' Many interesting stories remain to be told.

HY J. BOWLES.

TESTING AIRSHIP STRENGTH



— Photographed at National Bureau of Standards, Washington, D.C., by Ewing Galloway.

PRECISELY how much strain will an airship bear? This is an all-important problem which builders must determine definitely before their craft can safely be allowed to take to the air.

The larger of the two illustrations shows part of the business of testing an airship girder in the largest of high-precision machines. By means of numerous gauges, the operator is ascertaining the deflection this piece of metal undergoes when load is applied.

The other picture presents an end view of the same machine, which can exert 2,300,000 pounds in compression and 1,150,000 pounds in tension.

In 1926, the Bureau assisted in revising and amplifying 23 specifications for aeronautical instruments.

APPLES DROPPING

By LIZETTE WOODWORTH REESE

A CLOSE, apart, ancestral sound
It splits against the ground;
The road is full of it, and folk
Half turn around to see who spoke.

The old house hears it all day long,
Not one sound, but a throng,
Home-coming footsteps, heard before,
Fumbling a moment at the door.

A sprawled black stand the apple-trees
Up to their tattered knees
In the blurred light, in the strange grass,
As though long painted on a glass.

Yellow as broom the windows gleam
On the edge of a dream;
And in the blur of light about
That rich one sound goes in and out.

FRANCE *and* AMERICA—
an Industrial Contrast

By LOUIS C. KARPINSKI

RADICAL revision of the tariff laws, largely with a view to excluding American automobiles, typewriters, and other machinery, is under way in France. Her unfavorable trade balance with America is the subject of a great deal of concern by the politicians and economists. That this trade balance is against France only in appearance, and not in fact, rarely is noted.

American prosperity is the subject of a great deal of comment in all of Europe. Politicians have great difficulty in explaining the high wage scale in America, coupled with the low prices of American-made machinery. The tariff barrier is made to appear responsible for much of this prosperity, as well as for preventing European products from being sold in America. However, manufactured articles like automobiles and typewriters sell in Europe in competition with the European article, despite heavy import taxes.

American automobiles made by American workmen (who receive four and five times the daily wage of European workmen) sell in Europe in competition with European cars. These American cars cost in Europe almost double their price in America, owing to transportation and import charges.

Only rarely, and then by accident, does the European ascribe American prosperity to fundamental causes. Advanced methods of education, research laboratories, technical schools and the enlightened progressive policy of most American manufacturers have been responsible in largest measure for the rise and continuance of American prosperity. Methods long obsolete with us continue in use in Europe to the detriment of manufacturer and workmen. New methods leading to greater production per man are slow of adoption, owing to resistance on the part of the management and the workman. The management objects to the cost of installation of the new machinery, and the workman fears that there will be less work for him, and consequent unemployment.

European manufacturers have little conception of the fact that profits must be shared with the workers, particularly through a wage scale which will give some semblance of a living wage. The French workman does not have a sufficient wage to provide proper food and decent habitation. In consequence he is not physically able to give the quantity of production attained in American factories. The workman takes for breakfast a small cup of so-called coffee and a roll, costing three cents; or he takes a small glass of some strong drink. Neither puts a man into condition for real work.

In 1926 French exports showed a slight excess over imports for the first time since the war. However, since the imports were about fifty-nine billions of francs and exports sixty billions, the margin could be easily wiped out. It is only wisdom for France to revise the tax schedules so as to discourage imports and encourage exports.

French proposals to increase duties on goods imported from other countries will meet with most vigorous protests from Belgium and England. These two countries are, after America, the best sellers in France. Particularly for Belgium, any radical change in the tariff will be serious.

So far as the United States as a whole is concerned, the restriction upon imports from America would have little general effect. Individual manufacturers have spent large sums in advertising and in securing a foothold in numerous European countries. For quite a number the proposed tariffs would mean large losses. But this crisis should serve as a warning that advertising in Europe and the large expenses of installing branch offices may turn almost overnight into a total loss owing to some political change.

Of course the United States has a weapon which it may use to force a more reasonable attitude toward American machinery. France sells us chemicals, fruits, silks, metal tools, and iron and steel in large amounts. The suggestion of retaliatory measures would go far to induce a more reasonable attitude toward American products.

Of our imports of four and a half billions, two-thirds come in duty free; that is, three billions are not affected by the tariff. During the past four years our total imports have increased more than seventy per cent. This increase is the result of American prosperity, creating a demand for more French silks, gloves, lingerie, and perfumes, as well as other European products. It is probable that the American tariff is of direct benefit to European exporters.

French economists neglect the most important commodity sold to America, namely, France itself. *The total of expenditures by American tourists in France far exceeds the total of all French products exported to*

Literary Effort *in the* SOUTH

By AARON HARDY ULM

THE South is commonly regarded as a Sahara in matters of book and magazine publication—the latter variety being thought of often in terms of O. Henry's humorous story, 'The Rose of Dixie.' Many persons no doubt will be surprised when told that at least four excellent reviews are published in the South, along with several other literary and scholarly magazines of high quality. You don't see them ordinarily on the news stands—which may be a tribute to their excellence!

THE Rose of Dixie,' as every O. Henry fan knows, was an imaginary magazine put forth from an imagined town, Toombs City, Georgia. Yet the story of its rise and fall was, in exaggerated form, that of many attempts to establish mediums of literary expression in the South.

The magazine was edited by Colonel Aquila Telfair whose library contained 'ten thousand volumes some of which had been published as late as the year 1860.' 'The first assistant editor, Tolliver Lee Fairfax, had had a father killed during Pickett's charge; the second assistant, Keats Unwin, was a nephew of one of Morgan's raiders; the book reviewer, Jackson Rockingham, had been the youngest soldier in the Confederate Army, having appeared on the field of battle with a sword in one hand and a milk bottle in the other.' And so on—'even the girls who wrapped and addressed the copies were members of old Southern families in reduced circumstances.'

'You got to buy stuff according to its quality, without any regard to the pedigree of the author,' advised the live-wire Northerner who was brought in as manager. 'It's a magazine we're trying to make go off—not the first gun of Fort Sumter. Give the readers some change from goobers, governors and Gettysburg.'

THE climax came when Colonel Telfair ran as a leading article a message to Congress, 'by a member of the *well known Bulloch family of Georgia*, T. Roosevelt.'

Publishing efforts of that kind in the South are now mostly history. The Colonel Aquila Telfairs—alas!—are gone or are so far along in life and so overwhelmed by a generation twice removed from the Civil War that they figure little in the objective phases of life in the South.

The reaching out for native mediums of literary expression continues and, at last, seems to be succeeding—in some respects remarkably well. Though he does not know how they rank in matters of circulation or money earnings, the present writer dares declare that a half-dozen magazines now coming out of the South will stand literary and intellectual comparison with any published elsewhere.

These magazines are typical of the contrasts one finds south of Mason and Dixon's line. Within a certain and distinctive range they include the extremes. The ones that are most securely rooted lean upon the classical tradition of the past, others are ebullient in their vivid modernity. The common point of distinction is good taste, which, as to literary provender, holds on in the South as nowhere else in the country. No one of them is 'professionally' Southern in the manner of 'The Rose of Dixie' and its scrappy and scrapped prototypes of fact.

Yet, outside some severely limited circles, these publications are little known even in the South. One of the best of the lot—one so good that it was overthrown veritably by its own excellence—had, when suspended, fewer than a score of paid-up subscriptions in the state where it was published.

Two of them antedate O. Henry's amusing satire. But neither of these has ever been laden with the burden of having to become a commercial success; and, while distinctively Southern, no one of them ever has been rampant as a 'voice' of Dixieland.

One of the two referred to above is *The Sewanee Review*, founded in 1892 by Dr. Telfair Hodgson, at the time vice-chancellor of the University of the South. Its first editor was Dr. William P. Trent, now of Columbia University. It is a product of the University of the South.

'*The Sewanee Review* has had a very interesting history,' says one of its present editors, 'and has contributed much of value to the literary criticism of the past thirty years. It has been highly commended by such men as Theodore Roosevelt and Woodrow Wilson. Its contributions have come from all over the United States and parts of Europe, and include many from such writers as Galsworthy and Le Gallienne.

The other one with a long history is *The South Atlantic Quarterly*, a product of Trinity College, which is now a part of Duke University, Durham, North Carolina.

As reviews, both of these Southern magazines have ranked, among those who read them, with any published here or abroad. They survived because they were backed by institutions that did not insist on profits and also because their editors were not discouraged by meager circulation figures.

THERE are now two others of similar type and equal distinction, and perhaps superior aggression, coming out of the South. The youngest of the two is issued from Charlottesville, Virginia, out of the precincts and with the patronage of the University of Virginia, which Thomas Jefferson founded and which Edgar Allan Poe attended. It is *The Virginia Quarterly Review.*

'In the contents of its five issues,' says James Southall Wilson in the first issue of its second year, 'it has sought to redeem the promise of the first number "to be intelligently entertaining on all sorts of subjects" and to remember its claim to be "a national journal of discussion published in the South."

In this magazine there has appeared the work of such well-known American and foreign writers as Arthur Symons, Gamaliel Bradford, Luigi Parandello, Archibald Henderson, Walter de la Mare, Joseph Collins, Dallas Lore Sharp and Percy MacKaye, together with that of several others who were new to the reading public.

This magazine, which reminds one somewhat of the great *Edinburgh Review*, wherein giants of thought and expression like Carlyle and Mccaulay made their bows to the reading world, is the fruition of a plan long nurtured by that high representative of the intellectual South, Dr. Edwin Anderson Alderman, president of the University of Virginia. It conforms to what he said in 1915: 'I take leave to bring before you a dream: a magazine solidly based, thoughtfully and wisely managed and controlled, not seeking to give news but to become a great and serious publication wherein shall be reflected the calm thought of the best men.' Its future is underwritten by a group of friends of the university.

HERMAN MELVILLE and His Dog

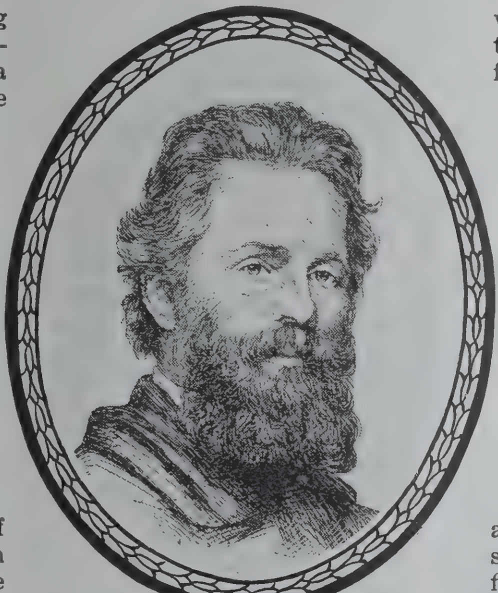
By JULIAN HAWTHORNE

IT IS some three years since these United States remembered that Herman Melville had been one of its literary assets, opened his tomb of fifty years, and brought him forth for examination. It was due to the appearance among us of a number of young persons of literary proclivity who, not satisfied with their success in poetry, fiction and drama, bethought themselves of the possible rewards of archeological curiosity.

These archeologists, questing through dusty biographical dictionaries, made the discovery that a world of letters had existed before the 20th Century, that American authors had written actual books, and that publishers had published them as lately as fifty or a hundred years ago. Treasure trove naturally seems valuable to the finders of it; and investigation showed that some of these resurrected volumes were (in the language of a late British critic) 'not devoid of a certain sort of spurious merit.' Nay, some of them were really good, allowance being made of course for the ignorance and ineptitude of such early writers. The profile sketches of cave bears and hairy elephants on the walls of stone age caverns are cordially spoken of, because we recognize the handicaps imposed upon the pre-Adamite artist.

At all events, a substantial volume appeared on our tables one morning which turned out to be a regular biography, in good set terms, of one Herman Melville (b. 1819. d. 1891). It was composed partly of such facts of his worldly career as had been accessible to the biographer, and partly of a critical estimate of his writings, rather aggressively enthusiastic; accompanying this were passages of indignant comment upon the neglect of both his contemporaries and the students of today in recognizing his amazing genius. He was *primus inter pares* of our galaxy; and yet who of our alleged intelligentsia could so much as name the titles of his works, or who had ever read the incomparable pages of his *Moby Dick?* King Tut had nothing on Herman.

Hereupon we began to ransack our garrets for possible relics of the deceased and for excuses for our remissness. Before long a new edition of *Moby Dick* appeared, which some of us read, in whole or otherwise; and we were somewhat relieved to learn that the author's *Omoo* and *Typee* had long since been included in one of the little pocket libraries of the classics. But what of *Redburn: His First Voyage, White Jacket, or the World in a Man of War* which preceded *Moby Dick*, and *Pierre, or the Ambiguities* that followed it? No publisher had been patriotic or hardy enough to republish these.



Herman Melville.

The indictment of neglect brought against Melville's contemporaries is, however, open to modification. In the first editions of the volumes named above, some of which were issued by Harper and Brothers of New York, *circa* 1849-1852, set forth on the flyleaves are a number of extracts from critical journals of the period, expressed in terms of almost hysterical adulation.

In my father's library were gift copies from Melville of all his books, the contents of which, in my boyhood, I knew by heart. After finishing a book, wishing there were more of it I would go on to reread the critical appreciations.

Fine as are many of the passages in *Moby Dick*, much may be found in the earlier books nearly or quite as good. As wholes they are superior. Nothing in sea literature, for example, is finer than *White Jacket* from beginning to end. And for us today it has a particular value because it portrays a way of life which has ceased to be and can never return. From Melville's eyes no significant detail escaped, and the episodes of his narrative—it is like Dana's *Two Years Before the Mast* —are so grouped that the fascination is cumulative. A delightful masculine humor pervades it, along with the seriousness proper to a great theme handled by one who knew it from keel to truck. It can never have a rival, any more than Dana's book can, and it is American to the core.

Redburn, which was Melville's first book, written when he was thirty, and also narrative rather than story, is almost incomparable in its simplicity and power. The character of Jackson, a ruthless and poisonous scoundrel of the seas, slowly dying of consumption, and eager only to do all the harm he may while life yet lingers in him: who dominates the whole lawless crew with a despotism of fear, though any one of them could have destroyed him with a blow: this is a figure never to be forgotten, more terrible and more real than fiction can parallel.

But the young Melville, in the freshness of his strength, before the dry rot of moral metaphysics got hold of him, knew the creature and immortalized him as only a born master can. Melville wrote only of men; there are no women in his books, except a few fantasies in *Pierre*, and the one lovely sketch of Fayaway in *Typee.* Doom hunted on his trail and came up with him long before his physical end. Had his mind remained healthy, he might have been less poignant here and there, but he would have needed no exhumation today; in all our libraries he would have been a living and loved presence. His genius was as sensitive as it was genuine.

In my child memory he is associated less with the tropics than with snows. He first became personally known to us while we were living in the little red house in Lenox, in the Berkshires; he came to us from Pittsfield, where he was then writing *Moby Dick;* he was shaggy and snow-powdered

No distinction of wealth, age or position is acknowledged during the dancing of the sardana, shown in progress at Barcelona.

The CATALAN SARDANAS

By WILLIAM CARL CHAPMAN

PEOPLE traveling in Europe who have their ears constantly assailed with rather stale American jazz cannot help wondering where Europeans get a superiority complex in regard to their own music. For if it is as good as they say, why not listen to it once in a while?

One may ask for native music in almost any restaurant on the Continent and be rewarded with a blank stare. Then after a hurried consultation among the members of the orchestra they burst forth with the national anthem, during which the guests rise disgustedly and eye one another with suspicion. For the Liberal Wing of the Left Center doesn't want the Moderate Conservatives to think they endorse such chauvinism, and the Nationalists and local Fascisti look about arrogantly and endeavor to spot the Bolsheviks. In the meantime the head waiter assures everyone that the tune is played merely to amuse the rich Americans, from whom he expects a tip, plus another for the orchestra.

There are, however, a few spots where national music may be heard without the asking, and the chief of these is Spain. For Spain, thank Heaven, is still Spain, and doesn't attempt to be a pale imitation of any other place, particularly New York, Paris or London. So if one doesn't like Spanish music he is simply out of luck. Jazz and fox trots are not entirely absent, it is true, but the national music has never been obliterated and never will be.

Spain is rich in national music and dances, not only in Andalusia, in which the Moorish influence still lingers, but in other provinces as well. The Chotas Madrileños, Valencianos, Jotas Aragonesas and the Sardanas Catalanas are equally distinctive, although for the most part they would be recognized as Spanish anywhere. It should be remembered that Spain was originally a collection of independent kingdoms, each with its national characteristics.

This article concerns Cataluña alone and particularly with its most popular dance, the sardana. The Catalans, who have been called the 'Irish of Spain,' are fiercely provincial, even to the extent of talking of separation from the rest of the nation. This, of course, would be the most foolish thing they could do, for economic reasons so obvious that only a one hundred per cent Catalan patriot will refuse to see them.

Sardana music is vastly different from other Spanish or even European music. It is as distinct as the music of Scotland, and, in fact, faintly reminiscent. Reed instruments counterfeit the drone of the bagpipes. Shrill clarinets, or something like them, imitate the chanters, and the dance itself is but a step removed from the dances of Scotland. It has been surmised that the music of the Galacian, Asturian, and Scottish pipers came from the same source, and while the Catalans have no bagpipes their reed instruments certainly play the same rôle.

The sardana is one of the surviving national dances among civilized people that is not limited to professionals. Neither is it reserved for fiestas, but is an everyday occurrence. Every Sunday after Mass crowds assemble in the city of Barcelona to indulge in the sardana, some of the visitors coming from remote mountain villages. The sardana is more than a dance—it is symbolic of the inherent democracy of northeastern Spain. For it is a tradition that no man is too high or too low to take his neighbor by the hand and tread a measure.

Why DICTATORS Rule

By MORGAN D. E. HITE

BY WHATEVER term one may describe them—as 'czars,' tyrants, dictators—the men who reach the plane of absolutist rule of a whole nation or of a great industry in its entirety—as has been seen in modern large-scale business—are the direct products of specific subsurface and subversive conditions. A 'czar' is a growth outcropping from a soil and environment which has been prepared to produce just such a result and no other, just as fully as is the case with vegetation, plant life. And so long as the underlying conditions persist, and in just such proportionate strength, precisely that is the period when this type of lonely ruler will hold sway.

Germinating seeds of unrest, injustice, and low mental stage, produce an urgent forcing-out process which brings into the light a dictatorial ruler, as in the case of national disorganization, or as in the case of a great industry which has become demoralized, a 'czar' or 'high commissioner' invested with absolute powers.

National demoralization, so general in the southern tier of European nations, has resulted in the rising of dictator-like types of rulers in those states, of late. This process continues intermittently, until doubtless every nation which shows itself incapable of settling its internal troubles by its own innate strength and ability will come under the only form of government or control—a dictatorship—which, apparently, has proved suitable in emergencies where a nation—or an industry—faces disintegration from within.

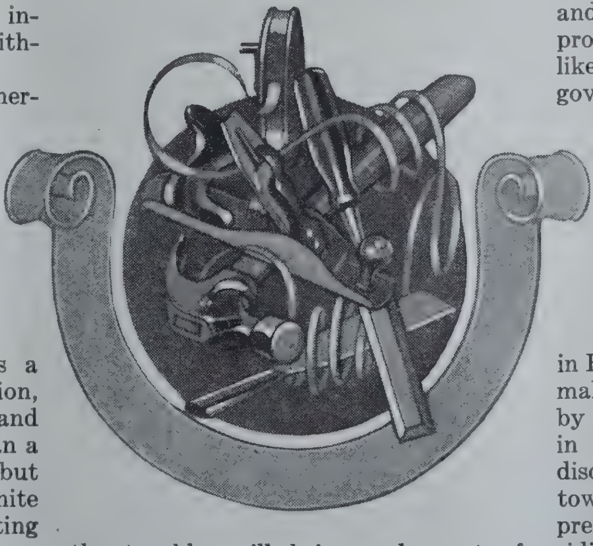
When a fine watch which has hitherto been a model timepiece begins to run faultily, and left to itself becomes more and more untrustworthy, its condition justifies a visit to a watchmaker. He may restore it to its original worth if he is expert enough, or add to its ruin if he is amateurish, incompetent. A fine watch will stand a lot of abuse before it becomes a wrecked piece of mechanism; a nation, being composed as it were of flesh and blood, is even more self-righting than a purely mechanical contrivance, but nevertheless flesh and blood has definite limits to its capacity for self-righting and readjusting.

Hence, where disorganization ensues on a great scale, ramifying through the warp and woof of a whole country, and reaches such proportions that every political, social and economic expedient fails to bring order out of a disordered situation, it is inevitable that such a nation must submit itself for a long or a short time according to the distress its disease engenders, to the autocratic domination of one man who knows what he wants, who knows his own mind among millions who have ceased to know their own.

The true dictator is one who has correctly diagnosed the causes of the vicious demoralization around him, and who has a remedy for its abatement, *and who can apply it.*

Today, business and industry in certain of its branches have grown to such magnitude that some industries are, taken singly, in worth, power and magnitude, the rivals of many of the world's nations. Such industries, usually those which supply fundamental human needs, form an integral part of modern life and cannot therefore be allowed to be sacrificed or permitted to disintegrate and crumble. They cannot collapse without bringing down with them other great superstructures of vital and world-wide importance. Hence, for such emergencies there has arisen the necessity for that entirely new figure in world history—the modern business dictator or 'czar.'

Given a disorganized and collapsing industry which has tried many expedients to save itself and has failed in its efforts, such a dictatorial personality, knowing his own mind first and having made a correct diagnosis of the trouble, will bring order out of chaos, perhaps gradually, but surely. But he must dominate the various divisions of that industry completely if he is to succeed; he must be a czar in fact and acknowledged as such.



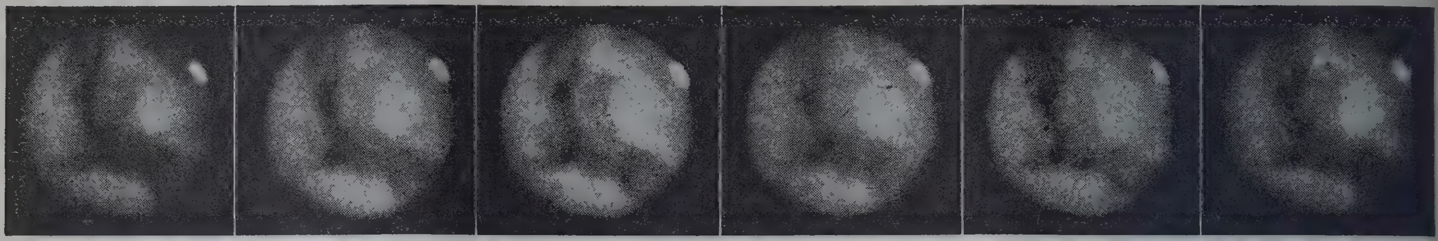
Thus in recent years two great American institutions—if it is not proper to classify them as industries—baseball and motion pictures, were subject to disintegrating influences and a form of paralysis when, for the baseball world Judge Kenesaw Mountain Landis of the Federal bench was made the high commissioner with despotic powers, and when Will H. Hays, Postmaster-General in the Harding Cabinet resigned his office to assume the position of 'czar' of the motion picture industry which similarly, and very largely from internal causes quite related to those which had threatened to extinguish baseball, faced self-wrecking.

ONE of the undertakings of Hercules necessitating the turning of the course of a river to utilize its rushing waters to clean out the Augean stables—the only possible way to effect such a giant cleansing—may have been something like the difficulties which Landis and Hays were faced with. It required supreme and dictatorial powers in order to attempt the feat of salvaging these two immense industries. That task is still not accomplished in the baseball and picture world. There are some surface indications showing that either the 'watchmakers' are not expert enough for the job or these originally fine timepieces were in a much worse condition than any of us thought possible when the necessity of urgent repairs was discovered.

Therefore, there have not only been *political* czars and dictators. Modern business has become so highly organized and has developed to such enormous proportions that its powers can be likened only to those of some national governments themselves, and that what is a mode of possibly curing mortally sick nations is also the method of curing mortally sick industries.

Every tree produces its own fruit. If you see a czar in Russia for successive centuries, it is not by accident that such is the case. It means that there is something in Russia and the Russian people which makes it mandatory for a government by an autocrat, a czar. It means that in that country there is an inherent disorganization, an internal disposition toward disintegration. It means the presence in such a nation of some insidious and incurable influence working ceaselessly as a disturbing leaven.

Only one form of control will grasp and hold together so unstable a situation, so huge a bulk of peoples, and that is a pure autocracy. The proof of this is that such a form survived continuously (Continued on page 28)



Enlargements of six photographs of Mars made during the close approach of the planet in 1924.

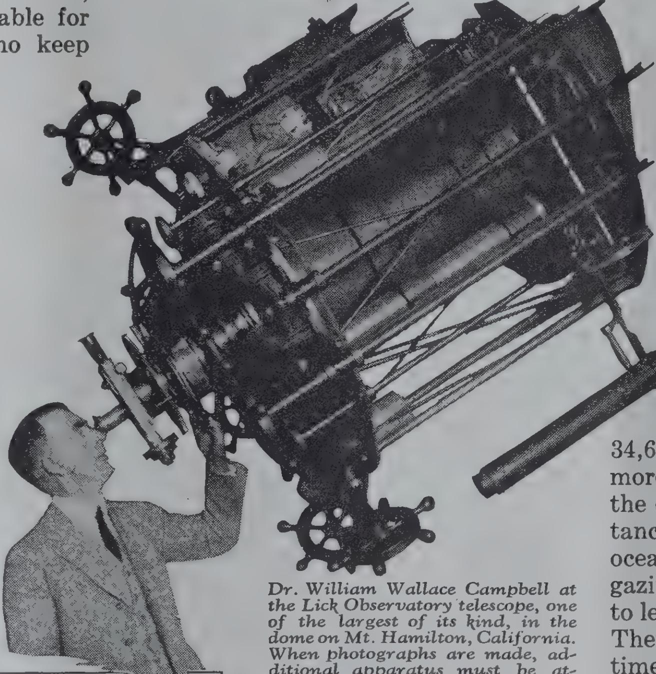
The Scientist Looks at MARS

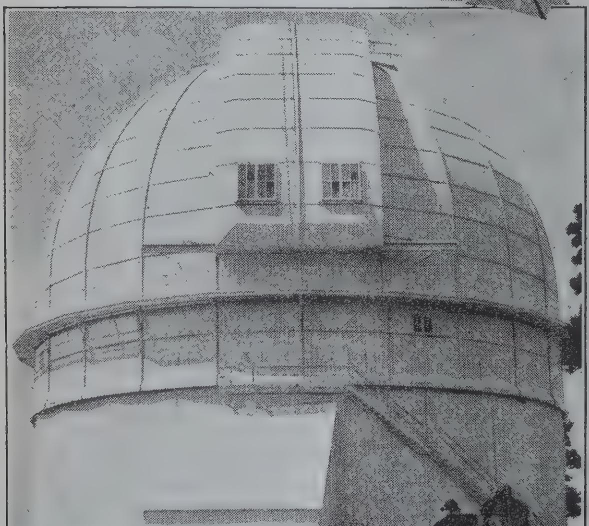
By OSCAR LEWIS

ON AUGUST 22, 1924, the planet Mars was closer to the earth than it had been in more than a hundred years. Not for many years to come will the two planets, swinging through space on their dissimilar orbits, again reach positions so favorable for observation. Astronomers, who keep accurate record of the movements, past and future, of the planets, have long known that the earth and Mars in 1924 would be in more favorable juxtaposition so far as observation is concerned than at any time since the development of the modern telescope.

In observatories throughout the world, therefore, astronomers for months had been preparing to take the fullest advantage of the planet's approach in 1924. It was hoped that some new facts might be added to the slender store of our knowledge of this most interesting of our celestial neighbors.

The facts they hoped to learn, however, were not very exciting to the lay mind. They had no expectation of making sensational discoveries or settling the question as to whether Mars is inhabited, or whether the so-called 'canals' are of natural or artificial formation; nor indeed did they hope to prove definitely if the areas on the planet's surface which are assumed to be water and vegetation actually are water and vegetation, or something else. The hope that some communication between the planets might be established, they dismissed as too fantastic.





—Ewing Galloway.

Dr. William Wallace Campbell at the Lick Observatory telescope, one of the largest of its kind, in the dome on Mt. Hamilton, California. When photographs are made, additional apparatus must be attached to this extremity. Left—Revolving dome on Mt. Wilson, housing the largest telescope.

'Don't expect startling discoveries,' they answered when questioned by the public. 'If we learn one new fact, however relatively unimportant it may seem, we'll be satisfied.'

And the public, impatient, eager for thrills, put such statements down to the excessive caution, the inbred conservatism of the scientist.

What the public does not realize are the limitations under which astronomers must work in their study of the planets, Mars included. If these scientists avoid rash statements and extravagant promises, it is because they are fully aware of these limitations and difficulties.

'Why,' the public asks, 'do astronomers hesitate to say definitely whether or not Mars is inhabited?'

Here are some facts that will go a long way toward explaining their 'excessive caution': The distance separating the earth from Mars during the time of their closest approach in August, 1924, was 34,600,000 miles. This is a distance more than 4,000 times the diameter of the earth, nearly 12,000 times the distance across the United States from ocean to ocean. Imagine New Yorkers gazing through telescopes in an effort to learn something about San Francisco. Then imagine San Francisco 12,000 times more distant than it is in reality and the difficulties in the way of studying Mars begin to grow evident.

On the date of its nearest approach Mars, when regarded with the naked eye, was a mere pinpoint of light in the firmament. It was distinguishable only by its scintillations; the body of the planet itself was invisible. On the night of August 22, 1924, the writer viewed Mars through one of the two most powerful refracting telescopes in the world. Atmospheric conditions were ideal for observation purposes. Magnified by the powerful thirty-inch lens at Lick Observatory, and further enlarged by an eyepiece, Mars looked smaller, farther distant, than the full moon appears to the unaided eye. Seen through the huge telescope, the planet was a distant, vibrating disk of light, faintly reddish in color. The untrained eye could distinguish nothing of its details beyond the polar cap, a lighter spot at one edge of the disk, and here and there

(Continued on page 20)

On CHICKAMAUGA Battlefield

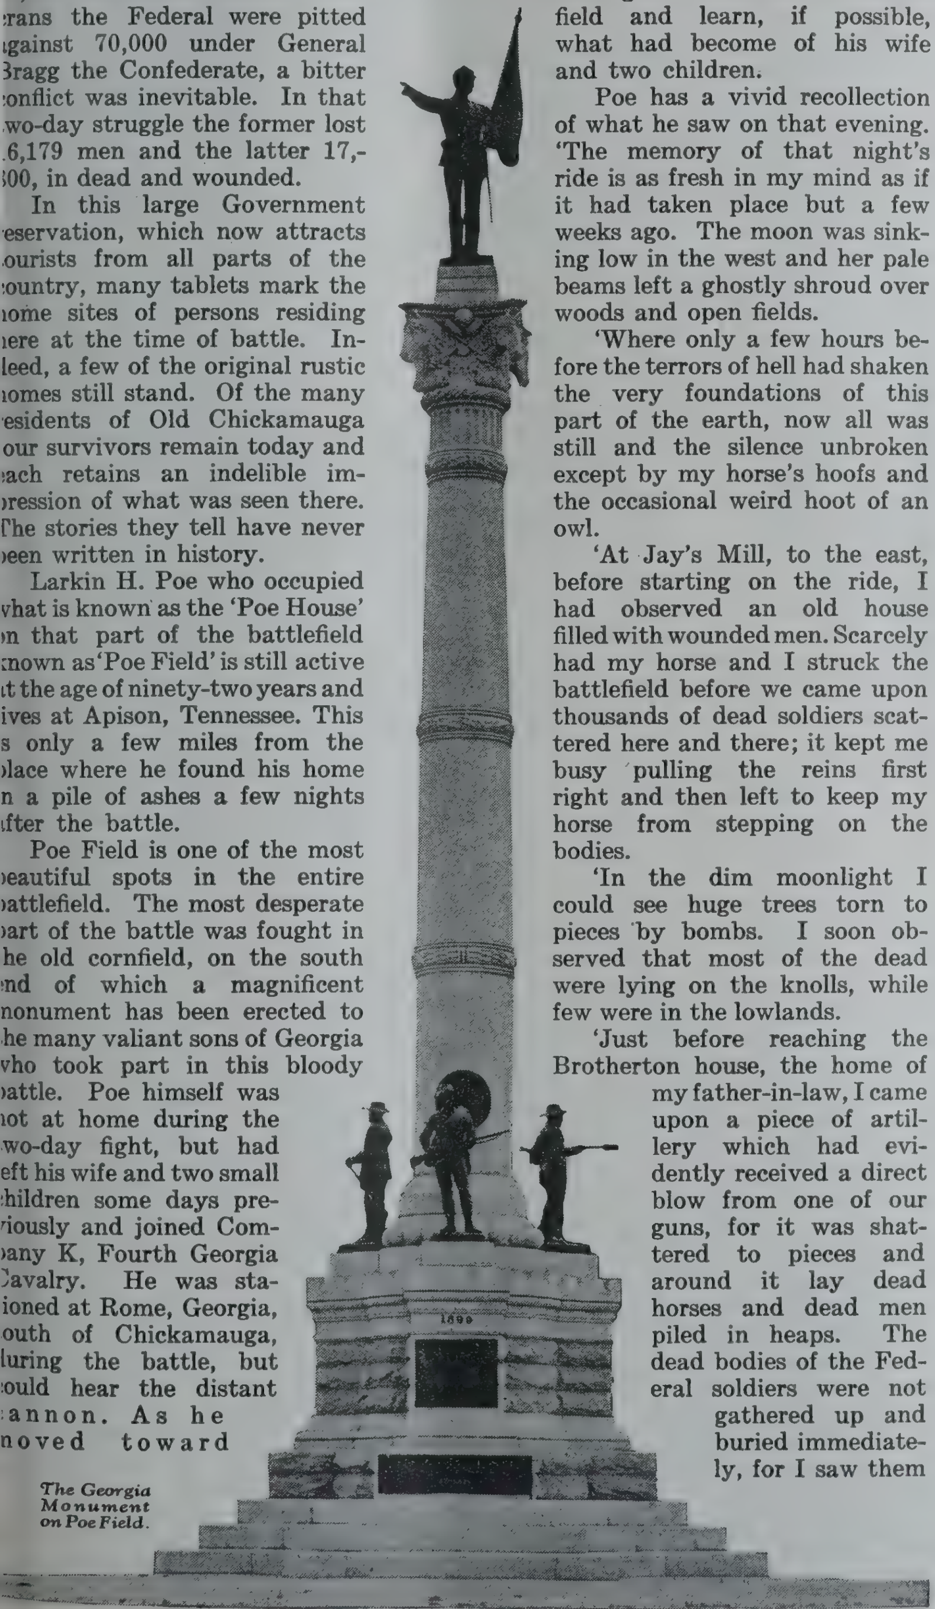
By ROBERT SPARKS WALKER

ON SEPTEMBER 19 and 20, 1863, near Chickamauga Creek in Georgia, twelve miles southeast of Chattanooga, Tennessee, was fought one of the most hotly contested battles of the Civil War. When 5,000 men under General Rosecrans the Federal were pitted against 70,000 under General Bragg the Confederate, a bitter conflict was inevitable. In that two-day struggle the former lost 6,179 men and the latter 17,-00, in dead and wounded.

In this large Government reservation, which now attracts tourists from all parts of the country, many tablets mark the home sites of persons residing here at the time of battle. Indeed, a few of the original rustic homes still stand. Of the many residents of Old Chickamauga four survivors remain today and each retains an indelible impression of what was seen there. The stories they tell have never been written in history.

Larkin H. Poe who occupied what is known as the 'Poe House' on that part of the battlefield known as 'Poe Field' is still active at the age of ninety-two years and lives at Apison, Tennessee. This is only a few miles from the place where he found his home in a pile of ashes a few nights after the battle.

Poe Field is one of the most beautiful spots in the entire battlefield. The most desperate part of the battle was fought in the old cornfield, on the south end of which a magnificent monument has been erected to the many valiant sons of Georgia who took part in this bloody battle. Poe himself was not at home during the two-day fight, but had left his wife and two small children some days previously and joined Company K, Fourth Georgia Cavalry. He was stationed at Rome, Georgia, south of Chickamauga, during the battle, but could hear the distant cannon. As he moved toward the place, he reached Jay's Mill on the eastern boundary of the battlefield three days after the fight. He turned his team over to a trooper, who in turn loaned Poe a horse in order that he might ride across the battlefield and learn, if possible, what had become of his wife and two children.



The Georgia Monument on Poe Field.

Poe has a vivid recollection of what he saw on that evening. 'The memory of that night's ride is as fresh in my mind as if it had taken place but a few weeks ago. The moon was sinking low in the west and her pale beams left a ghostly shroud over woods and open fields.

'Where only a few hours before the terrors of hell had shaken the very foundations of this part of the earth, now all was still and the silence unbroken except by my horse's hoofs and the occasional weird hoot of an owl.

'At Jay's Mill, to the east, before starting on the ride, I had observed an old house filled with wounded men. Scarcely had my horse and I struck the battlefield before we came upon thousands of dead soldiers scattered here and there; it kept me busy pulling the reins first right and then left to keep my horse from stepping on the bodies.

'In the dim moonlight I could see huge trees torn to pieces by bombs. I soon observed that most of the dead were lying on the knolls, while few were in the lowlands.

'Just before reaching the Brotherton house, the home of my father-in-law, I came upon a piece of artillery which had evidently received a direct blow from one of our guns, for it was shattered to pieces and around it lay dead horses and dead men piled in heaps. The dead bodies of the Federal soldiers were not gathered up and buried immediately, for I saw them still on the field, ten weeks later, after the battle of Missionary Ridge.'

When Poe reached the Brotherton house, the home of George Brotherton, he found the house and yard filled with wounded soldiers. Brotherton walked up the road with Poe, stepping over dead bodies and among trees splintered to shreds, until they came to the place where Poe was living when he had last seen his family.

William MacDonald and Larkin H. Poe, survivors of the battle at Chickamauga. They are brothers-in-law.

When he reached the spot, he found nothing but a pile of ashes bordered with dead bodies, and a soldier with legs burned off.

Poe finally discovered his family near the Snodgrass house, together with about sixty others, including old men, women and children, encamped about an open log fire, where they had been stationed since the first day's battle and where they remained for eight days. They had been without food, except a few peas which they had gleaned from nearby fields. Before going back to his company Poe provided them with two bushels of corn.

After the close of the Civil War, Poe and his family did not return to the battlefield to live. Although more than sixty years have intervened, time has not obliterated the horror of it from his heart. He breaks into tears today when he tells the story of this great tragedy.

The visitor at Chickamauga Park finds a prominent place known as Snodgrass Hill, on which is a tall steel observation tower. Nearby is an old log cabin known as the Snodgrass House, the home of George W. Snodgrass and his family during the battle.

This hill was the scene of the last stand taken by the Federal Army under General Thomas on Sunday, September 20, 1863. The old house is still in a good state of preservation, its windows and doors barred with iron rods.

When the Snodgrass family returned to their old home they found the furniture broken and stained with human blood and little of anything remaining. They moved away and did not return until after the close of the war. Then, like the average family living in the battle-stricken area, they were hard pressed for money; and so as a means of obtaining food and clothing, they collected relics on the battlefield, which they sold at small prices.

Mrs. Julia Snodgrass Reed.

One of the conspicuous houses on the Chickamauga battlefield today is an old log cabin known as the 'Brotherton House,' situated prominently in the park. This is the house that Poe visited on the night of his search.

Of the Brothertons, Mrs. Adaline McDonald, eighty-five years old, is the sole survivor. She lives with her husband on a beautiful farm eight miles east of Chattanooga. Her father was too old to render service in the Civil War but her brothers fought for two days almost within sight of their home.

When General Longstreet, commanding the left wing of the Confederate Army, heard that Thomas Brotherton was familiar with the lay of the land in and about the battlefield, he had him serve as his guide throughout the battle.

According to Mrs. McDonald, her father and his family of five children delayed moving off the field because the Federal officers had told them that the Confederates would be quickly driven away. But when on Saturday afternoon the showers of bullets and bombs became unbearable they fled, finally landing in the refugee camp with the Poes, Snodgrasses and others.

The Brothertons left four milch cows behind. As soon as the old home was out of the smoke of guns, Adaline hurried home, to find it filled with wounded men. It seemed more than a miracle that the four cows had escaped the hungry soldiers as well as eluded the thousands of bullets and shells. Thereafter Adaline Brotherton went home each day, milked the four cows, and gave the milk to the nurses to be fed to the wounded men.

When the Brotherton family returned to their old home, Adaline and her father buried nine dead soldiers in their yard.

At the north end of Chickamauga battlefield an iron marker indicates the site of the old McDonald house. This two-room log house was occupied by John McDonald during the battle. William C. McDonald is the sole survivor of John McDonald's family.

On September 19, General Johnson T. Wilder, Federal, learning that McDonald was familiar with all the roads in that locality, sent him to General Rosecrans, commander in chief, who forced him to serve as a Federal guide, retaining him until after the battle of Missionary Ridge.

When William C., the son of John McDonald, enlisted in the army he went with the Twenty-Sixth Tennessee Infantry but was later transferred to the First Georgia Infantry. During the time of the battle of Chickamauga, McDonald, being a teamster, was assigned the task of gathering up the wounded soldiers.

These he hauled over rough roads in a springless wagon to Dalton, Georgia, Ringgold, Georgia, and other points where they could be best cared for.

A week's solid work found McDonald's task still unfinished. He declares that the dead on some parts of the battlefield were strewn so thickly that it was difficult to keep the wagon from passing over the bodies of the slain soldiers.

John McDonald and his neighbor, Thomas Brotherton, living within two miles of each other, both acted as guides during the Chickamauga battle, one for the Federals, the other for the Confederates.

After the war, McDonald's son, William, married the sister of the Confederate guide.

Out of the dozen and a half or more families who were living on the battlefield at the time of this great struggle, sixty-four years has left only these four survivors, whose memories, though keen and unforgetting, harbor no hatred.

The 1928 Campaign

By A. R. PINCI

THE campaign of 1928 will be unique because it will lack both men and issues. The issues of previous campaigns have been worn threadbare; even names already associated with candidacies do not arrest national attention. There is danger in the possibility that presidential elections may dwindle to lackadaisical proportions. The voters' apathy is not encouraging.

The Coolidge policies, as we have come to know them, are of a routine safe-and-sane nature. The country is not half so wrought up about the tariff as some politicians like to think. Economy was one of Wilson's 1912 issues, and was open to both camps. It is somewhat too soon to project prosperity as a keynote.

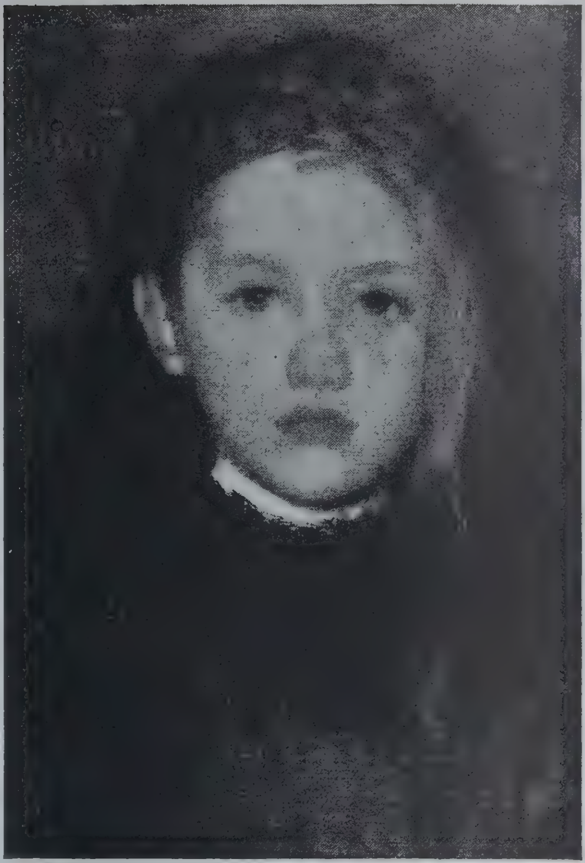
There is one issue—a grand, fiery, bitter, clean-cut and universal issue—that is prohibition. At any time that a majestic issue is needed prohibition will provide one. And it will, sooner or later. Prohibition brings us close to one of the novelties in American politics. Both parties and men are afraid of it. That is a pity, because it is the sole way in which to beget some tangible evidences of national thought about it.

It would be a welcome thing if, for the sake of an issue which would truly spur the voters to action, the major parties should decide to make prohibition the chief subject of 1928. Prohibition does not mean, in this sense, the nullifying of the Eighteenth Amendment, but rather the more simple expedient of going before the electorate with a proposal to modify the Volstead Act. The Volstead law is purely a congressional law, which any future Congress may change at will, without infraction of the constitutional amendment, the very vagueness of which is a joker. Prohibition will be in politics so long as it remains a purely congressional function enduring at its pleasure.

WITH regard to foreign affairs, the American people have reached a stage where they are weary of hearing about foreign lands and foreign problems. It is not that they want to be aloof so much as that they desire to free themselves from propaganda. The lessons taught us from preceding campaigns prove that the American people are interested in having their interests, at home and abroad, reasonably cared for, without hard and fast rules and guaranties of the kind which are adopted as campaign slogans. Voters know that campaign promises do not always square with what Providence ordains afterward.

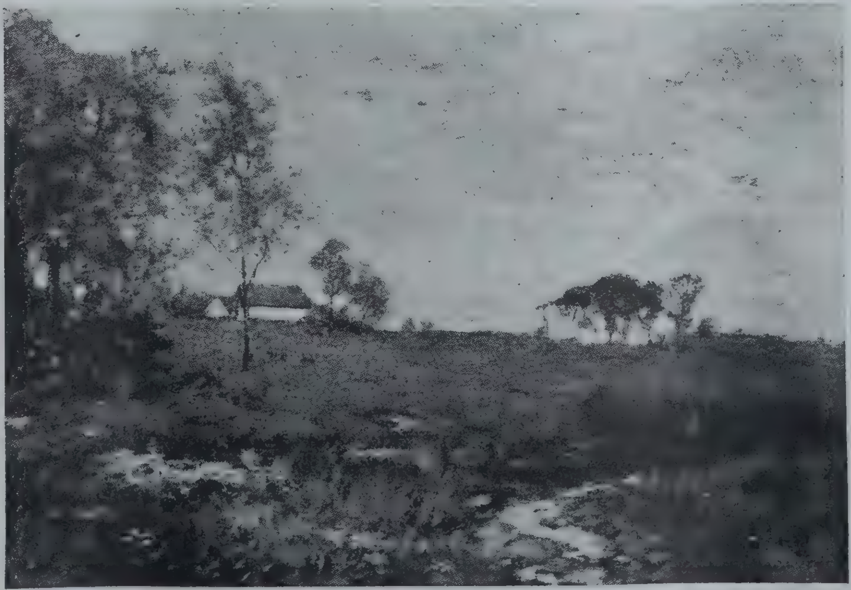
The DRIFT of ART

By IVAN SWIFT



Reproductions—Copyright, Detroit Publishing Co.

Little Rose of Lyme Regis—*by* **Whistler**, *in the Museum of Fine Arts, Boston.*



Early Spring—*by* **Wyant**, *in the Worcester Art Museum.*

A LECTURER may dispose of Chase by saying he was 'famous for fish and portraits,' and that may satisfy the audience if it doesn't cost them much, and it may be all they could carry home. But an artist or student of art would say more for him—not being able to say less. A knowledge of before and after is essential to a right measure of the present.

We have recently passed that period of sound perfection and preciousness and merge into manner-forgetfulness and higher beauty or radical analysis. A wonderful period of painting in America, that was. Chase was the image-breaker of the old school of inwardness and mysticism—of thought that limped for the want of language. Before a living model, a picturesque Italian, Chase said to his pupil, 'There is a copper kettle; paint it, paint it!' He painted a landscape that thrilled no one with the mood-magic of nature, but he said, 'Is it not sand? Is it not sand?' It was sand. His 'greatest picture' in his view was, 'Ah, possibly, the still life in the corner'—a tomato, a green pepper and a goblet! But they were painted by a great painter.

Now this brings us to another definition—'still life.' It has been the aim and end of many of our best painters. You will be surprised at the general application of the term to the art of the recently past time, and some painters are still backing water, afraid of the current in the mad stream of unbridled imagination. They were magicians as painters of things as they are, this Melchers, McEwen, Stevens, Symons, Sargent—top-men. Inness, Whistler, Wyant, Richel, Pyle, Dewing, Tryon, are in the poet class and would have found true expression in words, music or invention.

Art is still moving and what the painter is aiming at now is not covered by the old terms. If for four hundred years the law was that every object and effect in a given space was to be copied faithfully; and if with Whistler came in the dictum that a picture should transcribe only what can be seen at a glance; then perhaps we will concede that we have a right to paint that which we see when we look at a thing. And artists are trying that now, whether we like it or not, in such titles as *All Eyes* and *The Mustard Pot*. At least there is invention and humor in it, and the stripped soul of the artist himself, crazy or otherwise; and posterity shall know us as we were, not as we posed.

At any rate it is plain to us that a collection for the history of art cannot be made up of ancient things solely; and considering the cost of them perhaps we should not buy any of them. The best of the moderns are the best bargain and the most instructive for the longest time to come. Also the old masters have long ago starved to death for the want of contemporary aid and understanding and are not therefore in danger of the calamity now—as those are who are contributing to art's progress, honestly and bravely.

The artist is not trying to do better or worse what has been done. He is dreaming of a new thing, a new task for art, in a new manner, and banking on time for the respecter of names and negatives to look him up, as an antique—or a mummy. We respect the dead and try to preserve it. Nature respects the living and helps it to be born. The Persian rug, the Arabian nights and the radio are all part of today.

The Passing of the Old

MOST of the things which people say they see are actually seen. There is no imagination about it. The pessimist who sees things going to pieces is not deluded; he is correctly reporting what he actually sees. The optimist who sees things soaring to the height of perfection is an equally good reporter—he is not fooling us or himself—he sees what he says he sees. But the trouble is, too many people are doing all their seeing within too narrow limits, and while their reports of what they see are true, they are not comprehensive.

This has an important application to the state of mind in which many people find themselves today. There are perhaps more minds focused on economic problems than ever before, more people thinking, or perhaps it is more truthful to say they are wondering, about the conditions which have befallen human affairs.

Some people see certain things going to pieces. They see correctly. Certain established customs, methods, processes, institutions, traditions we have been accustomed to lean upon, are undoubtedly going to pieces, and they are going to pieces irrecoverably too.

It is that last element—the *irrecoverability*—that strikes fear in many people. They want yesterday to come back. But yesterday is not coming back. The old world is dead! dead beyond recovery. The things you see going to pieces are its funeral, its decay.

THE pessimist sees darkly and reports darkly. The optimist sees only the bright side of life, and reports what he sees. Each is reporting accurately according to his vision. But neither is seeing the whole picture. So it is with those who decry the passing of the Old Era. They see only the crumbling of the old leaning posts, the passing of established methods and familiar customs. They blind themselves to the good new things which are taking their place. They spend their time lamenting, and thus are unaware that the New Era, with its better promise and better efficiency and greater reward, is already here.

Those who say that everything they see is going to pieces are telling the truth, because their eyes are focused on the things which belonged to the old era. The old era is dead, and is being buried bit by bit. Every day another fragment of it falls into dust.

Now, if that is all that you see—and it will be all that you see if it is all that you look for—no wonder you have the feeling that *everything* is going to pieces. But if you turn around and see what is coming swiftly up behind your back, as you gaze apprehensively into the past, you will get the other half of the field of vision; *you will see the things that are to be.*

You see the oak take color in company with other trees in the autumn. Then come the rains, and the other trees let go their leaves; not so the oak, only a few does he let fall. Then the winds, and the branches of the other trees are left ragged; but the oak holds most of his leafage. Then the frost, and all the trees are stripped clean and bare of leaves; but the oak leaves shrivel a bit and take on the tone of old Cordovan leather, but for the most part cling to the parent boughs. They are a cheering sight in winter, those shriveled leaves that defy the frosts of autumn; they are a cheering sight as they defy the winter's snow and blast. Then winter begins to wane, and spring is a promise in the air, and green things begin to appear, but still the oak holds tenaciously to last year's foliage. A little later and the leaves begin to fall—in spring. If you had not looked around upon the earth to see what else was transpiring there, if you did not know what compensating work was being done, you might well think that at last every leaf in the world was about to go.

But this is the fact: the leaves that stayed longest, that we had learned to associate with stability—those are the leaves that fall before the new leaves appear.

In the social order, is it not our seemingly most strongly established things that are beginning to flutter down? Are not the most solidly essential services the ones that are now most under doom? Certainly, as anyone who focuses his vision only on the passing things will tell you. It is the collapse of the most dominant methods and institutions that alarms most people. Well, it need not alarm anyone. When the leaves of the strongest tree fall, spring is here. If you will widen your field of vision you will soon see other things springing up to take the place of those which are passing.

So, you have a choice. You can sit and look at the fading out of all that made the old era, and you can wail about calamity to come; or you can stand up and watch the new era come in, looking for your place in its ranks. If you do the latter, you will see an entirely different state of facts. It will not be imagination, or mental suggestion, or this foolish mysticism of pretending things are all right whether they are or not; it will be fact. The thing is true, the new era *is* here.

Certainly many things are going to pieces. They ought to! And if you look at them long enough you may get the impression that everything is going to pieces. You should turn around and look the other way, and see the New Era marching up the side of the hill. Then you will see that, although the ruin of all our own stupid, inefficient, unjust and unproductive methods is unavoidable and good, the real cause of their disappearance is the New Way which is pushing them out.

While you are looking, be sure to see it all.

When Chicago Went Movieless

CHICAGO movie patrons, deprived of their daily film fare by a recent theater strike, turned to books, news dispatches inform us. Photographs of long lines of people storming bookstores and libraries while the theaters stand empty are given as additional proof. All this probably should prove something, and behind it may lie some great moral; but what is it? That the movies are harming the book industry? More books are printed, circulated and read than ever before. That the movies, being on a lower intellectual level, should be discouraged while book-reading is encouraged? Much piffle is put in Hollywood cans, to be sure, and unreeled before the world; but likewise much balderdash is put between covers and sent broadcast as literature. And those at whom the moronic influence of the movies is directed are quite apt to be attracted by the moronic influence in certain types of books.

It is difficult to get a fair perspective of the movies. Supporters can hear, see and think no evil of them: they are recreational manna, uplifting, inspiriting, devotional, given to a weary world to brighten life and lighten old age. Their opponents, on the other hand, see them only as unmoral, unclean and degrading, fit solely for suppression and that right quickly. Neither, of course, is an accurate picture; the true one lies somewhere between. But where? Of a late movie magnate it was written that he replaced thousands of saloons with hundreds of pleasant picture palaces. The first part of the statement is doubtful. No one man, and surely no film producer, banished the saloon from America: that was done by the American people. But the second phrase contains a germ for thought. The main defense of the old saloon was that it was the poor man's club. A new club has arisen. Even the chiefest censurer of the movie would scarcely say it contains the same destructive forces as the saloon.

Speeding Up Traffic

TRAFFIC congestion is not merely a matter of the number of motor cars in operation, nor even a matter of their routing. The element of speed is of vital importance. The problems presented by a fifteen-mile-an-hour speed limit are made much simpler when the permissive limit is stretched to twenty-five miles an hour. This can be understood through a simple computation or comparison. Suppose we were back in the old horse and buggy days and that there were as many horse-drawn vehicles in our cities as there are now motor cars; our cities would simply be packed with horses and buggies, unable to move. The great speed of the motor car enables the quicker shifting of congestion and its spread over a wider area. Just as the greater speed of the car eliminates the problems that would arise out of the same number of horse-drawn vehicles, so the increased speed of cars over the present rate will eliminate many problems now pressing for solution.

Many large cities have found that a fifteen-mile-an-hour speed limit fosters congestion, and have raised the limit to twenty. It is obvious that when congestion follows upon the 20-mile-an-hour limit, the remedy will be greater speed. As a matter of fact, twenty miles may be the official limit, but the actual driving practice, except in downtown districts, is higher. In most cities a driver who should run only twenty miles an hour would find himself obstructing traffic. In some cities slow driving is an offense, like fast driving.

The whole question will work itself out in practice. We are still in the period when there exists a prejudice against brisk driving in the belief that it is reckless, dangerous. Brisk driving is not necessarily reckless or dangerous. Slow driving may be both. Brisk driving has probably prevented more accidents than it has caused. Safety is not a matter of speed, but of control, and control is a matter of the motorist and his brakes. In city driving the ability to stop is as important as the brisk pick-up. The prejudice against speed will gradually disappear with increasing driving experience and under the pressure of traffic necessity. But the prejudice in favor of control will increase until it is generally obtained.

The Destructive Rat

THE greatest destroyer within the borders of the United States today is the brown rat. There are as many rats in this country as there are people; the total yearly damage they cause amounts to $200,000,000. It would take the labor of 200,000 men to produce the material eaten and destroyed; it would require 5,000,000 acres to produce the grain they destroy

The lion is called 'the king of beasts,' but a single rat does more harm in a year than a lion in a decade. One cause of the increase of the rat is undoubtedly the indiscriminate killing off of their natural enemies: owls, hawks, herons, skunks, weasels, and snakes. Systematic poisoning and trapping are remedial measures, but combating the rat successfully is largely a building problem. Buildings should be so constructed as to exclude the animals from shelter and food. It is claimed that if half the money now spent in feeding and fighting rats could be expended in wisely planned and well-executed coöperative efforts for rat repression, it would be possible within a few years nearly to rid the country of its worst animal pest.

The Senate of the Fiftieth Congress

By BARNES COOLEY

IT IS more than sixty years since the close of the Civil War; yet two veterans of that conflict between the states can still be found in Congress. There were 2,128,948 men carried on the Union rolls, but Francis Emroy Warren, Republican senator from Wyoming, is the only Union veteran now remaining in Congress. No one knows the total number of Confederates who bore arms. The estimates range from 621,000, which seems to be too low, to 1,400,000, which is too high.

Whatever the number, Charles Manly Stedman, Democratic representative in the House from North Carolina, is the sole member of either House who served the Confederate cause. Veterans of the war with Spain and of the World War, year by year, increasingly enter the legislative halls, but in recent years the congressional number of those who wore the blue or the gray has been rapidly diminishing. Twenty Congresses ago half the members of the Senate, and a large proportion of the members of the House, were ranked among the veterans who had seen service in the field. Now but two are left.

WARREN, born in Massachusetts, June 20, 1844, was only a boy when he enlisted in the Union army. He served as a private and noncommissioned officer in the Forty-Ninth Massachusetts Infantry until it was mustered out and he was awarded the Congressional Medal of Honor for gallantry on the battlefield at the siege of Port Hudson. He was the first governor of Wyoming and has served in the Senate continuously since December 1, 1890.

Stedman is three years older than Warren. Born in North Carolina, January 29, 1841, he entered the State University in 1857, when sixteen, and was graduated in 1861, but before commencement exercises were held he enlisted as a private. He became captain, then major, served with Lee's army during the entire war, was wounded three times, and surrendered at Appomattox. He has been a member of the House continuously since March 4, 1911.

Warren was eighty-three in June, and Stedman was eighty-six last January. Warren's term does not expire until 1931, and Stedman last November was reëlected to the Seventieth Congress which ends in March, 1929. They are the venerable and venerated survivors of the hard, heroic sixties, and when the end comes to them, Senate and House alike shall know no more any who bore part in the war between the states.

The congressional loneliness of those two veterans stands out in contrast with the times, not very remote, when House and Senate rolls alike bore the names of scores of Union and Confederate soldiers. When the national legislature meets in December, it will assemble as the Seventieth Congress.

IT IS only forty years ago that the Fiftieth Congress entered upon its legislative existence. It was the product of the election of November, 1886, in the middle of Cleveland's first term and its life ran from March 4, 1887, to March 4, 1889. John G. Carlisle, a native Kentuckian who during the Civil War had been in Kentucky one of the most energetic of all the opponents of secession, was speaker of the Democratic House. But the Republicans had by a narrow margin regained that control of the Senate they lost when Cleveland was elected. The Senate in the Fiftieth Congress now stood thirty-nine Republicans to thirty-seven Democrats. In the Senate of the preceding Congress, in the first half of Cleveland's first term, there were forty-one Democrats and but thirty-four Republicans. Hendricks, who had been on the ticket with Tilden in 1876 and who was elected Vice-President in November, 1884, when Cleveland first won the Presidency, died November 25, 1885, without ever having presided over the Senate, of which he had been a member in 1863-69. In the Fiftieth Congress the President *pro tem.* of the Senate was the tall, thin, brilliant, cynical and unstable senator from Kansas, John J. Ingalls. There were then but thirty-eight states. Arizona, Dakota (as yet undivided), Idaho, Montana, New Mexico, Utah, Washington and Wyoming were but territories, each represented in Congress by a single delegate who could not vote. Oklahoma was then unborn and the Indian Territory had no representation whatever.

When Mr. Ingalls called the Senate of the Fiftieth Congress to order, thirty-seven of the seventy-six senators who faced him from the floor, Republicans on his left, the Democrats on his right, were men who had seen service in the Union or Confederate armies in the war that had then been ended twenty-two years. Of these thirty-seven, twenty-seven had fought for the South, only ten for the North, and yet there were thirty-nine Republicans as against thirty-seven Democratic senators.

The South was more enduringly faithful in its support of its military leaders than was the North. Nearly a quarter of a century after the war, here were thirteen Democratic states each of which was represented in the Senate by two men who had fought for the Confederacy. Only one Republican state was represented in like fashion by men who had worn the blue. That state was Kansas, which also sent a solid delegation of seven Union veterans to the House. While the great body of Republican senators had failed to seek glory in the tented field many had been valorous officeholders during the war or busy in the marts of commerce. Most of them were well-to-do, several were rich; whereas most of the Confederate veterans in the Senate were poor, many of them dependent on their salary.

A few were rich, like Hearst of California, father of William Randolph Hearst, and the courtly Eustis of Louisiana, but only a few. The combined possessions of a majority of the twenty-seven Confederate veterans would not have equaled in value the fortunes of any one of several noncombatants on the Republican side. Poor in purse these old Confederates were yet rich in pride. Not one had bought his seat, strange as that may seem in this more practical day twenty Congresses later. Not one but would have scorned to occupy a seat so acquired.

THE desks of senators are arranged in semicircular rows and senators themselves are seated, not by states, but according to their political affiliations, all Democrats being grouped to the right of the presiding officer, the Republicans to the left of the dividing central aisle. As very nearly three-fourths of all the Civil War veterans were on the Democratic side, they properly first may be given reminiscent attention.

Alabama was then represented by John T. Morgan and James L. Pugh. Morgan's seat was in the front row, the second from the center aisle. He was an impressive looking senator of the old school, partly bald, somewhat florid of complexion, ordinarily wearing a frock coat, a fluent speaker and capable in debate. He had been a member of the Alabama secession convention. Enlisting as private, he rose to brigadier general. First elected to the Senate in 1877 he was five times reëlected. Morgan was the great advocate of the building of a canal connecting the Pacific and the Atlantic, but favored with intense advocacy the Nicaragua route. He strongly urged intervention in Cuba and did much to create the sentiment which finally precipitated the war with Spain—a war which McKinley strongly endeavored to avert. So certain did it seem that presidential preventive effort would succeed that only a few days before the storm broke Mark Hanna was confidentially assuring Wall Street, 'There will be no war.'

Morgan's colleague Pugh was a member of the national House of Representatives when Alabama seceded from the Union and he went with his state. He, too, enlisted as private but soon entered the Confederate congress and served there until the war ended.

During Cleveland's second administration Edmund Winston Pettus sought the office of United States District Attorney in Alabama. Pettus had been a lieutenant in the Mexican War, had ridden a horse from Alabama to California in 1849 and had served in the Confederate army, entering as major and becoming brigadier general. When not engaged in such adventures he had for more than fifty years been practising law and felt that his experience justified his political ambition. So he asked Pugh for his senatorial endorsement. Pugh, born December, 1820, looked at Pettus, born July, 1821, and said: 'Why, Pettus, I can't do that—you're too old.' The disgusted 'too old' Pettus went back to Alabama and some years later, when Pugh was seeking renomination as senator, he became a candidate against him, defeated him and sat triumphantly in Pugh's place for the full six-year term after March 4, 1897.

TWO JIMS—James K. Jones and James H. Berry—were the senators from Arkansas. They sat side by side at the right end of the front row. Jones was twenty-one, Berry but twenty when the Civil War broke out and both went in, the former serving as a private soldier, the other entering as second lieutenant. Jones was a plump, pleasing person, agreeable in manner and kindly, who in after years became an ardent Bryanite and a Democratic leader. Berry lost a leg in the battle of Corinth in the second year of the war and walked on crutches for all his years thereafter.

Florida's senators were Wilkinson Call and Samuel Pasco. Neither bore a conspicuous part in the Senate, but Call had served as adjutant general in the Confederate army, while Pasco, born in London and graduated at Harvard in the class of '58, was a private. Wounded and captured at Missionary Ridge, he remained in prison until paroled in March, 1865.

Georgia's senators were Joseph E. Brown and Alfred H. Colquitt. Brown was a secessionist in 1860 and was Georgia's war governor. He opposed Jefferson Davis when the Confederate president urged conscription, holding the Conscript Act unconstitutional. So, when he raised ten thousand recruits to oppose Sherman's march to the sea, he refused to allow them to leave Georgia. When the war ended he accepted the result as final and came back heartily into the Union. He urged acquiescence in the reconstruction measures, and, because the Democratic Party opposed them, voted for Grant and faced courageously the inevitable unpopularity of his course. The Republicans in the Georgia legislature of 1868 nominated him for United States senator but he was beaten. Afterward, in 1884, the Democratic Party took the old war governor back into favor and sent him to the Senate. Colquitt, a Princeton graduate, was a major in the Mexican War, a member of Georgia's secession convention, entered the Confederate service as captain and became major general. Coming to the Senate in 1883, he later suffered a stroke that crippled his activities and died March 26, 1894, during his second term. Toward the end of his service he was often brought in a wheel chair to his place in the Senate—a seat in the rear row convenient of access.

Joseph C. S. Blackburn and James Beck were Kentucky's senators. Blackburn, Kentucky born, was twenty-two when the war began and 'went South,' serving in the Confederate army from 1861 until the war ended. He was an intense partisan and one of the best-dressed men on the Democratic side, with a fondness for light-colored clothes and bright ties. Beck was born in Scotland and there received an academic education. He was thirty-nine when the war began and there is no allusion in his biography to war service on either side. He served eight years in the House and died during his second senatorial term.

Two Confederate soldiers were in the Senate from Louisiana in the Fiftieth Congress. One was Randall Lee Gibson, the other James B. Eustis, the one of Yale '53, the other of Harvard '54, and each of social as well as political consequence. In the Senate they sat in almost adjoining seats. Gibson, enlisting as private, became major general. Elected to Congress in 1872, he had seen his credentials rejected by a House that had not yet forgiven him his service in the Confederate army. Sent to the Senate in 1882 he remained there until his death. He was a man of affluence and of a social standing that found recognition to which the average senator is a stranger. Eustis, his colleague, was on General Magruder's staff and then on Joe Johnston's. In Cleveland's second administration he was our minister to France. A man of liberal culture, he found leisure to translate the *Institutes of Justinian* and Guizot's *History of Civilization.*

James Z. George and Edward Cary Walthall were Mississippi's senators. George had served as private in Jefferson Davis' regiment in the Mexican War, was a member of the Mississippi secession convention, served as an officer in the Confederate army and had been chief justice of the Supreme Court of Mississippi. He was regarded as one of the very best lawyers in a Senate that was perhaps overburdened with members of that admirable but office-monopolizing profession. Walthall resigned his place as district attorney in 1861 to enter the Confederate service as lieutenant, and rose to major general in 1864. He distinguished himself at Missionary Ridge, where his colleague Pasco was wounded and where he saved the Confederate army from utter rout.

MISSOURI was then represented in the Senate by Francis Marion Cockrell and George Graham Vest. Cockrell, whose physique was that of the conventionalized Uncle Sam and who could easily have 'made up' for the part, had been a Confederate brigadier general and was severely wounded in battle during Hood's invasion of Tennessee. He commanded a division in the operations around Mobile. Cockrell entered the Senate in 1875, having been reëlected four times. He was a plain-spoken, unassuming man of inflexible integrity and careful in his supervision of federal expenditure. Vest, who died August 9, 1904, served in the Confederate army in 1861, but in the autumn of that year became a member of the Confederate Congress. Elected to the Senate in 1879, he remained there until 1903. He was short in stature, heavily built and his neckless head sat squatly on his forward-sloping, rounded shoulders. Brilliant, eloquent and well-read Vest was superficial rather than solid, showing much glitter for relatively small gold.

Two eminent Confederates represented North Carolina, Matt W. Ransom and Zebulon B. Vance. Ransom did his

ORDER *in* *the* ARCTIC

By CHARLES J. FINGER

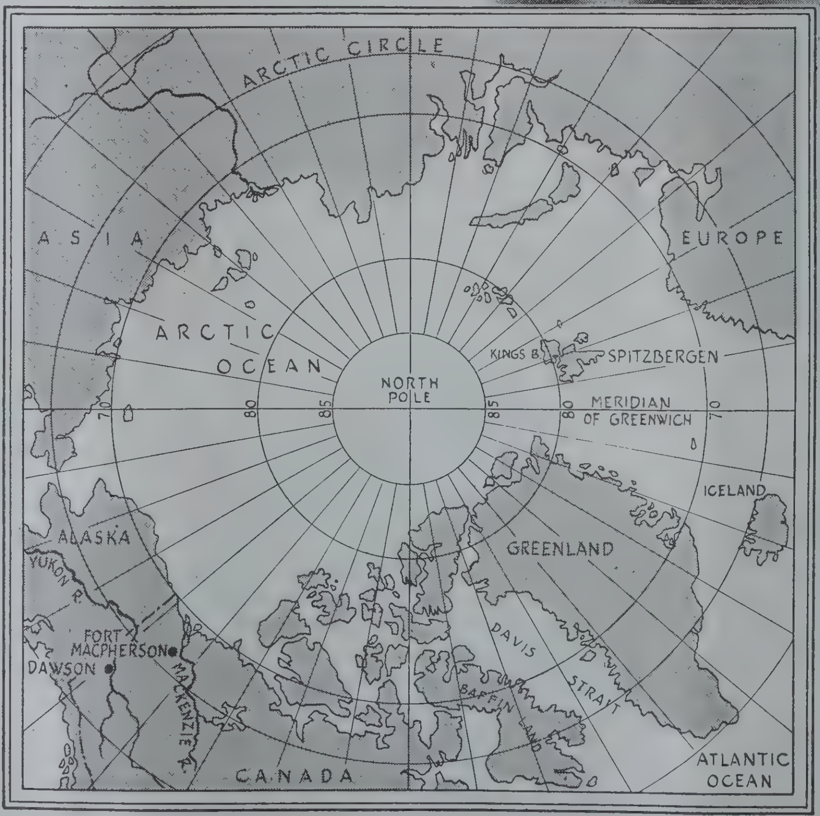
THE other day, in a Pullman smoker, a young man began to talk to me and proceeded so volubly that I could not get in a word edgeways. His pet subject was—the necessity for atheism. You have heard the sort. It's nothing new. Merely a rehashing of Ingersoll who some thirty years ago took certain phases of human depravity such as persecutions and inquisitions to be Christianity. So he denounced roundly, and much in the spirit in which a purblind man, seeing ragweed in a potato patch, might hold forth against gardening. However, this young man, who was pert and not athletic but very diffuse indeed, asked me this question:

'What do you think of the strides being made in this country toward the abolition of superstition?'

I told him that I had thought nothing at all about the matter, whereupon he fell into a state of enthusiasm and told me that no intelligent man should remain indifferent to the importance of Nietzscheanism. He said that the old order should be overthrown; that there were new ideas which had to be caught up and transmitted through society. He spoke of science and philosophy, quite as if he had them patented for his exclusive use. He referred lightly to the mechanical system of the universe, and to a fortuitous concourse of atoms, and all that kind of thing.

'What *we* aim to do,' he said, 'is to train youth to self-respect and courage and hope and cheerfulness, to the end that they may be self-sufficient and may endure and be strong. Christianity is a slave morality, as Nietzsche says, and therefore makes men cowards. You introduce your Christian civilization among natives and what do those natives see, I ask you? Nothing but a lot of weaklings! You send out to them a crowd of soft-handed missionaries and other fellows, to teach a religion that is empty and valueless. That's what you do. Away with the coward philosophy! We stand for endurance and strength.'

At that point we pulled into the station where the young man had to leave the train, and I noticed that in spite of his brave words there were no signs of endurance about him, for he allowed the porter to carry his bag, which weighed no more than twelve pounds.



—Brown Bros.
A conception of why the Northwest Mounted Police in the Arctic regions must walk. Map shows location of places mentioned in this article.

* * *

Now, to cut across lots in a manner of speaking, that young man was windy in a popular sort of way. There is a vast deal of such talk going on and the trouble with it is that the talking is done by those whose notion of travel is confined to going about in a train or an auto, but almost never by men of sound practical experience.

Let me tell you

something of some of those who have taken that order called Christian civilization into the disorder of the primitive. Mind you, they were not moved with any spirit of atheism, but were rather, to adopt the words of the talkative young man in the train, chock-full of that superstition of religion. So ask yourself, when you have read, how they niche themselves in your memory as masterful fellows of that moral character which gives self-respect and courage and hope and cheerfulness, and also the power of endurance.

Consider the case of Inspector C. E. Wilcox of whom I heard the other day in Quebec. He was of the Northwest Mounted Police. For order's sake, with his little party of Arctic police, he spent a winter at Craig Harbor, only to the end that the natives might come to know something of that mode of life which Livingstone taught his natives. The schooner *Arctic* landed the party on August 28, 1922, and returned for them on August 6, 1923. During that year patrols went here and there to a distance of seventy-five miles, making their journeys afoot, teaching the natives law and order. And consider the conditions and circumstances. Here is a passage from the official report:

'The sun was last seen on October 25th, and did not appear again until February 13th, a period of 109 days of darkness and intense cold. Severe blizzards were frequent and during January the wind blew for 21 days without a break, at times with the violence of a gale; a comprehensive idea of the winds of this region can be gained from the fact that during a period of 304 days the wind blew strongly for 221 days, frequently compelling the men to remain indoors for days at a time. The coldest temperature recorded was 51 degrees below zero in March, during which month the temperature averaged 35 degrees below, proved to be thecoldest month of the year.'

—Brown Bros.

To carry Christian civilization to the natives of the Far North has been the incentive for many white men to suffer the Arctic's cruel hardships.

That will suffice perhaps to strike the keynote for the man who talks of endurance but knows only the rigorous life of a steam-heated flat. With the keynote struck, listen to the story of Thorlief Mokleby and his companion Samonsen. It is the tale of a divine struggle, and a diary kept by Mokleby is the only document.

The two men were on duty at the Norwegian geophysical station in King's Bay, Spitzbergen, in the year 1922. Learning of a whaling ship in trouble, they set off in a boat to find the ship and pilot it to safety, and the journey began on February 21.

For three days they rowed and sailed on an ice-dotted sea, then came to a floe on which they hauled their boat, hoping to cross it. But the ice suddenly came thicker, and to launch the boat again would have been to court instant death from crushing. So there was nothing to do but to bide their time, drifting about on the iceberg in a midwinter Polar sea. However, they had two months' provisions and they were not of the sort to expect life to be a constant succession of agreeable sensations. Nor was their creed a creed of despair.

It was six days before they could leave the floe, and during that time there were blinding snowstorms so that there was no way of telling in which direction they were moving. Most of the nights they had to keep moving about for life's sake. But on March 2, they launched their boat again and made an attempt to reach land. After two hours' rowing they ran into a belt of floating ice and so had to proceed along the water lane as best they could, making very little headway. There were thirty-six hours of that heartbreaking toil before they found a floe large enough to hold their boat, and it was a task for the exhausted men to haul up their craft. But no sooner had they made things a little snug than a storm broke, and waves swept over the floe; they were forced to take to the water again. 'The oars froze to lumps of ice, and all we had to eat was a handful of raisins,' runs the diary. And again: 'Ice—ice—ice—miles of ice . . . We commended our souls to God and bade farewell to life.'

Nor did they reach the shore until March 17, and then at a place where the shore ice was from six to eight yards high. All they could do was to make their boat fast, and proceed to dig a hole in the snow. 'Our clothes and shoes are wet and frozen . . . We can only wait and hope . . . We pray to God that we may get out with our lives . . . I know what life is and also the taste of death,' is one of the entries. There is another entry scrawled by a frozen hand, one recording grief because of the anxiety which the families of the men must suffer.

ON March 20, Samonsen, frozen and hardly able to crawl, got out of the snow hole to look at the boat, and found that it had broken loose and had been carried away. Nothing remained then but to wait for the coming of a search party. A search party was indeed at work and came so close that the two men saw the schooner and tried to hail it by firing shots and shouting. But two men on a snow-covered ice ridge are scarcely discernible even a short distance from the deck of a ship, and the report of a revolver is easily lost amid the cracking and snapping of rigging, and so the castaways were not seen; the ship changed its course and was out of sight in a couple of minutes. 'We went back to our snow hole, drank a cup of coffee and after praying to God crept into our sleeping bags,' says the diary.

Four days later they shot a sea gull and three small sea hens. 'I have become used to the idea of saying farewell to life,' writes Mokleby, on April 24; then adds a line of tribute to his companion because of his bravery and high-heartedness. Another entry on May 7 expresses astonishment that they are still alive. And they were still alive on June 7, but 'tired, very tired . . . We deserve our rest.' Five days later the final words were written. They were: 'Life was short, but splendid. We are resigned and satisfied with our fate. In Christ's name: His will be done!'

* * *

There is another story of courage and endurance which would be hard to match. It is well worth rescuing from the files containing the doings of the Canadian patrols for the tale alone. It is worth more because of the hope in the midst of bitter sorrow. The belief of the men in their cause, the belief that the Christian civilization they represented was worth fighting and dying for—

Geneva, the capital of the League of Nations.

—*Henry Miller News Picture Service.*

CYCLING *in* SWITZERLAND

By QUINCY KILBY

FOR years I had looked at the map of Switzerland with a desperate longing to ride a century around Lake Geneva. I didn't know what the road distance would be, and I had no particular way of finding out, but that didn't drive it from my mind. There was no likelihood that I should go to Europe at all; but that didn't entirely squelch the idea.

I had a curious little book called *The Continong* that was packed from cover to cover with all sorts of useful and elsewhere non-get-at-able information, and in skimming through its contents one day I discovered that the distance around the lake by bicycle would be 171 kilometers. For reducing kilometers to miles, multiply the total by six, omit last figure, and add a little bit. Six times 171 gives 1026. Cutting off the 6 leaves 102. Add a little and you have 105, which is about correct.

—*E. R. Gammage.*
A Swiss Inn.

The roads were sure to be good, with the lake at our right and the Alps rising high before us and on our left. So why not tackle it? I would.

The opportunity came on the eighteenth day of June, 1909. For companion I had a young, strong, good-natured doctor. He wasn't a full-fledged doctor as yet, but a well-developed doctor-in-the-making, and I could wish no better companion. I too was strong and good-natured (at times), and on this day I felt young. On the morning of departure, we had what they call over there a *cafe complet*, which means bread, butter, coffee and honey. We were paying a dollar eighty-five at the Hôtel des Alpes—three meals and room—and it was fine. Switzerland is an extremely cheap country in which to summer, if you know how to drive your bargains.

We left our hotel at 7 a. m. with a song on our lips—

Whenever you would like to feel
That you are young,—bestride a wheel;
All business worries discontinue;
And hit 'er up for all that's in you.

The River Rhone flows out of Lake Geneva, or Leman—for the lake has two names—right in front of the city. Its current is swift and its water is clean, in marked contrast with all the rivers that flow through our own cities. As we crossed the Pont des Bergues we came in sight of Mont Blanc dominating the horizon on our right, dazzlingly white in the morning sun. I was reminded of a hot day in the latter end of June, 1890, when with a friend I had a swim in the lake close to where the river leaves it. The sun blazed with an almost stunning force on our uncovered heads, while we disported in the refreshing water, gazing up at glorious Mont Blanc, topped with that crown of snow which never melts.

That was one of the notable swims of my life, to be ranked with those in the

Adriatic at Venice, the Seine at Paris, the Thames at London, Lake Lucerne at Lucerne, the Niagara at Buffalo, various places in the White Mountains and at other New England summer resorts, not to mention the almost freezing waters of my native Passamaquoddy Bay. I could write a book about the places in which I have swam—swum?—swimmed? Swum goes.

THE Pont des Bergues is connected at its center with a little island on which is an artistic seated statue of the philosopher Jean Jacques Rousseau, who is supposed to have lived on the island for a while.

There was a great writer named Rousseau,
Who lived on an island like Crousseau;
And the people in wonder
Exclaimed, 'Why in thunder
Does Jean Jacques desire to dousseau?'

We rode past the magnificent monument to the Duke of Brunswick, who might almost be called the patron saint of Geneva, so much did he do for the city. The opera house which he built and presented to it is a lesser reproduction of the world-famous one in Paris. I once, away back in 1883, attended a performance in this Geneva, one of a spectacle called *Le Peau d'Ane* (The Donkey's Skin). As it was a little draggy and I was tired from travel and sight-seeing, I left before it was over. On my way out I thought I would take a return check, simply to see what it looked like. To my astonishment the doorkeeper gave me a playing card, the king of spades. 'Old man,' said I severely, 'I object to this. Some fellow might come in with the ace and take my seat.' American humor. Totally unappreciated by Swiss doorkeepers.

The beautiful Kursaal came next, and then we were fairly started on our way. The lake has a wonderful blue color, the like of which I have never seen on any other body of water. Looking down into it from the stern of a steamer, where it has been churned up by the wheels, I have been forcibly reminded of the water in a washtub after the bluing has been added. When a breeze skims the surface it takes on a pea-green tint, and from the heights at Glion I have seen its colorings for all the world like the strokes of a paintbrush, which would seem unreal and impossible if faithfully reproduced in a picture.

The lake is forty-five miles long and about eleven hundred feet deep at its lowest point. Its temperature near the top varies from forty-five degrees in winter to eighty degrees in summer, but at the bottom ranges only from forty-two degrees to forty-four degrees all the year round.

—Publishers' Photo Service.

A Swiss village snuggled close to the base of the Alps. Circle—Near the last lap of the ascent to the peak of Mont Blanc. Lower left—On Lake Geneva.

—*Keystone View.*

As we passed out of the city I was amused to see Waterbury watches for sale in a jeweler's window, for I had always supposed that Geneva was the watch center of the world and would brook no competition. That may have been the case once, but Waltham, Massachusetts, can beat it to death now.

We remembered that the city had been the stamping ground of both John Calvin the reformer and Voltaire the freethinker, though they never met. Most people think they never will.

About fifteen miles out we rode through Coppet, where Madame De Staël lived. If you haven't read her fascinating novel *Corinne* you must have eaten Staël bread. 'This thing has got to stop right here, or you ride alone,' says the doc. 'Aye, aye your worship,' says I.

At Nyon we saw near the railway station the Hôtel du Jura, which was built as a castle before the year 1400, and has walls ten feet thick. What we ask for in a hotel over here is not thick walls, but thick steaks. Near the lake is a walk called the Promenade de Perd-Temps (Lose Time). Of course we did not visit it as, being on a century, we couldn't afford to *perd* any *temps*.

The roads were smooth and not too hilly, and we easily made our twelve miles an hour, in spite of having so much to look at. The doctor said we ought to stop at Lausanne for something to eat, because when riding long distances one should keep the engine well supplied with food; so we went to a neat-looking little garden and consumed great quantities of Swiss cheese and bread, sparingly washed down with excellent beer. As we had done thirty-six miles in three hours we felt that we could spare the half-hour devoted to lunch.

The port of Lausanne is called Ouchy, which sounds as if someone had stepped on your corn. There is plenty to see and study in the city itself. One of the principal hotels is The Gibbon, in the garden of which the historian of that name wrote part of his great work on Rome. There are a castle, a cathedral, an art museum, and plenty of fine estates scattered about, with always that glorious view of lateen-sailed craft and white pleasure steamers cleaving the waters of the lake, picturesque villages on the opposite shore, snow-clad peaks rising above them, and dominating them all the most famous mountain in the world, Mont Blanc.

At half past ten we were away again. Twelve miles farther along we came to Vevey, where they make Nestle's condensed milk and Peter's chocolate. The towns and villages along here are winter resorts rather than summer, being sheltered from the cold winds by the wall of mountains close at hand to the northward. In another three miles we came to Clarens where on a house near the pier we saw a tablet stating that Byron the poet once lived there. Byron, one of the very few men born in the purple who ever attained artistic greatness!

Then Montreux, where in September people take the 'grape cure.'

A *funiculaire*, or cable railway, goes from here up to Glion. It is only 2,250 feet long, but is so steep that in going ahead a foot and a quarter it rises one foot.

THEN we came to the view which has always struck me as one of the most beautiful in the world, and one worth a journey from America to see—the Castle of Chillon. It juts out from the steep shores into the blue waters of the lake, dark green hills rising abruptly on the left, and directly beyond is the acute white triangle of the Dent du Midi guarding the valley of the Rhone, and in the far background rises peak after peak.

We stopped to visit the castle and found it of absorbing interest. In the basement we saw the pillar to which Bonnivard was chained for seven years, until his footsteps had worn a path in the solid rock, a path as evident today as when it was made. Poor Bonnivard! How well I remember Lord Byron's poem about him—

> Nothing to eat but food;
> Nothing to quench but thirst.

We were also shown an *oubliette*, which looked like a deep well with circular steps leading down into it. The prisoner would be told to walk down the steps, but when he had gone a short way the steps would suddenly cease and he would fall helplessly on sharp knives, there to lie until he had bled to death. Cheerful pastime for the onlookers! At the same time the duke would be living with his family in the palatial apartments overhead, perfectly callous to what was going on beneath him. He did not care any more for that *oubliette* than if it had been a freight elevator.

We reached Villeneuve (French name for Newton) at 1 p. m., quite ready for the dinner we had decided to eat there. It was to the little Hôtel du Port that we went, the meal proving entirely satisfactory—abundant and well cooked. The price was two francs, fifty centimes each, including wine. That is about fifty cents in our money. We had olives and radishes first, and then consommé, followed by some sort of fish fried in crumbs, with his tail in his mouth so that he looked like a huge doughnut. Potatoes were served with the fish. The entrée was a beefsteak. Then roast chicken, lettuce salad, a small slice of pudding, oranges, figs and cheese, with as much white bread as we cared to eat. The wine was a native product and rather sour, but we could have all we wished; and as we diluted it with half water as everybody else does over there, we found it rather palatable. With a smoke in the garden afterward we consumed an hour and a half in all, and were perfectly ready to tackle the remaining fifty miles.

STRANGE to say, most of the south bank of Lake Geneva is in France, in the province of Savoy. Few people seem to realize that Mont Blanc is not in Switzerland at all, but in France. That, however, is the case. The Monarch of Mountains is in the Alps, but no part of it is Swiss. Savoy is so isolated from the world by its altitude and its inaccessibility that the French Government has established no customhouses on its borders.

The Rhone River flows into the lake at Villeneuve and out again at Geneva, losing its identity for the entire intervening distance. We crossed it immediately after dinner and flew along at the best speed of the day until we reached the beautiful little watering place of Evian, twenty-three miles away. The guidebook says that Evian is frequented by French of the higher class, and its magnificent hotels, handsome bathhouse and showy casino seemed to prove that the assertion was right. The doctor wondered what the bathing suits in so high-toned a place might look like, but I hustled him homeward, telling him he could see a ballet at the Kursaal in Geneva that night if he wished.

Six miles farther along we came to Thonon-les-Bains, which my companion insisted meant Turn on the Beans, thereupon refusing to proceed until he had again been supplied with sustenance. This time it was an overgrown omelet that attracted us, more bread and some luscious strawberries, eaten in the garden of the Hôtel Pension du Lac, a vine-clad arbor shading us and a lazy landscape tempting us to linger.

But it was already five o'clock and it behooved us to haste away; so we sprang to our saddles for the final spurt and were once again on the sandpapered road, with but twenty-one miles between us and the end of a perfect day. It was the easiest part of the whole trip, so greatly were we encouraged by the sense of achievement and fulfilled desire.

As we rode into Geneva shortly before seven we couldn't help noticing how plentiful were the bicycles on the streets. I had never seen so many in one city before, not even in Boston in its bicyclest days.

> The wheel has always been a treasure,
> Employed for business or for pleasure.
> It bears us forth to deepest woods,
> Or carries home our kitchen goods.
> It takes us up to Alpine snows,
> Or helps young girls to meet their beaux.
> Its like there surely never will be.
> Yours very truly, Quincy Kilby.

Taking Power *From* Sleeping Volcanoes

By UTHAI VINCENT WILCOX

TO ENGINEERS it has long seemed a gross waste that the tremendous energy of volcanoes should not be harnessed and put to work.

Already means have been found whereby steam from subterranean sources can be utilized for industrial purposes. In Italy electricity derived from volcanic heat is sent over wires to Florence, Leghorn, Piombino, and other cities and towns for light and power. Borings for volcanic steam are now being made on the slopes of Etna, and also on the Island of Vulcano, which is one of the Lipari group north of Sicily. The Lipari Islands are subsidiary peaks of Stromboli whose crater was supposed by the ancients to be the main entrance to Pluto's fiery realm. Vulcano was the headquarters of the blacksmith god.

Steam wells at Larderello, Italy. One puffing hole near this place yields from 6,600 to 30,000 pounds of steam an hour, at 356 degrees Fahrenheit.

In Bolivia the government has granted a concession for the use of steam from Mount Tatio, in the Sud Lipez district, near the Chilean frontier. The volcano is to be made to drive turbine engines, which are expected to electrify all the Bolivian railroads.

The wells are bored usually to a depth of about four hundred feet, and are lined with iron tubes eight to sixteen inches in diameter. At the mouths of the puffing holes, both natural and artificial, the pressure of steam remains always the same, year after year, the subterranean heat supply being apparently inexhaustible. Nowadays the water is evaporated in huge lead-lined pans, beneath which live steam fresh from the depths is conducted through coils of pipe.

Boring for steam has been going on for more than a year near the crater of Kilauea, on the Island of Hawaii; but the rock is basalt and extremely hard, so that the drills have not yet penetrated very far. It is said that the scheme in that locality does not promise very well. But the Hawaiian Government has consulted our Department of Commerce about a plan, seemingly practicable, for making bricks of molten lava from the Kilauea crater. It is proposed to extend a trolley across the crater, carrying an endless chain of buckets, which would scoop up the liquid lava, carry it to the rim of the fiery hole, and pour it into molds.

The Senate of the Fiftieth Congress

(*Continued from page 13*)

utmost to avert Civil War, but, like many other men of similar purpose and equal standing in the South, 'went with his state.' He was peace commissioner for North Carolina to the Congress of the Southern States at Montgomery in 1861. He entered the Confederate army as lieutenant colonel and was major general when he surrendered at Appomattox. Vance was a tall, white-haired, ruddy-faced man who radiated good humor. Like Ransom he opposed secession, and 'went with his state.' He entered the Confederate army as captain in May, 1861, and was made colonel in August. The following year he was elected governor and in 1864 was re-elected. He, too, was one of the number of southern Democrats who were elected to Congress and refused admission in reconstruction days because their political disabilities had not been removed. Vance entered the Senate in 1879 and remained there until his death, April 14, 1894.

TWO southern aristocrats represented South Carolina, Matthew C. Butler and Wade Hampton. Butler was twenty-five, Hampton forty-three when the war broke out. Hampton came from distinguished ancestry. His grandfather of the same name served in the Revolution under Sumter and Marion and was major general in the War of 1812. The wealthiest planter in the South, that grandfather was said to own three thousand slaves. Hampton himself was an extensive planter in South Carolina and Mississippi, and was a Union Democrat. To favor the Union in the South Carolina of that day was to invite something more than mere unpopularity. When the war broke out, however, he raised and equipped at his own cost that body of cavalry, infantry, and artillery known as Hampton's Legion. Half his men were killed at Seven Pines and he was himself severely wounded at Gettysburg. When the war ended he accepted the result in good faith and supported reconstruction. Hampton served only a single term and died April 11, 1902. Butler entered the service as captain in Hampton's Legion and became major general. The South Carolina Butlers were represented by Pierce Butler in the Senate of the First Congress. At the battle of Brandy Station June 9, 1863, Butler lost his right leg, but, unlike Berry of Arkansas, who stuck to crutches, Butler wore an artificial leg and there was but little evidence of it in his movements. When the war with Spain came on McKinley made of this Confederate of the sixties a major general of U. S. Volunteers.

Tennessee was represented by Isham G. Harris, who wouldn't tell how old he was but had been a member of Congress as far back as 1849, and William B. Bate. Harris was a bald, irascible old gentleman, of whom it may now be said in eulogy rather than in disrespect, that no senator better carried his liquor—and there were many who were exceptionally capable carriers. He was an admirable parliamentarian and extraordinarily courteous and formal when presiding over the Senate. He served as a staff officer the last three years of the war and it is doubtful if he was ever thoroughly 'reconstructed.' Bate was a tall gentleman of the old school who habitually wore an extremely long frock coat. He had served as private through the Mexican War and entered the Confederate army as private; three times he was dangerously wounded; became major general. Like most warriors he was a modest, gentle, kindly man.

John H. Reagan, the postmaster-general and acting secretary of the treasury for the confederacy was one of the Texas senators; Richard Coke, who had served as private and captain in the Confederate army, was the other. Reagan, who died March 6, 1905, had been a member of the Texas legislature in 1847, only two years after Texas had ceased to be an independent republic. He had been a member of Congress before the war and was a member of the secession convention of Texas in 1861. After being elected to the Confederate congress he became postmaster-general and toward the end of the war was also secretary of the entirely empty Confederate treasury. Reagan had served twelve years in the House when elected to the Senate. He was the author of the Reagan Interstate Commerce Bill upon which all like subsequent legislation has been founded. Coke, his colleague, was a man of huge and imposing presence with a massive dome-like bald head that loomed up magnificently over his desk, conspicuous in the front row. Sheridan removed him from the state Supreme Court as 'an impediment to reconstruction.' That did him no more injury in Texas than did his service in the Confederate army, for he was twice elected governor before coming to the Senate.

TWO Confederate soldiers represented Virginia. One was Harrison Riddleberger, who served three years as second lieutenant, first lieutenant, and captain of cavalry. The other was John Warwick Daniel, who was an eloquent, gallant, handsome man for all that he walked limpingly. His long hair, straight as an Indian's, was still black. He looked more like a poet than the author he was of such legal textbooks as *Daniel on Negotiable Instruments*, *Daniel on Attachments*, and so forth. He was only eighteen when the war broke out and served until Lee's surrender.

John E. Kenna and Charles James Faulkner represented West Virginia. Each was but thirteen years old when the war began but each saw service. Kenna was a private, was wounded in battle when but sixteen and was surrendered at Shreveport, Louisiana, in 1865. He died while serving his second term in the Senate and Catholic clergy conducted his funeral services in the Senate Chamber in the presence of the assembled Senate. Faulkner's father, also named Charles, was minister to France in 1859-60. When he returned to the United States in August, 1861, he was arrested and imprisoned in Fort Warren on suspicion of disloyalty but was exonerated the same year. The boy, who had been in Europe attending Swiss and French schools, went South after his father's arrest, and, enlisting in 1862 at the age of fifteen, remained in the service until Appomattox.

While every senator in the Fiftieth Congress from every Southern State had served the Confederacy in the field, none of the Democratic senators from any of the northern or western states had served in the Union army. For that matter Cleveland himself had paid for a substitute. Among the senators was George Hearst of California, father of William Randolph Hearst, but he was forty when the war broke out. Delaware was represented by Eli Saulsbury, who was forty-three when the war began, and George Gray, who was but twenty-one. Gray was graduated from Princeton in the class of '59. Tall, dignified and handsome, he served two terms in the Senate and was a member of the commission that made the peace with Spain.

INDIANA was represented by Daniel W. Voorhees, 'The tall sycamore of the Wabash,' and David Turpie, perhaps the most scholarly man in the Senate, Hoar not excepted. He had an unfortunate affliction that caused his head to twitch continuously. Voorhees, who died April 10, 1897, deserves credit for the building of the magnificent Congressional Library.

Arthur Pue Gorman and Ephraim King Wilson were Maryland's Democratic senators. Gorman was but twenty-two when the war began but during all its length he sat snug and secure in a job on the Senate side of the Capitol. Smooth-shaven, with sleek, smooth gray hair and a clerical aspect he needed but robe and cowl to pose as monk. He became a Democratic leader. His colleague, Wilson, never emerged very far from Senate obscurity, but that implies no reflection on his latent capacity.

John R. McPherson and Rufus Blodgett were New Jersey's senators. McPherson during the war served the Peoples Gas Light Company of New Jersey very valorously. Blodgett was working as a machinist for a New Hampshire locomotive company during the war and was never at the front. And with his name now ends the roll call of the Democratic members of the Senate of the Fiftieth Congress.

That Congress began its life more than twenty years after the ending of the Civil War. Of the thirty-seven Democratic senators in the Senate all but ten saw active service in behalf of the Confederacy. Nothing could better illustrate the constancy wherewith the South supported the political fortunes of the leaders who had gone down with it to defeat than that, after the lapse of so many years, so large a proportion of the senators on the Democratic side should still be composed of men who had worn the gray. Nothing could better prove the fact that the war was over than that they who had gallantly fought the fight in the field, accepting the decision of the sword, should be joined with their former foes in the councils of the state for the good of the Union. In what other country could such a spectacle have been seen or evidence of such real reunion following internal war have been so soon supplied.

(*A second and concluding article, dealing with the Republican membership in the Senate of the Fiftieth Congress, as this deals with the Democratic, will appear in an early issue.*)

The Scientist Looks at Mars

(*Continued from page 6*)

certain darker areas. Observation is uncertain and difficult even to eyes trained to telescopic observation, and for that reason much of the study of Mars is made from photographs taken through the telescopes.

The writer examined a number of negatives bearing photographs of Mars during its visit to the earth. Each bit of glass, about three by four inches in size, contained from six to ten exposures of the planet. The image of Mars registered on the plate had approximately the diameter of a lead pencil. Is it surprising that astronomers, working from photographs half the size of a dime, hesitate to make rash statements as to what will be found there? The photographs, to be sure, can be enlarged, but only to a certain point. Beyond that point the image loses sharpness of outline and further enlargement results in less rather than greater clearness.

In common with workers in all the exact sciences, astronomers deal exclusively in proved facts. Everything else they ruthlessly reject. From the purely scientific point of view, the 'likely' and the 'probable' are valueless to them.

THIS distinction between fact and theory in regard to our knowledge of Mars has not been made sufficiently clear to the public at large. For instance, astronomers say that the surface of Mars shows certain markings which bear a resemblance to thin, dark lines. This is fact. The existence of the markings has been proved by many photographs, by the independent observations of scores of observers. When, however, one says that these markings are water, that they are 'canals,' that they are artificial rather than natural, one jumps from the basis of known fact into the realm of theory and inference. There is at present no proof that the canals are water; scientists merely say that such markings might be caused by water. To be visible at all from the earth it is probable that they would have to be at least two hundred miles wide. To many this would indicate that they are not of artificial construction.

Similarly, the photographs of Mars show a lighter area at each of its poles. These areas are known to vary in extent at different seasons of the year. The natural assumption is that these polar areas are snow, though with the present means of observation there is no possibility of determining this for certain. Again, observation shows that at certain seasons of the year, at the period when the polar caps are smallest in extent, broad strips appear about the bases of the caps and take on another color, and that these strips fade out again after a few months. To many observers these strips appear to have a green tint. When an astronomer leaves fact and indulges in theory, he says that these areas might be vegetation which springs up as the snow caps melt and recede, and which presently dries up and dies.

Let us see how the astronomer approaches the question about which we all have the keenest curiosity: Is there life on Mars?

His frank answer is that he does not know, and that unless our present means of observation can be enormously improved, he can see no possibility ever of knowing. Asked not what he knows but what he thinks, what his theory is, he will probably draw his inferences in about this way: If the polar caps which are plainly visible are actually snow, then it is probable that the darker areas which appear about their bases are caused by the growth of vegetation. From our observations of the distribution of life on the earth we know that vegetation does not exist here without the presence of some form of animal life. Of course, we are not sure that this rule applies also to Mars, but it seems more probable than otherwise. Therefore, provided the area we speak of actually is vegetation, it seems likely that some form of animal life must also exist there.

This does not mean that the many scientists who believe that life, and life of a high order, exists on Mars are not able to marshal a considerable mass of circumstantial evidence in support of their theory. The best known spokesman of this group was Dr. Percival Lowell, for many years the director of the observatory at Flagstaff.

Dr. Lowell's belief that Mars is inhabited by a highly intelligent race is largely based upon his study of the thin dark markings, the canals, of the planet. The peculiar straightness of these lines, the fact that they apparently are unvarying in width, their extreme length and their distribution over the surface of the planet, led him to believe that they could not be of natural formation. Nature, he argued, does not create such straight lines upon the earth or upon such celestial bodies as can be studied. Why, then, should we believe that Mars is the exception?

IF ONE accepts the theory that the Martian canals are not of natural formation it must of course be assumed that they are artificially made. The natural question then arises, Why? Dr. Lowell set about to discover a valid reason that would account for the necessity for so stupendous an undertaking. He found that necessity in the known fact of the light atmosphere of Mars, demonstrated by its almost complete lack of clouds. This, combined with other evidences, points to the highly probable conclusion that the planet possesses very little water, and that such water as exists is confined very largely to the polar regions.

His deductions from this point are easy to follow. Water is a necessity to life as we know it; existence depends upon it. Where it is scarce the struggle for existence becomes, in effect, a struggle for water. 'The study of planetary evolution in general,' writes Lowell, 'shows that as a planet ages, its surface water grows scarce. Its oceans dry up, its rivers cease to flow, its lakes evaporate.' This process, he argues, has advanced much farther on Mars than it has on the earth; to the point, indeed, where water becomes a very precious commodity, its proper conservation and distribution vitally necessary to all life on the planet.

Here was an incentive, the motive of self-preservation, that would spur the inhabitants of Mars to any effort, however great. It is on these grounds that he accounts for the construction of their canal system; their purpose to carry water from the remote polar regions, to husband its precious streams and ration it out over the planet's surface.

Seen in the light of this theory, the canals of Mars take on a significant and sinister interest. They become evidences, visible through millions of miles of space, of the tremendous struggle which the life of another planet is waging for its continued existence.

Here is a theory intensely interesting, one believed to be probable by many competent scientists. Is it true? Shall the question ever be settled for certain? Will inference be replaced by certainty, theoretical belief superseded by scientific knowledge? A statement by Dr. Robert G. Aitken, associate director of Lick Observatory, has a bearing on this question. 'The largest telescopic lens in existence today,' says he, 'is one hundred inches in diameter. It cost one million dollars. With a lens three hundred inches in diameter we might hope to learn if life exists on Mars. Such a lens, however, would cost, not three millions of dollars, but twenty-five millions. We are not likely to have it soon.'

France and America

(*Continued from page 1*)

America. By the French themselves this total of tourist money expended in France is computed to exceed the exports by fifty per cent. In any event, approximately one billion dollars is spent annually in France by the sight-seers; large sums are also spent by permanently expatriated Americans, usually very loud in their depreciation of everything American except the checks from home.

In view of the enormous volume of the American and English tourist traffic the attacks made upon English-speaking people during the summer of 1925 were peculiarly regrettable. The financial prosperity of Paris depends to a greater extent upon the foreigner than does the welfare of any other great city of the world. There are thousands of hotels, restaurants, curio shops, postcard venders, and tourist agencies which live upon the tourist. The famous exclusive shops of the Avenue de l'Opera and the Rue de la Paix have one French customer to five or more Americans. Indeed it is rather uncommon for the American buyer to encounter a native in these shops. There is hardly a fine store in Paris which does not advertise, 'English spoken here.'

American prosperity is the subject of great envy on the part of many Europeans. Attempts to unite the Europeans in a tradewar against America are discussed. The beneficial effect of this prosperity in contributing to the financial rehabilitation of Europe is not recognized. A real campaign of education is necessary. In particular the fundamental sources of our prosperity—the public schools, technical schools, research laboratories and progressive methods, decent wages to workers—need to be revealed. In these sources lies the economic restoration of Europe.

Sea May Hold the Secret of Weather Control

By S. R. WINTERS

MEASURE the amount of heat stored up in the oceans and we can forecast the conditions of the weather in 1930. This is the latest theory about the weather.

The waters of the oceans are said to be a vast reservoir for receiving and distributing solar heat. The oceans distribute this heat in varying quantities, and the full effect of a change in solar radiation is not felt until some years later.

Dr. George F. McEwen has succeeded in a measure in predicting rainfall in southern California from a study of the ocean temperatures of a few summers ago. However, the Weather Bureau of the United States Department of Agriculture is dubious about the possibility of long-range weather forecasting.

'There is need for determining pretty accurately the surface temperature of the water,' says Doctor Humphreys, meteorologist. 'The present method of determining such temperatures is very crude. We would like to ascertain the temperature of the water down to a tenth of a degree. Small differences in temperature frequently are very effective in determining high pressure and low pressure.

'One problem is how to determine these temperatures to a high degree of accuracy. There are some places that are more important in this respect than others—the region between Washington and the Bermudas, or, in fact, from Washington across the Atlantic at latitude 30 degrees. The data on temperatures between here and the Bermudas are very important. We would like to know if there is a barometric high-pressure ridge. There is in addition to these high-pressure ridges a high-pressure peak, wherever one of these ridges is crossed by a cold ocean current.

Chart makers sounding for depth. Position of boat is fixed by observers with sextants.

Equipment on board the U.S.S. Hannibal, used to measure ocean depth by sound.

'We would like also a survey of the output of ice in the Grand Banks region; to know whether that ice is much more frequent in one year than in another. Another thing we wish to ascertain is the supply of ice in the Indian Ocean.

'One-half of the Antarctic Continent is merely a great sheet of ice. Ten, twenty, thirty, forty square miles of ice will break off there and float away as a single berg. The thing that seems most logical as the cause of one year differing from another in India is the change in ocean temperature, and that probably goes back to the change in quantity of ice that is broken off in the Antarctic.

'We would like also to know the difference between the direction of wind and ocean drift. If the winds push the ocean surface in a certain way and affect the water drift, the water must in turn react upon the atmosphere. So almost must the land react upon the winds. We want definite determinations of the direction and velocity of the wind with increase of height.

'We find a curious thing commonly happens here in Washington and in most other places. As you go up, the velocity increases at first. Then you get to a place where the wind is faster than either above or below. We want to know if this phenomenon happens on the ocean in precisely the same way and if it has one law in one latitude only to vary in another.'

In recognition of the need for a thorough knowledge of the ocean and its effect upon weather conditions, the Navy Department contemplated a study of the Gulf of Mexico, but Congress failed to provide funds for the project.

It is claimed that *the total organic productivity of the earth's waters is probably greater than that of its lands; the agricultural and animal resources of the oceans greatly exceed those of the land.* Five-sevenths of the earth's surface is covered with water and this vast body of waters teems with living organisms.

The expedition will make an effort to have removed menaces to navigation like this derelict which was adrift for months.

An Indoor Game *With* Racquets *and* Balls

By V. A. CAZALET

WITH the exception of lawn tennis, those games which are played with a racquet and a ball do not for the most part figure very prominently in the minds of the public. Court tennis, racquets, squash tennis, handball, fives and squash racquets are games which for the most part are played in the seclusion of clubs and by a limited number of persons. Of recent years, however, the game of squash racquets has rapidly come to the fore, and is becoming almost a 'popular' game. For instance, there are in Boston and the surrounding districts, including Harvard University, more than one hundred courts. If you reckon that thirty to forty persons play on a court a year, it means that between three and four thousand play the game of 'squash' in that locality.

At Harvard University, it is reckoned that between one thousand and fifteen hundred undergraduates play the game. The other universities are taking it up, slowly but surely. This year, for the first time in America, fifty-six women entered for a squash racquet competition in Boston.

The game originated, like many other ball games, in England, and there, also, it is making rapid strides in popularity. It has, as its patron in England, the Prince of Wales who plays the game regularly.

Women have played the game for some time in England. They have realized that there is no better way of keeping physically fit and also of keeping their eye in training for the coming season of lawn tennis than by playing squash racquets in winter.

There are already one or two public courts in this country which are always booked throughout the day. There is a plan already afoot to build a dozen courts right in the heart of Wall Street so that business men can get their exercise during the luncheon interval.

THE reasons for the increasing popularity of the game are not hard to find. It is not an expensive game and it is easy to play. You can build a court (at any rate in England) for about a thousand dollars. A racquet lasts for as long as you care to keep it; the balls constitute an insignificant additional expense.

The game is played within four walls and only a very limited number of people can watch it at one time.

An all-English squash racquet team recently visited the United States. They have played some twenty-odd matches out of which they won seventeen. It is a good record, when it is considered that the team was not the best that England could send if all her most expert players had been available for the tour.

Perhaps it might be advisable to describe for those who have never played the game of what a squash racquet court consists, and how the game is played. The courts can be made of either wood or cement. The standard length is thirty-two feet; the width varies between eighteen feet six inches in this country and twenty-one feet in England. The back wall should be six feet six inches. On the front wall there is a little red line placed eighteen inches above the floor. This is called the 'telltale.' The game is played generally between two people, although there are larger courts which accommodate four players.

The object of the game is to keep the ball above this 'telltale,' and whoever hits it underneath or misses the ball loses a point to his opponent. There are no complicated rules to muddle you, and any person can learn all there is to know about the scoring and the way the game should be played in five minutes.

To become expert in squash racquets, as in every other game, requires certain characteristics. The qualities most necessary are physical fitness and keenness of vision. The playing of the game is not limited to England and the United States; it is very popular in Canada. Inquiries have been made from Japan where there is every likelihood of its being taken up with considerable enthusiasm in the near future. And even in far-off Siam, the king is a keen and enthusiastic player.

There is no better way of nations understanding each other than by meeting on the field of sport. During the tour which the English team recently completed, bonds of friendship and sympathetic understanding have been formed with people in all parts of the country through the medium of the game. There is no tie which binds all Anglo-Saxons with greater force than their love of sport. If we have done something to forge another link in the athletic chain which binds the English-speaking races together, we shall have accomplished something of far greater value than could be reckoned in the score of games or matches.

Giving *the* Dumb *the* Right *to* Speak

By GRACE T. STUTSMAN

ILLINOIS SCHOOL DEAF
JACKSONVILLE
ILLINOIS SCHOOL DEAF
JACKSONVILLE

The members of this brass band are totally deaf, but their music is very creditable.

MANY persons think that the reason a deaf person is dumb is because something is wrong with his speech organs or his brain cells. As a matter of fact the only reason he doesn't talk is because, not having heard any one speak, he doesn't know what to say. It is merely by the grace of God that we are not in like case, for the ear is a delicate organ, and anything—a light blow, a fall, a fever, or any of the thousand and one experiences of childhood—may impair its use and, if hearing is lost before the age of five or six years, a child rarely remembers for long the vocabulary it has acquired before that time.

Every state in our Union provides for the education of its deaf. Each year some school for the deaf is asked to enroll persons long past school age, who had never been sent to any school previously.

Literature has no blind heroine who is not of unusual sweetness and amiability, calling forth the deepest admiration and sympathy; but an attractive deaf character is hard to find in fiction, although in fact they are far from rare. In many ways the handicap of the deaf is far heavier than that of the blind. Imagine not knowing your own name, nor even knowing that you and everything else have a name till you were seven or eight years old, then laboriously learning the name of each thing, each action, each quality by conscious effort, and then learning how to fit these words together.

The deaf child who is sent to school from a family of hearing brothers and sisters comes back to them more sturdy in physique, more polished in manner, more firm in character, more able to earn a living than the normal boys and girls who stay at home. The schools for the education of the deaf all hold that 'education is the harmonious development of mind, soul and body.'

Nearly all the schools teach printing, including the operation of the linotype, shoe repairing, carpentering and cabinet-making. Some have courses in tailoring, house painting, and baking. The girls are taught sewing, millinery, weaving, basket making, cooking, and often photography and typewriting. It will be noticed that these are all occupations in which hearing is not essential, and the pupil is given an opportunity to learn the thing for which his taste and ability incline him.

For the student who completes the scholastic course in the state school there is an institution for his higher education in Washington, D. C. This is Gallaudet College, the only college for the deaf in the world. Its graduates are filling positions of trust and importance in all parts of the country in varied activities, from that of athletic coach to banker.

Literary Effort in the South

(*Continued from page 2*)

The growing exuberance of the field is illustrated by the way in which other publications more daring than the one which comes out of Charlottesville have entered it. One of these is *The Southwest Review*, published at the Southern Methodist University, Dallas, Texas, but, in its dress of red, reflecting none of the aspects of Methodism celebrated by the followers of Mencken. It was started in 1916 as *The Texas Review*, first edited by Stark Young, and it assumed its present status two years ago.

The Southwest Review puts emphasis on the Southwest rather than on the old South. By Southwest is meant the area between the lower Mississippi and the Pacific Coast, where nature, life and history abound with exotic color. The new literary movement in the South, as now taking form, seems to have an inclusive reach of that kind. Its spread is outlined by some as, broadly, covering the section of country lying south of a line running from Baltimore, Maryland, through Louisville, Kentucky, to Sante Fe, New Mexico.

Forces moving toward a more intense and diverse exploitation than the area hitherto has known are now perceptible. Those farthest away have moved mostly in miniature, but behind the groping for expression there is an evident urge which promises much. It is in this area that nearly all observers of literary trends expect the most distinguished writing of the near future in America to be done.

One finds in *The Southwest Review* the best reflection, given by that type of publication, of the literary renascence that is patently at hand in the South. Yet, like the others, it bears no sectional label, drawing its contributions from all the world.

Some time ago *The Southwest Review* absorbed *The Reviewer*, the most ambitious product of the literary revival in the South. That magazine was set up independently of institutional support, in Richmond, Virginia, in 1921. In 1925 it was transferred to Chapel Hill, North Carolina, where for a year it was conducted under the auspices of probably the most outstanding new literary group in the South, the one that is identified with the University of North Carolina. It issued from there, under the editorship of Paul Green, until realization came that it was in advance, practically, of the times. *The Reviewer* probably was the most authentic herald of the literary awakening in the South.

Yet of that awakening there are heralds which are still more provocative. One is *The Double-Dealer*, a magazine published in New Orleans by a group that bars from it no school of writing or thought.

All's Well, edited and published by Charles J. Finger at Fayetteville, Arkansas, should be included. Mr. Finger is an adopted son of the South, a man of world-wide experience in several lines of activity. As a writer he is well known to readers of this magazine.

Other Southern literary publications include chiefly poetry magazines put out by local groups, such as *The Buccaneer*, of Dallas, Texas; *The Poet's Scroll*, of Howe, Oklahoma, and *The Lyric*, of Norfolk, Virginia. *The Fugitive*, issued from Nashville, Virginia, is among the best of them. On a far boundary of the new literary belt there is published, at Sante Fe, New Mexico, *The Laughing Horse*, spokesman for the art colonies of that section.

And there is at least a reënergized school of scholarly, economic and social writers and investigators, who are abetted by probably the most distinguished magazine of the kind published in America. This is *Social Forces*, published at the University of North Carolina. And at Duke University the *Hispanic American Historical Review* has been revived. It is the only scholarly magazine dealing with Hispanic American history that is published in America.

—*Keystone View*

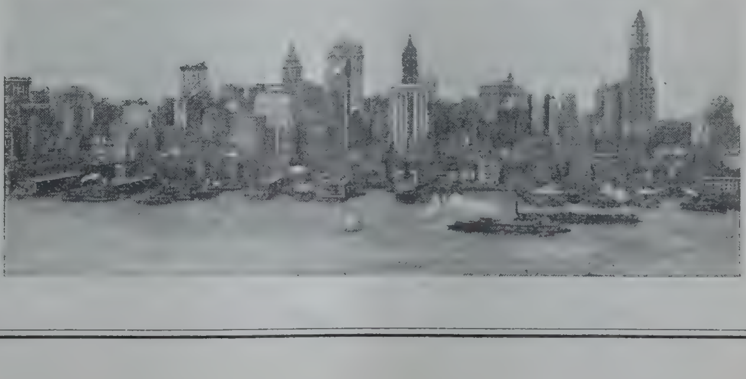
SAVAGES

By AMOS R. WELLS

TWO wild men stalked each other in the jungles of Brazil;
They crept through swamp and forest with a silent, steady will.
They were sinuous as the serpents, they were shadowy as the brake,
They were fevered with a throbbing thirst which only blood could slake
Till at once they spied each other, and their hatred with a hiss
Bathed their sudden stiffened bodies with a flame of burning bliss:
Their bow-strings twanged together and the poisoned arrows sped,
And in the rotting ooze and slime the two are lying dead.

* * *

TWO wild men stalked each other through the jungles of New York.
Not a serpent more insistent with his deadly turn and torque;
In the mazes of the market, in the labyrinths of trade,
They were feeling out each other, they were keeping ambuscade,
They were drawing lines of tape in a monster stratagem,
They were plying stocks and bonds with a sullen, savage phlegm,
Till the time had struck for action, and the poisoned arrows sped,
And they walk the streets as living men, but God knows they are dead.



Order in the Arctic

(*Continued from page 15*)

these were as real as the very snow and sky. Let me put it this way. The men engaged believed, as I believe, that real Christianity stood for order and duty and discipline. And so to the tale.

At the world's end stands Fort MacPherson, where the Mackenzie River enters the Arctic Ocean. It is the last outpost of civilization and at the settlement live a Hudson Bay man, a mission worker or two, and a detachment of the Northwest Mounted Police—the word 'mounted' is a mere name, because these must walk. The tale starts at eight o'clock on the morning of December 21, 1910, when the patrol started to go down to Dawson to see that all was well along the route, to keep up connections and to carry mail. The distance to be traversed was 470 miles. The patrol consisted of four well-tried, hardened men—the leader inspector Fitzgerald, his fellows Kinney, Carter and Taylor. They had three dog teams of five dogs each, and rations for thirty days. So there was no margin, and they calculated on making eighteen miles a day.

IT WAS a day of wolfish cold when they set out, for a strong wind was blowing and the temperature was twenty-one below; they made no more than fifteen miles—the dogs were found to be in poor condition! For five days thereafter they had a tremendous time, pushing and hauling through heavy snowdrifts, facing snowstorms that were like vast white walls, drudging all day and sleeping on ice-bitten earth. On the sixth day they met with a band of natives and hired one of them to help them across the portage. They needed the aid, for the way was over an eight-hundred-foot rise, all boulder-scattered, and beyond that rose a thousand-foot hill with very deep snow. To add trouble, the thermometer ranged from thirty-nine to fifty-one below, with a head wind at that, so that they only made nine miles a day. But they made the portage, and Esau, the native, bade them good-by and went to his own people.

Now what befell the patrol is known only from scraps of information in a diary which Fitzgerald kept. For when Esau and his people turned up in Dawson and spoke of helping the patrol at the portage, there was consternation and also activity. There were men willing to give themselves freely and generously. A rescue party set off north, and its members had a terrible time of it, what with glass-smooth glaciers, and a temperature of sixty-two below, and ice plains water-covered. With infinite toil they won their way to the Arctic Circle, for 212 miles from Dawson they struck the Fitzgerald trail, *but it was headed north*. And that trail told a tale of starvation and weariness. There were signs that the hard-pressed party had been forced to kill and eat their dogs.

And so back on that trail the rescue party went, here and there coming across signs, pieces of dog harness, things cast away to lighten loads, a broken sled. North and north the rescuers pressed, hopeful as they drew nearer MacPherson Fort that the patrol had reached safety. Then, fifty-eight miles from MacPherson they came across an old shack and in it a sign that the patrol had been so pressed and so weary that they had left the last thing they dared to part with. It was the mail sack and a dispatch bag. These were hung in safety across a rafter. And the next day the rescue party found the bodies of Kinney and Taylor. Kinney had died first and his companion had decently composed his friend's body, crossing his hands on his breast. Then Taylor had died, either by his own hand or by accident. For his hands clutched the barrel of a carbine, but of his face there was nothing left except the upper jaw.

Still there was hope in the rescue party, strong hope at forty miles from MacPherson, stronger at thirty miles, and mile upon mile thereafter. Then, when no more than twenty-five miles from the Fort, the tragedy leaped like lightning. A rag hung on a bush, and, guided by it, the rescue party found the body of Carter by the ashes of a camp fire. Fitzgerald had covered his companion's face with a handkerchief, and then, crawling on, still northward, had struggled forward until Death kissed him. And so there was peace after all that sorrow and pain in the doing of duty.

* * *

Courageous shouldering of burdens, you see. And for what? For that civilization which means order; for that religion which is not a ceremonial nor an organization, but an atmosphere and a way of life.

(*This is the first of two articles on this subject by Mr. Finger. The next will appear in an early issue.*)

The Catalan Sardanas

(*Continued from page 4*)

It is noon in the Parque de Barcelona in the *plaza* near the fountains. Already hundreds have assembled and thousands more are flocking to the spot. The members of the orchestra take seats in the big band stand and tune up. To the foreigner the instruments seem very strange. There are instruments similar to the clarinet, but a good five feet long. The brasses resemble cornets, only they are stubby and about twice as large. There is a sprinkling of conventional instruments, including bass viols, and then a series of queer-looking pieces resembling tin whistles. As a matter of fact that is just what they are except for the tin. This is a distinctive Catalan touch, as whistles of this type are found nowhere else. Attached to the right wrist of each whistler is a small drum about six inches in diameter. These are the only percussion instruments in the orchestra and the time is beaten in the cadence of three—*rat-tat-tat, rat-tat-tat*. At intervals throughout the dance the music stops except for the whistles, which continue for a few beats. This is the signal to change the step, and the music then resumes in another time.

As the first bars are being played everyone looks around waiting for someone to begin. A group of soldiers solemnly divest themselves of their belts, bayonets, and caps, piling them in a heap. They join hands, form a circle, and dance. Circles begin to form everywhere. Presently some young girls break into the ring, first laying their pocketbooks or prayerbooks in the heap with the rest. As the heap grows, so does the circle, and if the circle gets too big, smaller ones form within it.

It is decidedly reminiscent of the Highland fling and old-fashioned Irish dances, though in slower time. Nobody smiles—this is a serious business. I asked why they were so grim about it, and was told that about half the dancers were from the country or the hills and wanted to show the city folk how the sardana should be danced, while the metropolitan crowd was equally determined to show up the rural visitors.

Here is a peasant in the old costume—short jacket, knee breeches, footless stockings, sandals, sash, and the Catalan cap. Next to him is a little girl about nine years old whose right hand is held by a naval officer (Catalan of course). The ages run from eight to eighty.

The circles may contain from two to a hundred. Here at one side a young man and his sweetheart are endeavoring to make a duet of it. Nothing doing!

A brawny sailor, an artilleryman and his nursemaid horn in and make a fivesome out of it. Do the couple resent it? Of course not. The strangers have a perfect right to dance with them and so has the meanest beggar on the street. Even Don Alfonso himself could not resent an impromptu partner in a sardana.

We even saw one Yankee, whose love for old-fashioned things had not been killed by jazz and its associated plagues, shyly take his place in one of the rings; this gesture was accepted with obvious pleasure, even though his dancing indicated that he would never win any medals.

As my Catalan friend explained, 'This dance is centuries old. The richest man in Cataluña will take the hand of the poorest, and the general will take the hand of the newest recruit. If they refuse they insult every Catalan.'

While we watched, three more peasants came up in native costume. The oldest must have been well past seventy and was stone blind. Two middle-aged men, evidently his sons, supported him. The old man nodded in time to the music and presently his sons made a place for him in one of the rings, his partner on the right being one of the ultra-modern young 'sheiks' with Oxford bags, sideburns and everything in the way of clothes generally worn by an undergraduate with a wealthy father. On the left stood a very stout matron of forty in her best black silk. Once in the ring the old man renewed his youth exhibiting a few fancy steps that drew admiring comments from all. His sons watched him gravely for a few moments, and then seeing that he was well taken care of broke into the circle themselves.

The Layman Looks at Advertising

By G. HENRY HALE

THERE are advertisers and advertisers. First there is the golden-rule, progressive advertiser who strives to keep his product up to and a little better than what is claimed for it, and who gladly makes good any defect or inferiority in his output. Some go as far as to refund all costs, if the buyer, *for any reason whatsoever,* is dissatisfied. 'Satisfaction guaranteed, or your money back,' is their slogan.

Then we have the advertisers who have a much higher standard in their written description of their products than in their factory practice. These may not be intentionally dishonest. Some may simply lack the power of honest introspection.

How is the poor reader to choose between them?

Then there are the crooks who have no intention of making good. These criminals, masquerading in the garb of producers or tradesmen, rarely, if ever, get space in a good periodical.

There is yet another class of advertisers. In old established industries with a well-earned reputation for quality, there is a tendency sometimes for vigilance to be relaxed, and work to be done with less supervision and inspection than while the business was building its name. Articles which should be discarded as seconds are passed as first-class. The business is run on its reputation, and whatever advertising is done is written on the basis of the old reputation. You will hear from the purchaser of some product, 'It is not so good as it used to be.' Possibly the business has changed hands, and the new owners deliberately plan to cut the cost of production and thus to increase profits, in the belief that the old name and trade-mark will carry the product indefinitely.

Now, it must not be supposed that all who make extravagant claims for their products are dishonest. Thousands of men have invented some mediocre device which they believe has unusual merit, and if given a chance, would revolutionize trade, or travel, or manufacturing, or would make the housewife independent of servants. Many of them never get anywhere with their inventions. Occasionally one has enough 'salesmanship' to put his product over, never suspecting that it is not all that he claims for it. His enthusiasm and self-confidence and ignorance are such that he would scorn scientific tests, and his enthusiasm and confidence carry conviction to the readers of his advertisements.

A very popular method of playing on the credulity of people is to select some sensational scientific discovery or near-discovery that has been exploited in the newspapers, and commercialize the idea to the limit, using sentences and part sentences taken from some authority on the subject, and from these few statements pyramiding a great theory of cure, in which some particular product is the paramount remedy.

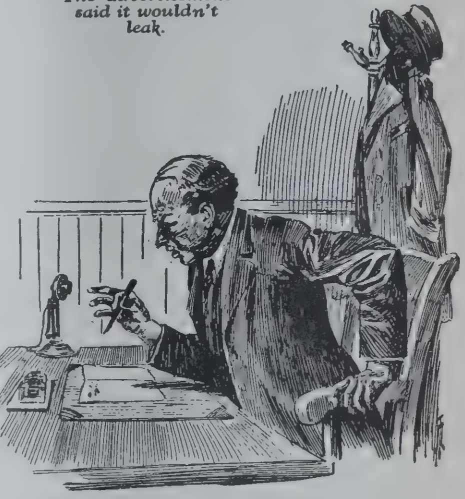
No sooner has a scientist or supposed scientist suggested some new remedy, however sensational—even to zebra glands!—than some cunning fellow, looking for easy money, plans to take advantage of the new interest of the people, and, with a plausible story, markets something that is taken up eagerly by persons who credit themselves with being intelligent.

Then there is a comparatively harmless form of misrepresentation that accompanies some legitimate advertising. It is the enumeration and elaboration of supposedly important points of superiority peculiar to the advertised product. Often much of this superiority is in the imagination.

Take, for instance, several toilet preparations.

Now, a superiority that must be measured by some sort of instrument of precision, an advantage that is not apparent to a man using the product, is not, in the writer's opinion, worth advertising. True, it is a strong selling point, for the average reader is not at all critical, and is easily misled by statements which misrepresent a thing to his mind without going through the crude and discredited process of lying about it.

'It is not so good as it used to be.'



The advertisement said it wouldn't leak.

What is the poor reader to do? As to deciding as to superiority, he might as well be a sheep among wolves. The products may be first-class. Without these claims, either might serve the purpose desired.

Advertising is one of the most ethical of professions. Advertising men know in their work that honesty is the best policy; that it is the only policy worthy of the name; that the man who advertises falsely never gets anywhere.

THE white paper that goes into a single copy of some magazines is worth more than the news-stand cost; moreover, the newsboys and others must have their slice. Who pays the publisher for his articles, his composition, his presswork, his editorial staff, et cetera? The advertiser of course. The money that the advertiser pays for space comes from the pockets of the readers. If the advertiser did not get from the readers more than he has to pay, he would soon give up advertising.

The selling point which the periodical holds out to the advertiser is that the magazine has a reading list of so many hundreds of thousands, which will represent just that much of a probable market for the advertised product. That is, the periodical, for a consideration, virtually delivers its subscription list and news-stand patronage to the advertiser. The advertiser can afford to pay, and does pay, a handsome price for this privilege. Now there can be no serious objection to this, except where the periodical (whether intentionally or unintentionally), lends its prestige in this way to misleading advertisements.

Advertisers have found that judicious advertising, by increasing sales and making it possible to take advantage of quantity production, actually diminishes costs. This theory of course does not always work out.

At any rate the consumer is satisfied; further, this is a free country, and he does not have to buy the advertised goods if he finds them too expensive.

Herman Melville and His Dog

(*Continued from page 3*)

from the drifts, and was accompanied by a great Newfoundland dog as shaggy and powdered as he. It was a journey of several arduous miles for him; but he was an alcolyte of *The Scarlet Letter*, and would have undertaken a voyage to the moon for the sake of talking with the author of the famous romance.

TO HIM, Hawthorne's genius was paramount, but it perplexed him: whence did he derive his knowledge of the human heart, and what was the experience that had led him to regions so deep and perilous? I think he finally conceived the notion that Hawthorne had in his youth committed at least one of the seven deadly sins, and was wont to meditate in that secret place of horror and receive awful information from witches. Thirty years after this Berkshire time, I talked with him in his house in New York; he was then more than sixty years old, and a melancholy and pale wraith of what he had been in his prime.

During the incoherent talk between us on that occasion he let fall several hints as to his interpretation of the source of Hawthorne's insight into the human soul. It was a sad interview; he seemed partly to shrink from the idea that obsessed him, and partly to reach out for companionship in the dark region into which his mind was sinking. I was writing a biography of my father and my mother at that time, and had applied to him for any letters that Hawthorne might have written to him in reply to several of his own during the 1850's. But he said, with agitation, that he had kept nothing; if any such letters had existed, he had scrupulously destroyed them.

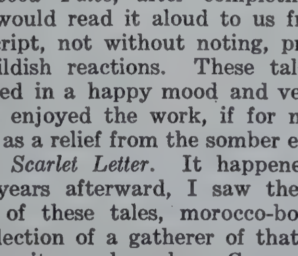
In my father's references to Melville at that time, in his journals and his letters to my mother, he had spoken regretfully of the increasing extravagance of the younger man's speculations and of his vain struggles to fathom the mysteries. Hawthorne's mind was healthy and firmly balanced and his ordinary mood cheerful, even playful, in contrast with his contemporaries, Poe and Melville. It was due partly to this wholesomeness that he was able to enter unscathed into the miseries and disasters of others—as Dante, in the *Divine Comedy*, was protected by the wise spirit of Vergil from the dangers of their tremendous journey. For months and years after the publication of *The Scarlet Letter* there had been a strange and pathetic pilgrimage of the afflicted to my father's door, seeking counsel and comfort. He gave them understanding and sympathy, and most of them, no doubt, went away with hope from the colloquy. It was a burden to him, but he sustained it without faltering.

OF ALL this Hawthorne's children knew nothing; my sister Una was six or seven years old, and I two years younger; and Rose was an infant. But we rejoiced at the visits of Melville, who with his friendly black dog would come trudging through the snow, muffled in his topcoat, his dark beard hoary with frost. He was well formed and active, not so tall as Hawthorne, his full beard giving him a quality of oriental mystery in the eyes of the young folk.

Dark, brilliant eyes looked out under the square white forehead and his bearing was simple and affectionate; we already knew his *Omoo* and his *Typee*, and would beset him for further tales of those fascinating regions. He responded cordially. His narrative powers were extraordinary by word of mouth as well as by pen. While his Sindbad yarns were spun mostly from fact, his imagination roused up as he proceeded, and he added magical touches, so that scenes and actions became visible, and were present and going on as we listened. He did not confine himself to speech either; he would be on his feet, escaping from weird perils, contending with savages, witnessing vivid events, buffeting the waves in equatorial tempests, or being tossed ashore on coral reefs and averting starvation with the milk of coconuts smashed on the rocks.

So strong was the illusion created by these tales that once my mother, after Melville had departed, searched for the club wielded by one of the native islanders in the fight which he had described: he must, she thought, have laid it aside in a corner of the room and forgotten to take it away with him. But the club was never found, nor had it ever been nearer the Berkshires than the Pacific islands of the Marquesas. It had seemed visible in Melville's narrative, for he had become the fighting savage he was portraying, and our little sitting room in the red cottage had enlarged into the hot jungles and white shores of equatorial seas.

Fortunate children to be thus entertained! And our enjoyment was the greater because our father who was about this time writing the *Wonder Book* and the *Tanglewood Tales*, after completing each story, would read it aloud to us from the manuscript, not without noting, probably, our childish reactions. These tales were composed in a happy mood and vein and, too, he enjoyed the work, if for no other reason, as a relief from the somber emotions of *The Scarlet Letter*. It happened that, many years afterward, I saw the manuscripts of these tales, morocco-bound, in the collection of a gatherer of that sort of treasure—it may have been George Childs, the Philadelphia virtuoso. The pages, as I turned them over, were written in a clear running hand, with very few excisions or interlineations, much in contrast with the manuscripts of his romances: one could feel the pleasure of the expression of a free and enjoying mind. Against this sunny background Melville came to paint his ardent pictures; and the powers of both artists were enhanced by the comparison.



Sometimes, when our visitor arrived early in the day, we would all sally forth to play in the snow. Splendid snows there were in that region, deep, crisp and spotless, and a coasting place down the steep side of the hill toward the ice-bound lake at the base. Occasionally the flying sled with its shouting freight would hit an unseen stump, and for a moment there would be silence, till we could emerge from our burial in the snowdrifts. Melville did a yeoman's part in these sports; and the Newfoundland dog would often be harnessed to pull the sled, Eskimo fashion, or to carry us astride his wet, shaggy back.

And then, after a private conference with Hawthorne in the study overlooking Berkshire Bowl, as the lake was called, and Monument Mountain and Greylock rising behind it in their ghostly robes, 'Mr. Omoo,' as my mother used to call him, would put on his topcoat, call to his dog, and tramp back to Pittsfield to resume his pursuit of Moby Dick. I wish some of the careless felicity of those days could have found a way into the pages of that appalling and inchoate work.

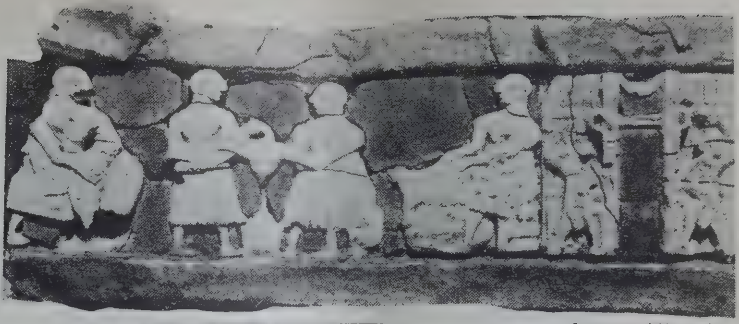
THE personal facts of Melville's career remain somewhat obscure, though his books are autobiographical; but as he was controlled from within, that record does not appear. He was born in New York of sound American parentage, went to sea as a boy, and was afloat almost continuously during his early manhood. But while a reader and a thinker—without the advantage of university education—he could not assimilate his self-acquired knowledge. His mental ship lacked ballast, and he launched upon the moral and intellectual ocean without an authentic chart.

We saw nothing of him after the Berkshire years—Hawthorne took his family to Europe in the year following. He seems to have been restless, wandering over the earth, not as a seaman but as a traveler. He appeared one day in Hawthorne's consulate at Liverpool, when chanced to be present, and sat talking for an hour. But his talk was not in the improvisatorial style of the red-cottage days; it was for the most part unintelligible to me, a boy of eight or nine, and he seemed depressed and aimless. He said goodby at last, and wandered away; I did not see him again till a short time before his death.

I KNEW that he had once proposed to Hawthorne to join him in some literary work, which suggestion had to be declined on account of our departure for Europe. During the seven following years Hawthorne wrote nothing except his journals. But doubtless he would have felt collaboration impracticable in any case. I spoke of this project to Melville but he made no intelligible response. His words were vague and indeterminate; and again and again he would get up from his chair and open or close a window with a stick having a hook at the end, which he kept by him seemingly for that purpose. When I tried to revive memories in him of the red-cottage days—red-letter days too for him—he merely shook his head. I felt that in spite of his bodily presence, the man we had known was not there.

The Oldest Building in the World

By
WILLIAM A. McGARRY



—International Newsreel.
Carvings in shell, mounted on a copper base, from the ruins at Tel El Obeid.

FOUR miles from the widespread ruins of Ur of the Chaldees, the first city mentioned in the Bible, archeologists have discovered a still older building. Its upper floors have crumbled away, and its towers have vanished, but under the sands of centuries the thirty-foot foundations are still intact, even to the delicate life-size shell carvings of men and animals made by ancient craftsmen nearly seven thousand years ago. The Arabs of today know it as the Tel El Obeid.

Scientists operating under the joint auspices of the University Museum of Philadelphia and the British Museum made the discovery more by accident than by design. The expedition went out to excavate Ur of the Chaldees, where it was expected would be found the world's first library of historical and religious records. C. L. Woolley, F. G. Newton, Sidney Smith and A. W. Lawrence, members of the expedition, looked over the Tel El Obeid one day in search of possible records concerning Ur and came to the conclusion that it was worth digging up.

Wall of the stage tower at Ur. Inset—Drain supposed to have been used to carry off blood of sacrifices from the ancient temple.

A few days later stamped bricks were found in cuneiform script informing posterity that here the great King A-an-ni-pad-da of Ur had built his temple. The name of this king was known from ancient Sumerian lists as that of a ruler in the earliest days of the empire that built the world's first civilization. But nothing definite had hitherto ever been found, and many archeologists contended that he was only a myth. The bricks stamped with his name settled that point.

The following official report of the find was made by Dr. Woolley:

'In a previous report I have given some account of the little temple at Tel El Obeid, about four miles from Ur, and have spoken of its columns overlaid with copper, its mosaic columns and decorative friezes. The excavation of the building is now complete and a much fuller idea can be had of what is, by a good deal, the oldest example of building construction yet found.

'A broad flight of stone steps led to a platform about twenty feet high on the south corner of which stood the temple proper, its gate tower fronting on the stairway, its façade set back from the edge of the platform so as to leave a narrow step on which stood a row of statues of bulls sculptured in the round. These stood some three feet high and were made of thin copper plates beaten up over a wooden core; their heads were turned out to face the spectator, and their horns were of gold.

'Two of these statues have been recovered, though in a bad condition due to the crushing of the metal under the enormous weight of the brickwork which had fallen onto the top of them, and to decay.

'Of the frieze of cattle lying down, these also beaten up from copper plates with heads cast in more solid metal and joined onto the bodies, we have now a dozen examples, many of them in a wonderful state of preservation. Above them was a frieze of a different sort; figures carved in white shell or limestone were inlaid against a background of black tesserae, the whole inclosed in a copper frame. Of this we have a complete section in perfect condition.

'Some show bulls advancing in solemn procession; the most interesting, a panel four feet long, has on one side a milking scene, cows and their calves, and men milking the cows into tall jars; in the middle a reed-built byre with heifers coming out from a gate, and on the other side men engaged in straining and storing some kind of liquid, probably wine, oil or clarified butter.

'Found close to this, but hardly to be connected with it, is a limestone plaque carved in relief with a mythological subject, a man-headed bull on whose back is perched a lion-headed bird. An important discovery was that of two columns ten feet high incrusted with mosaic work in black paste, red stone and mother-of-pearl; both had been damaged by their fall, and the cores on which the mosaic was set had decayed completely away, so that the tesserae retained indeed their position in the soil, but were kept together by nothing more than their own weight. However, it was found possible to remove large sections at a time and to fix these onto new cores without disturbing the individual pieces of mosiac, and so to preserve these remarkable columns if not as they stood in the temple at least as they were after they had once fallen from it.

'One small object, found almost by chance, afforded us a disproportionate satisfaction; it was a gold scaraboid bead inscribed with name and title of the man who built this, the oldest building in the world still standing above ground, King Aannipadda of Ur, who, if Sumerian chronology is right, reigned about 4500 years B. C.'

The fact that the building at Tel El Obeid is dated 4500 B. C. does not mean, of course, that no earlier buildings were constructed. Unquestionably such structures as the pretentious little temple were a long time in developing, and doubtless still earlier buildings were destroyed in the numerous wars. For instance, the archeologists have divided the periods at Ur into three, the first of which began in remote prehistoric time and continued to the seventh century before Christ.

Bronze bulls found in the ruins of the temple at Tel El Obeid.

Why Dictators Rule

(Continued from page 5)

for many centuries in Russia, and that today and ever since the downfall of the Romanoffs the control of that nation has been no less of an autocratic one, indeed has been even a more aggravated kind of absolutist government, vested in a ruthless communistic oligarchy.

The question regarding the destiny of the Russian state should be sought in the answer to this query: 'Is such an oligarchy, narrowed down to a point where it is composed of and represents about five per cent of the people, the precise form of autocracy suited to and conducive to the problem of making Russia into a homogeneous state? Or is an absolutist rule along the previous czaristic principle the more effective method of welding this mixed aggregate of peoples and diversified regions into a happy, orderly and prosperous national unit?'

THE weakness of the soviet-oligarchy is that it holds a remedy which is effective, not for the bulk of the Russian tens of millions, but only for a minute fraction of the people—perhaps five per cent. Perhaps it is true that it means to serve well only those relatively few for whom it is intended. But the point is that a dictatorship—for that is what soviet rule simmers down to—to be effective and to justify itself must serve the nation as a whole or a vast majority—or it will perish. By this test sovietism is doomed. The Russian watch has been sent to an amateur watchmaker; doubtless he is learning a few things while he pretends to repair the wonderful mechanism which is in his hands. But Russia—like the watch I have in mind—must proceed eventually, probably soon, into hands more expert.

This is the essence of dictatorship—for by this name I will classify roughly all forms of absolutist rule. It must be effective for the cure of the chief and besetting malady of a nation—or industrial sphere—as has Mussolini's in Italy, for example, and as was the industrial dictatorship of various American business figures in emergencies of the past. For the 'czar' in business is nothing new; a formidable array of past talent of this kind has appeared on the pages of American business history.

* * *

But no mention of czaristic tendencies can be complete without recalling the fact that in the French Revolution Robespierre rose as a pseudodictator for a brief hour, and that because he represented only a *fraction* of the people—because he was the representative and *tool* perhaps of the mere fraction of that identical type and kind which in Soviet Russia utilized Lenin for a tool similarly—he could not survive. Robespierre in the lust for personal power descended to become, as did Lenin, renegade to his own people—in the interest of an alien few; hence his absolute power could not be maintained. His bloody career ended at the guillotine. Absolutism is sustained, though few have considered it so, by majority rule.

The violence of the French Revolution baffled a correct diagnosis or analysis, because there were strange and entirely new forces at work underneath. The fever was for a long period uncontrollable because not understood, until the years eventuated in the rise of a man capable of truly analyzing and comprehending the causes underlying the internal conflict and disintegration of the French nation. Because he was an 'outsider,' that is to say more Italian or Corsican (and, assert some, of ancient Greek descent), Napoleon was better equipped with a viewpoint which would give him a correct vision of the events around him. One of the earliest means which he put into effect to unify the people was the reinstitution of a form of royal or imperial headship—the most effective means of bringing together the heterogeneous forces of that time, as it proved, and because it supplied the French people with something to which they had always been accustomed, for a thousand years or more, a 'king' or 'head of the tribe,' which is a monarch's true function. Without their king or something of similar import they were flopping around like chickens with their heads cut off—literally and figuratively. Napoleon recognized the void and filled it: that he profited by it was incidental. The first wedges were thus placed for the opening of a reign of orderliness.

Napoleon's progress was in direct ratio to his understanding of France's real troubles and his remedies were unusually sure and effective. His downfall came only when he placed purely personal interest in the continuance of his dynasty before the welfare of the nation; when he forgot his true rôle as mere dictator and autocrat for the salvaging of a great people and presumed to think of himself in another and wholly different rôle—that of monarchic head of the tribe, as it were. He overreached his original purpose; there are natural limits beyond which a dictator cannot proceed. The work of salvage done, he did not stop there but overdid his part, and thereby became a victim to The Nature of Things.

So it is with all who are placed in dictatorial authority; they have a specific task to perform: the powers vested in them imply such an unwritten agreement on their part to step down when it has been done. When dismay and disorder have been shaped under their hands into orderliness and peacefulness, and a state—or an industry—over which they have domineered regains the capacity for continuing itself unaided by methods of force and pressure and is able once more to follow an orderly routine and to progress on logical lines, the day of the dictator who brought such a betterment of conditions about, no matter how capable he may be otherwise, is done. His real task ends when the business can safely navigate without him. This point is readily determined in the case of a nation, an industry or an ordinary business by the same means by which is determined the point and the day when a receiver of a corporation finds his duties brought to a close and asks for his discharge.

AT TIMES some of the great American industries have faced crises in their existence and passed through perilous months or years. And though the fact is not generally known to the public, these great business structures, each worth its salt and worth fighting to save, each representing high forms of constructive industrialism and therefore of moment and vital to many thousands, even to millions, of people, andwhose welfare is bonded with that of the whole country, under circumstances involving critical turns in their history, have placed themselves unreservedly in the hands of strong and able men whom they have at the same time vested with arbitrary and czaristic powers.

The ever-increasing magnitude of modern industry makes it a field for diplomacy of a new type—novel, I should say, rather than new. It is merely the political system applied to business. It is to be noted that it is thus applied *only* where an industry is threatened with disaster or chaos. But it is my opinion that the general method has become a fixture as modern business more and more expands into dimensions heretofore only thought of in connection with nations and governments.

Training Future Tribesmen

By T. CAMERON TAYLOR

DOWN in the forests of Kamerun, French Congo and the Nigerian frontiers, the equatorial tribes have organizations which are the equivalent of the Boy Scouts and Girl Guides.

Acceptance in the order is marked by a special dress. It consists, often, in a close-hung screen of palm fronds, enveloping the 'Scout' from his waist downward. They have their signs and signals, and frequently a special variation of the local dialect.

In certain districts no common male person may address the novitiates should they be met with.

They are given the tribal laws, and made acquainted with the punishments attendant upon any infraction of these: forest lore and instruction; the tribal animosities and the grounds for these; the tradition of their people.

The principal purpose of the collecting of the boys, however, is for physical instruction. There is made known every possible aspect of those intimate physical matters which in less primitive regions are taken as understood and must not be talked about.

From the seclusion of the forest the initiate returns to his people an educated man. He is quite a personage, an eligible bachelor.

The education of the girls is no less complete than that of the boys in those matters regarded as of paramount importance by the African bush native.

CHATS WITH OFFICE CALLERS

'The Mississippi is truly a Father of Waters,' said the ***Man from Southern Ohio,*** 'even if it does rampage occasionally. There is a navigable water mileage of approximately 15,000 along inland waterways in the Mississippi and Ohio valleys alone, serving a population in excess of 60,000,000 persons in twenty-seven states of our Union. Truly a large system!

'To construct such a system would have meant an outlay of billions upon billions of dollars. You may wonder why it is not used more. Years of study have convinced me that river transportation systems become failures because of too heavy operating costs and too irregular revenue. Small lot shipments mean profit and every waypoint, large or small, is a possible feeder of tonnage. Too often the small ones are omitted.'

* * *

'You constantly hear the advice—"Go to your banker and ask him, before you buy stocks you know nothing about." To this I would add, be sure you know your banker,' said the ***Banker from the Small Town.***

'When a stock salesman invades a community he gets the names of influential key men whose judgment in money matters is respected. He looks for one whose former financial affairs have been successful, if shady. People will follow a man of this type, though they may hold a grudge against him. In every town there is one or two of them with stock in every successful enterprise, many acres of land, and perhaps a fourth of the business buildings on Main Street. They are always first to raise the rent, last to vote for a bond issue, kick the loudest, and give the least to the Red Cross.

'But a man of this type usually guesses right in money matters. Folks wish they knew as much as he does about making money. Such a man is approached by the stock salesman with apparently but one idea—that of selling him a block of stock. Usually the stock salesman fails. The salesman goes away ostensibly disappointed. Next day the salesman returns. He has another proposition. He offers to sell the local financier $10,000 worth of stock, offering an ironclad agreement that he will later dispose of the same stock for $15,000. There is one proviso. The financier agrees to write a letter that he has invested $10,000 and believes it to be a wonderful opportunity to obtain enormous profits.

'Then the stock salesman spreads the news broadcast that he has sold "old man so-and-so" $10,000 worth of stock. It must be good. Word is quietly passed around that the stock will soon advance in price. Later a definite date for the advance is set. With the confidence that the local financier's purchase creates, the stock salesman makes a killing. Everybody who can beg or borrow $100 to $25,000 buys a block. A few days before the advance is due the stock salesman disappears. That is the last the community ever hears of him.

'What happens to his agreement to sell the $10,000 block of stock for $15,000? Nothing. He has written the agreement in his own name. The so-called company he represents is in no way responsible. They do nothing. They already have the money. The local financial genius doesn't dare let it be known that he entered into it only because he thought he was going to unload the stock on his neighbors at a handsome profit. He keeps mum and pockets his loss.'

* * *

'If, as Henry Ward Beecher said, we are richer for what we give up, rather than what we pick up, I am much richer for having given up my viewpoint as to hospitals,' remarked the ***Woman from Upstate.*** She had been in a local hospital for six weeks and was now on her way home.

'All my life I have had an aversion to them,' she went on. 'My husband felt the same way. During the various occasions that arose in our married life requiring the services of a nurse or a physician, we always insisted on treatment at home. Later, when my husband became an invalid, we still used the home, for he had begged me not to let him be taken to a hospital.

'Since his death, I have been living quietly upstate, until one night recently I was rushed down here and for the first time found myself in one of those institutions that I had always tried to avoid. To be frank, all my preconceived notions vanished. The attendants were most courteous and my care was excellent. When time came to leave, I almost dreaded the parting.

'Now that I have found my previous ideas to be wrong, I am wondering how much of my life might have been changed if I had had a different viewpoint. Why do we carry these unfounded and hurtful prejudices throughout our lives, unwilling to listen to the experience of others, only to learn, after it is too late, that we have been so unnecessarily wrong?'

* * *

'The man who seeks to clothe himself with raiment from another will only find a misfit,' said the ***Visiting Pastor.*** 'Our own material must be used. We may do much, as members of an organization, but let us not sacrifice a personal conviction to gain popularity.

'Although individualism may end in selfishness, intolerance and vanity, these are less to be feared than the lowering of life to conform to the policies which attract the multitude.

'Justice and culture can never be created by political parties or literary clubs. Being personal attributes, they must come from the individual heart. And if society ever becomes temperate, chaste, just and honest, it will be not because of acts of legislation but because each individual so lives within himself.

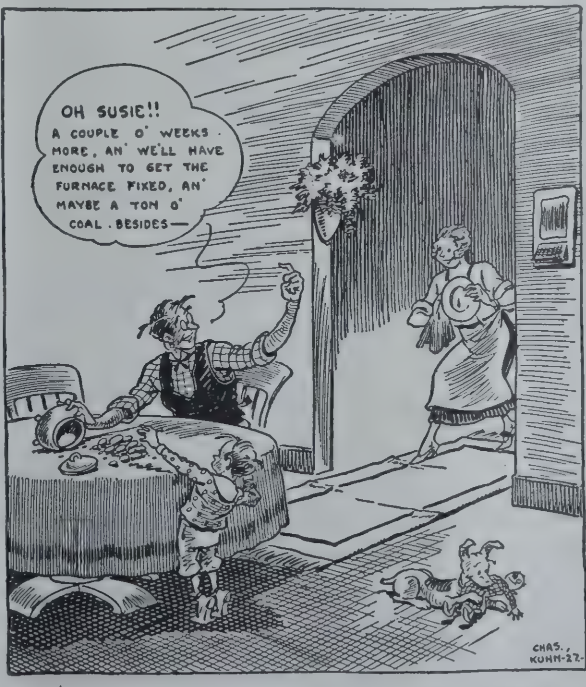
'Associated work has many advantages and uses, but it can never take the place fully of individual effort. Political parties and business corporations often adopt means to accomplish ends which those composing them as individuals would not adopt.'

* * *

'The group of Thinkers who call themselves Equitists are not Socialists,' said the ***Political Economist.*** 'They are individualists. They are far from being anarchists, for they would not seek to alter or eliminate government. Their remedy is based on an elimination of the fictitious "gold standard."

'If we would adopt a work-unit money, say the Equitists (who plan a new system of banks on new principles of banking to handle this work-unit credit), that is, if we would require that every dollar issued be issued *solely for an hour's adult human work*, and no one would have to pay money for anything but human work, this would put an end to pauperism.

'Involved in the plan is the organization of mutual banks by people acquainted with one another; that is to say, by people of the same communities, the same towns, the same cities, the same states, the same nations. In these banks the people agree to redeem their checks by their work and to accept the checks of one another, likewise redeemable by work and by work only. All the people being thus organized, and all the banks coöperating through a clearinghouse system, makes possible an up-to-date application of the work unit to modern industrial processes. Every person thus having a checking account, depositing all checks received and issuing new checks for all "payments" (orders), no "currency" would be necessary.'



OH SUSIE!! A COUPLE O' WEEKS MORE, AN' WE'LL HAVE ENOUGH TO GET THE FURNACE FIXED, AN' MAYBE A TON O' COAL. BESIDES—
CHAS. KUHN-22-

—Kuhn, *Indianapolis News.*

SPEAKING OF BUDGETS.

CAN YOU TELL ME?

Question. When was the frigate Constellation *placed out of commission?*

Answer. The U. S. frigate *Constellation* is still in commission, the oldest commissioned ship in the Navy. She is a training ship at Newport, Rhode Island.

* * *

Q. How long a term did President Harding serve? To whom was he married?

A. Warren G. Harding served as President of the United States from March 4, 1921, to August 2, 1923. He was married in 1891 to Florence de Wolfe, a widow, daughter of Amos Kling, a banker of Marion, Ohio.

* * *

Q. Who were the members of President Harding's Cabinet?

A. Cabinet members appointed by President Harding were: Secretary of State, Charles Evans Hughes; Secretary of the Treasury, Andrew W. Mellon; Secretary of War, John Wingate Weeks; Attorney-General, Harry M. Daugherty; Postmaster General, Hubert Work; Secretary of the Navy, Edwin Denby; Secretary of the Interior, Albert Bacon Fall; Secretary of Agriculture, Henry Cantwell Wallace; Secretary of Commerce, Herbert Clark Hoover; Secretary of Labor, James John Davis.

* * *

Q. What colonies did Germany lose through the World War?

A. By the Treaty of Versailles Germany ceded all her overseas colonies to the Principal Allied Powers. She thus lost in Africa the Cameroons (divided between France and the British Empire as mandatories); Togoland (to Great Britain as mandatory); Southwest Africa (to the Union of South Africa as mandatory); East Africa (to Great Britain and to Belgium as mandatories). These territories include some 18,000 Germans and between 12,000,000 and 13,000,000 natives. In the Pacific she lost the Marshall Isles (ceded to Japan as mandatory); Samoa (to New Zealand as mandatory); Nauru Island (to the British Empire as mandatory). She also renounced outright to Japan the Shantung Peninsula, a province returned to China in 1921. In addition to all these cessions of territory, Germany lost all of her state property, movable and immovable, in her colonies. She was further obliged to cancel all her valuable treaty rights, capitulations and concessions with countries like China, Liberia, Siam, Egypt and Morocco. An absolutely clean sweep was made of her transmarine possessions, properties, powers and rights. Even the property and stations of German missionaries were to be handed over to the trustees, and the individual missionaries controlled or expelled from the mandated territories, at the will of the mandatory.

Q. What was the approximate total strength of the Canadian Army in the recent war? How many were drafted and what were the casualties during the war?

A. During the war, Canada provided 628,964 men of whom 465,984 enlisted voluntarily, the remainder being added under the Military Service Act which went into effect in the winter of 1916-17. The casualties in the Canadian forces during the war were placed at 213,268 of whom 55,205 were killed or died of wounds or disease.

* * *

Q. Will you kindly give me some information regarding the Madeira Islands and their inhabitants?

A. The Madeiras are a group of islands in the North Atlantic Ocean belonging to Portugal and consist of two inhabited islands named Madeira and Porto Santo and two groups of uninhabited rocks named the Desertas and Selvagens. The area of the group is about 315 square miles, of which about 300 square miles are included in Madeira. Madeira is a collection of mountains of volcanic origin, but it has no active volcanoes at present. The scenery is magnificent, the deep valley known as the Curral das Freiras being especially picturesque. The coasts are generally high with precipitous rocky cliffs. Madeira is noted as a health resort because of the uniformity and salubrity of its climate. The inhabitants are of Portuguese descent with probably some intermixture of Moorish and Negro blood among the lower classes. The population of the islands is about 170,000. The dominant religion is Roman Catholic but the Church of England and the Free Church of Scotland are also represented. The archipelago is officially styled the district of Funchal; it returns members to the Portuguese Cortes and is regarded as an integral part of the republic. The district is subdivided into eight communes and is administered in accordance with the same laws that regulate local government in Portugal.

BUT WE ALWAYS DO.

JAMES HOLLOWAY, LONG ISLAND tree-grafting expert, has an apple tree in his orchard which is now bearing thirty-five varieties of apples.

THE BEST APPLE PIE AT the Wisconsin State Fair was baked by a man—Patrick Duffy of West Allis, for twelve years an assistant hotel steward.

A LONDON, ENGLAND, REAL ESTATE firm has adopted the practice of showing motion picture films of its properties to callers interested in purchasing or renting.

SALES OF LIFE INSURANCE in the United States now average $27,000,000 a day including Sundays, as compared with $17,000,000 daily in 1922.

NEW YORK CITY'S 2,000 TRAFFIC policemen are being summoned to police headquarters in groups of 100 and 150 for special instruction in the proper way to raise, wave and flip their hands so that the motions will be entirely uniform.

A RARE BOOK WAS FOUND in an old bureau drawer by Mrs. Bettie Wilson Neville of London, England. It is the first drill book of the United States Army, prepared by Baron Von Steuben, friend and aide to George Washington, and published in 1794. The only other copy known to exist is kept under close guard at the United States Military Academy.

BY THE FIRST OF SEPTEMBER transatlantic fliers had won $40,000 in prize money and were competing for an additional $75,000.

ASSYRIA WAS THE FIRST country to employ kilts as national dress.

ST. YVES, 'THE ADVOCATE of the Poor,' is the lawyers' patron saint. Legend relates that when St. Yves presented himself at the gates of Paradise, St. Peter inquired, 'Who are you?' St. Yves replied, 'An advocate.' 'Come in,' said St. Peter, 'for we have not yet a lawyer.' When his removal from Paradise was later demanded, St. Yves countered, 'I cannot resist, but it must be done regularly; my expulsion must be notified to me by a sheriff's officer.' Since no such functionary could be found in Paradise, St. Yves remained.

UNMARRIED MALES OF KOREA are not permitted to wear hats or to tie up their hair.

EXPERIMENTS SHOW THAT light gray, worn by West Point cadets, is the color first lost to sight in the field. Scarlet is the second least conspicuous color, with dark gray, blue and green following in the order named. In target practice scarlet has been found the most difficult color to hit, while, under the rays of an electric light, light green is almost invisible.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week tells of the Passing of the Old Era and the coming of the New.

* * *

Gari Melchers, whose painting *Mother and Child* is reproduced on the front cover, is an American artist of repute, and was born in Detroit, Michigan. The original of *Mother and Child* hangs in the Luxembourg Gallery.

* * *

The poem on page 2 of the cover—'Apples Dropping'—is by Lizette Woodworth Reese, poetess of Baltimore, Maryland. She is the writer of a number of books of verse which are highly regarded.

* * *

French economists neglect the most important commodity sold to America, namely, France herself. The total spent by American tourists in France far exceeds the total of all French products exported to this country. Louis C. Karpinski, who has been residing abroad for some time, contrasts American and French industrial methods and points out some of the things preventing more cordial relations between the two countries. (p. 1)

* * *

While a preponderance of books and magazines originates in the Northern States, the South is making rapid strides in a literary way. In a review by Aaron Hardy Ulm, we are made acquainted with a number of leading Southern magazines of criticism. While their circulation is small, their influence is felt not only in the South but in every part of the country. (p. 2)

* * *

Sic transit gloria mundi. What sort of man was the author of *Moby Dick?* The name of Herman Melville has only recently been rediscovered—seventy-five years ago the critics were praising him with 'almost hysterical adulation.' Julian Hawthorne knew Melville as a caller at the little red house in Lenox, and heard more than one tale of sea adventure from the lips of the master. Melville was always accompanied on these trips by a dog. (p. 3)

* * *

Most of the music heard by the visitor in Europe originates in 'Tin-Pan Alley.' In only a few spots does one find the passion for national melodies. Spain is one of these. William Carl Chapman describes the sardana music of the Catalans, one of the groups of people forming Spain. Their national characteristics are highly developed, and in this dance the inherent democracy of the Catalans is symbolized. (p. 4)

* * *

When a fine watch begins to run faultily and, left to itself, becomes more and more untrustworthy, its condition justifies a visit to a watchmaker. That is why industry at times must seek a watchmaker, in other words, a business czar. A dictatorial personality may be able to bring order out of chaos, but he must dominate the industry completely. These and other points are discussed by Morgan D. E. Hite in a companion article to one which appeared in a recent issue. (p. 5)

* * *

Because of its proximity to the earth, the planet Mars has received the close attention of scientists for many years. While numerous theories have been advanced, the chief point of interest, the existence of life, remains unsolved. Oscar Lewis tells us some of the things which are definitely known, and points out some of the difficulties under which astronomers work in their study of our heavenly neighbor. (p. 6)

* * *

Four residents of old Chickamauga survive today to tell of their experiences during the Battle of Chickamauga in September, 1863. In this historic battle, more than 33,000 men were slain or wounded. A Governmental reservation now marks the spot and hallows it for both the Blue and the Gray. Larkin H. Poe, one of the survivors, lived on a homestead inside the battle area. His description of his return to find his family missing is most vivid. (p. 7)

* * *

When the Fiftieth Congress was called to order forty years ago, thirty-seven of the seventy-six senators were veterans of the Civil War. Today, but one veteran remains in the Senate, and one in the House of Representatives. When these two have served their terms, Senate and House alike shall know no more any who bore part in the war bweeen the states. (p. 12)

* * *

Christianity has been called a slave morality, a relic of the age of superstition. The universe has been described as a 'mechanical system,' or as a fortuitous concourse of atoms. To refute the charge that this religion makes cowards of men, Charles J. Finger, well-known for the tales he has told of great adventures of bygone days, relates some thrilling episodes of the Arctic. They are from the annals of the Northwest Mounted Police. (p. 14)

* * *

Around Lake Geneva by road is about 105 miles, and few bicycle trips could be more magnificent. The River Rhone at its source; Mont Blanc overhead; the Alps; the deep blue of the lake itself; Lausanne; the haunts of Voltaire, John Calvin, Madame De Staël, and Rousseau are among the delights of the trip. (p. 16)

REMARKS BY OUR READERS

Los Angeles, Cal.

Your article 'From Greeley to Gump' is quite right The public is not to be blamed, but rather the Press itself.

The old-time journalism is dead, and so the reader takes refuge in the only thing in a paper in which he cannot be deceived, the joke. If he gets now and then a little fun out of them, though the jokes are mostly idiotic enough, at least he feels his confidence has not been abused.

A. SPARLING.

Savona, N. Y.

The article on Benedict Arnold by Randolph G Adams in a recent issue quite fails in its aim to raise the name of the archtraitor from the list of the damned to that of the merely damaged souls. To begin with his inference that the stern ideas of New England (that section produced so many traitors) and his mother's too ardent appeals were predisposing causes somewhat extenuating his crime sounds too much like the guess of the psychoanalyst earning a fat fee for defending the son of a millionaire on trial for murder.

As to the plea that Arnold felt somewhat freed from his obligation to the American cause by the entry of the old enemies, the French, as allies, the weight of that is materially less because of the fact that the French had aided from the first and that their formal entry into the war had occurred in February, 1778, fully two and a half years before the attempted betrayal of West Point.

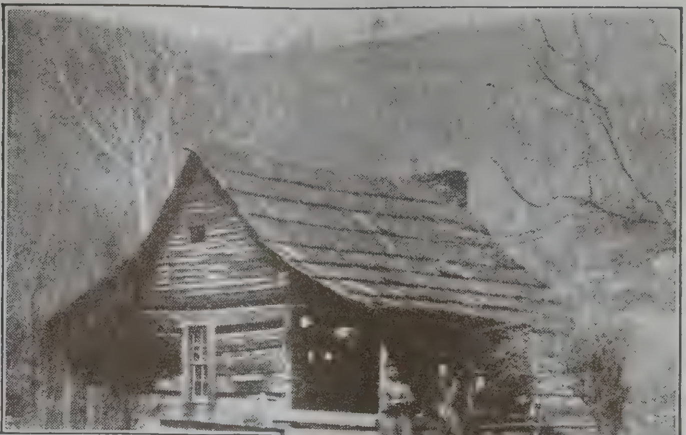
If Arnold had many annoyances he merely shared the fate of Schuyler, Greene, Hamilton, Franklin, and of Washington himself. The undisputed facts remain that he had held high commands throughout while fighting, and that, disabled, he was given the best post in America—that of governor of Philadelphia. When in trouble, as he usually was because of his own egotism, he ever had the powerful aid of George Washington by the special betrayal of whose confidence in getting him the command of West Point Arnold rendered his treason doubly foul.

In his praise of Arnold's exploits, Mr. Adams has failed to outdo any standard history of America which the reader may open. But the betrayal of his country and his chief, his raid against his native state, will ever rank the name of Benedict Arnold with that of the less-romantic and colorful Judas Iscariot.

A. L. SPENCER.

Mountain Districts of the SOUTH

Being Unlocked *by* Present-Day Penetration



Cherokee Indian cabin on the Cherokee Reservation in the mountains of western North Carolina. President Jackson drove out most of the tribe to Indian Territory, but a few fled to the mountains of North Carolina and about two thousand of their descendants live on that reservation today. They are law-abiding and moderately industrious, and lead the primitive life of the poor whites of the region.

Eastern Kentucky has in its mountains many such homes, log cabins of two rooms separated by a 'dog trot.' This home stands on a newly built road which runs eastward to the mountains of North Carolina from Berea, the mountain college town.

Little country stores, far from the main highways, are still found in the mountains of eastern Kentucky. This one is on a road that is a creek when water is running. Autos are rarely seen in these regions; horseback is the common mode of travel.

[—*Ewing Galloway Photos.*]

Sunday morning chapel finds most of the girls at Berea College in attendance. They are here seen on their way home. The nearly three thousand students of this college are practically all studying to be teachers, and to carry back to their home districts the culture they receive, thus proving Berea a mountain college for mountain folk.

THOSE who try to appear what they are not would make a better appearance by being what they are. Most people who try to appear better than they are, are really better than they appear to be. No amount of pretense can improve on the original. Character subtly makes itself known through every disguise; and this is a very comforting fact, since the character is usually so much better than the caricature. Be yourself . . .

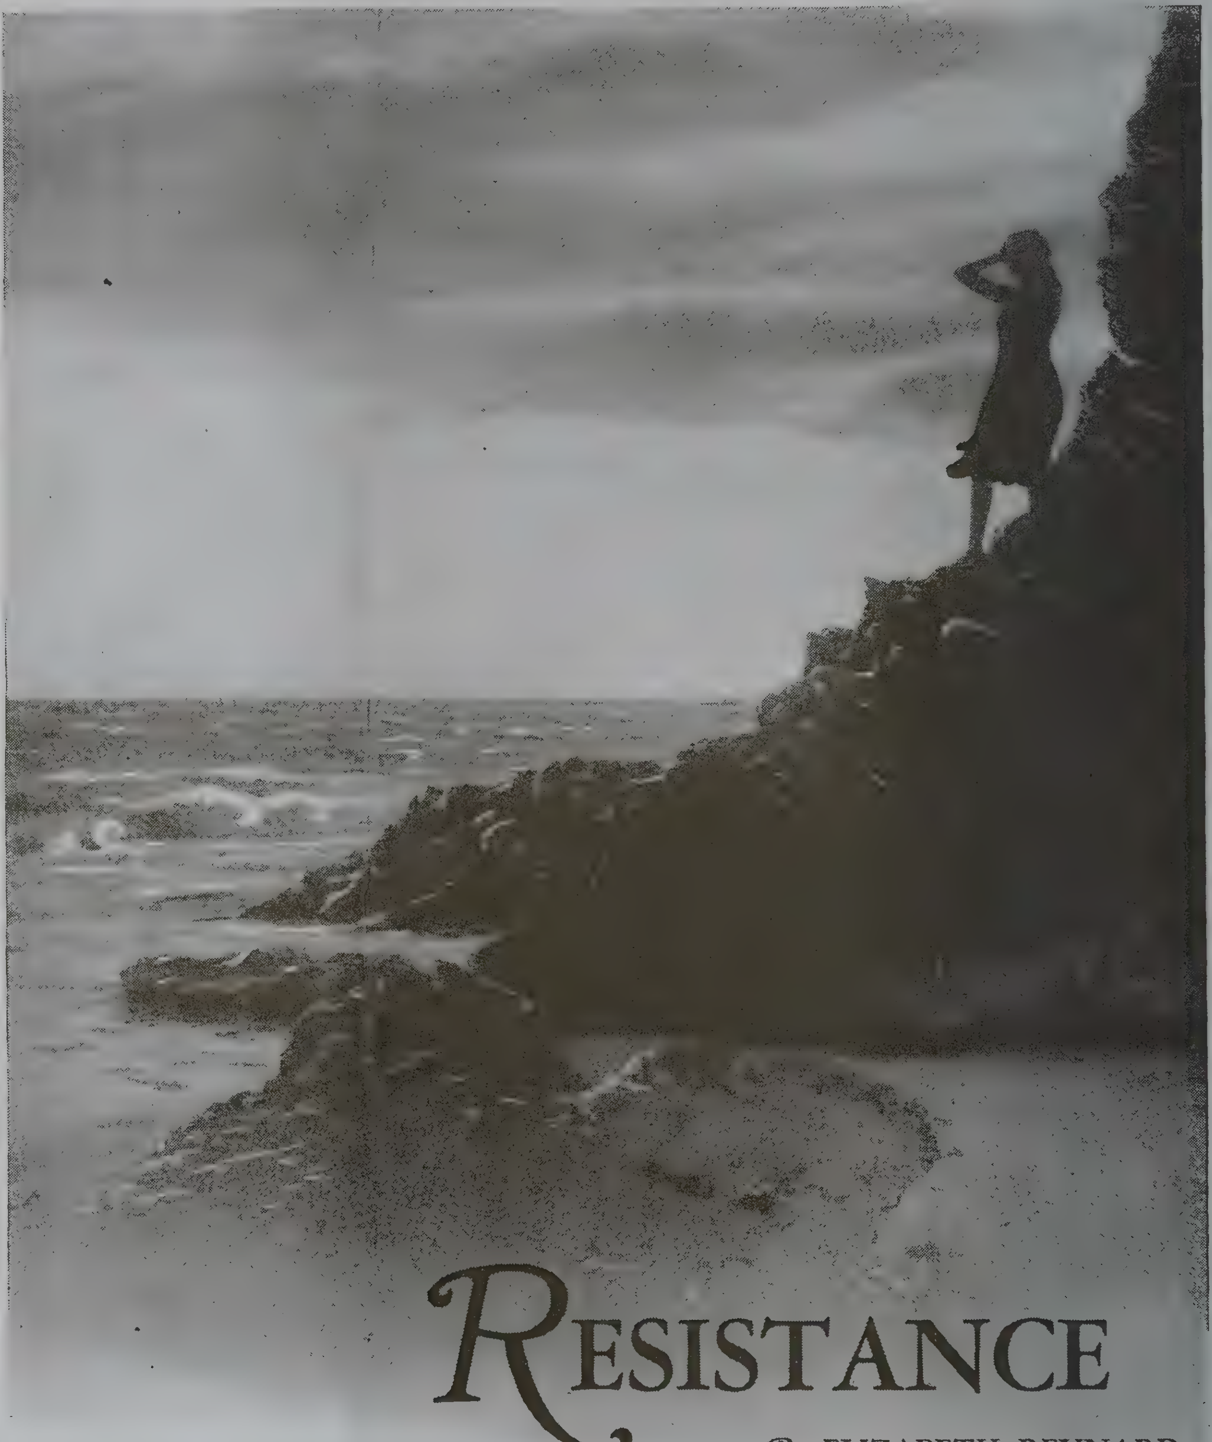
IN GRANDMOTHER'S TIME - - - Florence Taft Eaton



RESISTANCE

By ELIZABETH REYNARD

MAKING an even pattern of the days,
I find an art in laziness and laughter,
Only that memories come tumbling after
A color or a phrase;
Only that when the light plays
On a young face my heart leaps up in
wonder.

This is a peace that I create to save
My soul from Michael's sword, God's
thunder,
Devil's rack, and plumed wave
Of angel's wings, for I shall not drift under
Oppression of acceptance till my time comes.

Days come up and break like waves,
rain drums,
And sun fuses color and color. Grass
grows
And grass dies, and under it lies
Blind mole,—and unborn rose.

And of this laziness and laughter
I take courage and win faith,—
Only that echoes ride the rafter,
And smoke rises—like a wraith.

LITTLE ESSAYS *From a* NORTHERN COTTAGE

On LIKING ONE'S OWN TIME

By HUGH WALPOLE

Rest in Mount Pisgah National Forest, North Carolina.

AS I SIT in my garden here listening to the shepherd halfway up Cat Bells calling to his dog, hearing the stream, enriched with the storm of the last two days, sing through the thick grasses at the edge of the wood, and as I catch the soft refrain of the wood pigeons down by the lake, it is easy enough perhaps, for the moment at least, to be contented with my own time.

I have been aware during the last few years of a growing chorus of expostulation with our own poor generation. One of the troubles of our modern civilization is that you are made aware by press and telegraph and radio of every whisper; and the disillusioning whispers are naturally louder than the contented ones. A contented whisper also is considered a very selfish thing. How can you, you are asked, be so careless as to talk about your wood pigeons and your running streams when the world is in such a mess? And then when you enquire as to whether the world is more in a mess than usual, you are asked to look at China, at Vienna, at Mr. Saklatvala in Battersea; and when against Mr. Saklatvala at Battersea you put up Mr. Jones of Putney off on a char-à-banc with his family to Eastbourne, having beyond question more freedom and fun in his life than ever he has had before, you are asked to look again at Lord Pilborough of Bonnet Marches who has had to sell all his Rembrandts and send them to America, and to cut up his beautiful park into villas.

If you still protest, the argument is then given a personal colour. Of course you think your time a good one, just at the moment that you are one of the lucky ones, are doing a job that you enjoy, have enough money to live on, have no encumbrances, are in good health; and the answer to that is the always aggrieved personal one that one's intimate friends should know so little about one, that in truth success is as far away as ever, that money is never enough and, as to health—here one longs to enter into a thrilling history of perilous complaints.

But I believe I have founded my preference for my own time on good reasons. The first is sufficient for me. Here I have Mr. Wells for my supporter because he said only the other day that in all probability a larger proportion of the human race was enjoying comparative happiness and comfort today than ever before in the world's history. Yes, that's something, and it answers at once part of the grudge of dusty roads and piled up char-à-bancs, of beautiful places littered with paper, of the stealthy and unstayable march of the villa.

But if an adversary admits that ground, he retaliates at once by the argument of the General Level. It is probably true, he says, that the General Level has risen and that to pay for it we are losing everything that makes life worth while, we are losing rest and quiet and privacy and all the arts, the beauty of the country, peace of mind, the power of connected thought, decent morality, all religious faith. He admits that the loss of all these lovely things is not entirely due to the raising of the level but rather to the dreadful disruptive forces (a phrase that he loves), to what he calls bolshevist tendencies and (another phrase that he adores) worship of material success, selfishness of individual aim, greedy ambition. He can even, if he wishes, drive all these points into the very heart of my garden; even as I sit here, down the road go three char-à-bancs crowded with shouting school children; my morning paper has columns about the suicide of a gambling financier; my post, which the gallant gentleman on the very slow bicycle has at last brought to me, has invitations to night-club revelries, to excited meetings about bolshevist menaces, invitations to join societies for preserving the few places of beauty still left to us. Think of Jane Austen, my adversary cries, sitting—dear little sharp-eyed lady—in her charming parlour, the snow glistening beyond the windows, the church bell gently ringing, the farmer plodding his homeward way eager to bury himself, as our minister of education has recently reminded us, in the enthralling pages of *Pilgrim's Progress*.

Here I think we touch at the very root of the matter. Half the discontent with our time (only half of it I agree) lies in our poetic imaginings of earlier ages. It is a platitude to remind ourselves of how we look back and see winters forever shining with lovely frost and snow, Junes melting with the glory of their roses under eternal sunshine, families gathered in uninterrupted peace and quiet beneath their fig trees, glorious wars in which everyone wore beautiful armour and was wounded only picturesquely. And the great men, how many of them there were all crowded into one eternally glorious moment—Chatham and the younger Pitt, Marlborough and Nelson, Rembrandt and Velasquez, Keats and Dickens, Da Vinci and Savanarola; compare with these our Churchills and Mussolinis, our Sargents and Augustus Johns, our Kiplings and George Moores; look at the easy splendours of the *Spectator* of Addison and the Essays of Steel and then think of *The Daily Mail* and *The Daily Chronicle;* think of Casanova and then turn to Horatio Bottomley; consider Savanarola and glance then at the pale emaciated figure of Dean Inge.

SO IT goes and so it has always gone; you can pick up no memoir or diary of the 17th, 18th or 19th Century without discovering in it lamentations over the present as compared with the past—this possibly with the one exception of the Mid-Nineteenth when everyone great or small seemed to shine with the gloss of self-satisfaction which is, thank Heaven, absent from ourselves. What nonsense it always is and always has been, and what pathetic, glorious nonsense! How stoutly it proves the eternal longing of the human soul for perfection, his exasperation with the shortcomings, mistakes, and inadequacies of his own efforts!

In the Spanish Pyrenees.
—H. Armstrong Roberts.

Well, take the 18th Century if you like, and for your instruction read the three volumes of Parson Woodforde's *Journal.* Here is an old gentleman of excellent birth, of sufficient education, of kindly heart, of benevolent intention; read and discover what a messy, guzzling, insanitary, boring, and uncomfortable life he led; read of those ghastly mountains of food consumed by himself and his neighbors, of the liquor that was drunk, of the physical pains and penalties that followed, and of the only cure for these in violent purges and perpetual bleedings by some incompetent, clumsy physician. Read of the dullness, a dullness of which they were fully aware as you can see from the violence of poor Niece Nancy's querulous complaints; read of the snobbery, of the ridiculous obeisance to the county family, dull and ordinary; read of the discomforts of the travelling, of the complete ignorance of the world's doings, of the superstition and the vulgar buffoonery, of the helpless slavery of the domestic servant, her miserable wages, and the rest. I don't suppose that, in the upper classes at least, they were any unhappier than we; happiness is a matter of individual history and temperament; the upper classes were top dog then and the so-called lower classes knew it and expressed their irritation in the French Revolution. But that the world as a whole is happier now who can possibly doubt?

Or go further if you please and take the Victorian forties and fifties. Read any memoirs of those times and think for a moment of the snobbery, the hypocrisy, the materialism, the sham religious feeling. Not that for an instant I am indicting that period; no period is to be indicted. There were great men and women alive, there were glorious deeds, splendid enthusiasms; but little children were still being pushed up and down narrow chimneys, bulls were still baited, servant girls were still housed in dark, damp cupboards under the stairs.

How many faults my own time has! I am aware of them all, of the cynicism, the immorality, the noise, the discontent; but, as for the cynicism, has it not sprung from a healthy reaction to Victorian falsehood? As to the immorality, are we not halfway to a truer, cleaner perception of the sexual life of man than the world has ever known? As to the noise, do you know that the London streets of the 18th Century with their carts and their cobbles were so clamourous that when you met a friend and wished to exchange with him the time of day you had to go into a shop before either could hear the other speak? As to the social unrest, is it not that very thing which has led in the past to the increased happiness today of nine out of every ten?

TURN for a moment to the arts; here perhaps the complaint is loudest. Doctor Murray Butler, who always delights me because of the silly things he says so solemnly, announced somewhere last week that there was no great man alive in the world today. It must be fine to be so omniscient! Who knows in that mysterious, pulsing force that creates beauty, that is forever at work here and there in the world, what great men there are? Greatness is consecrated by time; no man can say of his own period what time will do with it. The arts never progress; restless persons are forever watching to see them move up and up. But it does not go like that. All that matters is that there should be a constant succession of men and women chosen to awaken in their companions an awareness of truth and beauty. That succession is nobly maintained in our time. Let us take only one instance among many: there are more good writers alive in England today than at any other time in English history,—I do not say great ones. The names are almost endless—Hardy, Kipling, Moore, Bridges, Yeats, Trevelyan, Galsworthy, Bennett, Wells, Santayana, Lawrence, De la Mare, Clive Bell, Virginia Woolf, Roger Fry, Davies, E. M. Forster, Lucas, Huxley, and so on and on; there is more interesting painting among the younger painters—Duncan Grant, Philpot, Gertler, Paul Nash, Dod Proctor, Cundall, Roberts, and so on, than at any time in English painting since the pre-Raphaelites; there is a revival in English music, with Goossens and Bax and Boughton and Holst and Berners greater than any

(Continued on page 18)

Keeping Fit at Fort Leavenworth

By FRANK M. CHASE

IT WAS hot. The July sun beat down hard in Kansas, not sparing the beautiful headland above the Missouri where Fort Leavenworth sits. On such a day nearly any man might be forgiven for not displaying his usual alacrity. Yet when I was presented to the commandant, Brigadier General Edward L. King, a man of middle age and a veteran of years of service, he came to his feet with a promptness which would have shamed many a younger officer, and in the few words that passed between us he showed a keenness and a mental alertness not found every day.

'Military training,' I said to myself as I left his office in tow of a staff officer with more time to talk. But a more enlightening explanation was shortly at hand. Just before luncheon—noon mess, as the army calls it—the General was out in the hall in front of his office, waylaying two younger officers (who weren't very eager) with an invitation to play tennis with him on that wilting, breezeless afternoon.

Keeping fit at Fort Leavenworth means more than mere physical fitness in the officers, though the commanding officer insists upon this also. It is basic to the purpose of the General Service Schools, the mission of which is to keep the higher officers of the United States Army fit to direct the means for your protection and mine.

While this nation is strongly committed against the maintenance of a large standing army, few deny the necessity of a body of officers being kept trained in the latest and best methods of military science, which body may form the nucleus of a larger organization in time of need. To give special training in higher command and in staff work to selected officers of such a body, and to keep up-to-date such military knowledge as they should have—these are the important tasks of the General Service Schools.

Technically, the principal school at Fort Leavenworth is known as The Command and General Staff School. In a way this is a postgraduate institution, carrying on the instruction of West Point and the other military schools. It trains officers for command of brigades, divisions and corps, and for general staff duty with divisions and with corps. Beyond this school lies only the Army War College at Washington, which gives special study to the problems involved in the commanding and directing of the corps, the army, and the group of armies. It also specially trains selected officers for duty with the General Staff in Washington.

Because the Fort Leavenworth School does train for high command, its students are naturally men of maturity, being usually in the forties or thereabout. Only officers of the rank of major, or above, and captains about to become majors, are admitted. These officers are from the Regular Army stationed throughout the United States, and come to Fort Leavenworth out of a desire to fit themselves for the duties of higher command when opportunity for promotion comes to them.

Their training occupies a period of nine months, from September until June. About two hundred and fifty Regular Army officers complete the course each year. The school's graduates also include about fifty National Guard and Reserve officers who come to Fort Leavenworth annually and complete an abridged course. The faculty consists of about sixty officers, ranging in grade from major to colonel.

Although the school possesses points of similarity with college and university, its method of instruction is, in general, more applicatory. Emphasis is placed upon the study of specific cases. Large use is made of so-called map problems, in which a military situation is presented and the student is required to prepare a solution. This may consist in a thorough estimate or analysis of the situation ending in a definite, clear-cut decision, or in the preparation of detailed orders covering the operation involved. Fifty-six such problems, laid around such historic battlefields as Gettysburg and Antietam, were given during the school year 1924-25.

Map maneuvers in which the various units of opposing 'Red' and 'Blue' armies represented by movable cardboard symbols contend against each other in accordance with the decisions and orders of their student officer commanders and staffs, lend further reality to the instruction. Usually both the map problems and the map maneuvers occupy a half-day. Six of the sixteen map maneuvers engaged in last year, however, occupied a full day of eight hours; and one map maneuver, coming late in the year after the officers had acquired some facility in making tactical decisions and transmitting them in clear and concise orders, lasted all day and all night. In this maneuver, which is an annual event, the students are arranged in opposing groups representing corps and division commanders with their staffs, the two groups meeting strategy and matching tactics just as they might be expected to do in a large-scale operation during actual warfare.

Riding hall at Fort Leavenworth.

IN THE so-called terrain exercises and tactical rides, the officers ride out on horseback to a selected area in the country surrounding Fort Leavenworth, reconnoiter, make decisions and issue orders under closely simulated field conditions. While attendance at about one hundred lectures is required each year, the officers have no classroom work in the accepted sense. Instead they have nearly three hundred conferences a year, in which the instructors and the groups into which the students are divided to facilitate their handling talk over the various subjects under study.

'A typical day's work for the student officer,' said Major Elvid Hunt, one of the instructors who showed me through the various departments of the school, 'begins at eight-thirty in the morning, with conferences and lectures lasting until noon. On three afternoons of the week he solves a practical military problem lasting from one o'clock until five, either in the map room or on horseback somewhere in the region about the school. During the winter he receives about three hours of riding instruction a week, finding time in the remaining hours of the afternoons for perhaps three hours of voluntary recreation.

'The evenings are pretty regularly devoted to study. In the officer's quarters, you may find him, often far into the night, before a large map posted on the wall of his study, sticking into it red and blue pins and placing bits of cardboard to represent opposing forces, adding arrows to indicate the direction of a contemplated advance or retreat, or attaching colored yarn to indicate zones of advance or lines of intrenchment. Perhaps he will be considering principles governing action which the commander might take under certain conditions; or obtaining practice in writing out orders for airplanes, artillery, infantry, or tanks for various operations; or possibly making a study of some operation in the World War involving the development of administrative plans for transporting from twenty to a hundred thousand men from one field of action to another, with due regard for food, ammunition, materials for fortifications, and signal communication.

'In planning large operations officers of the several branches of the Army frequently work together. Thus in the same study group at this school may be an officer from the Artillery School at Fortress Monroe, one from the Cavalry School at Fort Riley, and another from the Infantry School at Fort Benning. In such a conference each officer contributes his special knowledge, and so exemplifies the fact that battles are not won by individual effort but by coöperation and coördination.'

The student officers at Fort Leavenworth work harder than ordinary students. Getting down to nearly any kind of school work after none of it for ten or twenty years is no easy matter; and the course prescribed is light neither in amount nor in kind. Because they are carefully graded according to the quality of their work, the officers are also under considerable tension.

For these reasons it is highly important that they have suitable recreation. To this end the school supplies various forms of athletics—tennis, golf, and riding. The Y. M. C. A. stationed at the post also maintains a bowling alley and a swimming pool. Post hops are held frequently, and at the end of each strenuous week the officers and their wives have many social engagements, both in the garrison and in the neighboring city of Leavenworth.

During the school year there are about three hundred and fifty families at the post. The officers and their wives who come here are accustomed to holding positions of influence in their communities, and to taking an active part in affairs. They do the same at Fort Leavenworth. The women have their general club, which is associated with the Federation of Women's Clubs. They belong to the Parent-Teachers Association and see that their children have good schools. Many of them are college graduates and interested in alumni and college affairs. All in all, the life of the community is a busy, humming thing, presenting a vastly different picture from that sometimes drawn of army posts.

Monument by Lorado Taft at Fort Leavenworth.

Fort Leavenworth, establishment of which dates back to 1827, was not always a school. The opening of western trade routes, notably the Santa Fe Trail, in the early part of the last century called for protection against the Indians. To meet this necessity the War Department, early in the year mentioned, ordered Colonel Henry Leavenworth, who was then stationed at Jefferson Barracks, St. Louis, to ascend the Missouri River, select a site and establish a military post on the east side of the river within twenty miles of the mouth of the Little Platte River.

With four companies of the 3d United States Infantry, Colonel Leavenworth labored up the Missouri on keel boats, the trip requiring about three weeks. On exploring the location indicated by the War Department, however, he found it unsuitable, the east banks of the river being low and subject to flooding. Continuing up the river, he then found an area of high, dominating ground on the west side of the stream about twenty-five miles above where Kansas City now stands. This seemed to him an ideal site for the new post, and upon it he established his camp. This was on May 8, 1827, the War Department giving formal approval to the site the following September.

THE first escort sent out from the post consisted of several companies of the 6th Infantry which, in the spring of 1829, accompanied a caravan going from Independence, Missouri, to New Mexico, returning with it in the fall. Thereafter the post rendered many services in escorting caravans, on both the Santa Fe and the Oregon trails, in quelling Indian troubles, locating commercial routes and in collecting data of scientific and commercial value.

Owing to eastern Kansas having been made into an 'Indian country' in 1830 and the subsequent removal of the Indian tribes east of the Mississippi to their new reservations, Fort Leavenworth found itself in the midst of various troubles with the red man. In ironing out these difficulties the commanders held numerous conferences with the Indians at the post. Near the present flag pole there still stands the time-scarred old tree under which those conferences are believed to have taken place, and around which Colonel Leavenworth's men perhaps camped nearly a century ago.

During the Mexican War, Fort Leavenworth was the outfitting place for the 'Army of the West' commanded by General Kearney. In the two years 1846-47 six expeditions left the post to participate in this war. In 1857 the refusal of the Mormon leader, Brigham Young, to recognize the authority of the United States resulted in the marching of a large body of troops from Fort Leavenworth to Utah. Before this difficulty ended several contingents of troops were sent out from the post over a period of three years. In the Civil War the post again became a center for the assembling and equipping of troops, although then, as for some years later, it was still more or less concerned with spasmodic Indian troubles.

All this, however, pertains to the old and now little-remembered life of Fort Leavenworth. Only a fragment of the old stone wall, with its suggestive loopholes, stands to remind one of the price at which the West was won. Fitting and significant, too, is the fact that the barracks which once housed fighting men are now, in a converted form, the dwelling places of student officers and their families.

The present era in the history of Fort Leavenworth began in 1881. During as well as after the Civil War many new officers had come into the Army. For these officers a comprehensive system of military education was needed, to which end General William Tecumseh Sherman, who was then in command of the Army, directed that a school of application for officers of infantry and cavalry be established at Fort Leavenworth.

This school tried to make up existing deficiencies in the military education of the officers reporting for instruction, and during the first few years modified its curriculum according to the requirements of the annual classes. Gradually, however, a program looking beyond immediate needs was settled upon, so that by 1893 the schedule of instruction contained most of the essentials of the present course. Departments of strategy, tactics, military engineering, law, and hygiene were included and these are still to be found in the course.

During the years between the Spanish-American War and the World War the school gave instruction to so many officers approaching the rank of field officer that when the World War came there were a considerable number of officers of matured judgment, but still in the prime of life, who had received the Leavenworth training. These officers constituted the framework upon which the American Army in the World War was formed. They also organized and conducted great schools modeled on the one they had attended at Fort Leavenworth. General Pershing himself placed a very high value upon the Fort Leavenworth schools as a factor of American success in the World War.

Returning to Fort Leavenworth, some of those graduates have since played no small part in the reorganization of the school.

The commandant himself, who served as chief of staff of the 28th Division is a graduate not only of Fort Leavenworth, but of both the Army War College and the Naval War College. He bears decorations indicating 'extraordinary heroism' in the Philippines and 'exceptionally meritorious and distinguished services' in France.

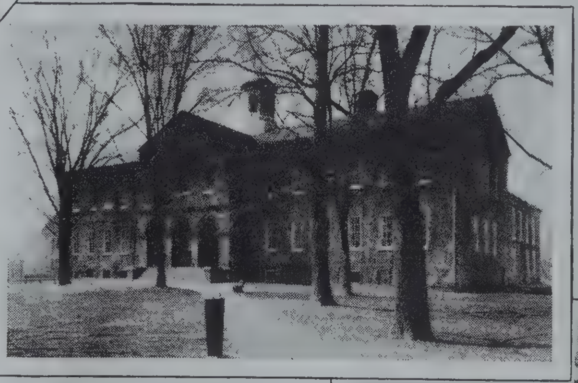
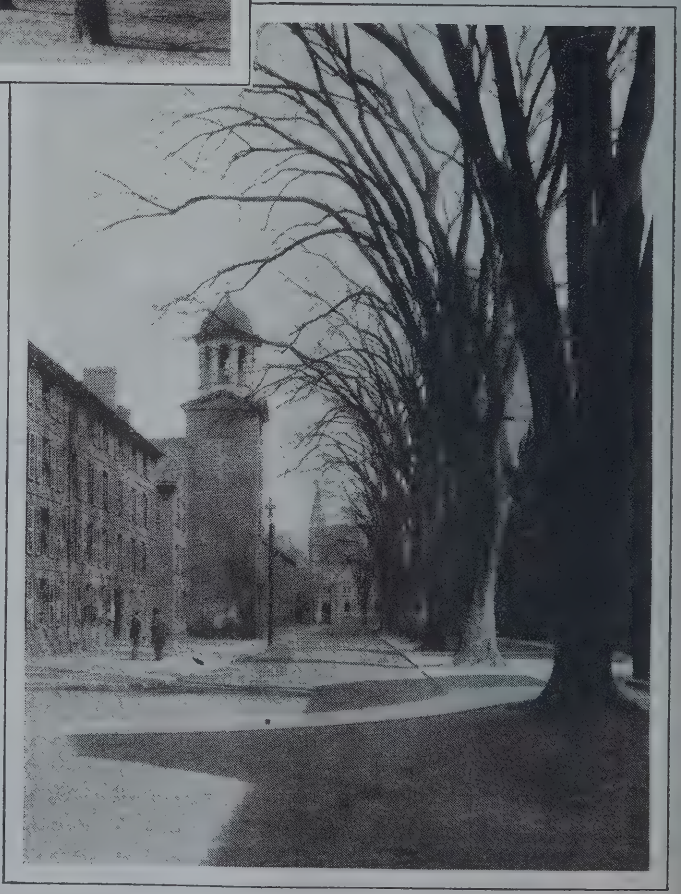
Paying for HIGHER EDUCATION

By
DR. H. M. CROOKS
President
Alma College

Salem College, which has been operated continuously 156 years.





William and Mary College, the second oldest in America. Right—The old quadrangle at Yale, showing the Chapel.

WHO is to pay the increasing costs of higher education? Ask the question of the ordinary young man just out of high school from the well-to-do home anywhere from Maine to California, or of the average young woman from Washington to Florida, and one is likely enough to receive first the answer, 'I dunno. They'll do it somehow, I suppose.'

If this young person be pressed for a better statement, if a definition of his 'they' be required, he will probably admit that the costs of education have never been his concern. Let this easy-going American youth be told that the taxpayers of America are asking whether they can continue to meet the increasing budgets of state universities, state schools of technology, state normal colleges, and he will possibly suggest, 'Well, they've got to do it somehow, you know; always have.' If he be further informed that representatives of great givers to private colleges have been saying aloud that private philanthropy cannot be expected, in a world of so many needs for every dollar that can be given away, forever to erect buildings and provide endowments that will furnish two-thirds of the students' costs to every one-third of their payments for tuition, he may then, if his processes of thought are fairly developed, remark, 'Well, maybe dad'll have to pay more.'

That's the educational heresy of the year as regards educational costs. Dad must begin to pay more. The college budgeteers have hounded the optimistic college presidents. A new class of business managers, bursars, and the like, many of them recruited from the ranks of hardened business men, have had something to do with it. Trustees have queried the presidents and have said, 'Show us the millionaires who are going to give,' and the president has had to talk only of hopes and half-promises. Troops of students passing the trustees' room are all too much in evidence. The colleges bulge and seethe with them. And the trustees, hard-pressed by the story of need, and not at all sure of the president's ability to touch the pocket nerve of the corpulent, upholstered rich, can see those students, and cannot see the givers. And the cry goes up, 'Why shouldn't they pay more? They look prosperous enough. Why should they buy education at thirty or forty per cent on the dollar?'

In the ordinary small church college with an annual budget of $100,000 a year, students probably pay $35,000 to $50,000 annually in fees, ordinarily less than fifty per cent of the institution's annual cost. In larger and older institutions, with greater endowments and more alumni to steer students to their beloved colleges, large tuition fees are charged, but larger salaries are paid, and less economy is necessary generally. Still the ratio of tuition collected to total annual cost is about the same. Throughout the Middle West few colleges charge more than $150 a year for tuition; in the East $200 to $300 a year is the ordinary fee. State institution fees are usually less than $100 a year for all but professional courses. If the smaller colleges in the Middle West did not keep down the cost of board and room, and did not maintain a more modest social standard, these private institutions could not long com-

The campus of Harvard University, Cambridge, Massachusetts. —Brown Bros.

pete in attracting high school graduates.

If the colleges and private universities have not endowment funds that furnish the major part of the balance required, they must soon close their doors. Annual gifts come also into their coffers from church organizations or from individuals. For these, college presidents and their agents must be ever on the alert. Indeed, the modern college president wanly admits that he is today more of a promoter and solicitor than a scholar and a gentleman of the old school. He does not like it, but his grip is as constantly packed as is a traveling man's, and his knowledge of 'prospects' would make a bond salesman envious.

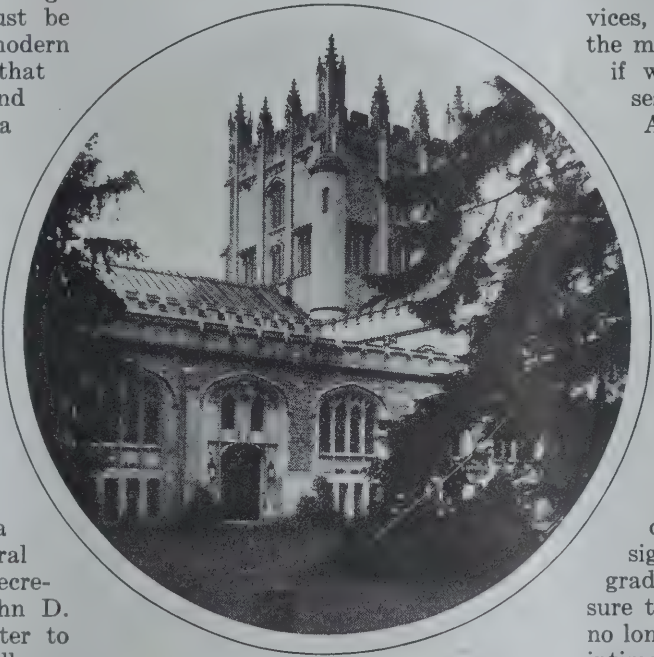
It's a fair question. Why should students not pay full price for education?

There may be an answer to the effect that they should not, but the question isn't eliminated.

Trevor Arnett, once bursar of the University of Chicago, for a time secretary of the General Education Board, and now a secretary of an intimate sort to John D. Rockefeller, Jr., spoke last winter to the Association of American Colleges, with perhaps three hundred and fifty college presidents present. He spoke on the same general theme of increased tuition fees to the Association of Urban Universities at another convention.

Now be it known to nonacademic folk that Mr. Arnett is regarded as about the wisest college and university financier in America. Indeed, the younger Rockefeller calls him 'the foremost student of, and writer on, college and university finance in this country,' when he quotes from the addresses above referred to. When Mr. Arnett speaks, college men have the habit of asking, 'Is he speaking for the General Education Board? Is he saying what John D. thinks?' The college executives have profound respect for Mr. Arnett's own wisdom at any time, whether he is speaking his own thoughts, or perhaps intimating what his influential associates in philanthropy think.

The speaker before these learned promoters of educational institutions had an excellent setting. A daring college president, Dr. D. J. Cowling of Carleton, who had read the other motto of Chicago, 'Make no small plans,' had just finished telling what a real college ought to have in the way of cash endowment and in buildings. A college of one thousand students ought to be possessed of endowment to the extent of $8,500,000 and buildings costing $3,500,000. There are many colleges with one thousand students, few of which have half or one-fourth as much money as Dr. Cowling says is necessary to train properly the members of such a student body. In addition there are four or five hundred colleges that know that when their peculiar excellencies are generally recognized they will have each one thousand students or more. Dr. Cowling spoke of the vast riches of America, reminded his audience of the familiar figures of the vast expenditures for gum, cosmetics, tobacco, war and other human vices, and put forth his opinion that the money would come to the colleges if we could only educate the possessors of the money.



—Ewing Galloway.
Library Tower, Vassar College.

And then, in a mild voice not at all lifted in controversy, Mr. Arnett gave voice to his opinion that money for education isn't abundant enough even in opulent America to do what Dr. Cowling and other college men deem is necessary to be done. He proposed a gradual plan for educating American fathers into paying more for tuition. He even suggested that students themselves whose fathers have not enough reserve money to educate their children should sign a series of notes payable after graduation. At any rate he was very sure that the costs of education could no longer be met by philanthropy, and intimated that the wise college educators would raise fees chargeable to the educatees as rapidly as their consciences and their waiting lists would allow.

In June the younger Rockefeller, whose personal gifts to college and university education are probably second only to his illustrious philanthropist father's, quoted Mr. Arnett in his address as presiding officer at the commencement luncheon at Brown University, his Alma Mater. Usually one hears much of 'dear old Brown' or 'dear old Siwash' from such presiding officers. Alumni throng the luncheon tables; perhaps they sing and cheer and roar at stories of the good old days. The ordinary luncheon orator recites anew the glories of his college. Imagine Rockefeller as presiding

In Grandmother's Time

By

FLORENCE TAFT EATON

I HAVE often thought how interesting it would be if, after we 'have shuffled off this mortal coil,' we could occasionally come back for an 'Old Home Week' and revisit the scenes of our previous existence! Perhaps not, however. There are two points of view always, and there is the possibility of such a visit's revealing conditions not so flattering to our self-esteem as we might fondly anticipate. I am wondering, however, if one could possibly find as spectacular and—to our present imagination—incomprehensible advances into the realm of science, both material and psychological, during a visit fifty years hence as grandmother would find, could she now revisit the scenes of her youth.

The old-fashioned character of the rooms is conveyed by all of the features of the bedroom.

Above—*Front of the house and its aged guardian.*

What would she think, for instance, of pressing a button and illuminating her house? Turning a valve and heating it? Opening the faucet and enjoying hot or cold water at a dozen convenient stations? Conversing with the world, in a comfortable seat by the telephone? Enjoying the best in music and oratory without leaving her own fireside? And what would be her sensation on looking out of her window and beholding the whirling streams of what were vaguely alluded to as a ridiculous possibility, in the last generation, the 'horseless carriage'? It's a dizzying thought—what we might find in the future of progress and development in both known and undreamed-of fields to equal the spectacular changes grandmother would now find could she take a look at the world she left!

I presume that life in grandmother's time in a small New England town was a transcript of that in countless others, and that in reproducing the occupations, pleasures, and duties of one family in one old New England homestead we may get an idea of those common to many.

The particular homestead most familiar to me, the life of which at that time I am now bringing to mind, is the old Taft dwelling house in Uxbridge, Massachusetts, a town adjoining Mendon, where the original Taft, named 'Robert' settled after crossing the water. This particular locality is still the abiding place of countless Tafts. Few, however, are now interrelated. There is a saying that if a stranger, entering town, should address the first ten persons he meets as 'Taft,' he would be correct in nine cases.

Our particular homestead had its hundredth birthday in 1807. It is not especially ancient, as you see, and has kept pace with the times in equipment, repairs, and additions. It is, however, old enough to have been the scene of interesting customs, old ways, and the various activities of grandmother's time, and new enough to be satisfactorily adequate to the far-different requirements of modern family life and to offer promise of kindly shelter to generations to come. The pleasant farm of two hundred acres, extending from broad, river-bordered intervale to forest-capped hills on the west, was originally half of that owned by the first proprietor, who rejoiced in the euphonious name of 'Bazaleel.' He divided it impartially between his two children, settling the homestead and half the farm upon his daughter when she married, and building the house here described for his married son—Bazaleel Junior. Both the houses are shaded by venerable elms and surrounded by wide stretches of velvety lawn. An ancient elm, gnarled, picturesque, and dearly beloved of the family, stretches its protecting branches over grandmother's old home, and the lawn under it has been the scene of many jollifications. In a deep fissure in its trunk was dropped by grandmother's hand, with merry rite and ceremony, a sealed tin case containing a record of the big 'Taft Meeting,' when the Taft kin gathered in the old home town in 1874. Though fifty years and more have passed, the old tree still guards the record: and whose hand shall eventually take it from its hiding place is a question for the future to decide.

A small white-trimmed brick building called the 'office' stands near the homestead, separated from it by the driveway leading to farmyard and farm buildings. This has a right to its name, since it has been used as a law office by three generations of lawyers, the last of whom is the present owner. It has now, however, fallen from its professional estate and in it are assembled various relics of old times—the ancient high desk (there was no luxurious self-indulgence in desk chairs in those days!), the old firearms and powder horn, the ancient 'broad axe' with which the timbers for the homestead were hewn, the queer farm and household utensils grouped around the roomy old fireplace with its antique iron firedogs, the uncomfortable, straight-backed, narrow wooden settle, various flotsam and jetsam, all collected from odd corners and hiding places and brought into the high esteem of modern approval. An old painted bookcase holds a collection of the often curious literature of bygone days—the 'Peter Parleys,' the 'Godey's Ladies' Books,' bound numbers of the *Cultivator*, and many separate volumes of the highly improving and religious compilations of the times. The office consists of this one big room into which one steps directly from the sunny south door, and two minute back rooms, one of which contains the tiniest and most fascinating midget fireplace imaginable. I do not remember ever having seen a fire there, but the blackened bricks affirm its use. There is no sign of closet, cellar, or second story; but I recall the apartment's having been used at one time long ago as a home for a family.

All of the original furnishings are retained in the dining room.

It is roomy, although lacking in conveniences—in comparison with some of the modern apartment houses! It is shaded by a tremendous old sycamore, others shading the road leading to the large house. We children used the office as a playhouse, and established 'museums' in the small rooms, with wondrous collections of country treasure—birds' eggs (I remember our pride and delight in the possession of a humming bird's nest and eggs, tiny and dainty), mosses and lichens, stones and shells. These we proudly exhibited to our elders on their giving the price of admission—ten pins!

The inside of the homestead in the early half of the last century included the ordinary conveniences and necessities of a prosperous family of that time. The original owner purchased the first real carpet in town, but suffered in consequence the invidious criticism that 'it was a pity the old squire had become so proud that he couldn't step on his floors!' He also, having been of an experimental and ambitious nature, substituted, to the grief of the present-day owners, twelve panes of glass instead of the original twenty-four in his front windows. And my mother remembers the townspeople driving down to see the 'big window panes'! He prided himself on the perfection of his plumbing also; and, as a contrast to the usual pump or earlier well sweep, he brought running water into the kitchen sink, where it gurgled and boasted its abundance day and night in a constant stream allowed to trickle into a big pail that it might always be found 'fresh.' Also, with great self-indulgence, he built a long wooden bathtub into a little side room in the washroom ('laundry' would be too ambitious a term) where, in warm weather, if any of the family felt energetic enough, they could carry sufficient hot water from the kitchen stove by a devious route to comfortably dilute the liberal stream of ice-cold water piped into the tub from the hill. Cold 'tubs,' which were an inconceivably ridiculous idea in those days except when warm water was unobtainable, came into esteem in another generation. The waters of the Blackstone River, rippling over a glistening sandy beach at the turn of the stream in the intervale, were pure and clear in those days, and we loved, in summer, to take our primitive bathing suits down and have a grand frolic in this part of the river. On Sunday mornings the men and boys always went down for a swim. One ambitious and well-seasoned denizen of the town took great pride in the fact that he took the river plunge every day of the year, breaking the ice when necessity required!

I cannot remember the sperm-oil lamps which in grandmother's earlier days were esteemed such a luxury; these, with tallow candles for bedroom and round-the-house use, were the illuminating mediums; kerosene lamps, then considered the acme of convenience, came while she was still here to enjoy them. Candle-dipping was one of the regular yearly (*Continued on page 23*)

Back yard. There are many vines and shrubs, and a pear tree 75 years old.

The Job of Thinking

THINKING is the hardest work there is, which is the probable reason why so few engage in it. Even to say this about thinking is of doubtful use, because so few have had enough experience of thinking to enable them to judge whether the statement is true or false. If it were possible first to teach the people how to go to work to think, and then to think, there would be hope for all sorts of things.

Just to have ideas is not necessarily to 'think.' Probably the man who comes to you most frequently with 'ideas' is the man who has never thought one through in his life. His only notion of the value of ideas is derived from the excitement which they cause in him. And as some of the best ideas are not exciting or stimulating at all, his judgment on ideas does not indicate even a reasonably competent mind.

> *THE secrets of life are open to the thinker. Thinking is the work of digging to the foundations and has the aid of higher lights. Merely having ideas is not thinking. Our minds, when they are not focused on a worthy work which engages every faculty, become the playground for ideas, but they are other people's ideas, not our own. We prefer the swarm of other people's ideas to our own thinking, because thinking is the hardest kind of work a mortal can do. And just because it is hardest, the higher rewards are reserved to it. Thinking calls for facts, facts are found by digging; but he who has gathered this wealth is well equipped for life.*

It is easy to have ideas, but whose are they, and what are they worth?

Think of the experience of the average mind during the course of the average day. Think of the tens of thousands of impressions, ideas that swarm across it, as passengers over a bridge. From newspapers and signs and voices comes a perfect torrent of ideas respecting all the things in creation, from the merits of a particular brand of chewing gum to the care which is advised for an immortal soul—all these clamor across the mind. And when they stop clamoring, we get books or go to plays to start another procession of ideas. Whose are they? Certainly they are not ours.

So that merely having ideas is not thinking. Merely 'having something on my mind' is not thinking. Merely 'wondering' is not thinking. Merely 'worrying' is not thinking. Merely listening with all intentness to catch and remember something that someone is offering as the essence of wisdom is not thinking.

We have intelligence to spare; intelligence is ability to receive. But we have little thinking. Thinking is creative or it is analytical. Intelligence comprehends the outlines of a thing. Thinking breaks it into its elements, analyzes it, puts it together again.

In the long, long story of the soul of the people, it may be providential that for the present every person is not a thinker. It may be that the earth until this time has not been ready to support races given to thought. It may be that if everyone were a thinker at this stage of our common life, we should find life not so pliable as it will one day become, and so all the thinking would be frustrated. We cannot say positively as to that; at the best it is but speculation; but when you begin to see that possibly everything has been about all that it could be up to the present time, then it may be true that thus far there has been enough thinking, at least as much thinking as could well be.

One feels, however, that regardless of the fact that up to the present time everything has been about all that it could be under the circumstances, there is a sense in which from this moment forward a new era may emerge—if the necessary human components of a new era decide so.

Perhaps the most that one can hope for now is to drive home a conviction that, as a people, we have not done much thinking. If we think we have been thinking and find out that we have not, the jolt of discovery may be of service to us.

It is interesting to speculate whether the brain originates or only transmits ideas, whether the mind really originates thoughts or is a wireless that catches them out of the great invisible and translates them into terms of our experience. A decision made upon speculative grounds may never be entirely satisfactory, but an opinion arrived at by experience may become very useful as a working hint. Most of us will say that ideas have come to us without expectation of our own, certainly without conscious effort of our own, and have not been inferior ideas either. Sometimes it does seem that the air is full of messages and that those whose receivers are attuned to the messages catch them. Whether these are ideas originating in minds all about us and are being broadcast in the ether of universal mind, or belong to a general source of ideas, is a question we play with occasionally. The point is, we don't know.

But we do know that this experience of receiving ideas is a real experience. It seems also that the degree of receptivity is in proportion to the degree of activity on the other side; that is, if one uses the mind quite actively, the mind is thereby made keener to catch impressions which do not seem to originate within it.

And whatever ideas may come, none ever comes without making a demand on the voluntary action of the mind in realizing or fixing its value. The very best ideas when they come tax the intelligence afterward to work them out and make them the useful and general possession of men.

So that, practically, the academic question is settled: the mind is neither one nor the other; it is both. It receives; it also works. But 'thinking' pertains more to that less romantic activity which we call working.

Words

BEFORE the Tunney-Dempsey fight it was estimated by one of the large wire associations that two million words descriptive of the encounter would be flashed around the world by telegraph and cable alone. That is interesting. The story of Creation was told in ten words; the entire Bible contains less than 775,000. But that is not the only interesting comparison. Thirty years ago prize fights were held in back-country barns where the danger of being raided was supposed to be lessened; they were witnessed by scant handfuls of men; the participants were considered fortunate if they earned a hundred dollars or so. Today prize fights are held in stadiums dedicated to the nation's war dead; they are witnessed by thousands of people, men and women; one participant receives a million dollars while the other receives half that sum. What has brought about this extraordinary change? And which is better for the country—the attitude of thirty years ago or the attitude of today? Much hinges on the answer.

Opening the Arctic

AIRPLANES are opening Alaska. Heretofore much of that fabled territory has been inaccessible, so far as practical purposes were concerned. Particularly was this true of that region within the Arctic Circle. It required a month to mush into the interior and another to get out before the winter freeze-up, leaving little time for exploration and prospecting. Aviation has changed all this. The northern parts of Keewatin, the Mackenzie District, Yukon Territory and Alaska are being penetrated by exploring parties depending on airplanes as means of transport. A regular air passenger service is in prospect in the Klondike district between White Horse and Dawson City. It is rumored the Royal Canadian Mounted Police will don wings to patrol the northern areas. Fitted with pontoons in summer and skis in winter, planes are proving invaluable to the hardy pioneers who live on top of the world.

Nor is Alaska alone. Greenland and Baffin Island are largely unexplored, but their secrets will soon be tapped. The interior of Baffin Land remains a blank, its geography unknown. Its mystery will give way before airplanes. Vast regions lie to the north which the eye of man has never seen; they hold vast wealth in minerals and other products, and it is probable that they may be made fertile and productive. Within a few years they may furnish livelihood for countless men. The airplane is not alone a useful machine in populous districts; it opens new opportunities in unknown lands.

The Clergyman Afield

THE clergyman comes in for as much criticism, probably, as any other professional man. Some of the criticism is justified; much of it is not. The most serious reproach, if repetition is taken as the gauge, is that by widening his sphere of activity, the clergyman has lost much of his power of religious leadership.

'People do not care to hear a minister talk about international relations, the stock exchange, or similar matters,' declares Professor McFadyen, noted Glasgow scholar. 'They want to hear about religion, in which he is a specialist. If a minister talks about secular matters in the pulpit there is certain to be some one in the pews who knows more about the subject than he does.'

At first flush this seems a just and pointed criticism. Many churches have lost their mystic religious aura through the injection of secularism; many pulpits have become mere debating rostrums or lecture platforms. Appeals ring out for the return of the old-time religion. But in justice to modern ministers it must be said that changing times have brought complexities to the church as well as to other institutions. New problems are being faced, new leadership is essential. There are moral issues without the church as well as within. If, in attempting to define these issues and solve them, clergymen occasionally step beyond the bounds of pure clericality, theirs at least is the error of zeal rather than of indifference.

One Way—But Dangerous

A UNIQUE experiment in dictatorship may be attempted in Cuba. Legislation is before the Cuban congress which would give their president the power to determine the amount of sugar cane to be crushed each year. A commission working directly under the president would report on world production and consumption; and an export corporation appointed and controlled by him would have jurisdiction in the sales on the world's markets. Thus the president of the island republic would virtually direct the supply of twenty per cent of the world's sucrose.

The wisdom of vesting such power in one man—and that man of necessity a politician—is open to question. The Cuban sugar growers, taking as their example the British rubber monopolists, hope no doubt to establish a monopoly in sugar which will give them handsome returns. But monopolies, particularly of essentials, have an unhappy way of developing boomerang tendencies. Farseeing Englishmen are already doubting the advisability of rubber extortion. There are other ways of making profits than by boosting prices. One is by cutting costs.

The TUSKS of OLD BOUL

A Jungle Idyl

By PAVEL BOULIGIN

NOON scorched. The secret places of the Great Forest smelled of warmish trunks of trees; red and yellow garlands of twining lianas hung clinging and drooping.

A tree swathed in lianas leaned over the cool waters of a small river. A young hairless monkey sat in its branches, alternately hiding her head in her shoulders and shooting it out suddenly to scare an elephant which stood up to his knees in the water.

The elephant was old; he had many scores of years behind him and one of his yellow tusks was broken. He sighed contentedly, covering his broad sinciput with water out of his wrinkled trunk. His ears flapped benignly and his small eyes smiled. This elephant was a special elephant. Long ago he had lived with people and had carried great Menelik on his back during the wars, but when the Negus' rights had become established on the cold heights of Choa in the new capital Addis Abeba (which means 'new flower'), he was retired to the forest in order that he should not serve anybody after him. During one of the many wars of Negus against the robber king of Tigré Mountain, the elephant had saved the life of his master, taking the blow of an enemy lance in his trunk, since which time the warriors of Menelik had esteemed him highly.

Covered with gilded and jingling ornaments he had stood behind the throne in the shadow of a shola-baobab canopy and had learned from Negus Negisty (the King of Kings) how to mete justice. Hence when he returned to the Great Forest all the beasts made him judge, gathering on the sands of the drinking place for Old Boul to settle their quarrels. If any would not abide by his decision, the old black gorilla housewife, whom the whole forest feared, would roar angrily.

The pierced trunk had long since healed but there remained in it for all time a noticeable gurgling whenever he sucked up water, and for this all the beasts called him 'Boul'—Old Boul, Wise Boul, Just Boul. All held him in respect.

But children—especially monkey children—like to tease. The little red lemur was one such and, noticing that there were no grown monkeys about, she jeered at Wise Boul. The old beast did not mind but looked cunningly sometimes out of his mole eyes—and suddenly directed a stream of water in a snaky jet from his trunk! The little red and white whiskered head ducked quickly behind a branch and from the curtain of lianas raised an offended squeak.

Something cracked in the forest. Boul looked toward the jasmine bushes warily. Something glistened, a rifle shot sounded dully, the forest sighed and the old elephant fell heavily with his ponderous body into the water, raising a mountain of splash. Two men with guns emerged from the tangled underbrush and ran to the river.

'That's fine, Mourakoff! right in the eye!' said the first raising the ear which covered the wound. They looked over their prize.

'Listen, Grisha, go get Abatchanaka and bring the saw, while I wait here and watch—or no, let Abatchanaka stay at home; better to bring a couple of *Shankalas* (Negroes) . . . ' and Mourakoff sat down wearily on the sand and lighted his short pipe. Grisha left.

THE sun was starting down and the ashes of the bonfire had long been cold when Grisha returned with two Negroes. They started to work forthwith, but as soon as they noted the head and trunk of the elephant they sprang back:

'*Getta* (master), what have you done? You have killed Old Boul! Negus Menelik! *Tekle-Mariame* will not help you take his tusks—trouble will come!'

Regardless of the curses of their masters, the natives slunk away into the bushes, from which they apprehensively watched the work of the whites. But work did not proceed well, for the white men were inexperienced: the sun reflected a string of rubies and corals in the ripple of the river and painted the upper branches of a strawberry tree on the other bank with red, before the tusks were finally sawed off. As the Negroes refused to carry them, the friends loaded the tusks on their own shoulders and, bent beneath the weight of them, started for home. The servants followed shaking their heads, whispering and looking back.

The sun blazed for the last time and sank into the density of the forest, which at once became dark. The forest uttered its last sound and became silent. Except for the rustle of reeds and the murmur of the current the river flowed on silently too. A lone star looked out, and another, still bluish, and then the night sky of Africa opened out covered with large splashes of icy lights. There were earth lights also: they twinkled in bushes, in grass, and flitted swinging and blinking through the air. The river slime began to breathe more livingly and the voices of the cicadas rose in deafening emulation harmonious with the silence. A milky line of fog marked the river. Night pampering itself floated tremulously over the warm forest. Something shook in the trees, some noise stirred; a full, flat silver disk lit up the thin wind-torn clouds not visible before and, moving out, flooded sky and forest.

It lighted the blue river also with the elephant lying motionless on his side and the jackals busy near it. The stream beat the seconds on the stones. A spotted skin crouched on a tree trunk projecting over the water and, lunging forward springlike, a leopard jumped on the body of the elephant. The jackals disappeared shrieking and Spotty sat down on the hulk, licking his chops. The moon dived into the down of a cloud, contorted it, and swam out again brightly. The leopard noted the head of the elephant. Catlike he jumped side-first to shore.

'Old Boul! Old Boul is dead!' he howled.

'Old Boul is dead! is dead!' repeated several voices hoarsely from tree tops, and a small covey of little green parrots fluttered off the branches of mimosa where they were about to go to sleep, and flew into the night to spread the unusual news.

THE leopard sniffed the cold ashes of the bonfire. A large ugly gorilla came out from the forest density.

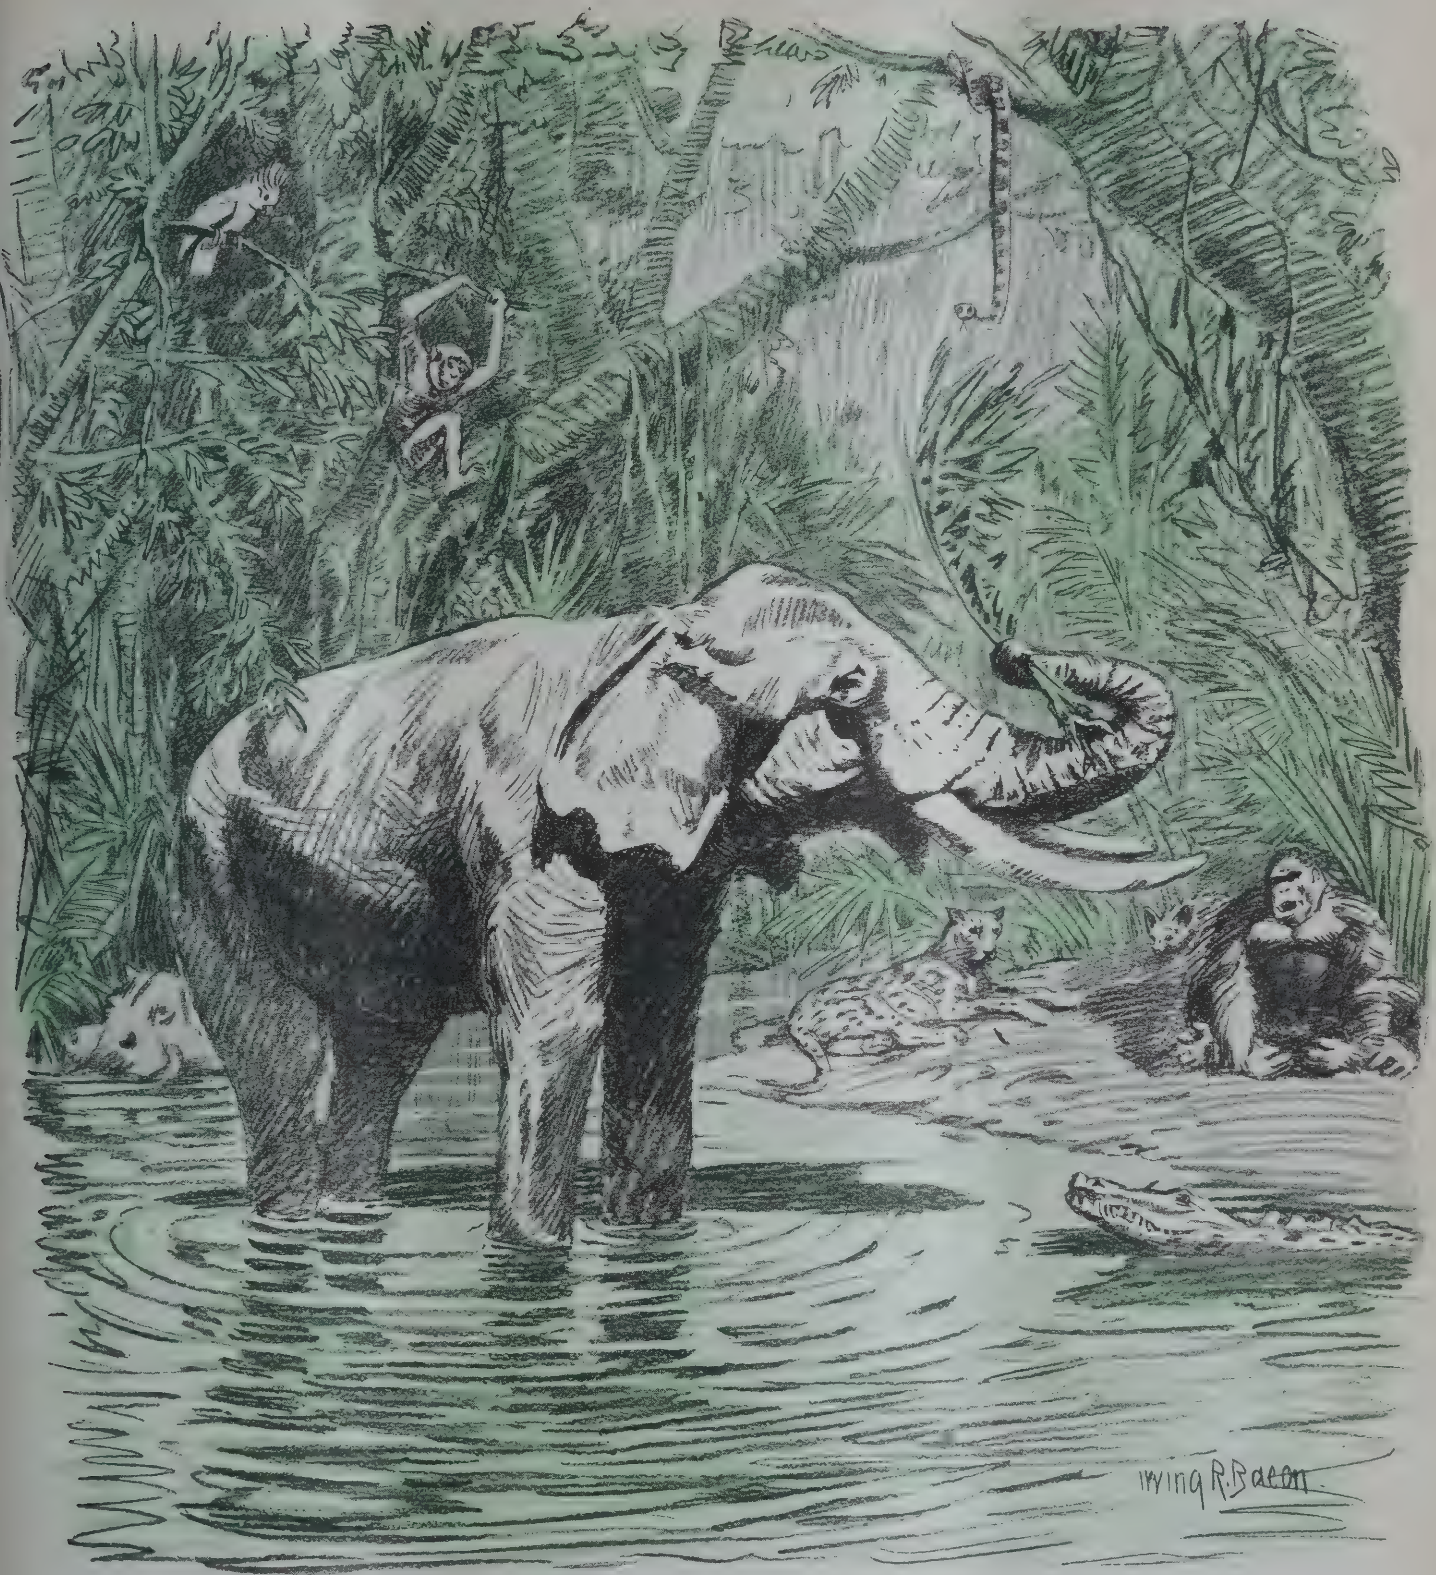
'What makes you choke, Spotty?' she sniffed. The leopard backed away with tail between his legs.

'Old Boul is dead, housewife, and right here lay the hairless murderer!'

The black shadow rose on short, crooked hind legs and, looking on the moonlit river, roared!

In the fresh dawn the birds flew through the forest wet with dew and hallooed: 'A council! A meeting at the drinking place. Old Boul is dead—killed was Wise Boul! . . . '

On a warm stone in a burned spot of the forest, unwinding its coils, with tail and little head hanging down as she turned her sides and spotted stomach to the hot kisses of the sun, basked the serpent, chilly Death. 'What do you warble about, my dear little



Old Boul stood up to his knees in the water; garlands hung drooping.

birdie?' she asked a parrot flying low. The green messenger fell into the grass weak and trembling.

'Well, I say, my dear,' continued Death, playing her emerald eyes and showing her little forked tongue. 'Who was killed, do you say?'

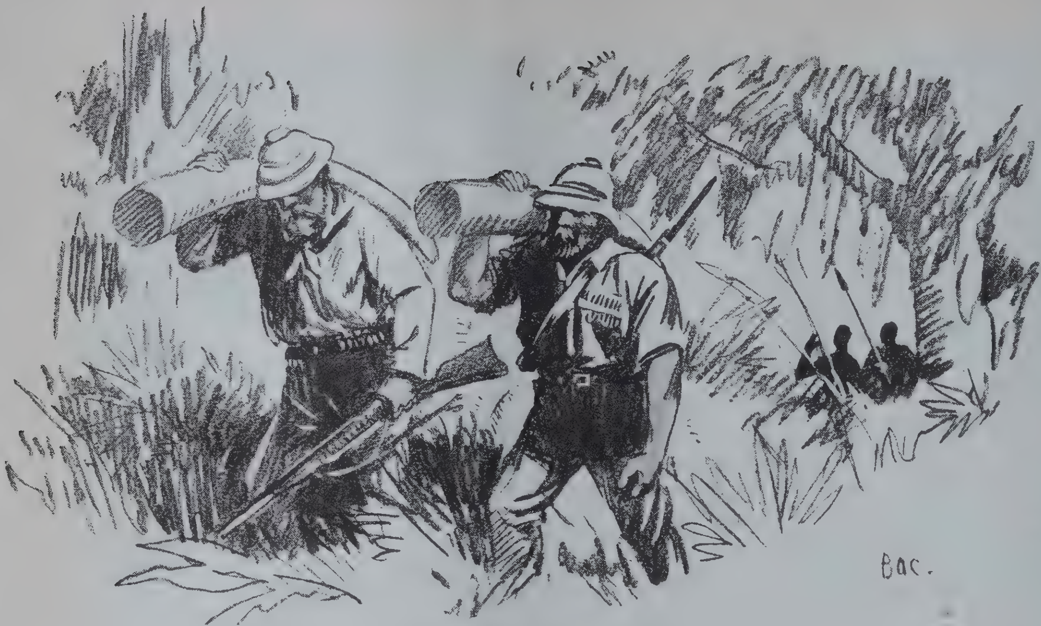
'Boul, the Wise Boul!' squawked the parrot, shuddering and raising all his disheveled feathers; 'and now there is to be a meeting at the drinking place and our housewife is already there.'

'Is that so! But who killed Old Boul?'

'I do not know . . . He lies there in the water at the drinking place . . . with a red flower in his eye . . . ' stuttered the parrot nearly dead from fright under the glitter of the emerald eyes.

'Bird, you are foolish and good only to be eaten; but then I would want to sleep and it is necessary now to find out what happened to the old elephant there. For a while . . . you may go . . . ' and with a clatter of rings, Death slithered off through the burnt grass.

So all the animals gathered on the sand at the drinking place. Near the water's edge on a hillock sat the black housewife scratching her fat hairy stomach. The leopard stood sidewise like a cat, keeping one eye on the housewife. From the reeds looked the blunt muzzle of the sweating hippo. A



As the natives refused to carry the tusks, the whites loaded them on their own shoulders.

crocodile yawned on the opposite shore. Death hung swinging over the river with tail hooked to a branch of liana. A red monkey sat grimacing on the limp carcass of the elephant. 'Great, Ancient and Wise Boul is no more!' he chattered. 'Here he lies never to get up. The Oldest Beast is dead. He lived so long, so long, and knew so much. He judged our quarrels and was just and wise. And see now how he lies in the water as carrion for jackals. And it was done by those pitiful tailless monkeys for whom he almost gave his life! They cut off his tusks, they disgraced the corpse of the Oldest Beast . . . '

'Go, fetch Death . . . ' snapped the black housewife.

'I am here,' and the liana crackled.

At the edge of the forest, near a little well, nestled a cottage roughly made of poles and earth. It sat in a yard surrounded with a fence made of branches of trees and bushes, beyond which seven mules chewed their corn and native *ashkers* lived in dark shanties. Behind the cottage was a hill crowned with the roof of a baobab tree. A cradle hung in one of the two rooms of the cottage, under the canopy of which a child slept smacking tiny lips. A big gray parrot swung in its homemade cage. Two native *olgas*, or beds, with mattresses, pillows, and blankets, stood near the wall. At the head of the beds a red icon lamp burned dimly before a Veronica image on a box covered by a clean towel, with the wedding candles and a bunch of broken willow branches behind the glass.

Morning. Mourakoff slept with his sunburnt face resting on his arm and his shaved lips tightly compressed. His wife in a kimona made of local striped cloth stood by the cradle. The slender figure bent solicitously over the child and the black braid fell over a well-tanned shoulder. Outdoors the voice of Grisha mumbled on. The parrot swung in the cage, whacked the wooden grating twice with his beak, and squawked: 'Eyes front!' The child began to cry and Mourakoff yawning stretched all his muscles.

'What are you fighting about there, Grisha. Olia, how is Lenochkka?' and he turned toward his wife.

'I fear she has a little fever.'

'Listen, Mourakoff,' said Grisha opening the door. 'I beg your pardon, Olia—may I come in? Listen, Sergei, these folks are real Ethiopians! They are asking to be released to go home; they say there will be trouble for the killing of Menelik's elephant; there was nothing written on him to say to whom he belonged and I would not say the elephant was good for much—his tusks are nothing wonderful. But our Shamil howled all night.'

'The devil take them!' answered Mourakoff—and stretched.

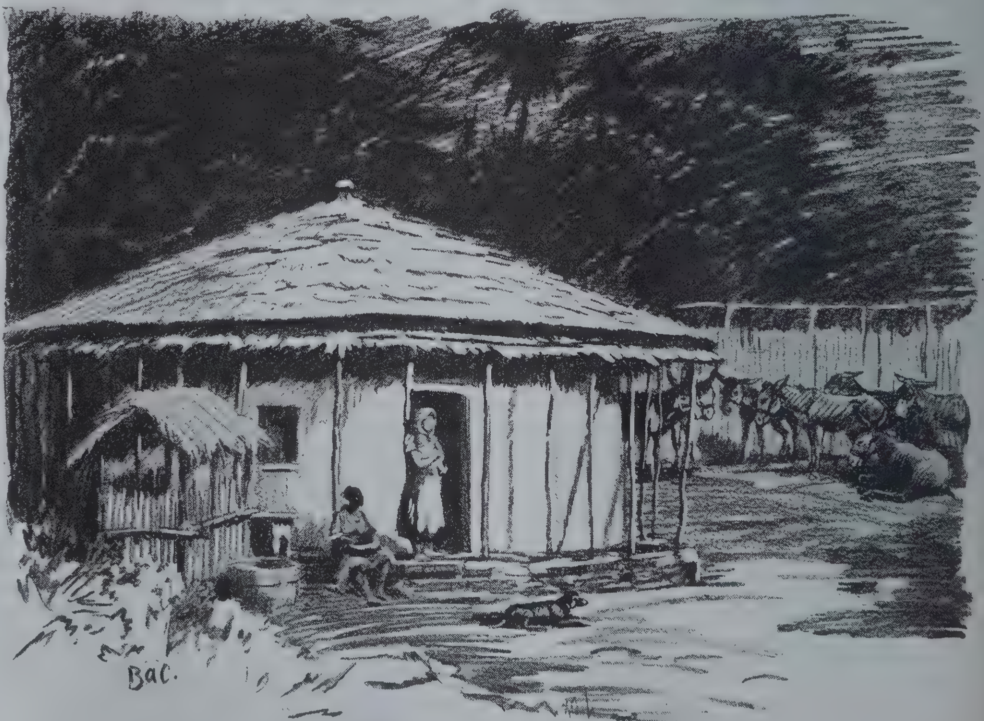
'Get out, Grisha, I am going to get dressed. Olia, is it time for breakfast?'

SHAMIL for a fact had howled and howled for two nights already! The third night Mourakoff went out to listen. The well-packed ground was striped with blue bands from the moon, and the dry reeds on the roof shone like gold. Shamil was hiding himself from the moonshine in a dark corner and howling woefully. Sergei called and the dog came and began to hound his feet trembling and whining. The hair on his back stood on end and he hid his tail between his legs. The moon was bright enough to read by, but the forest was dark, silent and dreadful. Mourakoff turned to the door. Shamil pressed close to his feet, attempting to enter the house, but Mourakoff drove him away.

'What makes him howl?' said the sleepy voice of Sergei from the first room.

'Howl! Well, the night is such that I would like to howl myself! Moon . . . sleep!' answered Mourakoff.

In the morning (*Continued on page 24*)



At the edge of the forest nestled a cottage.

In the NAME of the LAW

By C. C. DANIELS

AN HONEST, fearless public official deserves the respect and honor of the people whom he serves.

Criticism and fault-finding are always current. When officers work for the good of the public (as most of them do) they are entitled to feel occasionally some of the warmth of approval.

The line of demarcation between the faithful and the faithless public official should be clearly drawn so that each may be known for what he really is, not for what he seems. One of the most capable men to hold office in a great state was put on trial a few years ago in a strange city by the United States Government for criminal conspiracy. He was arrested, indicted, humiliated and required to pay thousands of dollars to meet and refute an unjust charge.

Somebody evidently thought they had the 'drop on him,' in the vernacular of the West. The evidence produced at the trial showed that this high-minded, patriotic lawyer, instead of being guilty, courageously advised and vigorously sought for observance of the law and preservation of the highest ideals. He was indicted, however, along with others who were in fact found guilty.

He was attorney for the organization but instead of being in sympathy with its illegal conduct he advised against the action complained of and exerted his influence on the side of the law. This could at any time have been ascertained by the use of ordinary judgment. After the evidence was all in, the court promptly directed a verdict of not guilty. He was, of course, discharged but he had been irreparably and unnecessarily injured in estate and reputation. A grave injustice was done in the name of the law and the man had no redress.

* * *

ANOTHER native-born American lawyer, of national reputation, was made defendant in a civil action for breach of promise to marry an unprepossessing woman, of whom he had never heard until demand was made for the payment of money.

The only reason such a charge was made against him was that he was of the same name as the man she claimed had promised to marry her. This lawyer refused to submit to blackmail. He was resourceful and had friends who aided him in ferreting out the scheme and uncovering those responsible. Some of those connected with this litigation were tried and convicted and the lawyer was successful in his counterfight against those who sought either his money or his destruction. The cost to him, however, was the equivalent of a small fortune and his time and attention were so taken up with the litigation that a large practice drifted to other offices.

He lost money and reputation by reason of his courageous refusal to 'buy his peace' and went to his grave before his time as a result of the terrific strain under which he had labored. One of the lawyers appearing in the action against him emerged from oblivion to the front pages of the newspapers, and thereafter became the candidate of one of the two great political parties for an important state office.

GERALD VAN DER HEYDEN.

* * *

A doctor who gave to his practice years of earnest investigation and research, as well as conscientious service, was wrongfully charged with malpractice. Upon refusal to 'come across' with cash, he was sued. The headlines of the newspapers featured the blatant allegations of the complaint and he was thereafter discredited in the minds of those who read them and who accepted the assertions that he was unskilful and untrustworthy, if not worse.

When the case was tried it was shown that the doctor was entitled to praise rather than censure for his work. But the public had read the attack and his reputation was irretrievably injured. The fact (overwhelmingly shown by the evidence) that he was a skilful, conscientious doctor, entitled to confidence and respect, was not 'news.' His vindication was never read by the people who had read and accepted the unfounded charges glaringly set forth in the headlines.

One of the remarkable things about the violation of the tariff law by the rich, returning from pleasure trips abroad, is that most of them smuggle in jewels and fine apparel and yet most violently advocate and defend the 'protective' tariff.

A man worth millions who had contributed largely to the doctrine of protective tariff was caught smuggling jewels valued at thousands of dollars. Instead of being put on trial for criminal violation of the law he was permitted to settle outside of court and thus satisfy the demands of the law. The 'soft pedal' was put on the newspapers about his 'lapse of memory' when he came to make his 'declaration.'

Not only are courts used as instruments of injustice to innocent people, but government commissioners and administrative officers are too often instruments of irreparable injury, for which no remedy is provided.

The experience of those forced to deal with the various boards and commissions set up by the federal, state and city governments has brought this fact forcibly home—and wise ones look up those having 'influence' with the members of these boards and commissions instead of relying exclusively on the righteousness of their cause.

* * *

THE reputation of a business selling its securities to the public is fragile. Unfounded suspicion and malignant gossip often inflict more actual injury than do the sneak thief and the burglar.

Sometime ago a successful corporation selling securities to the public became the target of competitors. An employe of a commission in one state in control of licensing the sale of securities made unjust and unfounded charges against it. These were broadcast through the newspapers and carefully transmitted to other commissions and industriously repeated by competitors. After full investigation, the commission officially determined that the charges were without foundation and gave the corporation a 'clean bill of health.' The employe who made the charges sought employment elsewhere.

Of course, such publicity causes injury, the effect of which cannot be estimated. The whispered word of doubt, the shrug of the shoulder, the raising of the eyebrow, are seen and heard and leave impressions far more indelible than outspoken statements. Peddlers of worthless stock trying to pull down reliable securities revel in such.

Most commissioners honestly try to protect the public

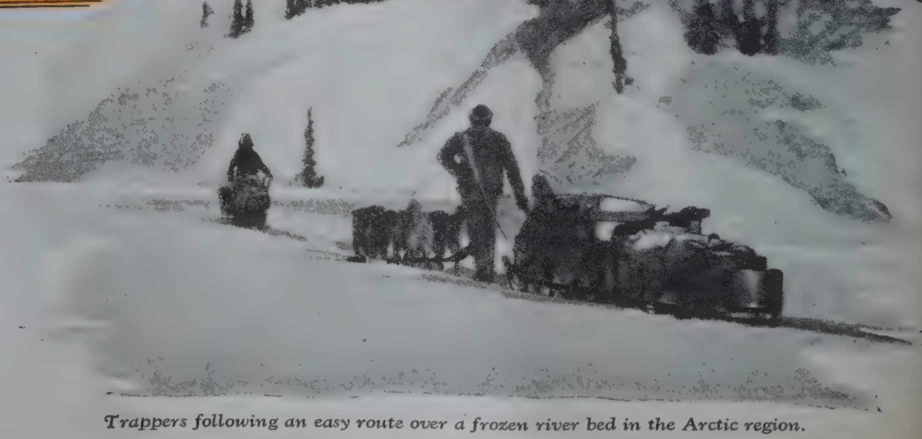
THE trouble with the noisy fellows who call themselves opponents of religion is that so often they think they are attacking religion when they are attacking what religious men condemn.

My contention is that, first and foremost, religion means order. I hold that the passage in the prayer, 'Thy kingdom come, Thy Will be done, on earth as it is in Heaven,' means that it should be every man's aim to get that order and regularity in the affairs of men which we see in the stars and sun and moon. The fourteen words express common sense. Indeed, the entire prayer is as practicable as the multiplication table. So, if you ask me for examples of the power of religion, I give you instances of the establishment of order done in the name of Christian civilization. Where there has been trespassing, things done contrary to order, real religion does not go trampling and revenging and slaying, with any idea of an eye for an eye and a tooth for a tooth and a life for a life, but rather it goes in a spirit of fair play, justice in mind, but tempering justice with mercy. And the agents of order have no vindictiveness in them, nor have they any spirit of sensationalism. But they work patiently for results. They know discipline. They are workaday men capable of zeal and self-sacrifice. Glory and name and fame are not what they strive for. The duty that lies nearest and the one step ahead, not heroics: there you have the aim. Industrious and close application to the job in hand, and not windy platitudes about uplifting humanity, that is what counts. So to my example.

* * *

There were two white men, who, in the year 1911, had a mind to journey into the Far North. They were an American named H. V. Radford, who had made some collections for the U. S. Biological Survey at Washington; and an Ottawa man named T. G. Street. Early in June, 1912, they reached Bathurst Inlet where they fell in with an Eskimo tribe. Nothing more was heard of them until May 31, 1913, when an Eskimo who had guided them from Schultz Lake to Bathurst Inlet reported that the two men had been mur-



Trappers following an easy route over a frozen river bed in the Arctic region.

dered by Eskimos. His tale was to the effect that Radford had bullied a native, and 'to enforce obedience had struck him with the handle of a whip, whereupon Radford was stabbed in the back by another native.' His companion, Street, was also killed in the scuffle.

So murder had been done and machinery had to be set in motion for justice' sake. But justice and revenge are not the same when Christian gentlemen handle matters. 'Mr. Radford showed poor judgment when he tried to enforce obedience by striking an Eskimo,' observed the Hudson's Bay Company agent, Mr. Hall, who first heard the story. Nevertheless, there had to be an official investigation, although Superintendent Starnes estimated that the capture of the men responsible for the killing would take 'the best part of two years.' It would be the establishment of order at a great price if the duty of investigation was accepted, but that price the men at the head of affairs were willing to pay. The duty was accepted with promptness and discharged with farsightedness.

And that duty? Look at the map of Canada. To get to Bathurst Inlet, which opens into the Arctic Ocean, involved a tremendous journey. It meant a long overland trip from Chesterfield Inlet. And to accomplish it there would have to be established a base of supplies somewhere on Chesterfield Inlet. To establish the base necessitated a sea voyage from Halifax, into Hudson Strait, down Hudson Bay, the journey to be made by sailing vessel. However, the job was undertaken but not in 1913, because the Hudson Bay schooner was wrecked. So, July 31, 1914, as soon as weather conditions permitted, the schooner *Village Belle*, purchased for the purpose, set sail, Inspector W. J. Beyts in charge of the expedition. But bad weather and many adverse conditions prevented the establishment of a base. Again the expedition had to be put off for a year. The next year, 1915, though there were exceptional difficulties of transportation, the base of supplies was established on Baker Lake at the head of Chesterfield Inlet, and in the winter of 1915-16, Beyts made two attempts to get to Bathurst Inlet overland but failed.

YET there was no giving up in despair. In 1917, the Canadian Government instructed Inspector F. H. French of Halifax thus: 'It will be your duty to get in touch at the earliest possible moment with the tribes said to be responsible for the deaths. You will make inquiries and take such statutory declarations as may seem necessary in order to obtain a full and accurate account of the occurrence. From information received, it is assumed that there was provocation. If this is found to be the case, it is not the intention of the Government to proceed with prosecution. If, however, there was found to be no provocation, the Government will consider what further action is to be taken.'

To that, Inspector French wrote: 'I hope to make a successful trip, commencing in March next (1917); my only difficulty is the inevitable dog-feed question, which seems to rise at every point a man moves in this country, so devoid of timber and vegetation. If I can only procure the game along the line of march, I feel sure I shall be able to bring the patrol to a successful termination . . .'

—Publishers' Photo Service.

Walrus on a floating cake of ice. These were afterward caught by Eskimos dressed in white to harmonize with the surrounding ice.

They left Baker Lake on March 21, 1917, and the party was made up of Inspector French, Sergeant Major Caulkin, and four natives named Joe, By and Bye, Quash-ak, and Solomon, the last-named a woman. They had twenty-five dogs, three sleds and two canoes. Their rations would, with care, last a month, after which they would have to live on the country.

During that month they were on the march constantly, day in and day out, over stretches of barren, rocky country. There were frequent blizzards and when there were no blizzards there was dense fog. The snow was beginning to melt; therefore their difficulties increased when they had to pass over broad ridges of sand and gravel, sometimes unloading the sleds and carrying all for miles. To carry burdens when clothed in furs is a job to tax the hardiest. There were boulder-strewn places, too, and detours had to be made. Wolves were numerous, and several times the camp was attacked by them.

THEY came out upon the Arctic Coast on May 7, about fifteen miles west of the Ellis River and crossed the ice to Melville Island where they killed some deer. Long before that there had been short rations and they were stinting themselves to feed the dogs. Then, in the middle of May, at the mouth of Bathurst Inlet they came upon an encampment of Killin-o-muits and at once set to work investigating the Radford and Street case, taking depositions, examining witnesses, interpreting, all with the same care and fairness they would have exercised in a case where their own kind were involved. It became abundantly clear that there had been gross provocation on the part of the slain Radford.

There is an entry in the report, significant of the state of affairs and what the white men were undergoing in the way of hardship. It runs:

'. . . We traded with these natives for footwear and seal-line, etc., our own being pretty well played out. We also traded and procured a native stone lamp and some blubber, but this method of cooking was so slow that after several attempts to boil a kettle, consisting of an all-night vigil, we eventually abandoned the lamp and found small twigs growing on the island in the inlet, sufficient to make a small fire.' And again: '. . . we could notice the snow disappearing off the land—in fact so much so that I concluded we had no time to lose if we were to get back out of the country before the snow cleared off altogether.'

THEY therefore started south, their business being done, though they were entirely out of dog feed and 'did not know when we would come across deer again.' The weather had grown so warm that their snow house fell in upon them one night. 'We traveled as long as we could and camped when the conditions were favorable, going on two meals of half-raw deer meat during the day, and found it not very agreeable to keep on the go for fourteen or sixteen hours between meals.' On land there were vast bare places over which they could not pull, and 'the sea ice became bare and jagged and cut the dogs' feet so that the majority were lame. I had an outfit of sealskin boots made and put on all the dogs, but the ice was so sharp that they would wear out a pair in a night, as was also the case with our own footwear.'

(Continued on page 18)

Soon they were at a place where the ice was covered with water fifteen inches deep. That became fast-running water, knee-deep, which swamped the sled loads, while the land was bare of snow and impossible for sleds and dogs. Moreover, they were entirely out of supplies and were living on a straight meat diet.

There was nothing for them to do but to get into the north and the cold, until winter made travel southward again possible. At that point, while they were studying pros and cons, some Eskimos came to the camp with news. It was that there were three ships frozen in, about nine days' march over the ice. The expedition packed up and headed northward facing the amazing trip without fuss. Here and there the white men found encampments of natives, and, says Sergeant French, 'I stayed and gave them a lecture on the murdering of white men, and pilfering, and also dwelling on the laws of civilization generally. They appeared to be greatly impressed.'

It was hard going all the time. The sea ice was getting rotted and there were large cracks necessitating detours of several miles. Snow fell also for days at a time, until 'about eight inches deep on top of the ice, and the cracks were covered over and impossible to discern. Caulkin and two natives fell down cracks in the ice and were wet through while walking ahead of the dogs, so thereafter the dogs had to be urged from the rear.'

They then took to the shore awhile. And, wonder of wonders, they came across a white man, a lone Swede named Albin Kihlman, who was trapping. He confirmed the story of a ship frozen in the ice three days west of his shanty. On June 8, they found the schooner, which proved to be the U. S. gasoline schooner *Teddy Bear*, commanded by Captain Barnard. A glance at the map will reveal more of what that journey meant than columns of words, if the exact point, which was latitude 67-46 and longitude 115, be marked.

THEY stayed with the schooner for two days, then headed southwest for Bernard Harbor, where stood the nearest Hudson's Bay Company station. Mr. Phillips, a missionary trader was there, but he had few supplies of any kind, nor did he have ammunition. The record runs, very simple and matter-of-fact: 'This was a hard trip. I must say . . . the hardest trip I have ever made, and we suffered much from cold and exposure. These we felt all the more when our supplies ran out and when, toward the end of our journey, our deerskin clothing got the worse for wear and the hair started falling out and the winds pierced through the seams and holes. Most of us were continually frozen about the face and hands, and with regard to snow-blindness we were suffering from this more or less during the whole journey . . . Both Sergt-major Caulkin and myself were in very poor shape as regards health.'

But there was company of their own kind, for at the trading post two lay preachers lived and worked under the direction of a missionary, a Mr. Girling, who had gone to Herschel Island by dog sled. Nor was there anything but hardship. Those at the station had little more than enough to carry them through the summer, and French and his companions were not of a kind to shift their burden to other shoulders. So they opened a cache belonging to the Canadian Arctic expedition, took bare necessities, made a list of what they took, and then sealed the cache again. Off they went to the mouth of the Coppermine River, there to camp until the world froze up again so that they could head homeward. On the way they picked up the lone Swede, for 'he did not possess sufficient supplies to see him through . . . and he would have been destitute if left on the coast.'

They were thus at the turning point, or halfway on the entire trip, and the mileage made was 2,483 miles. But there was no despair, no grouching. Now and then natives came to the camp, when Sergeant French seized the opportunity to pound away at his lesson of order and obedience to civilized law. 'I gave them,' he writes, 'lectures regarding civilized laws, etc., through our interpreter, Joe. For it was from this tribe that the natives came, who were responsible for the murder of two Roman Catholic missionaries.' The white men's religion was unassociated with any particular creed or denomination. It was a manly religion of order first, last and all the time.

ON the return trail they were at Bathurst Inlet again by the middle of November with 'grub getting low . . . storms at times, the snow melting as soon as it landed, wetting our clothes and outfit.'

There were days hard and weary after that. Storm followed storm, and once they were forced to burn a sled to keep themselves from freezing to death. The men went without food that the dogs might eat, for the animals were so ravenous that one night a litter of pups was devoured. There were white days of blinding snow when the horizon was two yards ahead. By January 'we were down to soup only, and none of us feeling any benefit from it, although it kept us alive, but we felt rather groggy about the knees towards night after tramping all day, and we were now feeling the cold and our clothing was sadly in need of repairs.' To make matters worse, the natives in the party lost faith in their leaders and planned to take what they could and leave the white men to perish.

At last relief came, for, tolling a rise, at 9:30 a. m., on January 26, the sky suddenly cleared and they saw the island where the Hudson's Bay Company post stood, 'which we were all greatly overjoyed to see—land we knew after an absence of over ten months. We made the post in the afternoon and were kindly greeted by Mr. Ford, the post manager, and given the best of food. We stayed there and thawed out a little, and arrived at the detachment all well and glad to get home.'

To be sure there was the other part of the trip, with the sailing up Hudson Bay and down Hudson Strait and to Halifax, but that hardly counted. What did count very much indeed was that fair play had ruled where Christian civilization had set foot. The chief thing was that there had been order and justice.

In the Name of the Law

(*Continued from page 15*)

against worthless securities and the higher their reputation, the greater the injury inflicted when they are misled, or act on malicious or ignorant evidence supplied by those having a sinister purpose.

On the other hand, the more carefully these investigations are made and the more nearly justice is approximated, the greater service is rendered the public. The public demands impartial and unbiased judgment in protecting the honest as well as exposing the dishonest.

The action of the commissioners of one state is transmitted to the commissioners of other states, and charges even though discredited are revitalized and revamped before a new audience with added prestige. To meet these charges costs money; takes organization and necessarily slows up business. If repeated often enough in different states they may bring about the destruction of the strongest financial institution.

It is a known fact that many perfectly solvent and well-managed financial institutions have been destroyed by the ignorant or malicious gossip of knaves or fools. People are often like cattle and when stampeded trample upon and destroy even their own.

The injury inflicted by unjustified assaults or rumors about financial institutions can never be corrected. This character of reckless disregard of their rights is made indictable in some cases.

The court or the commissioner, however, who recklessly or knowingly allows himself to become a drainpipe for transmitting the refuse and filth of hate or private interest into the official stream of publicity, to the unnecessary injury of another, deserves to be put under severe jurisdiction and recognized as a purveyor of things obnoxious.

Has not the time come when the lines should be tightened, if not by law, then certainly by public sentiment?

One's Own Time

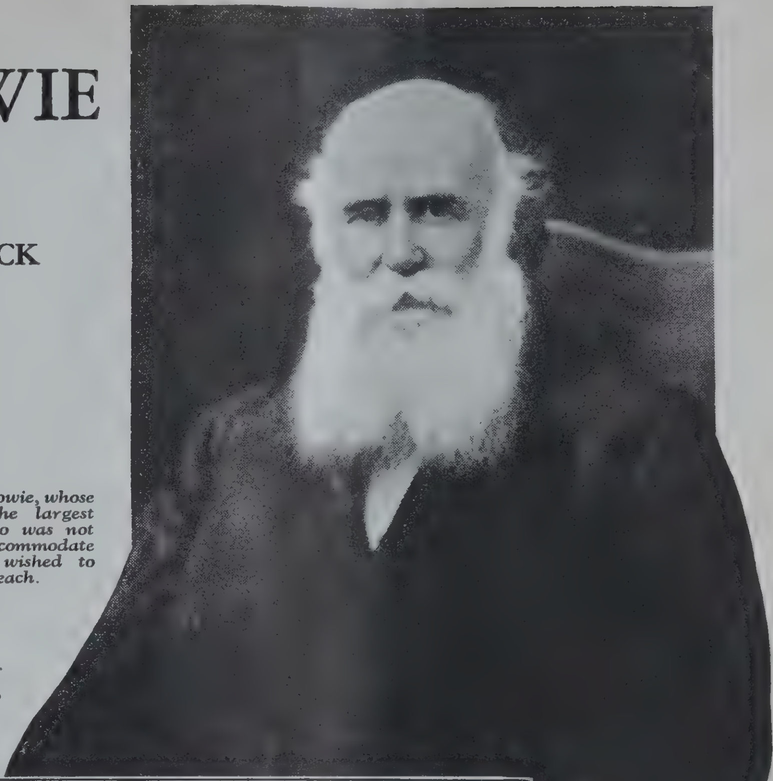
(*Continued from page 2*)

England has known since the days of Burcell. And as to religion, it is true that many of the churches are empty, that the religious sects seem to the ordinary man to be eternally occupied with unimportant quarrels; yet outside and beyond this there is a more widespread, honest and far-reaching interest in the spiritual life of man than any of us alive today can remember.

I believe this time of ours to be an intermediate one; we are beyond question in an age of transition. Perhaps every age seems to its citizens to be that; but we are moving conscious at last of some of the truth, not only among ourselves but among the inhabitants of the whole world. There are signs at last that because of the discoveries of science the world will presently move forward in harmony; there will soon be little excuse for the misunderstanding of one another, so close shall we all be together. The time has even now arrived when a passion for truth unobscured by sentiment or tradition or prejudice is leading to a comradeship based on finer instincts than it has ever known before.

The Doctor Dowie I Knew

By LEWIS WEADOCK



John Alexander Dowie, whose auditorium in the largest theater in Chicago was not large enough to accommodate the crowds that wished to hear him preach.

THE first of my many meetings with Dr. John Alexander Dowie, founder of the Christian Catholic Apostolic Church, and founder, also, of ion City, occurred in 1900. I had just eturned from Kansas City where I had een covering the Democratic National onvention for the *Chicago Journal*.

'Of course there may be no trouble at his Dowie meeting in Oak Park,' my city ditor said as he sent me on to 'cover' the ssignment.

As a matter of fact, there was nothing ut trouble. For, no sooner had Dowie, tubby, bald and with bristling beard, lanted himself upon the platform than, in he words of his favorite poet, Shakespeare, e began to unpack is heart and fall -cursing. Such words! 'Murderers' nd 'stinkpots' were two of the mildest.

He had many more. He had all he words there were. I have heard Billy Sunday, and Sam Jones, and nce I was lost in a og off Sandy Hook ight with the captain of a seagoing ug—but never ave I listened to he equal of Dowie, he man of many words. As compared with the normal vocabulary, his was n unabridged dictionary.

Present were more than one hundred students from Rush Medical College. As a rule, medical students are not easily shocked, but these were. They were o shocked that they jumped to their feet nd, laying down a barrage of eggs and vegetables, rushed the platform. Simultaneously some of the windows were shattered by stones hurled in from the street.

Above the tumult, for the students used their voices as well as their hurling arms, rose the falsetto of the First Apostle. Dowie's voice, like Theodore Roosevelt's, was likely to squeak under the stress of emotion, and this night there was reason for its shrillness. The trouble with these yells of 'Hang him!' and 'Get a rope!' was that some fool might take them seriously. Dowie showed no sign of fear.

In those days police were detailed to every Dowie meeting, and this night those that were stationed about the building charged into the fray. Surrounding the still voluble and gesticulating little man, they moved with him down the stairs to the patrol wagons which were to escort his carriage out of danger.

The auditorium of Shiloh Temple, Zion City.

After that, I covered several tumultuous meetings without detecting in Dowie any symptom of fear. But, although he was not afraid, he was prudent, as I discovered when, in the fine house his followers had built for him in Zion City, he showed me a fortified room in the basement and remarked very seriously:

'The world kills its saviors.'

Before the opening of Zion City in 1901, Dr. Dowie (as he always called himself by virtue of his degree of Doctor of Divinity) and I became good friends. In public, he declared that all newspapermen would burn in everlasting flames, forever and ever, amen; but in public he was accustomed to use the loud pedal in all his utterances. In private, his manner and speech were more subdued.

One of the most enthusiastic demonstrations I have ever seen anywhere was the one that occurred in the Auditorium Theater on the Sunday when he first announced that he was the reincarnation of Elijah the Tishbite.

When he shrieked, 'As the Lord God of Israel liveth before whom I stand, I am Elijah!' that vast audience just went wild.

I never could see why anyone should object to the fact that his followers gave a tenth of their income to his church. They had no doctor bills nor drug bills; they used neither alcohol nor tobacco nor snuff nor pork nor oysters; they went to no theaters or dances, and they did live simply and work hard. They sang much, and prayed more, but neither of these activities cost anything, and their reading cost only a trifle more. They could read only the Bible and Dowie's official publication, the *Leaves of Healing*, and the few, the very few, publications which he approved.

He was born in 1848—that year of almost universal unrest—and when he was twenty he entered Edinburgh University where he studied for the Congregationalist ministry. He earned the money in Australia with which to do it, and, when he had accomplished it, he went back to Australia and became pastor of a church near Sydney.

'Almighty God told me to go to Melbourne and heal by prayer,' he said, in the most matter-of-fact fashion. 'I did, and great works followed me. In 1888 God Almighty told me to come to the United States. I did, and great works followed me here. I shall stay, I hope, in the United States until I die.'

But he didn't. Two years after he founded Zion City and set up the lace works and the candy factory, which were the nucleus of what he meant to make an industrial center, he toured the world on a visit of inspection of his churches.

He was mobbed in London, but he had been mobbed so many times before, that it did not depress his spirits. The thing which hurt him most, I think, was that when he went to New York and held meetings at Madison Square Garden he was not mobbed. He knew how to deal with violence, but apathy was too much for him.

Of course, the action he most regretted to his dying day was his decision to plant large colonies of his people in Mexico. For it was while he was in that country making the necessary arrangements that his wife, his son Gladstone, and Voliva, first overseer in Zion City, put their heads together and came to the conclusion that it would be best for all concerned to retire the First Apostle.

I went to St. Louis to meet him in his private car on his return from Mexico, and the language with which he described the disturbers within his household was wonderful to hear.

He was breaking then, physically, at least, possibly mentally, because the tragic death of his daughter had been a severe blow to him. She was an attractive young woman in her early twenties and between father and daughter there had always existed a bond of sympathetic understanding.

Dr. Dowie's daughter died from burns she received when an alcohol lamp at which she was heating a curling iron set fire to her clothing. I heard him announce the news of her death to his congregation and, in a voice which he could scarcely control, tell them she would have lived had she not disobeyed the letter of the church law against the use of alcohol in any form.

Probably, one of Mrs. Dowie's reasons for losing some of her enthusiasm for her fiery husband was that a certain rich young woman became so impressed with his apostolic fervor that she left her home in Switzerland and moved to Zion City that she might be closer to the source of supply.

The personal attractions of this pious pilgrim were not negligible, nor was their effect upon the beholder lessened by the fact that she was one of the few daughters of the rich that could see any sense in giving one-tenth of her worldly goods to the Christian Catholic Apostolic Church in Zion.

But neither her pulchritude nor her piety caused so much anguish in the Dowie household as did her idea of where she wanted to live. Dowie bore his share of this anguish with Christian fortitude, but his wife was distinctly annoyed when she learned that the only lot in the more than three million square miles of territory in the United States which the young woman regarded as a suitable home-site was the lot which adjoined the residence of the Dowies.

Zion Home, of which the third floor between the towers is devoted to the overseer's residential suite. Inset—Wilbur Glenn Voliva.

Nor did Dowie make matters better when he once inadvertently referred to this home-seeker as his 'little lump of gold.' While Mrs. Dowie and her son Gladstone Dowie, whose chief claim to serious consideration up to that time lay in the fact that he had attended the University of Chicago without having been kissed, were at the Dowie summer home in Michigan it became noised around that the house in which Dowie lived, and the house in which the young woman from Switzerland lived, were connected not only by neighborly ties but by a tunnel. 'If you find a tunnel I'll give it to you,' Dowie said to me, disgustedly, with that faint Scotch burr that stuck to him all his life.

It was one of the only two times I ever heard him speak of a serious thing lightly. The other time was when I went to him on behalf of a celebrated author who had been commissioned by a widely circulated magazine to write an article about him, and who, having been a reporter before commencing author, thought it might be advisable to build his story on an interview.

'I won't see him. I've never heard of him. I've never heard of that magazine,' said Dowie, straight-faced, and then, grinning like a happy kid, he sputtered: 'But, maybe, they've never heard of my *Leaves of Healing.*'

His power and glory had waned considerably at the time he took me into the basement at Zion City. In a corner of that basement was a sizable room whose walls were of brick and whose door was thicker than any door I ever had seen except in a bank, a gambling house or a jail. The room was furnished with simplicity that was in contrast with the richness of the rest of the house.

Dowie's taste inclined to the ornate and sometimes ran over the line into the flamboyant. Indeed, more than one of the sumptuous apartments in which the First Apostle had received me had been strikingly reminiscent of those palatial drawing-rooms whose mirrors, chandeliers, gilt furniture, palms and other potted plants were revealed to the public eye in the twenty-four-sheet lithographs which bore the explanatory legend: 'Messrs. Williams and Walker at Home.'

I said to Dowie that this cheerless room in the basement looked as if it was built to stand a siege.

'The world kills its saviors,' the First Apostle reminded us again. It never became necessary for Dowie to retreat to his storm-cellar. The world was not responsible for his fall. He fell, as greater and lesser men have fallen, because he tried to take in too much territory. If he had not set out to establish colonies in Mexico he would not have been charged with having misused the funds of the church.

Shiloh House, Dr. Dowie's residence, which rumor claimed had connections with the 'outside world' through a tunnel.

Of the conservative element he said: 'If they had let me alone, every dollar that I put into the Mexican plan would have returned itself a hundredfold.'

In Grandmother's Time

(*Continued from page 9*)

tivities; the products were no colored, risted, or other fancy variety, but plain llow, the material for which was tried out om the fat of animals killed for food. The agrant bayberry oil, however, was even en used to perfume the candles made r 'best.'

Fireplaces were in all the rooms, and iginally, of course, a 'Franklin stove' d been built into the dining room, in hich a wood fire was kept burning to rnish the entire heat. The next generation elighted in the comfort and luxury of irtight' stoves and, later, of 'base-burners.' he upstairs fireplaces, although not bricked to keep out drafts, as was too often the se in old houses, were practically closed by ted fireboards through which the pipes the 'air-tights' were run. Downstairs, owever, we enjoyed the big open fires in ring and fall, before the base-burners ere set up. In these we always preferred burn the apple-tree brush (than which ere is no finer or more delightful firewood) immed from the trees in spring. A tre-endous rough gray hearthstone faced the g chimney in the kitchen, which, when ore modern methods of cookery were stituted, was preserved, as an interesting lic, in an outside doorstep.

HE big attic, extending over the entire ouse, was a fascinating place to visit. remendous hand-hewn beams, enough to rnish the framework of several modern ouses, support the roof. From handmade ooden pegs on the rafters hung all sorts of ncient relics (the slogan of 'keep nothing at is neither useful nor beautiful' not aving yet invaded the sacred precincts of e attic), voluminous carpetbags, bundles f rods for candle dipping, quaint bonnets nd hats and quainter garments, even the eprehensible hoop skirt, and all sorts of ld-time conveniences and necessities, which terested the visitor and delighted us hildren, who here found wonderful material or 'dressing up' to costume the plays with hich we sometimes entertained our elders. nder the roomy eaves were pushed anti-uated trunks (many of them covered with orsehair), old chests, boxes of remnants of ld wall papers, boxes of old letters and most mpressive farm account books, a trundle bed, high yellow bedside cradle, spinning and arding wheels—the accumulations of two or ree generations of owners and of family onnections who had claimed the hospitality f the old attic for their disused possessions. ne of the large chimneys was roomy nough to contain a smoke-room, in which ams and bacons were hung to cure by the moke of walnut wood or corncobs. Win-ows at each end kept the big attic fairly ool and airy in summer (I shiver as I re-ember its winter temperature!) and in ld times the extra 'help'—usually neigh-ors' sons or relatives—imported for haying me often slept there on mattresses laid on e floor. To this enchanting place—as we hildren regarded it—two flights of terrify-gly steep stairs led from the second story. mong the ancient wall papers in an old runk one unbroken roll was found, so old hat the location of its companion rolls was ot remembered. This was made up of two-and-a-half-foot lengths, single prints of the design being pasted together to form a continuous roll. The colors were as fresh and bright and the paper as strong as if the pair of quaintly costumed lovers under the spreading tree in the landscape had but yesterday plighted their troth!

The old-time cellar was also interesting, though in lesser degree. Great bins of potatoes, carrots, beets, their capacity designed to take the family through a winter guiltless of canned products, stretched along its sides. These vegetables sprouted toward spring: I remember we children used to make hanging baskets of scooped-out carrots, and marvelous dolls' bouquets of tiny bright red beet leaves, yellow turnip tops, and feathery carrot sprays. The big sand box of celery stood near the stairs, the pork barrel near it. One passage led into the cool, dark milk cellar, where the pans of cream, in those refrigeratorless days, were chilled while accumulating for the churning in the big blue hand-churn. Later in the year this room was filled with barrels of winter pears and apples, flanked with the stone crocks of preserves and pickles.

But the sight of sights was the tremendous stone ash pit in the bottom of the main and biggest chimney. This was a good-sized room, shivery and fearsome to us children, into whose cavernous depths, through a dark aperture, was thrown the winter accumulation of wood ashes, to be used as fertilizer in spring. Later on, the modern heating apparatus taking the place of the numerous stoves, this dungeonlike ash pit was taken out. Its stones turned the green back yard into a veritable stone quarry: and I should hesitate to state the dimensions of the stretch of stone wall constructed from it!

Needed extra service was of an entirely different character in grandmother's time from that of the present when the various temporary incumbents flit in and out of our kitchens, and those accepting the outside farm positions hold them in such ephemeral manner as to scarcely impress us with their personality. The terms 'maid' and 'servant' were unknown as applied to our domestic or farm helpers. 'Hired girls' and 'hired men' gave mistress and master their friendly assistance when extra help was needed—the latter, on this particular farm, including a trustworthy, affectionate, and capable Irishman who had lived there so long as to be considered one of the family, who loved the farm, and was as conscientious regarding the work as the owner; in an emergency, he would keep an eye on the children as competently as any experienced nursemaid. Extra seasonal help—as in haying—consisted of relatives or boys from the neighboring farms. At such times, there was much friendly rivalry as to who could cut the best swathe, plow the straightest furrow, or pitch the greatest number of haystacks onto the load.

For the family wardrobes a minimum of material and no made-up garments were bought. In the earlier days stockings, baby clothes, blankets, and so forth, were made of wool from farm animals, spun, carded, and woven or knit at home. Linen sheets were woven (I have a pair of grandmother's yet), rugs braided or 'drawn in,' quilts pieced and fine shirts made by hand, the linen bosoms and cuffs wondrously hand-stitched. A shoemaker came to this farm spring and fall and measured and made boots, both large and small, from skins of animals raised on the place and tanned. The little boys—even as late as my childhood days—wore minute boots reaching to just below the knee, which were an exact replica of those worn by their fathers. A tailoress who tailored a generation of small boys' clothes, also came spring and fall. Small garments were of similar nature and made exactly like large ones—except as to size: the 'little men' of those days would look very strange to us now when children's styles are as individual as those of grown-ups. There were then no sewing machines, and the 'song of the shirt,' as well as of the trousers and the women's garments, might well have often been sung.

Entertaining was absolutely different, too: no afternoon teas, no bridge parties (although plenty of serious, conscientious whist), no receptions, no week-ends—we would have been shocked beyond measure at such limited hospitality as the latter! How did friends get together? Those were the times of 'spending the day,' of tea parties, of sleigh rides ending with supper and dance; of surprise parties, barn-raisings and husking bees. Of the latter, grandmother remembered those at the farm when the big barn was lighted by chandeliers made of suspended cart wheels glittering with candles, when the huskers, after an evening of jolly but real work, gathered in the big kitchen for dances, for which the music was provided by a fiddle manipulated by a fiddler of such skill as to make one's feet to tingle and one to dance all over! For such a barn party, one of the few daily passenger trains was once stopped at the crossing on the farm and 'passengers for the husking' were informed that their destination had been reached! Visits were often unannounced and not specifically arranged. But whose hospitality could be so meager as to fail in making the unexpected guest welcome for as long a time as such chose to stay!

'How long are you going to be at Joe's, Cousin Maria?' is, with its answer, a traditional anecdote in the family. 'Well, if they don't seem very glad to see me I shall stay only six weeks. If they do seem real glad I don't know how long I *shall* stay!'—with an entirely justified inference of the latter condition.

THE farm activities in grandmother's time were many and interesting. The sheepshearing was one—all farms usually including sheep among the necessary domestic animals. Skilled shearers were necessary, and the catching, throwing, holding, and shearing of the terrified animals was—I regret to say—one of the interesting spring diversions of us children. The annual and most exciting pig killing was of interest and allure also! This involved the later 'trying out' of lard—with by-product of delicious 'scraps'—the curing of hams and bacons, the salting and packing in brine of the fat pork, the making of pans of delicious sausage meat and 'souse,' an old-time dainty most delectable. Choice chops and roasts, saved for family consumption, were packed away in snow.

Haying was of course delightful, and many frolics in the hayfield, rides on the big load of hay and thrilling, semiterrifying slides off it, were among childish diversions. Threshing time was another interesting occasion. The threshers—the same respected and skilful workers appearing so many years in succession as to seem family friends—arrived each fall with their horses, their impressive machines, and all the necessary paraphernalia, and established their machines in the open space in the big barn, their horses in the stables, and themselves in the house, where, in those days, they ate at the same table with the family. They worked and worked, with cheerful and noisy clatter and rattle of big wheels and tramping and stamping of horses as they stepped on and on and up and up, never getting any farther along, to the children's wonder, as many days as was needed to thresh, winnow, and bag all the shining grain produced yearly on the farm. Husking time was another delight. Everybody helped husk: a party was occasionally arranged, and the children too constructed wondrous wigwams with the cornstalks and played Indian to their hearts' content.

THE preparation and serving of the food was, in grandmother's time, one of the great occupations and interests of the women folk: no steam-cooked grains, no canned vegetables, soups, or fruits, no granulated sugar, none of the thousand and one culinary conveniences or products that now ease up and simplify housekeeping. 'Beef creatures' were fattened and killed on the farm, and the best roasts and steaks retained for family use. Pork products furnished one of the main staples. I remember, even in my childhood, that sweetbreads and calves' liver, considered valueless, were presented to my mother, who had a progressive taste in all directions. The making of cider applesauce was one of the seasonal activities. For this a barrel of sweet apples was used, the cutting up of which the night before constituted a jolly family job; the next day they were simmered in the capacious brass kettle, until rich and dark red, in ten gallons of sweet cider. A dish of this sauce was usually on the table. The preparation of pumpkin for pies was another family job. The pumpkins were pared, cut in strips, and simmered until tender; and next day they were mashed, spread on large tin sheets, marked into squares, dried in the sun, and packed away. When used, this dried pulp was soaked in milk, and eggs, sugar, and so forth, were added to make delectable pie filling. Grandmother knew nothing of canned products, but the farm fruits and berries were preserved for winter by being dried in the sun and then stored. The fruit was sliced, the corn cut from the cob, and dried on long smooth white boards on a nearby wall, covered with netting, the process taking two or three days. Beans of all sorts were dried and threshed with a flail if in quantity. From the beans and corn was made the most delicious 'succotash'—I have never tasted anything in the vegetable line more delectable! 'Pound for pound' preserves, made for 'company' and 'best,' were kept in big crocks in the milk cellar.

Butter-making was, of course, an inference on every farm, and enough was hand-churned to supply the family, including the scattered members, and to take to the store to pay the grocery bill. Churning was a tedious task which the children dodged if possible. June butter was thought to be best for winter use.

The big kitchen with its five windows and three outside doors was the scene of various and often delightful family activities. Although the house included not only a dining but a breakfast room, meals were usually served, for convenience, in the kitchen, except when 'company' came. Jolly family kitchen parties on Sunday evenings, when the family were gathered informally for the night meal, each person collecting his or her special preference in food from the well-stocked buttery and consuming it, perched upon table or chair, to the accompaniment of stories, jokes, and family talk, are now remembered with delight by the children of those days. In winter corn would be popped, molasses candy boiled and pulled and corn balls made, nuts cracked, and big pans of apples brought up from the cellar. Tremendous iced watermelons furnished the especial summer treat for these kitchen parties.

The big brick oven in the kitchen was long retained for sentiment and as an interesting relic of old times. In grandmother's executive days it was, of course, used for Saturday's baking.

Saturday was cooking day—and a busy day it was, mistress and maid and older daughters all being occupied in preparing enough to last over Sunday and well into the week. The baking was accomplished in the big brick oven, which could do excellent work when well managed. But woe to the person not used to its idiosyncrasies, who undertook the weekly baking for the family! A good many things had to be taken into account. First, the wood must be hard and well-seasoned and cut the right oven length—four feet. The draft of the chimney must be perfect, and more than once must the great oven be filled with wood, which must burn down to beds of bright red coals, finally to be removed by a large, long-handled iron shovel into the fireplace nearby. The smaller coals and ashes were swept out by a wet broom or a birch brush broom. Then went in the big loaves of brown bread, slipped from a bread-peel (a long-handled wooden shovel, kept white as snow); next, an iron kettle of beans, an Indian pudding, and, a little later, after the first heat had subsided, pies: mince, apple, pumpkin, and all the rest. The beans and brown bread were baked all night, and in the morning were a rich brown color, and of a flavor quite unlike that of the present time.

Patriarchal conditions of family life were much more common then than now. Almost every family included a grandmother or a grandfather who, as a matter of course, had come to live with one of the children, welcomed by all and adored by the little ones. Grandmother's room was a pleasant, peaceful place, and grandmother often proved a 'friend in court' on the young folks' side, when there was a difference of opinion between parents and children! Often two families would settle down in the same house. This particular homestead housed the grandmother—honorably retired, but theoretically the head—and two sons with their wives and families. I venture to assert it would be an impossible combination as considered at the present day!

Helping Folks *to* Help Themselves

By W. T. KRONBERG

IN HIS extensive Oklahoma enterprises representing $20,000,000, the founder Charles Page, has retained only the right of an executive, with power to manipulate and guide it during his lifetime. The Page wealth is all held in the orphanage known as the Sand Springs Home. He has endowed the home that its existence could be perpetuated after his death. Around it he has placed a circle of thriving industria units, of which the earnings go into its coffers.

Charles Page with one of the residents of his Sand Springs Home.

The Sand Springs Home was organized in 1908, when Page erected a small cottage in the center of seventeen thousand acres previously acquired from the Indians. He sought to restore health to a couple of waifs The idea grew, and so did successive buildings, until today the home proper represents an investment of $200,000.

The orphans range from one-year-olds to men and women on the threshold of life When boys or girls leave the institution they do not get beyond the watchful eye of the home. In case of marriage, a trust fund comes to the rescue. A home is built The house is paid for by the former inmate, but no interest is charged and the payments are made in moderate monthly installments To date, more than one thousand boys and girls have come and gone. The big majority find employment in the Page industries —the railroad, the hospital, the creamery, the cotton mill or in the light and power or kindred concerns.

The Widows' Colony consists of a collection of neat, comfortable cottages. Rent, heat, light and milk are furnished. The women find employment in the cotton mills or the orphanage, and the infants of this colony are fed and cared for in day nurseries during the absence of the mothers. The older children attend school and are fed in the home dining room along with the regular inmates of the orphanage.

Paying for Higher Education

(*Continued from page 7*)

cer quoting financial facts! Scores of lions have been given since 1914 to her education, he said. Generally speak- the increased income resulting has simply de good the loss in the buying power the American dollar. Those scores of lions are required for the expansion sed by the popularity of the colleges, ulting in the doubling and trebling of ollment in most institutions. Said 'That these vast sums can be ured from private sources in lition to all that has been en during the past ten years ms hardly possible, in t, is improbable.'

Every college president in ıerica doubtless read the sociated Press report of . Rockefeller's remarks. had other chances to read because a half-dozen of his stees clipped the newspaper m and mailed it to him.

If this proposal that students ır a large percentage of the cost of ıcation is accepted what will result? And y have administrators of colleges and iversities all over America missed the portunity of so easily augmenting their omes? Or is it so easy?

Let's to the latter question first. There is America the idea that every boy and girl, wever poor, ought to be educated. ucation is not alone for the titled or the neyed few. Indeed America has been led foolish in its universal acceptance of s and similar theories. Was it Plato that gan it? 'The first business of a republic is ıcation,' was his statement of it. We ieve that ignorance is the greatest foe to od government. We believe that the k and burden of edu- tion belong to society d not to the individual.

But, says the advo- e of higher tuition es, the old plan of all fees belongs to the y when embryo public vants, such as teach- , preachers, and states- n, alone were being ıcated. Now hordes of dents go to college in ler to secure business ining that will permit em to get more from, her than give more to, iety. Other hordes go social distinction, for r years of rare fun and h-class amusement. latively fewer, even in institutions founded the church, go to fit emselves for service to manity.

Says the low tuition advocate, 'Better dercharge four who could pay, but will t unless they are forced, than to keep one or lad out of college.' They point to tesmen who learned to speak on a bare tform in a fourth-story college debating ll.

They point to inventors and scientists, whose researches have made development of riches equal to the total value of all the college plants in America. They tell true and touching stories of preachers and educators who have walked from the farm, taught school between terms, somehow paid their small fees, and emerged to bless the world.

Graves Library, Hope College, Holland, Michigan.

'But,' retort the high-payment theorists, 'we'll still care for those. Let us charge full cost, from all who can pay, arriving at it by a gradual series of increases and educating the public to the idea as we go. Let us then raise loan funds. With these loan funds let us carry the poor boys and girls until after graduation—for ten years if necessary—and then let them pay out of the larger incomes college training makes possible.'

Page Hall, quarters of the Law School and College of Commerce, Ohio State University.

That state universities in the Middle West, already overwhelming in numbers and in influence in the state as compared with the colleges on private foundation, charge so little is a consideration of first importance. But rumblings of discontent are heard in many a legislative session. Legislators may adopt the new theory.

If students in state universities are asked to pay one-half the actual cost of their year's training, then the state university fees will be larger than those of the colleges now charging more than the almost negligible fees of the public institutions. Annual appropriations would be cut nearly in half. There are probably ten state universities that would collect two and a half million dollars a year from students, if half the annual costs were assessed to students. The statement has been made that five millions a year each would be a closer estimate. Will it always be easier to have all the citizens of a state pay all the cost than to have the more favored sons and daughters of the state share equally the cost of their enrichment?

At any rate the colleges of the Middle West will necessarily be slower to advance their charges than the eastern private institutions that do not have state institutions to dominate the field of higher education in their states.

The general working out of the theory depends in the Middle West on the action of legislatures and university regents.

If this theory is adopted, there will be a check on the rapidly growing college and university enrollments. There are those who consider that this is desirable. Many voices are raised in a not inconsiderable chorus that too many are going to college.

Students will demand more of the college, perhaps. As long as John Jones from Jonesville is getting a bargain he cannot demand a warrant that what he purchases is the best possible. But if he begins to pay costs in full he can then more reasonably quarrel with the seller. College professors may well shudder at this suggestion because modern student bodies are vocal enough in criticism.

When students have learned the cost of education by paying all or a large share of the cost price, will they work harder to get their money's worth? Scores of men believe that the students will react surprisingly to the result of such a plan. They point to professional schools where costs are more nearly met by students themselves as an example. They argue that free things are least valued, that a man's treasures are those articles that have cost dearly.

* * *

At any rate the movement toward higher tuition fees is on its way. Our generation will probably not see students paying all the costs, but students will soon be paying a larger share.

The Tusks of Old Boul

(Continued from page 14)

Grisha broke into Mourakoff's room: 'Shamil is gone!'

'What do you mean—gone?' asked Mourakoff jumping up.

'Well, he is gone! Olia is there and knows it, but did not want to waken you; I decided that I ought to, though.'

Both ran out to the yard. The sand showed the marks of paws and some black spots of blood. Shamil was gone. They followed the tracks; these led to the forest and disappeared in the bushes. They found a bunch of Shamil's red hair, but Shamil was gone!

That afternoon the natives mutinied and asked to be paid off. Even their chief, who had served Europeans all his life—old Abatchanaka—was silent and hid behind the others. Only the promise of double pay held them for this month.

That night when Sergei went out to the gate, he noticed a funny big black figure pass on short, crooked hind legs along the edge of the forest in the moonshine and hide behind the white trunks of the first trees.

THE evening of the next day all three were sitting in the front room which served as a dining room and also as the bedroom of Grisha. A candle was burning on the table made of packing boxes and there was also a bottle of whisky. Olga was busy preparing the supper on an alcohol lamp; eggs hissed on the pan and frying onions gave a pungent smell. The door to the bedroom was shut; in there, lighted with the quiet glow of an icon lamp, little Lenochkka wriggled her fat fingers. 'Gai,' as she called her gray parrot friend, was dreaming in his cage.

'I don't know why, Serioja, but I have been feeling uneasy of late; perhaps we ought to leave this place—don't you think so?' said Olga turning to her husband.

'Well, that's enough! These Ethiopians have scared you! It is certainly too bad about our dog, but it is a common thing—a leopard stole it; I can see that by the tracks. It jumped over the fence, killed the dog and took it off to the forest. It might happen even to the workmen. But I think it is best not to talk of it. Let's talk about old times . . . Remember, Grisha, the funny masquerade in Mourakovo at Christmas time . . . ' Supper had been over for a long time but still they sat on. Their voices were lively as they recalled the far distant past, their young days fragrant as a night during hay cutting.

'What ails them—why don't they go to bed?' muttered Gai as he stepped up bristling on his perch in the cage, seeking a more comfortable position for sleeping. 'They will wake the child with their chatter . . . '

Suddenly something crackled in the bedroom and the parrot, cocking his head, met the cold, dreadful green eyes of Death.

'Don't touch her!' squawked Gai, raising all his feathers.

'Why not, bird?' said Death hesitating.

'I love her . . . '

Suddenly Gai jumped and screeched:

'Eyes front! Messieurs Officers also!' It was all he knew of human parlance.

Death glided into the cradle. The child screamed and fell, cradle and all, to the floor.

'O God!' Olia jumped and ran to the door—and dropped. Those coming behind saw the face of the child covered with blood.

The next day they buried little Lenochkka. Olia was like one mad, and was only separated by force from the body, which had turned black. It was clear that the baby had been bitten in the mouth by a snake, because her little lips were swollen. Grisha made a small coffin from two packing boxes and Mourakoff, after reading a chapter from Matthew's Gospel, laid his daughter between the roots of the big baobab on the hill behind the house, placing over her a cross made by Grisha. On the cross he wrote with indelible pencil:

'The child Elena Sergeievna Mourakoff,
from the nobles of N. Province of the
Russian Empire.
Born 1921, died 1923.
Thy will be done.'

In the evening Olia took sick and her husband spent the night sitting by her bed. Coming into the bedroom on tiptoe, Grisha whispered that the natives had run away. Mourakoff only waved his hand, and Grisha went out noiselessly. Olia regained consciousness in the morning and, remembering, cried like a child. Mourakoff went out and rapped bitterly on his forehead with his fist.

Two days later they left. As they packed their things, Grisha asked Sergei what to do with the tusks which lay in a corner of his room—Mourakoff did not answer but only looked on them strangely.

IN THE early morning dew the little caravan was wending its journey away from the Great Forest. The first mule carried the bent, pale, tired Olga, grown old in a day. Mourakoff walked alongside with an arm embracing his wife. Behind them followed other mules carrying the slim household belongings. Grisha came last with his gun across his back; he sucked his short pipe thoughtfully. The last mule carried an empty cage, fastened to the load all askew, for Mourakoff had freed the parrot on the grave of its mistress, lest its presence might disturb Olga.

The Great Forest was left behind.

The noon hour was hot. Spotty lay in the empty cottage panting heavily, with his tongue lolling out. He wanted to get to the water but saw through the door the black housewife down by the creek. The tusks of Old Boul lay in the corner among other forsaken junk.

Under the baobab tree overlooking the grave of Lenochkka chilly Death basked in the sun on a big stone placed by her father to protect the body from hyenas. Birds screamed and scolded in the claw-shaped branches of the big tree. There Gai also protected himself from the flock of small green parrots pecking at him as a foreigner. He squawked hoarsely: 'Eyes front! Messieurs Officers also!'

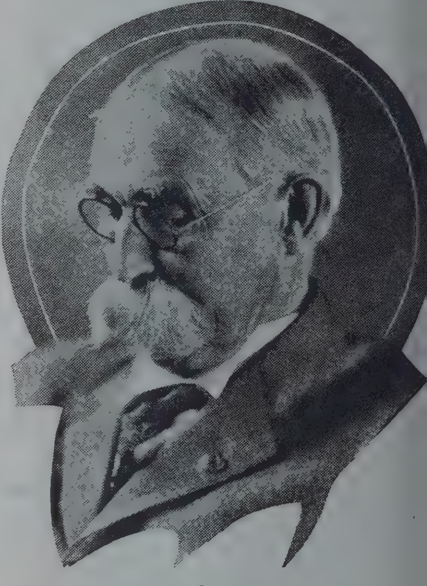
Spotty the leopard yawned, his eyes half closed; then stretching catlike, with a spring he bounded out the door. In the distance, stepping heavily on her crooked legs and raising her bald back high, the black housewife was going on all fours into the Great Forest.

How One Man Built *a* City

By FRANK H. READE

OUT on the Pacific Coast they a
building the largest city in the worl
You may smile at that; you may eve
close one eye at it, but you can't laugh
the fact that a certain town of a hundr
thousand in 1900 is now in the million clas
that it has doubled its population eve
decade for thirty years, and that peop
have come into it to live at the rate
ten thousand a month.

The most interesting feature of L
Angeles was formerly a tall, slende



Frank Wiggins.

vigorous individual, who would have be
seventy-five years old on November
1924, had he not died shortly before. Bo
about the time of the gold rush to Ca
fornia, this man grew up in Indiana, a
then made a rush of his own to the Paci
Coast where he has been held responsible
more than climate, money, men, oranges
railroads—for the making of the large
city west of Chicago.

When the writer first met Frank Wiggi
both were wearing out their shoes on t
pavements of a town of fifty thousand i
habitants, the latter as secretary of t
chamber of commerce, and the form
hunting a job. When the writer saw Fra
Wiggins thirty years after that first mee
ing, he was still secretary of the chamber
commerce, but, instead of walking fro
store to store and from firm to firm, he w
using the telephone to raise some trifli
sum like fifty thousand dollars for a ne
publicity explosion whereby the populati
of the city would be raised another ten
fifteen thousand.

Beneath Wiggins' ordinary roll-top de
lay spread a city whose industries re
resent invested capital of seven hundr
million dollars, with an annual production
nine hundred and sixty million and week
payrolls of five and a half million. The
industries were brought there by this ma
Frank Wiggins, who for thirty-five yea
ever since 1889, had lived and breathed a
thought nothing but Los Angeles.

LLOYD'S—*an* Institution

By PAUL TYNER

Where Lloyd's is located. No sign is displayed to guide strangers inside.

LLOYD'S,' perhaps the best-known and probably the oldest commercial organization in the world, occupies the northeast corner of the Royal xchange in the heart of the City of London. lthough so famous that it is known by ame the world over and its classification any years ago of 'A 1,' signifying the horough soundness of a wooden ship, has ecome an idiom of our speech, there is a ather hazy idea of just what Lloyd's eally is. While most people assume that has something to do with shipping, many hink of it as an insurance company and thers seem to regard it as a sort of general quiry office.

In reality, it is simply an association of erchants, shipowners, underwriters and hip and insurance brokers. *Lloyd's List of hipping* is an invaluable reference book in very newspaper office. It enables a subditor to ascertain at a glance and with bsolute accuracy all about any ship named a news dispatch as lost at sea, involved a collision, or overdue. An alphabetical dex tells when and where the ship was uilt, its tonnage, construction, engine, ome port, history, owner and captain.

In fact, the one great function of Lloyd's that of a great marine news agency. It as its agents and correspondents in every ort of the world and utilizes mail, cable, elegraph, and wireless in gathering and ransmitting daily and hourly formation in regard to arivals and departures, accients and delays, connected ith shipping.

Even news only indirectly ffecting shipping is transitted instantly to Lloyd's nd bulletined conspicuously. hence the splendidly organzed system posts the news in ermanent records. When a re breaks out in Bombay or ancouver, Manila, Hongong or Calcutta, Buenos ires or Rio de Janeiro—or nywhere else—if there is ven a chance of its reaching he shipping in the harbor, hat fact is instantly posted.

Underwriting room.

The name immortalizes ne Edward Lloyd, a Welshan, who must have been a orn newspaperman, although here were no newspapers when he started is coffeehouse in Tower Street away back 1680. In fact, he deserves to be hailed s the 'father of British journalism.' loyd's Coffee House became a favorite athering place for sea captains and shipwners. They exchanged news and gossip f all sorts daily and on this news and ossip the merchant venturers of that time ased many of their speculations. The reat business of betting on or against the contingency of a ship and cargo's safely reaching its destination was the 'one big gamble' in those days of wooden sailing vessels, when wireless was not even a dream and while capital organized for the express purpose of covering marine risks was still in the future.

From the small and obscure beginnings of the noonday gatherings of this little group of ship captains and shipowners, gradually increased by merchants anxious to obtain 'tips' of use to them in deciding on ventures in foreign trade from the news and gossip exchanged over a cup of coffee or other refreshment, has grown the institution that has come to be today one of the chief mainsprings in the commercial life of the world.

But its inspiration was the genius of Edward Lloyd, the coffeehouse keeper who, with a nose for news, added immensely to the attractiveness of his place by picking up and winnowing this news and gossip and posting its salient points in a daily bulletin. Merchants who undertook marine insurance in addition to their ordinary business, as a sort of side line, soon found the daily consultation of these bulletins an essential part of their business. So Lloyd's became in a short time so popular a resort that in 1692 it was necessary to remove to more commodious quarters in Lombard Street—in the center of 'that portion of the City most frequented by merchants of the highest class,' as an old chronicle puts it.

Shortly after this event in 1696, Lloyd established a weekly newspaper called *Lloyd's News* for the better dissemination of the shipping and commercial news hitherto obtained by him from letters which were read out to the company or passed from hand to hand before being digested in bulletin form. In 1726 this news sheet was resuscitated in printed form, under the title of *Lloyd's List.* This name it retains to the present day, being the oldest newspaper in existence.

Lloyd died in 1712, and the coffeehouse was taken over by a committee of his patrons who retained the old waiters on a sort of commission basis.

Despite the steady growth of the business conducted by the frequenters of the coffeehouse, there is no record of any formal organization on their part until the close of the year 1769, when abuses began to arise that threatened to bring Lloyd's coffeehouse and the more respectable among its frequenters into disrepute. The place being open to all and sundry, the company at times included unscrupulous persons who did not hesitate to take advantage of the opportunities afforded. Illicit wagering and gambling policies were sometimes issued and there were defaults in the payment of claims under these. This became a scandal to the honest frequenters of Lloyd's coffeehouse and so in 1770 a group of underwriters and brokers who desired to remedy the abuses and to do a legitimate business got together, obtained possession of *Lloyd's List* and, dissociating themselves from the old coffeehouse, moved over to Pope's Head Alley. There they opened a temporary establishment under the name of 'New Lloyd's.' Four years later they removed to the Royal Exchange, which has since remained the home of Lloyd's, except when it was temporarily vacated owing to a fire which destroyed the second Royal Exchange in 1838.

It was not until January 12, 1779, that a uniform printed policy of marine insurance was adopted, which policy still remains in use with few slight alterations, being accepted as the standard policy the world over.

Visitors to Lloyd's are not encouraged, and admittance within its privileged portals is not easily obtained.

Committee room.
Left—Casualty book. Right—Chairman's chair (made from rudder of La Lutine).

After presenting my credentials to a servitor gorgeously arrayed in scarlet and gold, I was escorted to the secretary's office on the floor above, immediately adjoining the general offices, where a staff of about 150 clerks were busily engaged in the administrative work of the establishment and in collection, tabulation and distribution of the enormous mass of marine news reports constantly arriving by post, telegraph, and wireless night and day.

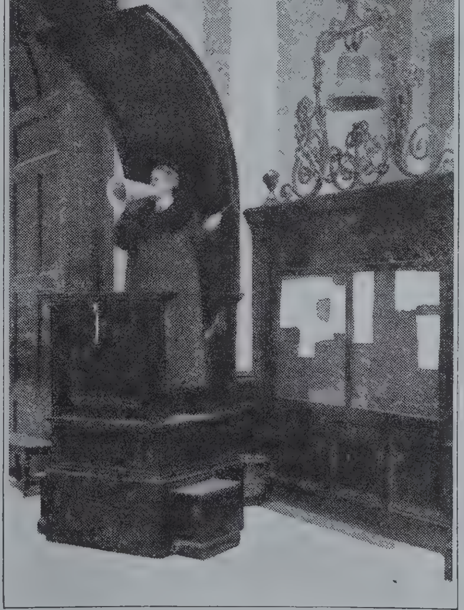
Mention must not be omitted of the famous 'Lutine bell' in the underwriters' room. It is mounted high on the rostrum, as it used to be called, from which the stentorian-voiced doorkeeper shouts out the name of any member who may be called for. He strikes a single note on this bell when news arrives of the loss of a ship at sea. When news of the safety of an overdue ship comes in two strokes are sounded.

The Lutine bell was taken from a French frigate of that name captured by the British and afterward utilized to transport bullion to the Continent. In 1799 she was wrecked at the mouth of the Zuider Zee, having upward of a million sterling in her hold at the time. Though this was a tremendous loss for the underwriters, they paid up promptly. Some of the treasure was recovered by Dutch fishermen at the time, who were allowed by the Dutch Government to retain a salvage commission of one-third of all they brought ashore.

More than half a century later, Lloyd's made a contract with a Dutch company to conduct further salvage operations, in which they were to share fifty-fifty on what gold was recovered. Some forty thousand pounds was salvaged before operations were abandoned. Something of the difficulty of the task may be imagined when it is told that during one attempt a million tons of sand were shifted, out of which only five grains of gold were obtained! Whether this great treasure still lying at the sea bottom off the Dutch coast will ever be brought ashore is an open question; there are many who think that modern salvage methods by means of specially constructed submarines may succeed with it. Should this hope be realized, the society of Lloyd's is authorized by special act of Parliament to take possession of the proceeds after paying any claims which might arise.

Another object of striking interest in this room is the *Loss Book*, in which particulars of any ship reported lost are at once written in red ink. In the telegram room are posted reports of minor casualties and of arrivals and sailings, besides notices relating to missing or overdue vessels. If no news is received within a week after a vessel is posted at Lloyd's as 'missing,' the amount for which she is insured is collectible and the crew are legally presumed to be dead, whereupon the heirs may obtain probate of their wills.

Perhaps the department around which hovers the greatest sentimental interest is the square chamber known as the 'captains' room.' In olden times this room was a favorite resort of shipmasters, and here no doubt the old salts spun many a yarn over mug of ale or glass of port. It is to be regretted that no scribe with the gift of a Conrad or a Clark-Russell was there to report the talk that went on within its walls; he certainly would have found it a rich mine of 'copy.'



Ringing the historic bell.

Nowadays, the captains' room is used chiefly as a luncheon restaurant and there is even talk of the space being converted into additional office accommodation. But the sentiment of the members is strongly against this. Indeed, when the time comes for removal to the new quarters of Lloyd's on which architects and contractors are now busy, there will be much regret among the older members for leaving this celebrated home in a building opened by Queen Elizabeth in the Sixteenth Century and by Queen Victoria in the Nineteenth.

Lloyd's figures in much Eighteenth Century literature. It was the subject of an essay by Steele in the *Tatler* and of a racy letter by Addison in the *Spectator*. That Lloyd's Coffee House early became a city landmark is shown by a poem printed in 1700, entitled 'The Wealthy Shopkeeper,' which contains this couplet:

'Now to Lloyd's Coffee House he never fails
To read the letters and attend the sales.'

The reference here is to the fact that, in addition to its chief interest as a news bureau, Lloyd's at that time had also become a ship's auction room. Vessels were sold 'by inch of candle,' the procedure as described by Pepys, being that a large pin was inserted through the candle an inch below the flame. Bidding went on until the candle was burned down to the pin. The last bidder before the pin dropped was declared the purchaser.

THAT old standby, the *Gentleman's Magazine*, in its issue for April, 1740, contains this reference: '11th March, 1740, Mr. Baker, Master of Lloyd's Coffee House in Lombard Street, waited on Sir Robert Walpole (the prime minister) with the news of Admiral Vernon's taking of Portobello. This was the first account thereof, and, proving true, Sir Robert was pleased to offer him a handsome present.'

Appreciation of efficient news service in our days is not apt to be shown by a tip at the hands of a premier; a modern reporter might feel it a slight to his dignity, but at that time such reward seems to have been acceptable.

In 1824, the monopoly of marine insurance business which had been enjoyed for more than a century chiefly by Lloyd's ended with the repeal of the Act of 1720. This class of business was thrown open to all, and companies for the purpose were incorporated year by year in steadily increasing number. The various wars which were in progress almost without cessation contributed greatly to the financial prosperity of Lloyd's.

Reticence—*A Gentlemanly Instinct*

By LEWIS WORTHINGTON SMITH

ONE of the striking developments in the field of story-telling in America at the present moment is a body of magazines specializing in confessions. These periodicals appeal, no doubt, to the universal human pleasure in a story. Then there is another pleasure very closely related to the pleasure with which some of us listen to gossip.

In the interest that we take in gossip there are at least two elements. So much of evil is inherent in all of us that we have some satisfaction in hearing of the misfortunes of others. A second interest is personal. We wish to know about other people. If the proper study of mankind is man (as Pope has it), certainly it is also one of his indubitable instincts. Confessions are, therefore, human documents of no small value. At any rate, people are paying for them on the news stands, and the periodicals that offer them are increasing in number.

Something like this exploitation of the private and the personal appears in recent literary criticism. In some quarters a poet is praised because her work is in a great degree self-revealing. The canons of criticism by which that quality in it becomes a merit are new to America. Indeed, they are new to the English-speaking world as a whole.

It is not the English way for a man to parade his emotions before the eyes of the world. It is not the American way, as far as America lives in the spirit of its best traditions, for a man to fling the passions that possess him in a cry on the winds for all his fellows to hear.

An instinct for reticence, a feeling for privacy, is almost the first requisite of the gentleman. When a man can no longer preserve even himself, inner or outer, from the prying eyes of the crowd and from their pushing elbows, there is nothing left for him to hold as his own. He may just as well open up his hearth to the rains of heaven as permit the very inmost part of his being to be washed out in the ceaseless beat of other lives upon his own.

A CERTAIN disdain for promiscuity always has been and always will be the mark of the finer man. No democracy, however insistent and clamorous, can ever strike that fact into nothingness.

It is fairly certain that any change in us is largely due to the influence of Continental Europeans. The desire for privacy is not a part of their creed. They understand it only as a wish to cover up something that the world might account criminal. That as a simple matter of self-respect a man may wish to preserve something of himself for himself is a thing outside the range of their mental sensibilities.

What we say or reveal to others about ourselves may be interesting as a human document, but the producing or assembling of documents is not art. Documents are but the raw material. The artist functions when he chooses from the raw material that which suits his purpose, and gives it coherency and form. When he uses it in the raw he is failing in his office. When he is willing to look into his own heart and write, he is in danger of surrendering himself as a man.

LIFE itself should be a sort of artistry. When we turn it into a welter of conflicting aims and untutored purposes, we are as far away from the artist's designing and shaping as a boy making mud pies in the garden. The *laissez faire* doctrine as applied to the ordering of society has lost the authority it once had. However much man may be helpless in the face of the material universe, he is the creator of the world of his social relations. Within the compass of so much of the universe he may insist that as far as his abilities permit, he will arrange things to suit his needs. If he thinks that life is made ugly by a too exuberant display of the turmoil of our inner beings, it is quite within the scope of his privileges to do what he can to stop it. That life has been made uglier than need be in America, no one with a reasonable degree of social and esthetic sensitiveness can fail to realize.

A strange notion seems to be prevalent that when we have made the alien familiar with the Constitution and loyal to it, familiar with our political institutions and loyal to them, we have made him a good American. That is only a little more sensible than expecting to make a South Sea Islander into an intelligent member of a civilized community by clothing him in garments suitable for Broadway. The inner man cannot be so easily transformed. No doubt being well-dressed is useful in raising the tone of the mental and moral activities of the man blessed with good clothes. No doubt, also, a good form of government is conducive to the general enlightenment of the citizenry living under it and to the general elevation of its character.

Enlightenment and even elevation of character do not necessarily contribute to social homogeneity. Taste is not a matter of intellectual capability. Only in a limited degree is it a matter of intellectual cultivation. It is the product in the main of our ancestral history. Our emotions, our social reactions, all of the things that make up our likes and dislikes, have come to us out of a long evolution of thousands of years. Inasmuch as the evolutionary process has not been the same for different peoples, the products of those processes in characters and tastes cannot be the same.

It is absurd to expect to eliminate the consequences of those processes in a few years by putting them in subjection to a governmental form. When a man who has lived in a hovel finds himself established comfortably in a good house, the change will probably have some effect upon the general drift of his ideas and his tendencies, but it will not make him over.

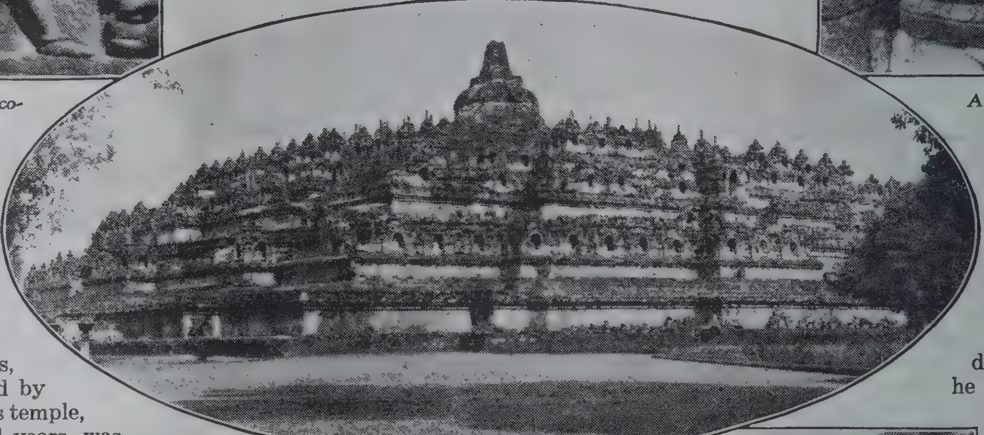
It is much to a man's interest for him to have a beautiful house. However, the life that goes on within the house is a thing of very much more importance. The customs and habits and ideals of our social order must have a roof over their heads. They must be shielded from anarchic and revolutionary storms, but they, and not the encompassing political order, are vital to happiness. We have so much ignored this that we have been very much like the man who makes a beautiful dog kennel and then gives its proper occupants the companionship of an equal number of vigorous cats. The dogs may be all right in themselves and the cats may be all right in themselves. Separately and individually they may be quite capable of achieving happiness and of contributing to the comfort of their own family group; but in their fellowship that possibility will not obtain. Their aims are diverse and they are not susceptible of reciprocal accommodation. However much they may agree that they have been provided with a wonderful kennel, they will not find occupancy of it together a state of perfection.

PEOPLES who have little regard for the privacies will vulgarize life for the tastes of those who have developed in themselves the finer restraints. That we are already suffering the consequences of this debasing of our social ideals is observable in our newspapers every day. Unabashed personal exploitation beyond the bounds of a reasonable self-respect flaunts itself on their pages continually. A nobody willing to parade as a bathing girl in the scantiest clothing within the limit of the law easily displaces the countenance of a statesman, a painter, a financier, or of anybody who goes quietly about important business. By and by, if we permit ourselves to be continually inundated from Continental Europe, he will be the greatest writer who can unearth the most interesting excitation from his personal experiences. The gracious self-effacings that have given charm to polite society will have yielded place to the babblings of egotism. The poise of good breeding will fail of recognition, and the upstarts in America will drown the voices of all the gentle and the wise. From that end to our democratic dream we can save ourselves only by shutting the sea gates tighter than they have ever been shut before.

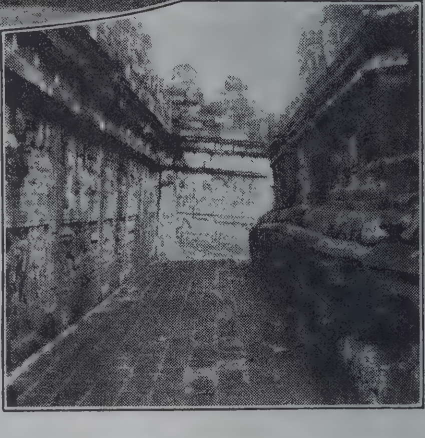
One of thousands of decorations on the temple.

BORO-BUDUR
Java's Wonder Temple

A large part of the sculp
turings depict animals



The temple, preserved a thousand years under the ash and lava from a nearby volcano. Right—Corner of a passage.



By WILLIAM L. STIDGER

IN THE central part of Java is a great pyramidal temple rising tier on tier, each level encircled by beautiful stone bells, the whole surmounted by an immense bell. This temple, buried for a thousand years, was recently excavated to stand as one of the new 'Seven Wonders of the World.' It is called Boro-Budur.

Compared with the Great Pyramid of Egypt, Boro-Budur makes that colossus with its plain stone surfaces fade to insignificance. The Boro-Budur not only is as large as the Great Pyramid but is sculptured in an ancient art, involving the history of a religion, of a people and their customs, that could not be equaled today either in fineness of conception or in skilfulness of execution.

The date of the completion of Boro-Budur is put by authorities at A. D. 850. It was built by the Javanese under Hindu influences and culture.

Then came the Mohammedans, who swept over Java destroying all things beautiful, sparing no art, no culture.

The story is told that Buddhist priests who loved the Boro-Budur, knowing the ruthlessness of the Mohammedans, covered it with earth and then planted it to tropical vegetation and trees. These grew up rapidly in the fertile valley, and when the Mohammedans reached this section of Java, the temple looked so much like a large hill that it escaped them and remained buried for a thousand years.

Some scientists discredit the story but the Javanese will have no other. The legend that old Merapi, a still active volcano only a few miles away, buried it is just as interesting, even if it does not have a human touch. Vast layers of volcanic dust and ashes and lava were found when the British excavated it between the years 1814 and 1834.

It stands a solid mile of decorations, ten thousand feet of sculptured story, 2,141 separate decorations in carved stone. It tells the story of Buddha from his infancy, through his path to holiness as he traveled the lives of the deer, the hare, the fish, the quail, the swan, the monkey, the elephant, the bull, the woodpecker, the tortoise, and the horse. These animals are prominent in the work and are so well done that a child could recognize them.

There are five rows of Buddhas, each row on a terrace of stone. These statues are the conventional Buddhas, like those of Japan. The first three rows are inclosed in stone bells, which have little peepholes in them. These are symbolic of Buddha's not having entirely isolated himself from the world. It is the first stage in the progression toward complete isolation, which is Nirvana, according to the Buddhist religion.

The final stage of the progression is symbolized by the great bell, called the
dagoba, whic
crowns the te
ple. It is thir
feet high and
made of solid m
sonry. Inside is
huge statue of Bu
dha, symbolizing th
he has reached Buddhi
perfection, co
plete isolation fro
the world. O
has a tremendo

CHATS WITH OFFICE CALLERS

is Baguio, a beautiful mountain spot arly two hundred miles north of Manila the Philippines, that makes American cupation possible. Americans go there ice a year, during the hot season, April d May, to build up again,' said the ***ome-Coming Correspondent.*** 'It the only pine-clad country in the islands; e one spot that makes a resort for Ameri- ns during these hot months. It cost close three million dollars to create this summer ty and to build an accessible road to it. It used much criticism, but even the most dical Filipino critic responds to its praises.

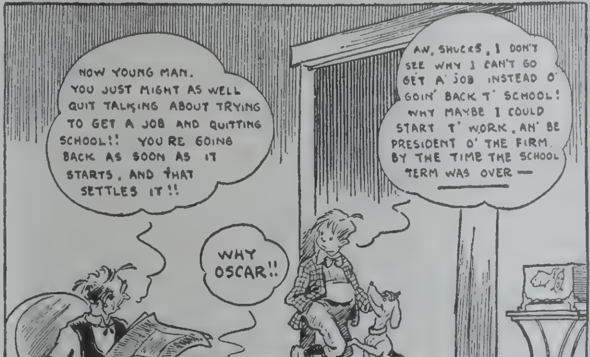
'The altitude is a mile high. The mperature is as cool and pleasant as any alifornia resort, reminding one of Lake ahoe. A great section laid out for the army en is known as Camp John Hay. The ountry Club with its mountain links, the eachers' Camp, to which come the Ameri- n and Filipino teachers who labor all ear in the trying climate of the islands, d the little city of Baguio itself, make up aguio the beautiful.

'One who has lived for months in the hausting heat of Manila can understand hat it means, after an all-day ride in a usty, dirty train in cars that boast none the refinements of our Pullmans, to imb into an automobile and ride for forty iles with the rush of cool breezes on one's eeks. The sudden change, the odor of ine trees, the murmur of mountain brooks, e dash of mountain streams and water- lls, make one forget everything but this aradise of the Pacific.'

* * *

Between East Las Vegas, New Mexico, the new town," and an incorporated town alled Las Vegas, or "old town," flows the allinas River,' remarked the ***Man from ew Mexico.*** 'In the dry season one n cross on the rocks without etting one's feet. Here in 1541 rancisco Vásquez Coronado, Span- h explorer, crossed with his caval- ade of adventurers and today the d town stands on the spot where ey made camp. From 1821 to 879 the traders' wagons following e Old Santa Fe Trail crossed here nd more often than not camped in e circular plaza now the center of e old town. This plaza, built riginally by the earliest Spanish ttlers, consisted of low adobe ouses all facing a center inclosure ome one hundred yards in diameter. was in this inclosure that the ettlers sought safety from maraud- g Indians.

'Now, of course, the old houses re gone and are replaced by mod- rn business structures. In 1846 rigadier General Stephen W. earney with his Irish Brigade rossed the Gallinas at this spot, amped in the plaza and then, from e top of one of the old buildings ill standing, proclaimed the sov- reignty of the United States Gov- rnment and took possession for the tars and Stripes. The bridge has arkers describing briefly these oc- urrences and is one of the spots of interest to the overland tourist following the Old Trails' Route.'



NOW YOUNG MAN. YOU JUST MIGHT AS WELL QUIT TALKING ABOUT TRYING TO GET A JOB AND QUITTING SCHOOL!! YOU'RE GOING BACK AS SOON AS IT STARTS. AND THAT SETTLES IT!!
WHY OSCAR!!
AW, SHUCKS, I DON'T SEE WHY I CAN'T GO GET A JOB INSTEAD O' GOIN' BACK T' SCHOOL! WHY MAYBE I COULD START T' WORK. AN' BE PRESIDENT O' THE FIRM BY THE TIME THE SCHOOL TERM WAS OVER —
CHAS. KUHN-27.

—Kuhn, *Indianapolis News.*

THE ANNUAL BATTLE IS ON.

* * *

'Speaking of delayed mail,' said the ***Postman,*** 'did you ever stop to consider the many different causes, such, for instance, as the use of the two-cent stamp? While this item may not mean much in a small office, in larger offices it impedes the transmission of mail sometimes as much as twenty-four hours.

'Numerous devices have been worked out to eliminate this one item. Stamped envelopes, meters which print postage directly on mail matter, the postage imprint, a combination of stamp, cancellation, meter and postmark, are among them.

'In business offices the development of devices to eliminate the adhesive stamp has also resulted in large savings. One thing these have done, besides saving labor, has been to stop petty pilfering. One large business concern which sends out 175,000 statements at the end of a month was able to cut down the time consumed in sealing and stamping the letters, from 21,370 minutes to less than 700 minutes.

'So even the lowly two-cent stamp has its faults, and some day it will probably vanish from the business world, although probably never from private correspondence. There is something about a stamp on a personal letter that no machine-made postmark can replace.'

* * *

The ***Country Parson*** from the Middle West brought an anecdote with a moral. 'I will not soon forget the day,' he began, 'when I came upon a parishioner, a typical mountaineer, seated upon a log, the picture of dejection and grief. His face was in his hands and through his fingers the tears fell like rain. All solicitude and sympathy, I wondered what dire calamity had befallen this downcast man.

'On inquiry I found that the cause of grief was the recent rains that had fallen, ending a long summer drought. It seems that this particular farmer had cleared a long, narrow piece of new ground along a water course, and had planted it out to corn which gave promise of a good harvest.

'He began to have visions of himself selling corn to his neighbors whose crops were drying up in the dusty fields about him. But in the nick of time the rains descended and floods came. His visions of a corner on the corn market of the community disappeared and his opportunity for a little profiteering vanished into thin air. Hence his bitter tears.'

* * *

'Everyone who comes out of West Virginia brings a new story,' said the ***Editor from That State,*** 'I wonder why. For example, I was eating lunch at a certain hotel in downtown Detroit last week, when my companion turned and asked: "Tell me, why is it that West Virginia never did anything about the Herrin affair?"

'Of course, I immediately explained that Herrin is in Illinois and that the affair belonged to the people of that state. The thing that bothered me was *why* he thought it was in West Virginia.'

* * *

'The humble burro, unheralded and unsung, contributes not a little to the economic welfare of Spain,' said the ***Visitor from Abroad.*** 'Day in and day out, morning, noon and night, in the mountains and on the plains, the faithful servitor is seen, plodding cheerfully along under burdens sufficient to crush a less sturdy spirit. Passengers and goods are on the same burro.

'Commonly, however, the major burden is carried in a tremendous load in the saddle baskets, and the driver sits on top with his feet stretching straight out in front, or hanging over the shoulders of the mount. In the early morning the milk wagon, which at home awakens so many Americans, is replaced in Spain by the jogging burro. Four large cans, suspended in a saddle-bag of basketwork, enable the beast to perform this service with little danger to the contents. In Spanish cities milk is in large measure distributed directly from these containers to the buying public.

'The burro serves numerous communities as a water carrier, since running water is not found in any large number of Spanish houses. Olive oil in protected containers and wine, which also serves for drinking purposes, are transported in the same way. Frequently two large flagons of glass, in basketwork, replace the four large metal cans used for milk and water. For milk, six baskets, three on each side, carry large milk cans, with additional baskets sometimes of boiled milk.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. Will you please tell me who built the Capitol at Washington?

Answer. After the National Capital had been located on the Potomac in 1789, George Washington and Major P. C. L'Enfant selected sites for the public buildings. On the decision of a board of three commissioners with Washington and Jefferson, the plans of the Capitol and the President's house were given out in 1792 to public competition. For the President's house James Hoban's plans were accepted at once. For the Capitol none was satisfactory, but the three foremost competitors were given another trial and one, Stephen Hallet, was employed to revise his plans under the commissioners' criticism. But later in the year, Dr. William Thornton of Tortola Island, West Indies, submitted plans whose 'grandeur, simplicity, beauty and convenience' forced the committee to accept them. They were too grand for the commissioners' ideas of national needs or resources at that time, however, and specified too costly materials. Thornton was accordingly forced to reduce their scale and material greatly. Work was begun about August 1, 1793. The southeast cornerstone of the original building was laid on September 18, 1793, by President Washington with Masonic ceremonies. It is constructed of sandstone from quarries on Aquia Creek, Virginia. The work was done under the direction of Stephen H. Hallet, James Hoban, George Hadfield, and B. H. Latrobe, architects. The north wing was finished in 1800 and the south wing in 1811. A wooden passageway connected them. On August 24, 1814, the interior of both wings was destroyed by fire, set by the British. The building was immediately repaired. In 1818 the central portion of the building was commenced, under the architectural superintendence of Charles Bulfinch. The original building was finally completed in 1827. The cornerstone of the extensions was laid on July 4, 1851, by President Fillmore, Daniel Webster officiating as spokesman. The work was prosecuted under the architectural direction of Thomas U. Walter till 1865, when he resigned, and it was completed under the supervision of Edward Clark. The material used in the walls is white marble from the quarries at Lee, Massachusetts, and that in the columns from the quarries at Cockeysville, Maryland. The House extension was first occupied for legislative purposes December 16, 1857, and the Senate January 4, 1859. The dome of the original central building was constructed of wood, covered with copper. This was replaced in 1856 by the present structure of cast iron. It was completed in 1865. The entire weight of iron used is 8,909,200 pounds. The dome is crowned by a bronze statue of Freedom which was modeled by Crawford.

* * *

Q. What is the largest area of ground covered by a pyramid in Egypt and where is it located?

A. The 'Great Pyramid,' the tomb of Cheops at Gizeh, covers upward of 13 acres of ground, its base being 9,068.8 inches square. Its present perpendicular height is 451 feet but originally, including the nucleus of rock at the bottom and the apex which has disappeared, it measured 482 feet. Gizeh is located on the left bank of the Nile, opposite the island of Roda and about three miles from Cairo.

* * *

Q. I should like to get a report of the undesirable aliens deported by our Government in 1925 and how they are distributed as to nationalities. Who decides on deportation and do the individuals have any legal rights of resistance?

A. Aliens deported to countries whence they came, after entering the United States, for the fiscal year ended June 30, 1925, are as follows:

African	167
Armenian	26
Bohemian and Moravian	30
Bulgarian, Serbian and Montenegrin	105
Chinese	261
Croatian and Slovenian	117
Cuban	8
Dalmatian, Bosnian and Herzegovinian	22
Dutch and Flemish	249
East Indian	67
English	1,072
Finnish	94
French	469
German	750
Greek	279
Hebrew	250
Irish	554
Italian	796
Japanese	83
Korean	6
Lithuanian	23
Magyar	72
Mexican	1,751
Pacific Islander	3
Polish	161
Portuguese	65
Rumanian	82
Russian	93
Ruthevian	44
Scandinavian	5
Scotch	4
Spanish	3
Spanish-American	
Syrian	1
Turkish	
Welsh	
West Indian	
Other nationalities	1
Total	9,4

When an alien is to be deported, he arrested by the immigration authoriti under a warrant of arrest issued by t Secretary of Labor, and he may be releas on bond pending final decision of his cas He is first given a preliminary hearing, an after this, he is given a final hearing befo the Board of Reviews, when he is given opportunity of being represented by couns The hearing is then forwarded to the Gener Board of Reviews, Washington, D. where he has a further opportunity of bei represented by counsel. After the fin decision is passed, if it is unfavorable warrant of deportation is issued. Then is taken into custody by the Immigratio Service and deported to the country when he came.

* * *

Q. I should like to get some statisti on the Post Office Department.

A. The revenue of the Postal Servi for the fiscal year ended June 30, 192 including fees from money-order busines amounted to $659,819,801.08. The audit expenditures for the year were $679,704 053.25 or $19,884,252.17 in excess of t revenues, and by the addition of losses postal funds by fire, burglary, and oth causes of $88,127.25, the total cash deficien in the postal revenue for the fiscal ye amounted to $19,972,279.42. T deficiency is subject to adjustmen however, since it is based on actu payments made during the fisc year ended June 30, 1926, and i cludes payments for services re dered in previous fiscal years whi could not be paid at the time t obligations were incurred, and do not include obligations outstandi as of June 30, 1926. Thus adjuste the total of expenditures and undi charged liabilities chargeable to t fiscal year ended June 30, 1926, $697,725,919.15 and the operati deficit, $37,906,118.07. The pri cipal source of the postal revenu is the postage paid on mail, the r ceipts therefrom during the ye amounting to $587,856,191.18 89.09 per cent of the total revenu On June 30, 1926, there were 15,4 postmasters of the first, second a third classes and 35,411 postmaste of the fourth class. On June 3 1926, mails were carried und authorization of the departme over 229,280 miles of railroad while during the year 2,256,1 miles of air-mail trips were flow with mail.

WHEN DREAMS COME TRUE!

FALLS KILL MORE people than battles, according to the National Safety Council.

THE POPULATION PROBLEM IS one of immediate concern to the globe, warns Professor E. M. East of Harvard University. Available food supply, he states, can eventually sustain a total of only 5,000,000,000 persons, which number, judging by the current rate of increase, will be reached in about 100 years.

TWO HOSPITALS IN London have no male surgeons.

SINGING TEAKETTLES HAVE been manufactured and used by the Japanese for many centuries. Musical sounds come forth only when the water boils, for they are produced by steam bubbles escaping from beneath thin sheets of iron fastened closely together near the bottom of the kettle.

OVER 6,000 KINDS of caterpillars have been found in America north of Mexico.

ETON COLLEGE SCHOLARS dress according to their height. Those five feet four inches or more in height wear morning coats, while their shorter brother students must wear the famous Eton jacket.

NEVADA IS NOW A STATE without a street car, buses having entirely supplanted the trolley system.

A CLOCK MADE NEARLY 350 years ago by Isaac Habrecht and now in the British Museum recorded the recent eclipse. The clock has two dials representing the sun and the moon. The 'moon' covered the 'sun' at exactly eclipse time this year.

AFTER RICHARD GRIFFITH OF Baltimore, Maryland, rolled from his bed out of a third-story window, he awoke in mid-air to find himself clutching a pillow. Using it to protect his head when landing, he suffered only slight cuts.

THE REALLY HAPPY MAN OF today never laughs, declares Professor F. Aveling, University of London psychologist. Laughter is an ugly mask indulged in only by the 'superior' or discontented man, according to the professor, but smiles, he says, are beautiful 'as marks of human sympathy and understanding in a heart that is at peace with itself and all the world.'

PATRICK KENNY, A GREENWICH, England, cobbler, believes he has the smallest workshop in the world. Built in the massive stone support of a railway bridge, the shop is only four feet square, but has a roof fifty feet thick.

THE KING OF CAMBODIA, who recently died at the age of eighty-seven, delighted in completing his dress attire with an old opera hat on the top of which was fixed a knob of diamonds worth $100,000.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses the job of thinking.

* * *

Is it a good thing to be contented with conditions as they are? Half of our discontent today comes from poetic imaginings of earlier ages—'the good old times,' as we like to refer to them. Hugh Walpole, the eminent English novelist, gives us his philosophy as to 'liking one's own time,' in the sixth of his little essays from a northern cottage. (p. 1)

* * *

To give special training to selected officers in staff work and in higher command, and to keep up-to-date in military knowledge, are the purposes of the Fort Leavenworth Military School. In an enlightening article, Frank M. Chase describes the nature of this training. He also tells of the methods employed to keep the higher officers of the Army fit to direct our military forces in time of war. (p. 3)

* * *

Will the day ever come when students will have to pay the entire cost of their education? America has had a tradition that every young man and woman, however poor, should be educated; that the branches of higher learning should be open to every class. The views of Doctor Crooks will interest a large number of our readers. (p. 6)

* * *

It would be a strange world that great-great-grandma would find, were she to revisit the scenes of her former existence. Think of her pressing a button and illuminating a house! Opening a valve and heating the house! Turning a faucet and deriving an endless stream of hot or cold water! Conversing with the world from a comfortable seat near a telephone! Enjoying the best music and oratory without leaving her fireside! And watching the whirling stream of motor cars from her window; or the droning airplanes!

Some of grandmother's joys in housekeeping are set forth by Florence Taft Eaton. (p. 8)

* * *

Old Boul, Wise Boul, Just Boul—in his day he had carried Menelik, King of Kings, and learned how to mete justice. Retired to the Great Forest, he served as arbiter for all its denizens until one day a white man sped a bullet into his brain. Thereupon the old black gorilla housewife and Death, the chilly serpent, went forth to avenge the patriarch. The faithful dog and the big gray parrot warned in vain . . . Death kissed the sleeping babe. (p. 12)

* * *

Not only are courts sometimes used as instruments of injustice to innocent people, but government commissioners and administrative officers are instruments of irreparable injury, for which no remedy is provided. Things are done in the name of the law which bring ruin to an honorable career, for which no redress is possible. Some incidents of this nature are related by an attorney. (p. 15)

* * *

If religion first and foremost means order, then the efforts of the Canadian Government to dispense even-handed justice in the murder of two whites by an Eskimo tribe on the shores of the Arctic should reveal the stamina of a Christian civilization. So believes Charles J. Finger, whose *Tales from Silver Lands* and whose *Romantic Rascals* have been so much enjoyed. (p. 16)

* * *

John Alexander Dowie was a unique character in Middle Western history just a few years ago. He believed himself to be the reincarnation of Elijah the Tishbite, and was able to heal many sick and crippled persons. A newspaperman of Chicago who attended many of Dowie's meetings and interviewed him on various occasions relates his recollections of that interesting figure. It was Dowie who first discovered that all newspaper writers are eternally damned, *per se.* (p. 19)

* * *

Down through the years since the days of the old coffeehouses of London has come Lloyd's—a business institution the growth of which has kept pace with the centuries. Few persons know that this establishment grew out of a gathering of old-time merchants and mariners who met to exchange notes on shipping conditions and the far seas. It was Lloyd, the innkeeper, who first conceived the idea of posting bulletins recording this information. Thus his coffeehouse became the rendezvous of the sea captains and the traders. (p. 25)

* * *

The influence of Continental Europe is responsible for the abandonment of a certain reticence regarding our personal affairs that has marked the Anglo-Saxon gentleman. The parading of our mistakes before the world in popular magazines or in vaudeville or in the daily press tears down ideals of decent conduct and fills the mind with filth. Lewis Worthington Smith appeals for a return to modesty and refinement. (p. 27)

* * *

Even greater than the Pyramid is the Java temple, Boro-Budur, according to Doctor William L. Stidger. This little-known masterpiece of an ancient builder combines the massiveness of the Egyptian monuments with the carvings of an Inca monarch. Bells of stone expressing the travels of the Lord Buddha form just one of the fascinating features of this forgotten shrine, recently dug out of the jungle. (p. 28)

REMARKS BY OUR READERS

La Grande, Oregon.

The migration into the Oregon country, whi
began in 1842 and reached its peak ten years lat
was the greatest of all time—its many perilous mi
from Independence, Missouri, are steeped in ho
seekers' blood, and unknown thousands paid the gre
price along the trail. Those who belong here in t
West can show even today where trails were wo
axle-deep through the scorching desert sand as t
prairie schooners, four, five, six, and even ten of the
hub to hub creaked and skidded their weary way
the Oregon country.

We who live on the Old Oregon Trail as it is toda
adorned with pavement and modern convenienc
are saturated with the romance and tradition of t
world's most historic highway, and are ever alert
tell somebody that may have only vague fancies of
all something about the Oregon Trail.

A. W. NELSON.

Bonanza, Oregon.

I am a constant reader of your valued paper.
have been very much interested in the articles by Vac
Lindsay about the Pacific Northwest, in which he h
referred to us as 'backwoodsmen.'

Well, comparatively, we are backwoodsmen wh
considered alongside the great industrial cities of t
East.

We have no complaint for thus being designate
but we have a complaint against the idea that scene
is more valuable to mankind than the watering of lar
commonly referred to as irrigation.

The backwoodsman is at a loss to know why so
cannot regard development under irrigation and ag
culture in any other light 'than a destruction of natu
grandeur.' There is nothing we can do to the W
to make it more beautiful. Is it not a fine thing to
people living and aspiring to higher things out on t
'Great American Desert' where, even when I was a b
there was nothing but desolation? Is it not a fine thi
that we are able to visit the grand forests and lof
mountain regions in comparative comfort? Yet it
the plainsman and backwoodsman who have made t
possible. There could be no great amount of ag
culture in the West without irrigation. There could
be much industrial development without the supp
of agriculture, and hence for the all-round developme
of the West, there must be encouragement given to t
development of irrigation and power.

We have read much against irrigation in easte
papers lately but nearly all these writers have hunt
up failures and made little effort to locate success
spots.

WM. G. B. CHASE.

The Sands of the Desert Baffle Scientists

But Roads *Are* Penetrating *Their* Most Remote Sections

—Photos by Publishers' Photo Service.

View from the top of the Pyramid of Cheops, looking over the pyramid road toward the Mena House. The small camp seen at the left is a desert police station. It has been said that Egypt is but the facade of an immense sepulcher, and it is this feeling that impresses one when examining this view of the timeless sands that hold captive the secrets of centuries of history.

Circle—
View of the winding roads on the desert route on the way to Biskra, approaching the Arab village of El Hamel. It was to this country that the Moors came on their expulsion from Spain. Later a piratical state was established and the famous Barbary Corsairs or Algerian pirates terrorized Christian nations. To-day, however, under the third republic Algeria is developing rapidly, industrially and politically, and colonists are establishing homes there in increasing numbers. Such fine roads as these are coming to penetrate all parts of the country.

Another view from the top of the Pyramid of Cheops. To the right in middle distance is seen the Sphinx.

TO BE good is not enough: we must be good for something. Unfortunately weakness is often mistaken for goodness because it is harmless and brainless. Ability, ambition, achievement—these must be added to give goodness true value. Combined they spell Service. And Service is no longer a mere word. It is a work.

FOOTSTEPS

By JOSEPHINE PINKNEY

I PACE the dry floor heavy-shod
Between the gray-green walls
In the silence of a windless wood
Where no leaf falls.

Yonder a slowly twisting stick,
Giving a ghostly sound
As of a bodiless footprint's tick
On the dead-leaf crusted ground.

Echoes on cluttered boughs above,
Portent that time goes by
On silent dials under the roof
Of an uncandescent sky.

The blue palmetto's saw-edge drips
A gray light, shivering
In nightmare at the impending steps
Of yet another spring.

A Nation's Menace—HER CHILDREN

By WILLIAM MATTHEW HOLDERBY

THIRTY-ONE million five hundred thousand children—30 per cent of the population of he United States—are uner fourteen years of age.

The child population of he United States is greater han the entire population of he twenty-one states west f the Mississippi, including Visconsin. The total popuation of the United States n 1860 was only 31,400,000. Ve have enough boys and irls of nineteen years and nder to replace the entire opulation of France; nough under fourteen to epopulate Canada almost our times.

The State of Kansas ould be repopulated every ve years by the boys and irls of America who die beore reaching the age of ten ears. And Kansas has a opulation of 1,769,000.

From these 31,500,000 oys and girls will come tomorrow's presidents, legisators, judges, authors, artists, musicians, teachers, inventors, fathers and mothers. They are the hope of America; commingling of the world's civilization, they are he hope of the world.

Where are these boys and irls today? And how are hey preparing for tomorow's tasks?

Our public school system ims to make the child inelligent—but it does not each righteousness as such. Religion has little or no lace in our public schools; the result is hat we are raising our young people o lead lives of spiritual illiteracy.

The various Christian denominaions are endeavoring to curb this literacy through the Sunday school nd young people's organizations, but he results have been far from satisactory.

More than 27,000,000 children and youth, under twenty-five years of age, are not enrolled in Sunday schools and receive no systematic religious training.

Protestant denominations are not alone in this neglect. Catholics also complain of the spiritual ignorance of their youth; New York City Jews complain that three-fourths of their children of school age—206,000 in all—do not attend religious schools.

—Northwestern Photo Service.

There are Rotary Clubs for father—
Women's Clubs for mother—
Sororities for sister—
Boy Scout troops for brother—
But
Where is the Club for the Family?

The Family has been split into individuals, and the individuals have been segregated.

This survey of national condition confronts us with circumstances appalling in their dimensions of possible dissolution of our Government if this generation of childhood is not conserved religiously and politically. No man needs to be counted an alarmist who frankly faces the facts and truthfully reveals them to the people.

Two expressions of religious life nationally have been the means of securing for us and securing to us our national liberties. These institutions are the Christian Sabbath and family worship. The breakdown of these two expressions of religious life in our nation, within the past decades, confronts our national life in its political phases, with the certainty of suffering inevitable disintegration. So serious are the conditions of total disregard for constituted authority now developing in all the social areas of America's population that, unless something is accomplished within the next five years to reëstablish in the national consciousness a responsibility toward the things of righteousness and godliness, America must pay the price of veritable anarchy that shall be forced upon her by what may be expected in a complete social breakdown.

Water wastes itself when it flows on in a stream, but when a dam blocks it, power is developed. Today tremendous energy is being wasted in a stream of social effort, on behalf of youth, because it is not working against the barrier of an idea. What is needed today is an idea with the efficiency of a scientific accuracy that would get results for all the time, energy and means now being wasted on impractical methods of social service. *The greatest* *single error in modern life is the development of the individual as the unit of society.* This is most seriously represented by the conceited attitude of present-day youth, fostered by types of educators playing for popularity.

The Marxian philosophy in its development within the half-century has displaced the *ideal of the family as the pivotal point* about which revolves the organization of industrial, religious, political, and social expressions of life. The vogue of criticism of excesses and indulgences of the children of our present age, however, will need more than resentment on the part of a passing generation of adult minds, if conditions are recovered that will produce decency as in former social relations. We are now doing no more than treating the sores with either salves or caustics rather than eliminating the cause of our social splotches and open pus pockets of moral decay.

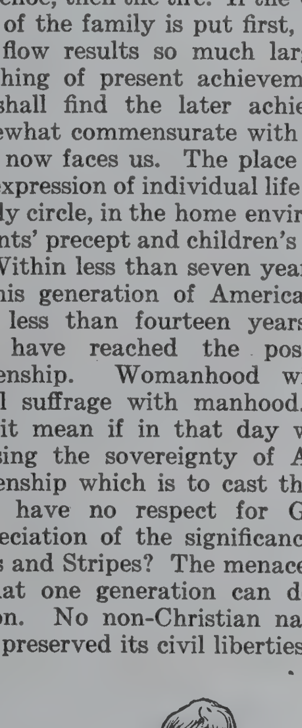
America is surfeited with community movements and public welfare organizations. The plea for support of these efforts is almost bedlam. Cannot someone in the midst of the din and confusion see the futility of them? What these misdirected social efforts have done is to destroy the family in America's life. According to sex and age, father, mother, son and daughter have been separated into groups and the social expert has been given the responsibility to progressively develop these into the social units that will represent our eventual achievements for a mass society. The benefits of any discipline as exerted by such directors of youth groups seem to last only while the supervision lasts. This won't work. No such conditions of juvenile delinquency ever existed in American life as that discovered today. Not until the American family is reconstituted and father and mother are again placed as the social experts at the point of original responsibility, as God intended them to be, dare we hope for a better generation.

THE contribution of a high order of organized family life is expressed toward the three divisions of a social, religious, and national responsibility. These are represented in the three institutions of home, church, and nation. These institutions are themselves creations of the family and in turn are the protectors and defenders of the family life. It is evident that only as the family is of a high standard of living and representative of the solidarity that this group demands will these institutions be strong to serve the community life of groups of families. The family must be preserved intact if these institutions are to live, and anything that strikes at the preëminent position of the family and the official position of father and mother strikes at the heart of home and church and nation, for neither individualism nor socialism can establish them or preserve them.

When the Pilgrims gathered in the cabin of the *Mayflower* and devotedly committed themselves to God for His service, they covenanted with each other and signed a compact. A reading of this document discloses the first stipulation to be that when they reached the shore each man should build himself a house. Thus we are somewhat justified in maintaining that the home is the foundation of our other institutions, both of religious and political life, in that it has been the forerunner of them.

THE staggering thing is that the task is so large. Using wrong methods of social effort, such as the idea of the individual for the primary unit of society or the mass idea of socialism, we accomplish very little. The failure of present-day methods is as if we were trying to work from the outside in, rather than from the inside out. It is not practical to build the wheel by putting the felloe inside the tire, then placing the spokes in the felloe and trying to insert the hub as the last operation. The order must be reversed. First, the hub, then the spokes, then the felloe, then the tire. If the vitalizing idea of the family is put first, out of it will flow results so much larger than anything of present achievement that we shall find the later achievements somewhat commensurate with the task that now faces us. The place to begin the expression of individual life is in the family circle, in the home environs with parents' precept and children's practice.

Within less than seven years, many of this generation of American youth now less than fourteen years of age will have reached the position of citizenship. Womanhood will have equal suffrage with manhood. What will it mean if in that day when expressing the sovereignty of American citizenship which is to cast the ballot, they have no respect for God, nor appreciation of the significance of the Stars and Stripes? The menace we face is that one generation can destroy a nation. No non-Christian nation has ever preserved its civil liberties.



Human Wastage

By JANE BARCLAY

WHENEVER relief money
spent to support an ab
bodied man, or one who mig
be able-bodied if properly nourishe
there is a waste of man power—
greatest loss to the state, far more
be reckoned with than the millions
dollars and cents.

Yet thousands of complacent peo
are proud of the growing millions
charity; not for the purpose of removi
the need for its expenditure, but mer
to fill up the gap.

Ameliorative measures, charity
der many guises, leave the workir
man less capable, less fit to look af
himself and to regain the standi
which he may have lost through fau
not his own, but common to all
manity.

The charitably inclined pub
merely tread the mill and keep
wheels going with cash, while the
chine, dealing out charity, investigat
catalogs, devises, surveys without e
plans boxes at Christmas and fr
air camps for the summer, holds

MISSOURI—*A Land Worth Knowing*

By CHARLES J. FINGER

THIS is about Missouri and a booster.

Boosters have the best intentions in the world, but in many cases they grow eless and will go on telling about ir industries, their churches, schools, nks and waterworks, never once pecting that they are guilty of a d of reflex egoism. They make ary human signboards of themselves, , like many wayside signboards, y effectually hide the scenery and tort the character of the country.

Here is an instance of the wrongful ivity of a booster. He did not lize that most men are interested in nature of a country rather than in commercial activities. Some of us e sitting in the Hotel Mayfair in Louis, listening to Opie Read who ppened to be in felicitous mood, and ose conversation was a happy chap- of literary chronicles plentifully prinkled with old-fashioned oaths. ie of *The Jucklins* is a downright sort man who has a way with him. Also knows his Missouri.

There were, in our little party, art P. Sherman, Carl Sandburg, bertus Love who wrote a history of se James the outlaw, and a pushful ing English novelist who entertained high opinion of himself. Opie was king of the jewels in Missouri's wn and named Mark Twain, Herbert S. Hadley, and Jim Reed, besides many others now on the road to fame who had been discovered by William Marion Reedy—Zoe Akins, Edna St. Vincent Millay, Edgar Lee Masters, the artist Bloch, and the woman who had the *Patience Worth* experiences.

'Missouri,' said Opie, 'has things to her credit in a literary way.'

THEN it was that the booster swung into the center of things. He was a breezy and bustling man, well-dressed in a flashy way, and, with curious zeal, he wrung our hands and slapped our shoulders, assuring us that he was extremely glad to meet us because we could put Missouri before the world in her true light.

'Missouri!' he exclaimed. 'Lemme tell you. There's nothing like her in these here states.' Then he waved his arm, and, to use a style of eastern allegory, switched on a battery of information, stepped on his rhetorical gas and went full speed ahead. Never shall I forget the sadness that came over us as he went on, not merely content to hold us with his glittering eye, but hooking a detaining finger into our coats at the least sign of impatience on our part. He told us about Missouri's farming and stock-raising; then he gave us much information about the number of bushels of peaches and grapes and cherries and potatoes both sweet and Irish that were raised annually.

He grew eloquent about mules and sheep and pigs and turkeys; also about soy beans and cowpeas and peanuts and millet. It was all very true and impressive, and he flung vast statistics in ou faces in the manner of a lecturer o economics, doing it all so gallantly a well that we were both amazed wearied because of his gift of men for figures.

Strongly, ably, volubly, he went on to talk about Missouri's geology and mining, plunging headlong into a mass of facts about the production of mines of coal, iron, lead, and zinc. Then he gave us very minute but tedious information about the manufacture of boots and shoes, of clothing, of confectionery, of street and railroad cars, of tobacco. Mind you, all that he said was quite true, for Missouri is a busy place and her assets are in the cleanest possible shape, but, after all, few men are so constituted that they can find repose in a workshop contemplating enormous activities.

So, one by one, with sickening treachery, my companions slipped away while the man went on unperturbed, steadily marshaling his facts with indefatigable skill, crowding into me important facts about Missouri banks and their capital stock, about the estimated value of school property, about the assessed valuation of the state, about miles and tonnage connected with railroads. All of which fell on my brain with sledge-hammer blows so that I became dazed and gazed at the booster spellbound, much as the wedding guest gazed at the Ancient Mariner. Suddenly he ended by telling me that the attention I had given him augured well for the future of the state.

'Tell the world about us,' he said. 'We develop daily, and as we develop so must our institutions adapt themselves to increasing wants. So now you catch on,' he added, in a kind of confidential undertone. 'Now you've got a picture of Missouri.'

—St. Louis News Service.

The swift Current River, recently made a trout hatchery by Missouri.

Certainly I had. But it was an impression as of an enormous tract of factories; of metallic clangor; of cities crowded with excited, energetic people. It was a confused picture of men plowing fields with tractors, of men rounding up mules, of men driving beasts to slaughterhouses and stockyards. I saw Missouri as a place of gray business affairs bordering on a vast yellow flood that was the Mississippi; as a place of barbed-wire fences, of silos, barns, banks, ditches, and corrugated-roofed sheds—but I did not see it as I have seen it since, that is as a pleasant place for any man whose aim it is to get away from the endless circumstances of everyday existence for a little while. I did not see it as a place in which a man might make a comfortable home; nor as a place of natural wonders. If the booster knew anything of the existence of what I saw in a few auto rides off the beaten track, he kept that knowledge a dark secret from us.

Consider.

For the whole of one day, for the greater part of a night, and for the whole of a second day, I, with my three sons, were swept down a tumbling, roaring river in Missouri territory, and during all that time we did not see six human beings. For seclusion we might have been on the upper reaches of the Congo. For adventure we might have been on the Green River in Wyoming. For beauty to compare with what we saw when the su

Tricks his beams, and wit
new spangled ore
Flames in the forehead o
the morning sky,

we might have searche the Berkshires, the Adirondacks, the Grampians and Killarney.

We shot rapid afte rapid. Sometimes w bumped on hidden rock and sometimes we wer capsized and forced t swim. And always w had to keep a shar lookout for landin places, marking the speedily and making fo them energetically because of the swiftnes of the current, for ther was no hope of headwa against it. Nor were such landin places very numerous, because for man miles the river sped through a canyo the sides of which were cliffs two an three hundred feet in height, perpendicular and forbidding, and against th base of them the waters dashed in whit foam. A place of adventure, as yo may see; yet the beginning of it i only a few hours run from St. Louis at the little town of Galena on th James River. There, I repeat, you ma launch your boat and give yourself t the strong tide, to be swept into solitary valley which is much as it wa a thousand years ago.

The fortunate part of it is that o the way to the starting place, in going from St. Louis to Springfield, you cros the land of the Gasconade which i one of the most healthful spots in th

High bluffs densely covered with foliage along the Gasconade. —St. Louis News Service.

world as well as being full of interest. At any rate the people living there radiate health. As for the interest of it let me give this by way of indication. In one place the road slowly ascends until it sweeps along the crest of a hill. It was early morning when I first found myself there, and a white mist in the valley hid the river. As the sun climbed higher the white clouds became rose-tinted and soon afterward vanished. Then it was that the river Gasconade took on a strange, emerald beauty as it wound through green woods far below.

—Ewing Galloway.

Old mill once used to grind corn. It is located in the Ozarks, near the Missouri-Arkansas border.

The sensation of looking down at the land that lay as a map outspread was like that of viewing a country from an airplane. The hills were checkered with sun and shadow, and through openings in the trees glory after glory appeared in flashing pictures—a patch of red-gold wheat, a quiet meadow, a flower-dressed hill, a cliff all scarlet and brown, a great amphitheater where sheep grazed, a little lake framed in graceful boughs.

Small wonder that Stuart Olivier, riding through that country and finding the sight of it to gratify some desire within him, left his Baltimore and his Broadway, his theater and his banking interests, and without a second's thought wrote his check for three-quarters of a million dollars for a Springfield newspaper property! Small wonder that Fielding P. Sizer, worried with the friction of a hundred affairs, finds fresh vigor of soul in his Ozark town of Monett, occupying himself happily with such things as the making of a public library, the turning of waste land into a playground, the creating of a public park! Small wonder again that William Marion Reedy refused offers that would take him away from the hills and rivers of his native state!

THINKING back, it amazes me that my booster said so much about commercial activities and nothing about that part of Missouri so likely to make for peace of mind. For all of us would have been far more interested hearing about Roaring River than about the number of passengers going through the Union Station annually. Because this Roaring River is one of the world's wonders. I have seen a hundred and more river sources on this continent, and in Africa and in Europe, but never such a one as this.

Imagine a river flowing out of a rock at a speed of six miles and more an hour. Picture that river as being sixty feet wide and ten feet deep, the water sweet to the taste and of delicate coloring because of the blue of the sky and the rich-hued foliage of the hills and the play of light and shade. Out over clean white and yellow sand the water flows, a river full grown at its birth—out and down a valley the sides of which are lined with poplars and maples and sycamores and willows, the higher hills covered with pines and firs. Imagine the air sweet with the subtle perfume of a thousand mountain shrubs and flowers, and strangely restful, too, because of the drowsy music of bees and babbling waters. Imagine a clear river without mud, with grass growing to the water's edge, with shade trees everywhere. If you can, you have a hint of the source of Roaring River. I know nothing at all of the river in its maturity because its perfection of youth satisfied me. Heaven lies about it in its infancy.

Then there is a curious cave not far from Springfield. It reminded me somewhat of Fingal's cave, because I explored it in a boat, which is the only possible way to explore it. To enter it is like venturing into a world of spirits because of the gloom and the mystery, the silence and the coolness. As you twist and turn, the golden radiance of the world narrows to a mere speck, it then vanishes, and all that is to be heard is a distant gurgle of waters and the faint sound of falling drops. At one place I heard a queer sound like the steady beating of hidden machinery, very regular and very mysterious, as if it came from a subterranean workshop like that pictured in the German film *Metropolis*. From time to time I stopped to listen but without discovering any change in the character of the sound. After awhile I happened to thrust out my left hand and in doing so felt something hard and cold and smooth, which exploring by touch, I found ran perpendicularly. So I struck a match after several attempts, and the mystery was a mystery no longer. It was a four-inch iron pipe, and when I grasped it I felt the vibrations of a pump plunger. Eighty feet above my head was a farmhouse, and the owner of it had drilled a well that went down and down, piercing the cave roof and entering the cave river.

I could tell of many other things seen in Missouri; of a place where a man has made an estate out of a hillside, with underground dens for silver foxes, of a lake and a fountain, of a pleasant home; or a town called Neosho where people may have a considerable river at the end of their lawns and gardens; of orchards hung thick with fruit; of other places where nature strikes a sterner and grander note. But what continues to puzzle me is why anyone should be foolish enough to think that anything could be known of Missouri when only its commercial activities are told of, with all that, and more, of which I have here so sketchily told, omitted.

Business is business whether public or private, and most certainly industry is a duty and a sheer necessity, but it is hardly to be classed as a virtue. As for the ordinary machinery of commerce and civilization (for churches and schools and banks, like typewriters and safes and motor trucks, are, after all, nothing but tools), why boast of possessing them? They should be taken for granted exactly as are knives and forks and spoons.

To be sure, Missouri is busy and industrious and is on a very sound economical basis, just as the booster said! But it is more. It is an ideal country in which to idle and ramble. It is a good place in which to rest and loiter and drowse. In its shadowed stillness a man may think, may learn to be patient and tolerant, may know the singing world. Some day I hope to write a guidebook about it. It is a land worth knowing.

(*In early issues Mr. Finger will write of West Texas, New Mexico and Ohio.*)

Making EDUCATION a SERVICE

By
WILLIAM
A.
McGARRY

—Gutekunst Studio.

Dr. Russell H. Conwell, author of Acres of Diamonds.

IN PHILADELPHIA not long ago a man passed away after fifty years of unexampled achievement. The man was the Reverend Dr. Russell H. Conwell, and one of his achievements was a university built in garrets, cellars, shops, office buildings or wherever he could find cheap space and students.

The personal story of Dr. Conwell could never be told while he was still alive. For one thing, men were too much impressed with his works to get a proper perspective. In addition, Dr. Conwell was too shrewd a psychologist to permit even his own personality to overshadow his aim.

First as a newspaper reporter and later as a writer of magazine articles, I knew Dr. Conwell rather well during the last fifteen years of his life. During the first ten years of that period I was sent to interview him nearly every year on the anniversary of his birth, and later I saw him two or three times a year until shortly before his death. In all that time I cannot recall anyone writing a personal description of the man—how he looked and acted at close quarters, what made him a famous preacher, how he reacted to praise and blame and the normal human vanities. One day I suggested just such an article, and his reply throws a great deal of light on his character.

'I will answer any question you wish to ask,' he said, 'but each of us wants your article to have the greatest possible inspiration. You come to me because you and your editors believe there will be wide popular interest in the things I have been trying to do. Don't you think it would be a mistake to write into that account more than the biographical summary? If you go beyond that, there will be a temptation to depart from the true picture. An account of my personality should contain a record of my faults and failings as well as my virtues and accomplishments. Such things are not well done in one's lifetime. The writer wants to be generous, and he flatters. If you confine it to things done, there will be no need for flattery.'

'You keep your faults pretty well concealed even from your friends,' I suggested.

'Only by trying to work so hard that they will not have a chance to crop out,' he said.

There is Conwell in his own words—challenging himself after a lifetime of toil and suffering. I do not believe that even many of his friends knew how much he suffered. Exposure during the Civil War had made him subject to the most violent attacks of rheumatism and he was never wholly free of its effects. A few years before his death I saw him in his study while he was convalescing from an attack that had been expected to kill him, and I asked
him what he planned to do when h
was able to be about again. He ou
lined three books he intended to write-
and he was then more than eighty yea
of age.

'But I'm only an old man, crippl
up with rheumatism,' he added, 'ar
the work is terribly slow.'

He exhibited his hands, the finge
so twisted by disease that he w
unable to straighten them. Neverth
less he did get back to work, and h
did finish most of what he had set ou
to do. Much of his later writing w
done by hand, late at night or in th
early morning hours, when a secreta
was not available to take dictatio
Page after page was written und
extreme difficulty, so much so that D
Conwell at times had to draw ea
letter.

Dr. Conwell's own idea of th
secret of this indomitable will was fait
But it was not merely faith in a li
hereafter. He saw with econom
clarity how earth could be broug
nearer to Paradise for all human b
ings. His belief in the power of goo
over evil seemed naïve and childlik
until you sounded his economics.

'Did you ever stop to consid
what would happen in this world,' h
asked me once, 'if we could transfor
all the energy used in scolding an
denunciation and attempting to f
the blame for evil, into a united effo
to replace it with good? If every cit
and town and hamlet had all the pla
grounds and recreation and civic ce
ters needed for all its population, youn
and old? If we had all the librari
and schools we need? If we put mo
thought and humanity into living an
less into the mere earning of a living

His own answers to these questio
are of particular interest today becau
nearly five million dollars has bee
pledged for the development of ideas i
education that he did not dare to e
pound in full when they first came t
him. Very early in life he had learne
the uselessness of urging too strongl
changes that society is not yet ready t
accept. One of these—the basis of h
whole scheme of teaching—was tha
the educational system should exist f
men, instead of the other way abou
A dozen years ago he made this stat
ment:

'America is too rich and prosperou
for any boy or girl to be without a
education. The trouble is that we st
regard anything beyond the hig

hool as the privilege of the wealthy. generation ago we had the same idea the high school. It was said the untry would find it impossible to pport itself unless children went to ork at an early age. Since then we ve seen the prosperity of the country crease in proportion to the increase educational facilities for the masses; t we have not taken the lesson to art.

'I should like to see a rearrangement work in all our stores and factories here it is at all possible to give part-me employment to young people, to the age of twenty-two or beyond, that they could continue their udies into the college courses. In not ry many years I believe we shall me to that in this country. When we we shall carry education to the asses instead of making them seek out and hedging it about with re-rictions.'

HE SAW education, in other words, a service that society owes to each dividual, instead of a privilege for e favored few. But instead of wasting s time making speeches to at effect, Dr. Conwell set t forty-two years ago, in 84, to prove that his plan as practicable. He began ith seven students and the ar of his death saw an en-llment of more than ten ousand. More than that, per cent of the students ere partly or wholly self-pporting; the university as paying a larger propor-n of its expenses out of ition than any institution comparable size, and ition fees were consider-ly below the American erage.

Dr. Conwell has been ened to Lincoln. There as a physical as well as a iritual resemblance. He as a huge man, rather avily set, and with a ambling gait and a loose-inted carriage that made m seem even larger. He as also more homely than e most unflattering portraits of ld Abe' and his lack of formal comeli-ss was accentuated by a set of gold eth reminiscent of old-time dentistry. e profile photographs most fa-iliar to the public flatter him, but l to indicate fully his rugged ength. Yet in spite of the gold eth, when Dr. Conwell smiled, mething happened that is hard to scribe. It sounds trite to say that face was changed. Actually one t an impression as of a shade awn up and a sudden burst sunlight into a room that d been cold.

This curious power of radiating kindliness and warmth has been noted by nearly everyone with whom the famous author of *Acres of Diamonds* came in contact. It was in keeping, too, with his talk—his refusal to criticize individuals. He held that no man takes kindly to public criticisms, and that the calling of names defeats its own purposes by inciting to anger. At all times he was fearful of driving men to evil by too much insistence on good.

'You cannot compel righteousness,' he would say; 'it must be inspired. Where evil triumphs it is the fault of the good. Merely to destroy a gambling house or a dive is not an act of Christianity. It should be replaced with a library or a school made more attractive than the dive. The basic philosophy of Christianity has always been constructive.'

A newspaperman who had been sent to cover one of Dr. Conwell's sermons once said that he was a great preacher because he never preached. In other words, the constructive principle that he applied to education was the foundation of his course of conduct in everything he said or did. Analysis of all his sermons shows them to be filled with homely incidents. He tried to dramatize familiar things, and to that end he drew constantly on the training he had had in his younger days as a newspaperman. His legal training helped also.

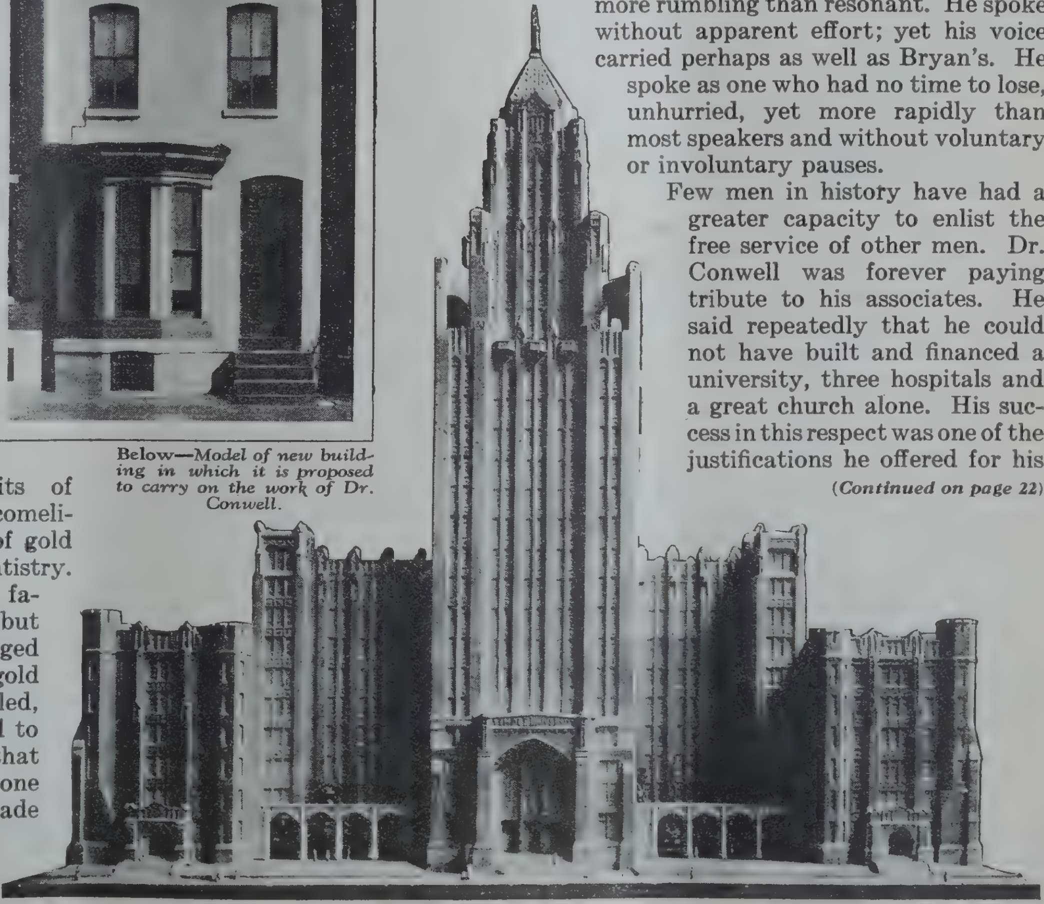
EVEN into his old age Dr. Conwell carried a remarkable power of observation, and he never lost the gift of applying what he saw to the lesson he wished to teach. He was fond of the parable form, but the basis was always something near at hand. It is said that *Acres of Diamonds*, delivered more than six thousand times, was never exactly the same. Dr. Conwell always tried to get a local, familiar application. The first thing he did on entering a new town or city during his lecture tours was to visit a barber shop, where he always said he could learn more about a community in an hour than he could anywhere else in a week.

IT GOES without saying that after a lifetime on the lecture platform Dr. Conwell knew all the tricks of the trade, but if he used them at all he did it so artistically that it was never apparent. He said himself that he did not aspire to be an orator. He wanted to talk *to* men, not *at* them. And even when his audience ran into many thousands he was able to create the impression of intimacy. Undoubtedly his voice was an aid in this respect. It was deep, but more rumbling than resonant. He spoke without apparent effort; yet his voice carried perhaps as well as Bryan's. He spoke as one who had no time to lose, unhurried, yet more rapidly than most speakers and without voluntary or involuntary pauses.

Few men in history have had a greater capacity to enlist the free service of other men. Dr. Conwell was forever paying tribute to his associates. He said repeatedly that he could not have built and financed a university, three hospitals and a great church alone. His success in this respect was one of the justifications he offered for his

(*Continued on page 22*)

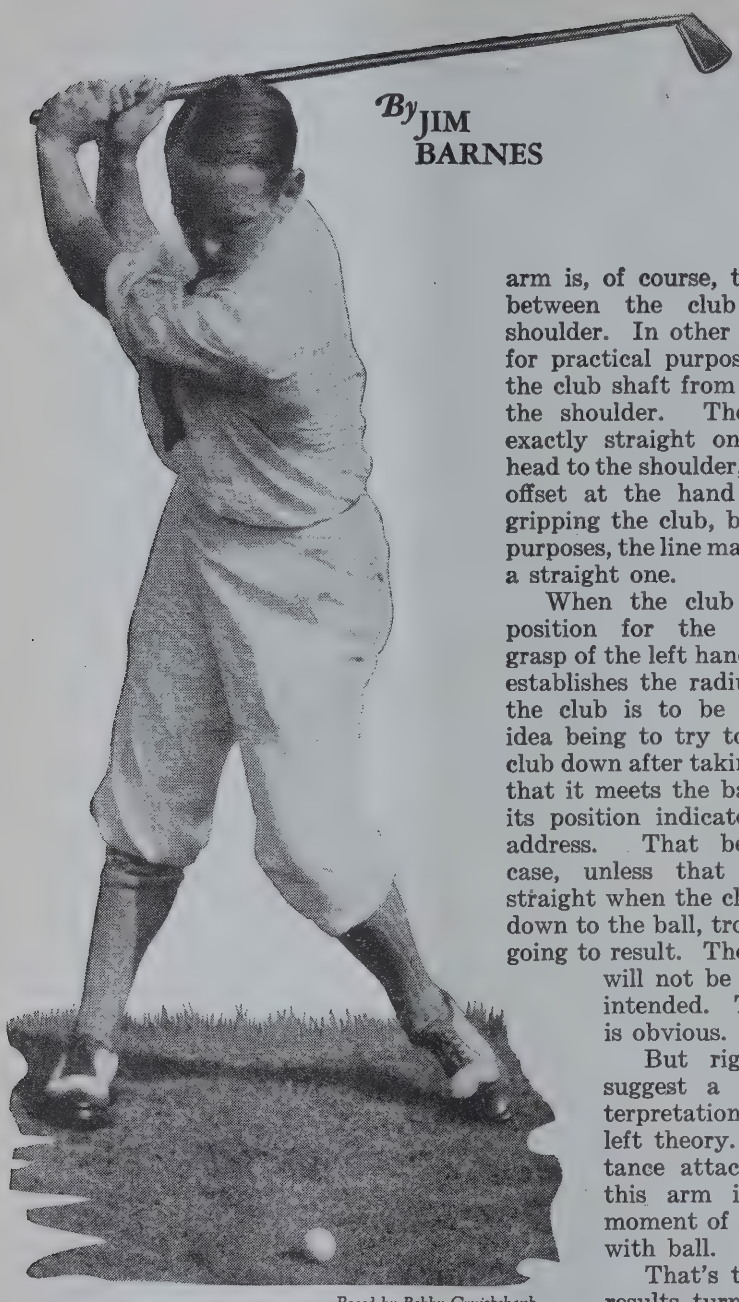
The early quarters occupied by Temple University.



Below—Model of new building in which it is proposed to carry on the work of Dr. Conwell.

The STRAIGHT LEFT Arm

By JIM BARNES



—Posed by Bobby Cruickshank.
Correct position at top of swing for midiron shot.

LIKE keeping the head still, the eye on the ball, following through, and the like, every golfer who has listened to any appreciable amount of instruction, paid for or received gratis, I suppose, has had pounded into his head the advice to keep the left arm straight on the back swing. I may add that the doctrine is good, though I have known cases where too much of the theory worked the wrong way. Or perhaps I had better say, the patient did not fully understand just what the prescription meant and possibly applied it in overdoses.

A little careful study of a well-made golf swing will readily show just how and where the importance of the straight left arm lies. Its importance is this and nothing more: The left shoulder is the actual anchor point on which the club is swung, and the left arm is, of course, the connecting link between the club shaft and that shoulder. In other words, that arm is for practical purposes an extension of the club shaft from the head on up to the shoulder. The line is not an exactly straight one from the club head to the shoulder, owing to a slight offset at the hand in the way of gripping the club, but for practical purposes, the line may be considered a straight one.

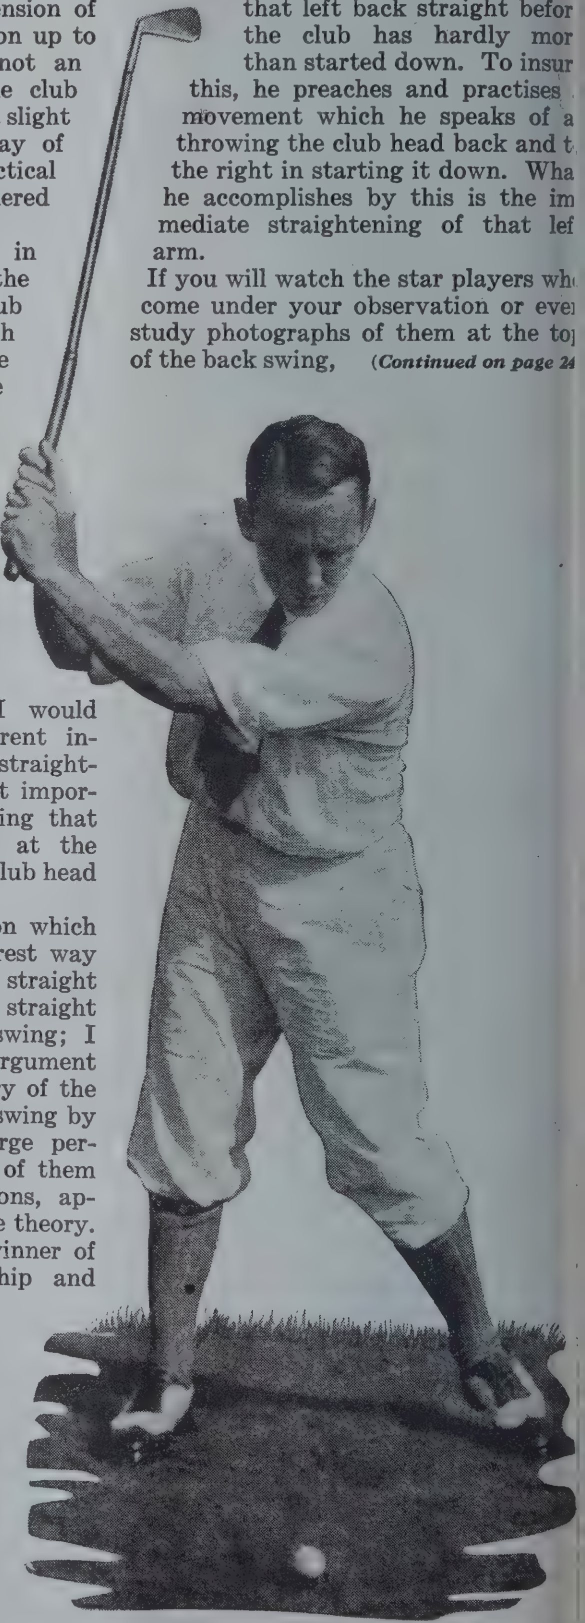
When the club is placed in position for the address, the grasp of the left hand on the club establishes the radius on which the club is to be swung, the idea being to try to bring the club down after taking it up, so that it meets the ball just as its position indicates in the address. That being the case, unless that arm is straight when the club gets down to the ball, trouble is going to result. The ball will not be hit as was intended. That much is obvious.

But right here I would suggest a little different interpretation of the straight-left theory. It is that importance attaches to seeing that this arm is straight at the moment of impact of club head with ball.

That's the point on which results turn. The surest way to go about having it straight there is to keep it as straight as possible throughout the swing; I make this point to meet the argument of those who answer the theory of the straight left at the top of the swing by pointing out that a very large percentage of good golfers, some of them champions or former champions, apparently give no thought to the theory.

Harry Vardon, six times winner of the British open championship and American champion in 1900, for instance, has his left arm bent very noticeably at the elbow at the top of the swing. But Vardon is a very rare exception, aside from his most remarkable championship record, in this respect. In bringing the club up on the back swing, Vardon slings it back, using both hands to a more nearly equal extent in the operation than any other player I know. In order to do this, he mus bend that left arm. Yet Vardon, a does every other first-class golfer, get that left back straight befor the club has hardly mor than started down. To insur this, he preaches and practises movement which he speaks of a throwing the club head back and t the right in starting it down. Wha he accomplishes by this is the immediate straightening of that lef arm.

If you will watch the star players wh come under your observation or eve study photographs of them at the to of the back swing, (Continued on page 24



Incorrect position of arms, body and midiron.

Early AMERICAN Spellers

By LOUIS C. KARPINSKI

IN THE English-speaking world spelling has long been a favorite indoor pastime. Even today a spelling contest arouses widespread enthusiasm and national contests are staged periodically to determine a spelling champion. The weekly spelling match, held usually on Friday afternoon or evening, was a feature of Colonial schools and even of those within the memory of many present-day adults; it was a gala occasion, usually concluding with oratory superior to much that comes over the radio.

One of the earliest English spellers was published in 1590 by Edmund Coote; it was entitled: *The English Schoolmaster, teaching all his scholars, of what age soever, the most easie, short and perfect order of distinct Reading and true Writing our English tongue that hath ever yet been known or published by any.* Evidently at that time tailors, weavers, shopkeepers and seamsters occasionally included the teaching of spelling and reading with their weaving or their shop-keeping, since to them Coote addresses a direct word of advice. He says, 'Thou mayest sit on thy shopboard, at thy looms, or thy needle, and never hinder any work to hear thy scholars, after thou hast once made this little book familiar to thee.'

Center—Spelling book published in 1812 for school use.

Left—Spelling book prepared by Noah Webster, and printed in Philadelphia in 1829.

Watts' rules 'published for the benefit of all persons who desire a better acquaintance with their native language.' London, 1740.

F. D. Pastorius about 1698 published in Philadelphia from the press of William Bradford, *A New Primmer or Methodical directions to attain the true spelling, reading, and writing of English.* This was probably the first speller printed in America; the only copy known is in a library in Manchester, England. The German author settled in America in 1683, becoming an ardent Quaker; his memorial of 1688 against slavery inspired Whittier's poem, 'The Pennsylvania Pilgrim.'

The spelling books used in the American Colonies before the Revolution were largely made in England or were American reprints of English works. In Pennsylvania the most popular of these was compiled by the Quaker, George Fox. His *Instructions for Right Spelling and Plain Directions for Reading and Writing True English* appeared first in England in 1673, and then several times on this side of the water.

Perry's *The Only Sure Guide to the English Tongue* superseded in popularity about 1785 Dilworth's *New Guide to the English Tongue,* which like the same author's arithmetic had been exceedingly popular in the Colonies. Both enjoyed many American editions.

In 1783 a native product appeared to contest the field with the numerous spellers of English compilation. Noah Webster, a schoolmaster at Goshen, New York State, was impelled by the scarcity of schoolbooks to publish a speller as the first part of a comprehensive work on English for schools. This was followed in 1784 by his grammar and in 1785 by his reader, all parts of the *Grammatical Institute.*

Noah Webster's old blue-back speller may properly be termed the most popular book ever issued from the American press, approximately one hundred million copies having been sold. For many years this little booklet sold at the rate of a million copies a year. As late as 1880 the speller was going strong and it continues publication to the present day, being found in the current publication list of one of the great publishing houses. Probably no other book except the Bible has had a greater influence upon American speech and American choice of words.

Originally Webster took the title, *First Part of a Grammatical Institute of the English Language.* Later the title *American Spelling Book* was adopted; and it is safe to say that the text would never have sold in the millions if it had retained such a title as *Grammatical Institute.* Webster's portrait ornamented, so to

New Methods Are Needed for New Problems

WHAT portion of progress is due to effort, and what portion to the pressure of destiny no one can say. It is certain, however, that not all progress is due to conscious effort, whatever the philosophy of the times may say to the contrary. There is a mixture of the two forces; it may be that there is a coincidence of human effort and destiny, so that when the universe begins to urge, man begins to will. Certainly progress cannot be forced upon those who are unable to receive it, and it is equally certain that mankind is not wise enough to know in what direction progress ought to be made. There is a mixture of exterior guidance and interior desire.

> *WE SHALL not make any progress by trying to solve new-era problems with old-era men or methods. The people know this by instinct. That is why they expect so little from the politicians. Politicians would do better if they only knew how, but they belong to the old era and they do not know—they will not learn that old things have passed away, and they have not the understanding to fall in with the new. But the people know that new men will come to fit the new time. Then our present problems will be not only solved but abolished.*

It is not necessary, however, to chart the whole wide sweep of destiny before we are able to understand certain matters near at hand. In our own affairs, in our own time, it must be clear to us that progress rarely comes of the adventurous will of man—taking mankind in the mass—but as the result of some kind of outward pressure. Men are pushed ahead oftener than they go ahead of their own will; that is, mankind in the mass.

The pressure may sometimes be due to the appearance of a new personality with a new idea, or it may be due to a combination of circumstances too big for any person to cause or control. An illustration of the first may be found in the inventor who throws a new idea into the midst of society, forcing society to reorganize certain activities around that invention as a high point. That has happened several times in the lives of men still young.

But the other pressure—that generated by circumstances—is the clearer illustration of the dependence of progress on outside influences.

Take the political and economic conditions of the country. No one can say with any conviction in his voice or his heart that present conditions are perfect or even near-perfect. No one can pretend to say with wisdom that there is nothing to be done but wait. But every one knows in his mind and in his heart—that is, by both his thoughtful mind and his instinct—that none of the old remedies will work the cure. And every one knows just as surely that the old remedies will be dropped only under compulsion.

Well, there will undoubtedly be compulsion. Not the mistimed compulsion of revolutionary violence, nor the impatient imbecility of illiterate usurpation, but the compulsion of events. When old-era men attempt to grapple with new-era problems, something inevitably happens. Instead of the men's solving the problems, the problems dissolve the men.

It is probably necessary that this process should appear between the old era and the new, because it has a preparatory value. The tree never easily lets go its leaves until the old leaves cease to serve and the new leaves begin to press in. Society holds hard to the old until the pressure of the new pushes it off.

To know that we have come to the end of our resources within a given circle is to know something worth while. If the old circle is barren, nothing is left but to break into a newer and wider circle, and that is exactly what will occur under the pressure of the circumstances which are now piling upon us. Responsible persons are waiting for something to happen, praying for some issue to turn up, that will give them a cue how to act. But there will be no such luck. The old system is going out of business; there is no cure but the wisdom to welcome the new era, which will not alone solve our present problems but abolish them utterly. No people in our stage of development has any right to have the kind of problems that we have! They don't belong to civilized mankind.

It was very nice to be a politician and officeholder fifty, or even twenty years ago, when so much could be done by a deft speech or a skilful bit of legislation. Those were the good old days when legal enactment could soothe almost any hurt. But that day is past. The political day is past. The day of speeches on the stump and bills in the legislature is past. Because, the circle in which these charms worked has fulfilled its destiny. A new and wider circle waits.

The tragedy of present-day politics is that, with the most desperate need of party salvation on all sides, the party men cannot see what they must do to be saved. And could they see it they would not do it. The old era has them in too fast a grip, and all the powers that are to collapse with its passing.

That is where the pressure of destiny will come in. This state of things will continue. There will be conferences on this and that, and agreements to this and that, and great trumpet announcements of this and that, but nothing will move.

Circumstances, however, will steadily press. Men and measures will give up and disappear. And then, silently out of the long preparation of obscurity, it will be done. The people who will do it are here. The vast majority of plain people are new-era folk. They know already that the old way is forever finished. The soil for the new time comprises practically all of the people.

The Measure of Education

THE real standard of education is usefulness; nothing more. You don't read Plato just for the satisfaction of being able to say so; you read him because he is going to contribute something to your mental equipment which, in turn, you will apply to the practical problems of your own life and time.

If a man were shut in a room filled with books containing all the wisdom of the world, and lived long enough to absorb them all, and died there, he might be the wisest man in the world, but he would also be the most useless; if, instead, he had learned only how to drive a nail, and had spent his life driving nails in building new homes, he would have been turning his knowledge to useful ends, and contributing something to his fellows.

It isn't what we know; it's what we do with our knowledge that matters. Any study that is idle and adds nothing to a man's stock in trade for his life work is wasted study. When a youth completes his course of study, whether at university or technical school or shop, he has had his chance to sow his seed; the fruits of that seed will be his success in life, plus the attention that any good crop demands, which means work. But when he steps out into the world all the education he has garnered must be directed toward his personal productiveness, whether with brain or hand.

Looking at it in another way, the boy spends his years of study in constructing, adapting and completing a machine with which he purposes working out his life; if he has waste parts on that machine, he has wasted his time putting them there; if it is just a pretty machine, but doesn't make anything, he has wasted all his time; if he has built a simple, but useful machine, and has learned to make the other parts he needs as they become wanted, he should make a good job of himself and his life.

The man who knows a little and knows that little well is generally more useful to his fellow men than the man who has a smattering of all tongues and arts, but can practise none of them.

Mere learning means nothing; the application of it is everything.

It would be an interesting experiment if universities should devote the first two years of the college course to dispensing knowledge and the last two to teaching the students *how to use* the knowledge they have acquired.

Give Him a Chance

WHEN a man, not a criminal at heart, has completed a prison sentence imposed upon him by Society and walks forth from the prison with what little money the state allows him, bearing the marks of his confinement, he is entitled to say to Society:

'I've paid. Now see to it that I am not constantly reminded of the fact that I committed a crime. Be as game as I have been, and give me a chance.'

He is entitled to say that, and perhaps he does say it. Whereupon Society proceeds to let the plea in one ear and out the other. The commonest thing is to make the man's record a perpetual handicap against his attaining any degree of success outside the prison walls.

However, we are making some headway in the matter of our attitude toward the man with a prison mark against him. We no longer subject him to the tortures that were common a few generations ago. We make sure that he is given light in prison, something to occupy his mind and hands, exercise, sanitary living conditions, and we allow him at least a few of the common pleasures of existence. We give him tastes of freedom outside the walls occasionally. We have grown broader, kinder and more tolerant toward the prisoner while he is a prisoner. The time is here when we should be kind to him after he is released.

Mining Camp Preachers

GOLD miners of northern Manitoba not long ago advertised for a minister—'a he man who wears a Mackinaw and stuffs his pants in his boots and can paddle a canoe and trek on snowshoes.' All of which was perfectly in accord with human nature. The successful clergyman must understand the problems of his fellows. The problems of a mining camp are comparatively rudimentary: a knowledge of hardships, of rough life, an aptitude for good fellowship. But it is as necessary that the mining camp preacher understand these, as that the metropolitan clergyman know the complex problems of a great city.

Industry the Solution

IN AN obscure journal of an obscure country in an obscure corner of Europe appears an obscure statement by an obscure speaker in which he half-timidly says: 'America is wealth. America has industries. Is it effect and cause? Should we not cultivate industry?'

There was a time when it was the custom in certain circles of Europe to decry American industry. Americans were referred to as inveterate dollar-chasers. The increasing output of manufactures, from motor cars to watches, was looked on with outward contempt and some inward trepidation. Today civilization looks to industry, and industry alone, to rebuild its fortunes. Looking over the map of the world, note this fact: where there is industry, there is prosperity. Test every country by that; it never fails. Where industry is halted, or even threatened, grave councils are called and the national safety is considered imperiled. Industry is the result of intelligent human effort; it is the commander of prosperity.

SPANISH Spirit *in* PAINTING

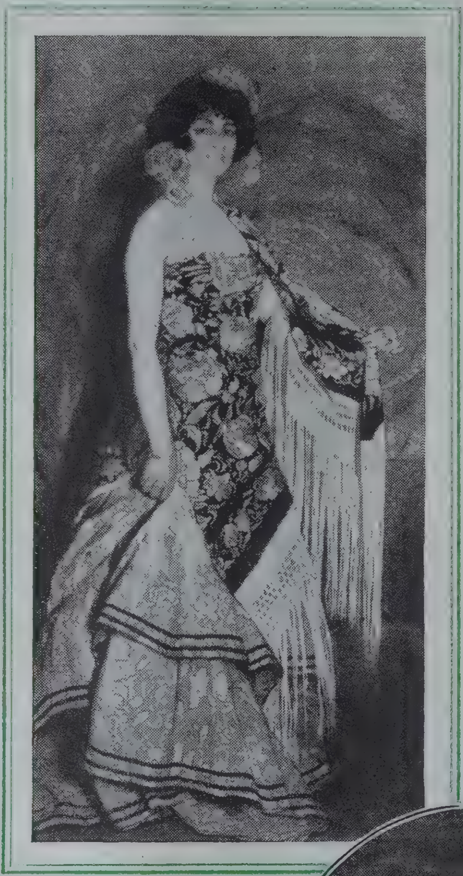
By REGINALD POLAND

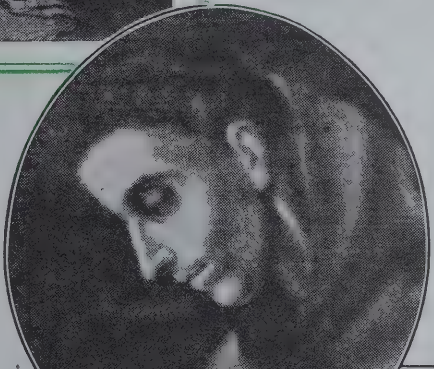
LION-COLORED, barren, undulating land—self-satisfaction and indifference, with *mañana* (tomorrow) as a watchword—extremes of climate—extravagant expressions in life and art—and, finally, contrasts in character such as kindliness and severity—these are some of the first dominating impressions of Spain.

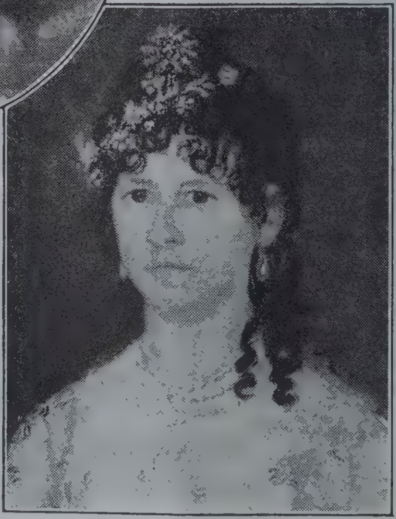
This land seems isolated from Europe and is still suggestive of connection with northern Africa. At times it recalls a volcanic waste. Such verdant areas as those of the north and the south are like oases in the desert. But it is prolific in olives, grapes, almonds, tobacco, cork, and wheat, in spite of burning summers with long droughts and the ghastly strong and cold winds of the winters. Spring alone offers a paradise as balm to refresh the drooping spirits that the people may weather another year. The Spanish have become inured to hardship and conflict so that they are self-reliant and proud, keeping apart from other civilizations, primitive and provincial and mystic as compared with matter-of-fact Western Europe.

In the Eighth Century Spain received the Mohammedans, who by their science, art, and strength made a valuable contribution. Alphonse I began to eject the Moors, however, so that by the 13th Century, the heyday of their culture, Granada was their one last stronghold. In 1492 the Catholic kings concluded their expulsion and inaugurated the era of glory and wealth when Spain was mistress of the world. It was the loss of the Armada in the reign of Philip II that brought defeat to the dreams of conquest. In art, however, her painting has justly attracted the world; and she is most clearly interpreted by this painting.

In the 16th Century appeared Morales, influenced by both Italian and Flemish, but emanating an aristocratic Spanish air. Somewhat later El Greco liberated the soul of Spain, especially in her chivalrous aspect. Thus he is a parallel for Cervantes and his *Don Quixote*. In the 17th Century Ribera of the southeast led on to Murillo and Zurbaran. Ribera is a virile dramatist in sensitive color and sure chiaroscuro. Murillo has the spirit of youth; he reveals his soothing Andalusia with a feminine, sensual, but faithful ardor. No wonder his laughing children and sweet brunettes are popular! Zurbaran is of the monastic sphere, simple, humble, frank, but of impassioned expression. He is a more realistic Fra Angelico, a link between robust Castile and gentle Andalusia, between genial Murillo and dignified Velasquez.







Top—*'My Cousin Antonia,' by Ignacio Zuloaga, in the permanent collection of the Fine Arts Gallery of San Diego, California.*

Circle—*'St. Francis,' by El Greco, about 1585. In the permanent collection of the Fine Arts Gallery of San Diego.*

Right—*'Portrait of a Lady,' by Francesco Goya. This is a signed picture, and is of the Spanish 18th-19th Century.*

Critics have often recognized in Velasquez the epitome of painting. He said of his own work, 'It is truth, not painting.' But it is a beautiful truth. After him painting declined and languished.

A hundred years later Goya aroused the dormant art. Inspired by nature and Rembrandt as well as by his last great compatriot, he kindled a fire that culminated in the Spanish revolution, symbolizing the decay and corruption of Spain. He initiated an imaginative, temperamental impressionism in which colors became emotional and decorative. This manner has contributed much to present-day art as developed by Italy and France.

TODAY Zuloaga has 'modernized' Velasquez by his more schematized forms and his highly organized composition; the De Zubiaurre brothers reveal the Basques and their life in virile forms and in emotional, decorative tones. Anglada interprets the soul of present-day Spain with his almost abstract splashes of luscious, fresh color, suggestive of oriental stuffs or porcelains. At his best he gives us the fête life—our own dream-pictures of Spain.

On our way to visit Zuloaga, we stopped at the picturesque Gothic San Salvador church, in Guetaria, on whose undulating old floor knelt worshipers before curious coals of fire like glowworms in the weird, dark interior. A private museum on the Zuloaga grounds reveals El Greco, Velasquez and Goya whose torch Zuloaga keeps burning brightly. The artist himself lives in a flower-covered house set on a narrow strip of land between mountains and sea.

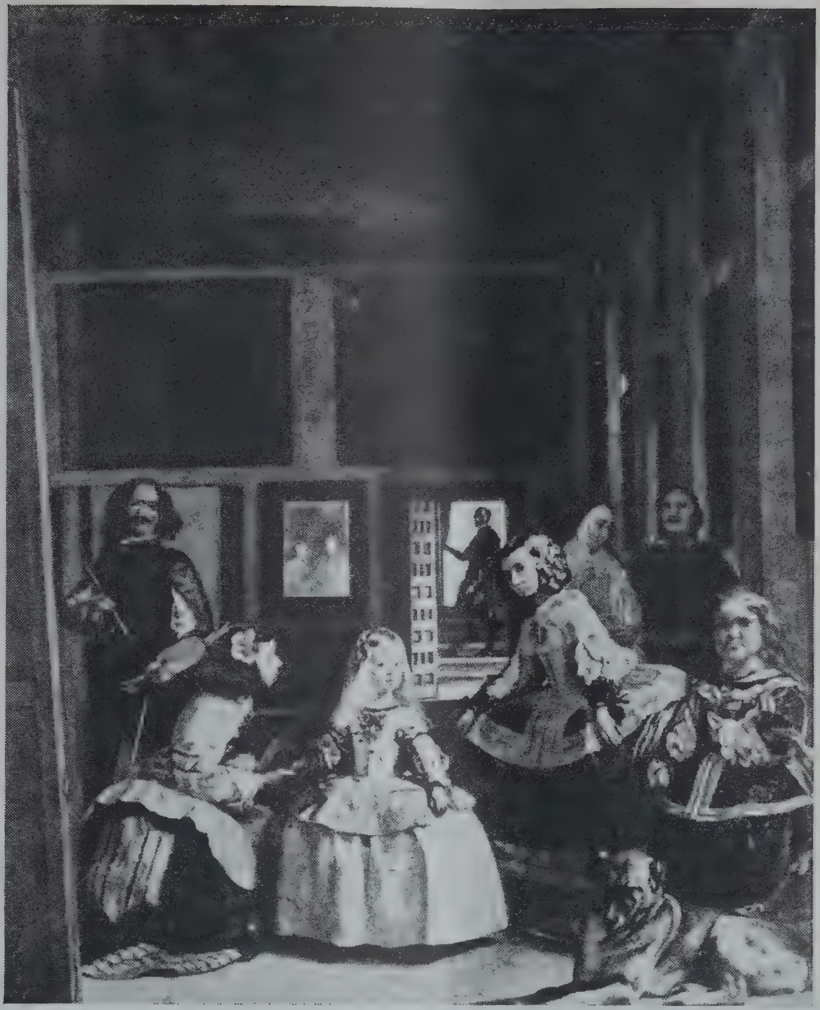
Toledo is the place in which to study the Moorish. Often called the 'oldest Spanish City' it has an opulent cathedral on the site of a Sixth Century Visigothic temple. In the sacristy we saw El Greco's magnificent 'Expolio,' wherein Christ is being stripped on Mount Calvary, the blood-red robes and the ivory flesh interpreting the sacrilege against the spotless Saviour. In burning color, dramatic light and drawing that ranged from the academic to the 'distorted,' El Greco re-created the soul of Spain, the ecstatic religious and spiritual attitude which scarcely permitted one to remember that, after all, humanity is partly of the earth. His people try to free themselves from such bonds.

A museum of El Greco's pictures is a significant attraction in Toledo. Still more so is the artist's house, emanating the atmosphere of a perfect home. About a court open to the blue sky, its walls are adorned with sculptured panels, wrought-iron grills and inlaid wooden doors. At just the right place, ample jars and climbing vines increase enchantment.

MADRID'S Prado Museum reveals completely the brilliant story of Spanish painting, from eclectic or colloquial primitives to Goya and his early followers. Here are Ribera's sentimental Magdalenes or melodramatic martyrdoms and a room of portraits and church themes by the intriguing El Greco. Another big gallery discloses Goya's positive personalities. There are 'Murillos' from dirty but delightful urchins eating melons or grapes to the 'Miraculous Works of Saints' and the 'Immaculate Conception,' for which he is justly famed.

The oval gallery filled with Velasquez canvases would alone more than repay a trip to Spain. There appear three superb equestrian portraits wherein he makes the king dominate an entire scene. His two greatest, the 'Maids of Honor' (Las Meninas) and the 'Spinners' (Las Hilanderas), would 'make' any gallery, of course. The former portrays the little Infanta well attended, the King and the Queen reflected in the mirror, and Velasquez himself painting on a huge canvas in the midst of the scene. For many reasons it has been called Velasquez's masterpiece, the 'Theology of Painting.' Personally, we prefer 'The Spinners,' wherein women in a complexity of direct and diffused light form a more colorful, dynamic, perfectly balanced and harmonized organization full of life and interest. Another picture there, 'Los Borrachos,' which should alone entitle Velasquez to a place among the immortals, depicts rough but handsome peasants in the open, drinking a toast, while their leader, garlanded and in the guise of Bacchus, places a wreath on the head of a neophyte. The whole is bathed in a glorious golden light.

How dignified, proud, aloof and aristocratic are his people, without vulgarity or too intimate familiarity between sitter and artist or public! Philip IV showed true greatness in patronizing Velasquez.



'Las Meninas,' by Velasquez. The artist himself is represented painting the Infanta. The King and Queen are reflected in the mirror.

One hurries through Cordova, staying as long as possible, however, in the glorious, arcaded mosque. This mosque with one thousand double superimposed horseshoe arches, alternately light gray and pink, has experienced much. In the Eighth Century the Moors had built on an old Christian site. After two hundred years of growth it had become the greatest of Mohammedan shrines. Then the Moors were ejected from Spain. The Catholics placed their own cathedral in the very center of the mosque, a colossal, crushing structure, trying vainly to outdo the Moorish success. Charles V, on beholding the clashing of these opposite architectural spirits, said, 'You Christians have built here what anyone could have built anywhere and have destroyed that which can never be replaced.' However, this conqueror did not practise what he thus preached; a little later he was to tear down the most glorious part of the Alhambra to make room for his own depressing Italian palace.

The southern part of Spain is both Spanish and delightful. Picturesque storks are quite prevalent. In one place we saw in the blistering sunshine of midday two successive lines of about five horses, each 'tearing around' in a circle on the hard ground of a threshing floor beating out the grain, while scores of storks looked down from housetops as if superintending the work.

SEVILLE, in genial Andalusia, has been called the Venice of Spain and with reason, for, though there is only a river connecting it with the sea, the air is balmy, the growth tropical and life prosperous and pleasant. The leisure class enjoys clubs, theaters, and bullfights, and driving along the many attractive routes in open carriages drawn by horses. In the heart of the city is the far-famed cathedral, the largest Gothic structure in the world, with a quiet Moorish patio and bell tower. Before the high altar the dances of the 'Seises' take place in connection with Corpus Christi Day.

If Seville offered a luxurious life, Granada was still closer to Paradise with its palaces of the Moors. The setting for the winter palace of the Alhambra is an elevated site looking from west to east;

King Solomon Discusses Us

By CHARLES D. CAMERON

A NEW kind of surprise awaits any man or woman who will open the twentieth book of the Old Testament.

He will find a writing more up-to-date than his newspaper and as local as his city hall.

Of making many volumes of adages and sayings there is no end. But these collections are localized and national and limited in time or place. In *The Proverbs* we do not find mere Hebrew wisdom, isolated and temporary, but an international insight, an everlasting common sense. They are not wisdom about life, but the wisdom of life itself.

In these days all educators, philanthropists and preachers are aghast at the violence of criminal gangs composed of young men. What leads these lads into robbery and murder? The writer of the first chapter of *The Proverbs* knew all about it:

> My son, if sinners entice thee, consent thou not.
>
> If they say, Come with us, let us lay wait for blood, let us lurk privily for the innocent without cause:
>
> Let us swallow them up alive as the grave; and whole, as those that go down into the pit:
>
> We shall find all precious substance, we shall fill our houses with spoil:
>
> Cast in thy lot among us; let us all have one purse.
>
> My son, walk not thou in the way with them; refrain thy foot from their path:
>
> For their feet run to evil, and make haste to shed blood:
>
> And they lay wait for their own blood; they lurk privily for their own lives.

This has in it volumes of criminology. In this way youth is still corrupted. In this way youths who go out meaning only to rob are involved in murder, because such gangs 'make haste to shed blood.' Solomon knew all about crime waves. He would have said that a crime wave is a folly wave and needs to be counteracted by a tide of reason. Who can say more?

A pleasant type of modern writing is that called 'inspirational.' All this mass of books and papers is like expansion and commentary for *The Proverbs:*

'He becometh poor that dealeth with a slack hand; but the hand of the diligent maketh rich.' Again, 'Go to the ant, thou sluggard.'

The best of these 'inspirational' works show a thrifty appreciation of independence. One proverb is: 'The rich man's wealth is his strong city: the destruction of the poor is their poverty.'

Still another has a grim bearing on all schemes and plots for hasty advancement: 'He that maketh haste to be rich shall not be innocent.'

In business transactions and in everyday life, we need again and again to be reminded: 'A fool uttereth all his mind: but a wise man keepeth it in till afterwards.'

And who that has observed life has not also observed: 'Even a fool, when he holdeth his peace, is counted wise: and he that shutteth his lips is esteemed a man of understanding.'

THE wise men of *The Proverbs* seem not to have missed observing any of the problems of our life, as individuals or as a race. We have not mentioned the ever-familiar sayings of meekness and sweetness, such as, 'A soft answer turneth away wrath,' and 'He that ruleth his spirit is better than he that taketh a city.' All that our best-bred ladies and gentlemen know of self-control can be discerned in this: 'The discretion of a man deferreth his anger; and it is his glory to pass over a transgression.' The book includes promises that a man diligent in his business shall stand before kings—it also includes words of vital value for all who are to be in social intercourse with the powerful. The etiquette of *The Proverbs* is as sound as its business counsel.

Though words of wisdom are thus valued, mere talk is not, for 'In the multitude of words there wanteth not sin.' The wise man is not a mere arguer: 'A prudent man concealeth knowledge: but the heart of fools proclaimeth foolishness.' And the sages of old could see as others of us have seen: 'If a wise man contendeth with a foolish man, whether he rage or laugh, there is no rest.'

One seems to be thrust into the midst of life, so that he sees one lesson after another.

The Proverbs announces itself as a book by which one may know wisdom. And the wisdom offered, though it deals with earthly affairs, is never presented in *The Proverbs* as a mere earthly sagacity. It is always a divine thing—it is proffered as being of like matter with the wisdom by which the Creator made the worlds!

This lifts *The Proverbs* far above all other proverbial collections, while still keeping the readers on the ground and in the street. The thought of the book is summarized in a title given to a commentary on it by a Scottish preacher of the last century: 'Laws of heaven for life on earth.' The book is offered as wisdom for the world, though not 'worldly wisdom.'

In the old Greek proverbs Aristotle thought he discerned fragments of primitive philosophies. *The Proverbs* are offered as wisdom itself. They are offered, also, as illustrative of Solomon's wisdom. It is evident that even in David's time a recognized proverb, a sort of condensed parable, could be cited in a public plea as a lawyer now cites a legal precedent. Thus David did before Saul. Of Solomon it was said that he knew three thousand proverbs. In the book called *The Proverbs* there are about four hundred. If Solomon knew all these, and twenty-six hundred more as telling, as universal, as perpetually true, we may say of his wisdom what the Queen of Sheba said, 'The half was not told me.'

THE wisdom for which the great king asked in his vision of the Lord at Gibeon was not a mass of mere learning and still less of the magical knowledge ascribed to Solomon by Mohammedan fables. He asked 'an understanding heart to judge Thy people,' the judicial wisdom of knowing right and wrong. Whether Solomon knew these same proverbs, or others like them, or more than these, the fame of his answers might well draw troubled minds to him from the uttermost parts of the earth. If anyone wishes to know why all men sought Solomon, let him go to this book today with his own questions: personal, domestic, political, religious, commercial, social—and let him read until he finds the proverb that deals with his matter—it is sure to be there.

Did Solomon himself really write the proverb which will give him his answer? The man will not know. He will not deem this so important. But he will know that 'on the lips of him that hath understanding, wisdom is found,' and that some such man of understanding set down these words for him and for all of us.

The Courting of Mary Todd

By WILLIAM E. BARTON

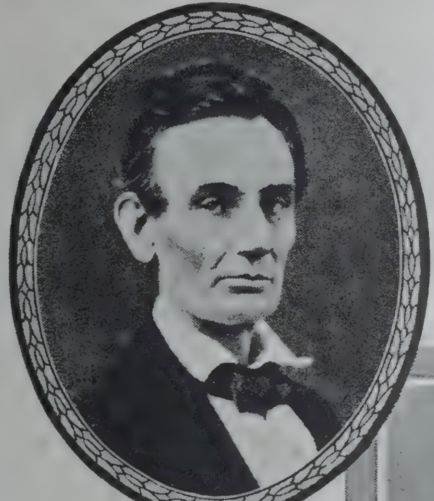
ON THE tenth day of October, in the year of our Lord, 1839, the Honorable Abraham Lincoln and certain other of the younger members of the state legislature of Illinois took a survey of the new state capital at Springfield, and decided that it was deadly dull. It lacked the charm of settled society which had belonged to the older community of Vandalia.

The session was to convene in Springfield, December 9, 1839. There was a grand ball in honor of the opening. There were printed invitations, as ostentatious as any that could have been produced in Vandalia. The caption 'Cotillion Party' was set in a curve that was a trick of high-grade job printers calling for the use of plaster of paris. Underneath was a spread-eagle, with the motto, '*E Pluribus Unum.*' The invitation read:

> The pleasure of your company is respectfully solicited at a Cotillion Party, to be given at the 'American House,' on tomorrow evening at 7 o'clock, P.M., December 16, 1839.
>
> M. H. Ridgely
> J. A. McClernand
> R. Allen
> W. H. Wash
> F. W. Todd
> S. A. Douglas
> W. S. Prentice
> N. W. Edwards
> J. F. Speed
> J. Shields
> E. D. Taylor
> E. H. Merriman
> N. E. Whiteside
> M. Eastman
> J. R. Diller
> A. Lincoln
> Managers.

We do not seem to miss any names from that list of men who ought to have been managers. But the real manager of that ball arrived a little late, with her sister Elizabeth. When the younger Todd girl entered the room, a plump, vivacious little woman, dressed within an inch of her life, her changeable silk dress standing out over seven or eight flounced or starched white petticoats, there was not a man who did not turn and look at her.

Mary Todd had arrived. If there was a young man in Springfield who did not propose to her within six months, it was because he considered that it would be of no use. She left behind her a long line of broken hearts, and came very near to breaking her own in the process.



The Abraham Lincoln of the early 1850's.

Mary Todd was born in Lexington, Kentucky, December 13, 1818, a daughter of Robert S. Todd, of Lexington. She had a stepmother and for that reason came to Illinois to make her home with her sister Elizabeth. Mary Todd had lovers enough, and admirers still more. For she was more brilliant than lovable, and more witty than wise. She had studied under Madame Mentelli, and spoke French fluently. She was a gay conversationalist and a vivacious correspondent.

—*Ewing Galloway.*

The Edwards home, where the Todd-Lincoln nuptials took place.

One thing Abraham and Mary did in Springfield. In the autumn of 1840 they saw the elephant. For two days, October 8 and 9, a menagerie and circus were in Springfield. The *Journal* had a two-column cut showing an animal declared to be of that species, and a gigantic male elephant was actually there, the first ever seen in Springfield. There was a giraffe and a Bengal tiger. There was ropewalking and trapeze work, and a display of horsemanship, and an exhibit of the new dance known as the waltz. And Mr. Lincoln and Miss Todd were among those present.

—*Albert Davis Collection.*

Mrs. Lincoln and two of her sons.

The fact that other men wanted her was an added incentive.

Mary Todd had encouragement in her own family. Her sister and her brother-in-law, Edwards, had known Lincoln ever since their arrival in Vandalia. Lincoln and Edwards were personal and political friends. And, while Lincoln lacked social graces, he was a rising politician and a man of the very best moral character.

To the surprise of many people he

courted Mary Todd and won her.

He called at the Edwards home, not as regularly as Mary could have wished, and he took her out less frequently than she desired. When he called he sat almost silent while she, a brilliant talker, chatted to him. Once in a while, though she liked to do more than half the talking, she wished he would talk more. He could talk with men; he often spent with them evenings she could have wished him to spend with her.

Impression of the Lincoln-Douglas debate, from an old drawing.

And that brings us to the perplexing problem of what Lincoln in one of his letters to Speed calls 'the fatal first of January, 1841.'

It is affirmed by many people that it was the date set for the marriage of Abraham Lincoln and Mary Todd, and that he deserted her at the altar. It need not have been so bad as that. The fatality may have been at a New Year's Eve party, and he may have kissed another girl when the lights were out at midnight. It may have been that he offended her by some act of what she thought impropriety at the Edwards' New Year's reception. He may not have paid her as much attention as she thought due her on the night of the New Year's ball. We simply do not know what it was that made the first of January, 1841, a fatal date. The newspapers of Springfield have been scanned line by line to discover a social event whose character or location might have given rise to a quarrel.

The testimony of Mrs. Edwards, as related to Herndon, was:

'Lincoln and Mary were engaged; everything was ready and prepared for the marriage, even to the supper. Mr. Lincoln failed to meet his engagement. Cause, insanity.'

It is undeniable that something happened to mark what Lincoln called 'the fatal first of January, 1841.' It was something in which he felt that he had caused the deepest pain to Mary Todd, and he blamed himself for it with a merciless and desperate self-castigation. On January 23, 1841, Lincoln wrote to Joshua F. Speed:

'I am now the most miserable man living. If what I feel were equally distributed to the whole human family, there would not be one cheerful face on earth. Whether I shall ever be any better, I cannot tell; I awfully forebode that I shall not. To remain as I am is impossible. I must die or be better, it appears to me.'

There is no escaping from the import of these incidents and letters. The first day of January, 1841, was a day when Lincoln and Mary Todd parted under most unhappy circumstances; and the memory of it made him ill and nearly drove him frantic.

It does not appear, however, that the preparations had gone so far as a formal announcement of the wedding. There would surely have been some public announcement, some documentary proof in the form of card of invitation or newspaper announcement.

One thing we know, which is that Lincoln's mind was of such a cast, and his circumstances in life at that period were such that, had he proposed to any woman and been accepted by her, he would almost immediately have reacted into sad contemplation of his debts and his slowly growing practice, into doubts whether his services in the legislature had stood for anything but the ruin of the state, into serious misgivings whether he had laid or was likely to lay any foundations upon which he could hope to build a successful life, and, consequently, whether he had not committed an irretrievable blunder for himself and an unpardonable sin against the lady in asking her to share his hopeless future. In case of Mary Todd, this situation was aggravated by the sharp contrasts between them, and the quarrels that now and then arose.

From 'the fatal first of January, 1841,' till late in the autumn of 1842, Abraham Lincoln and Mary Todd kept apart. He had paid brief attentions to Matilda Edwards, and had had a little affair with Sarah Rickard, and found no more rest than Noah's weary dove. He was rather more than ready to pluck an olive branch and fly back to the ark. Mary, too, had had her share of gayety, and Abraham heard of it and thought he was glad, but deep down in his heart he was not happy about it, and she, if anything, was even less happy than he. These two people, who were divinely created to irritate each other, were also constituted in such fashion as to be necessary to each other's comfort and peace.

Two matters occurred to help in bringing them together after the breaking of their engagement. One was Lincoln's correspondence with his friend Joshua F. Speed. Speed had been in love and hesitated much as Lincoln did; but Lincoln had encouraged him to go on and be married. Speed married and Lincoln wrote to him, asking questions such as one man seldom asks another. Speed answered these questions frankly, and in a manner wholly to his credit. He assured Lincoln that his misgivings had been largely imaginary, and that his married life was happy beyond his expectations. Lincoln believed that Speed would not lie to him in so grave a matter, and Speed's letters had weight with him, and exerted no small influence in reuniting Lincoln and Mary Todd.

The other affair concerned a prank of Mary Todd and a friend, Miss Julia M. Jayne, afterward her bridesmaid, and still later Mrs. Lyman Trumbull. Lincoln had written for the Sangamon *Journal* an article entitled, 'Letter from Lost Townships' and signed 'Aunt Rebecca.' This article held up to public ridicule James Shields, an Irishman, prominent in

Springfield politics and a rival of Lincoln's. The article excited much mirth, for Shields, though a man of ability, was one whose characteristics easily lent themselves to ridicule. Simeon Francis might have hesitated to publish an article so certain to provoke wrath, had he not been a warm personal and political friend of Lincoln.

Mary Todd, the future wife of a President, and Julia Jayne, the future wife of a senator, wrote a second article, in which the satire was carried further, and they signed it with the same name, 'Aunt Rebecca.' This also was published in the *Journal*. Shields, angered by the first, was infuriated by the second article. He sent a friend to Francis demanding the name of the author of the two articles. Lincoln was out of town and could not be consulted. Francis, compelled to reply, and feeling sure that Lincoln would wish to shield the girls, gave Lincoln's name.

Shields, accompanied by a friend, followed Lincoln to Tremont, where Lincoln was attending court, and challenged him to a duel. Lincoln, after some attempt to avert such a proceeding, accepted the challenge. Happily, the duel was called off by the good offices of their friends, but not before the affair had become public, to Lincoln's subsequent great mortification. He had the good sense to be heartily ashamed of his part in the whole matter. Mrs. Francis was an intimate friend of Mary Todd. This matter, which had coupled the names of Mary and Lincoln in much public talk, proved Mrs. Francis' opportunity to bring the two together. They had a number of secret meetings at the Francis house; and at length reached a swift agreement to be married at once, with no more nonsense about it.

The next day was Friday. It was not a day which either Lincoln or his bride would have chosen for a wedding, for both were superstitious, but they feared nothing now so much as a delay, in which each would have opportunity to permit the resolution to be 'sicklied o'er with thought.' The Springfield records contain the license, issued November 4, 1842, with the return of the minister, the Reverend Charles Dresser, certifying that on the same day he married Abraham Lincoln and Mary Todd. The only contemporary newspaper reference is in the *Journal* of the following week, November 11, 1842, and may have been written by Lincoln himself. It is very brief and precise, as follows:

> MARRIED: in this city, on the 4th. instant, at the home of N. W. Edwards, Esq. by the Rev. Charles Dresser, ABRAHAM LINCOLN to MISS MARY TODD, daughter of Robert S. Todd, Esq. of Lexington, Kentucky.

Lincoln and his bride secured quarters in the Globe Tavern, and there lived for a considerable period. They paid two dollars a week each for room and board. There they remained until after the birth of their first child, who alone, of their four sons, lived to manhood, Robert Todd Lincoln; born August 1, 1843, and died July 26, 1926.

The first year of married life of the Lincolns was far from being free from care. The prospect of maternity was immediate, and the Lincolns prepared for the coming of the baby. On July 26, 1843, in an unpublished letter, Lincoln said to Speed:

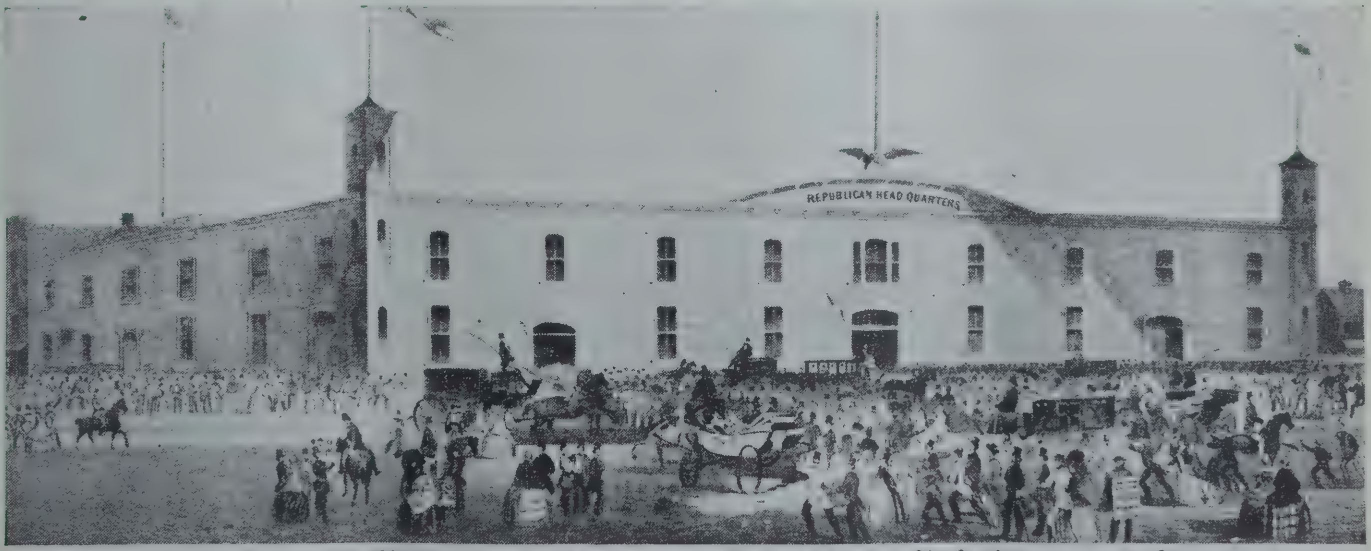
'We shall look with impatience for your visit this Fall. Your Fanny cannot be more anxious to see my Molly than the latter is to see her, nor so much so as I am. Don't fail to come. We are but two, as yet.' Only four days longer were they two. This is Lincoln's only contemporary reference to the increase in his family. It is as laconic as that which he sent to Sam Marshall of Shawneetown just a week after Lincoln's wedding: 'Nothing new here, except my marrying, which to me is a matter of profound wonder.'

He had not much time to sit down and wonder about it. Even four dollars a week for board is an item, and there were other expenses. If Dr. Henry was the physician who ushered the new baby into the world we may be sure that he took his fee in political expectations, for he was a good Whig and Lincoln was trying hard to get him the postoffice as a means of livelihood.

At this he did not succeed any too well. His partner, Stephen T. Logan, was trying hard to go to Congress and wanted Lincoln to attend to the law business while the senior partner made stump speeches, but Lincoln preferred to look out for politics on his own account. Lincoln drove Logan out of the running, but had himself to reckon with other rivals.

He wrote to a friend in March, 1843, 'If you should hear anyone say that Lincoln don't want to go to Congress, I wish you, as a personal friend of mine, to tell him you have reason to believe he is mistaken. The truth is, I would like to go very much.'

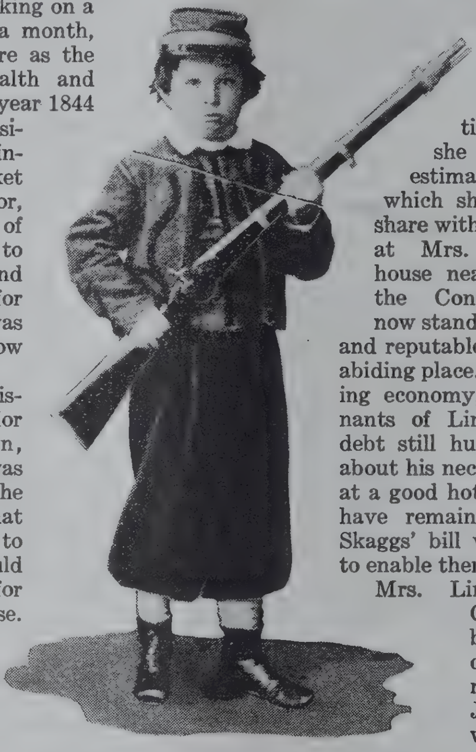
There was a sort of Whig primary in Springfield, and he and Edward Baker were the leading candidates, but as the voting went on, Baker came to Lincoln, and proposed that the balloting cease, and Lincoln was glad to accept the suggestion. Baker had beaten him badly and was generous enough to be willing not to advertise the extent of Lincoln's defeat. For him Lincoln named his second son, Edward Baker Lincoln, who was born March 1, 1846, and who died February 1, 1850.



Republican Wigwam, capable of accommodating 10,000 persons. Dedicated May 12, 1860, for the convention in Chicago.

But when the district convention was held, though Lincoln went as a delegate instructed to vote for Baker, and did so, the winning candidate was John J. Hardin, thus many well-laid plans went wrong that year.

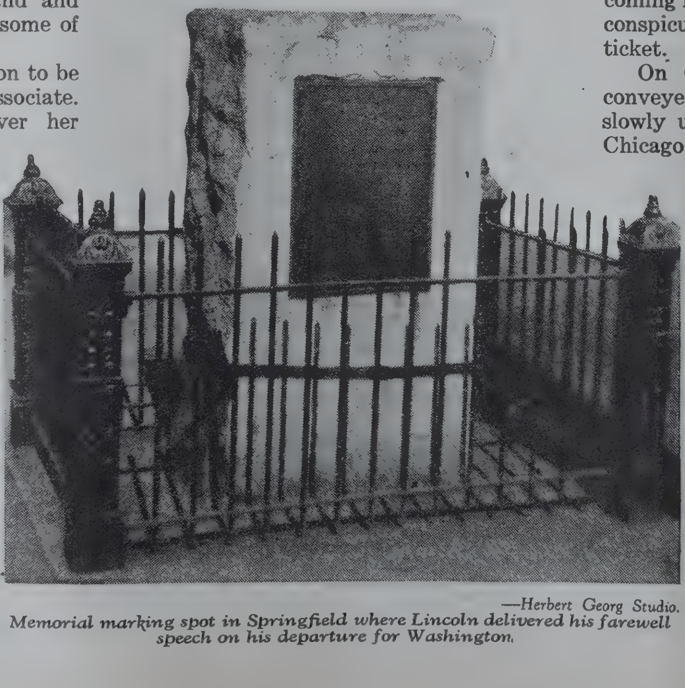
And now Lincoln made a sad discovery; his marriage had not thus far helped him politically. There was a certain prejudice against the aristocratic families of Springfield, and Lincoln had to explain that he did not belong to the silk-stockinged class. 'I, a strange, friendless, uneducated, penniless boy, working on a flat-boat at ten dollars a month, have been put down here as the candidate of pride, wealth and family distinction.' The year 1844 brought the next presidential election, and Lincoln was on the Whig ticket as a presidential elector, and stumped a portion of Illinois, and also went to his old home in Indiana and made stump speeches for Henry Clay. But Clay was not elected, to the sorrow of Abraham Lincoln.



Thomas ('Tad') Lincoln when he was eight years of age.

In 1843 Lincoln's disagreement with his senior partner, Judge Logan, reached a crisis. It was practically certain that the Whig nominee from that district would be elected to Congress and Lincoln would not step out of the way for Judge Logan or anyone else. The partnership was broken off on September 20, 1843, and Lincoln chose a new partner, William H. Herndon. Herndon was the son of an influential proslavery man, but had been a student of Illinois College, where he became an Abolitionist. He was younger than Lincoln. He was impetuous, and a very good judge of human nature. He had more initiative than Lincoln, and was much more given to diversified reading. He was a prolific correspondent and his letters from Theodore Parker and other eminent men in New England and New York kept him in touch with some of the leading minds of his generation.

All in all Lincoln had much reason to be thankful for such an assistant and associate. Mrs. Lincoln was not happy over her husband's choice; she did not like Herndon. Her feeling of repugnance dated from their first meeting. At a ball in Springfield, she danced with Herndon in that new and fascinating movement called 'the waltz.' Herndon greatly admired the lightness of her step and the precision of her rhythm; he attempted to pay her a compliment. He should have said, 'You glide through the waltz like a bird,' but unfortunately he said, 'You glide through the waltz with the agility of a serpent.' She resented the simile and ever afterward disliked Herndon. Although Herndon was a good lawyer and his qualities were such as to supplement those of Lincoln, his personality was offensive to her. When she entered her husband's office, she walked straight by Herndon, and was careful to hold her skirts a little aside. She never made a worse mistake. If Mrs. Lincoln had treated Herndon with a little more consideration, the world would never have heard of Ann Rutledge.



—Herbert Georg Studio.
Memorial marking spot in Springfield where Lincoln delivered his farewell speech on his departure for Washington.

Mary Todd Lincoln was a happy woman when the November election showed her husband to be the new member of Congress from his district; she was going to Washington, where she was certain she would be a society belle; she had no doubt that her husband would go on from one position to another and she set no limit in her estimation as to the honors which she might ultimately share with him. They boarded at Mrs. Skaggs' boarding house near the place where the Congressional Library now stands. It was a pleasant and reputable but rather modest abiding place. They were practising economy, for the last remnants of Lincoln's New Salem debt still hung like a millstone about his neck. If he had put up at a good hotel, that debt would have remained unpaid. Mrs. Skaggs' bill was modest enough to enable them to get out of debt.

Mrs. Lincoln visited the Capitol with her husband and he pointed out to her the great men who were there: John Quincy Adams, who had been President of the United States, Daniel Webster, John C. Calhoun and Alexander H. Stephens. On the whole her Washington experience was a disappointment. The wife of a new member of Congress filled no very large angle in Washington society. Mrs. Lincoln did not have the social standing or the dry goods necessary for distinction; she was an interested onlooker, but she subsided into inconspicuous obscurity. However if she saw in that one term in Congress that her husband was not enough to give her standing in Washington, she also saw that the star of the Whig Party was in the ascendant.

Willie Lincoln at the age of eleven years.

Congress adjourned August 4, 1848. Mr. Lincoln went to New England to make speeches on behalf of General Zachary Taylor, when in February he had helped nominate at Philadelphia a Whig candidate for president. He made most earnest arguments on behalf of Taylor and returned to Illinois by way of the Great Lakes. At some point on the return route Mrs. Lincoln joined him; apparently she had remained in Washington during the New England trip and met him in New York.

It had become certain that Lincoln would not be asked to succeed himself in Congress, but he was not feeling very bad about that. The Whigs were very certainly coming into power and Lincoln had rendered conspicuous service for the party and its ticket.

On October 5, 1848, the boat which conveyed Mr. and Mrs. Lincoln steamed slowly up the mud-clogged channel of the Chicago River, and they walked down the gangplank, and put up at the Sherman House. To her great delight their arrival was not without recognition. A committee of Whig politicians awaited her husband and asked him to deliver a political speech the next night in the courthouse. Lincoln was happy to accept the invitation. Handbills were printed and circulated, and with only thirty hours' notice the town of Chicago was made aware that the Honorable Abraham Lincoln, who was returning from a successful campaign in New England, would address the citizens of Chicago on the political issues of the day.

The courthouse was packed, and Mary Todd Lincoln sat in the audience and heard her husband, who was almost a stranger in Chicago, applauded to the echo. They went back to the Sherman House after the evening's entertainment and sat and talked awhile before they went to bed. The future had never seemed more rosy. The days of their Springfield residence were numbered, Taylor would surely be elected and Abraham Lincoln already knew just what office he wanted and what he thought he would get. He wanted to be Land Commissioner of the United States. If he secured that position he and his family would have a permanent residence in the capital of the nation.

Zachary Taylor was elected, but the influence of Daniel Webster secured the land office for Justin Butterfield. Lincoln was so distressed that he made a special trip to Washington in a desperate effort to secure the land office; he did not succeed. Moreover, he found that his objections to the Mexican War had brought upon him and his party so much criticism that while Judge Logan secured the Whig nomination for Congress and while the Whig ticket in general went into office with Zachary Taylor, Logan was defeated—as he believed, largely on Lincoln's account.

It was a cruel home-coming for Mary Todd Lincoln; all her political hopes and social ambitions seemed to be at an end. There was nothing to do now but to live in Springfield and make the best of it. With many tears, as we must surely believe, and yet on the whole, with a courageous heart, and an ambition that, if hurt, was not killed, she set herself to her unwelcome task.

THE services rendered the new Whig administration by Abraham Lincoln did not go wholly unrecognized. 'Old Rough and Ready' Taylor died too soon after his inauguration to look up a suitable office for him, but Millard Fillmore promptly tendered Lincoln the secretaryship of Oregon, which was virtually a territorial governorship. Lincoln was so discouraged he was tempted to accept this consolation prize, reflecting that Oregon would soon be a state and he might hope to be one of the first senators therefrom after its admission to the Union. That was precisely what had occurred in the case of old Governor Ninian Edwards. He was territorial governor of Illinois, one of the original senators from the new state, and then returned to be governor. But Mrs. Lincoln vetoed the proposition to go to Oregon. She had faith in her husband's political future after he himself had lost it. In Springfield they remained.

Whatever faults Mary Lincoln had, she was not indolent; she looked well to the ways of her household. She was an excellent seamstress and made most of the clothing for her children; she was a most affectionate mother, though too excitable to be always a good one. Her home was well-kept. Lincoln had difficulty in living up to her standards of propriety. It was not easy for him to restrain himself from going to the front door in his shirt sleeves, welcoming in the neighbors and excusing himself till he could 'trot out the womenfolks.' Only by degrees did he learn that he must let the 'hired girl' open the door, and that he must not put his own knife into the butter. Mary Todd Lincoln wanted an aristocratic home; it is said in Springfield that while Lincoln several times visited his father and stepmother in their home his parents were never invited to visit Mrs. Lincoln in her home.

In 1854 the repeal of the Missouri Compromise brought Lincoln back into politics. Again his wife had a vision of life in Washington, for there was a time when it seemed that her husband was to become United States senator. So sure was Mary Todd that her husband was to be nominated, that she and Elizabeth Edwards prepared a great reception to be given to Senator-elect and Mrs. Abraham Lincoln on the night when the two houses of the Illinois general assembly, in joint session, were to have elected him United States senator. That honor did not come to him nor to her. Lyman Trumbull and his wife, who was Miss Julia Jayne, and who had been Mrs. Lincoln's bridesmaid, received the honor which Lincoln failed to get. The reception at the Edwards house was given in honor of Senator and Mrs. Trumbull, but Mr. and Mrs. Abraham Lincoln stood beside them in the receiving line.

DISAPPOINTMENT had come again to Mary Todd Lincoln, but her spirit was unconquered; she still believed that honor might befall her and her husband, and that good fortune would ultimately return them to Washington.

In the summer of 1858 Lincoln formally entered the lists as a candidate for senator against Stephen A. Douglas. The campaign which ensued was one of the most brilliant and picturesque in the history of the United States. There were processions and brass bands, cannon and fireworks. The most notable incident of the campaign was a series of joint debates between Lincoln and Douglas. In November it was found that the legislative choice gave Douglas a very small majority. For the second time Lincoln failed in his attempt to become a United States senator; yet he failed so narrowly as to give him promise of a successful political future. His popularity was growing, his name was becoming known outside the limits of the State of Illinois. Mary Todd Lincoln every now and then repeated to her friends what she said when she married her tall husband; namely, that while he was not a handsome man, he would some day be President of the United States.

SWIFTLY passed the months between the Lincoln and Douglas campaign and that of the election of 1860. Abraham Lincoln went to New York City and delivered a notable address at Cooper Union. He went on to New England and gave another series of addresses, which increased his reputation as an orator, a thinker, and a man of coming power. The political convention of 1860 was arranged to be held in Chicago, the great city of Lincoln's home state. He was far from being the most prominent candidate. William H. Seward held that place, and next to him stood Salmon P. Chase, but Lincoln, though a minority candidate, was in a strong position as a possible dark horse. Nothing happened that summer in the political arena which passed Mrs. Lincoln's observant eye. She was the most interested of all those who believed in the tall Illinoisan. In all the ups and downs of his career which had in it no little of disappointment she steadfastly believed in him.

On the concluding day of the Chicago convention a telegram was received, stating that on the third ballot Abraham Lincoln had been nominated as President of the United States. A hundred evenings he had sat at the grocery store, swapping stories and apparently forgetting that he had a wife or a home, but in that high hour he hardly waited for the first congratulations of his friends. 'Excuse me, gentlemen,' he said, 'there is a little woman down on Eighth Street who is interested in the result of this convention. I want to go and tell her.' She knew before he got there, for the neighbor women had rushed in and brought her the information. No record exists of the manner of their greeting; it was decorous, without doubt, for Mr. and Mrs. Lincoln were not alone; but then, or later in the day, we cannot doubt that he took the plump little woman in his great arms and told her she was entitled to her full share of credit for the honor that had come to him.

There came in due time the day when Mary Todd Lincoln and her husband boarded a train for Washington, and he was never to return. They had rented their house and spent the last few weeks of their stay in Springfield in the Chenery House. It cost them more than the four dollars a week when they lived in the Globe Tavern, but still their expenses were not large, and their manner of living was modest. On the night before they started for Washington, their trunks were brought down into the office of the hotel, and Mr. Lincoln, with his own hands, carded them. He took some cards of the hotel, and wrote on the back, 'Lincoln, White House, Washington, D. C.' and tacked them on the trunks. Then he went upstairs and he and Mary Todd Lincoln and the three boys—Robert who was in the East at school had come home to accompany his parents to Washington—spent their last night in Springfield together.

NEXT morning, Monday, February 11, 1861, the day before Lincoln's fifty-second birthday, Mr. and Mrs. Lincoln entered the rickety old hotel bus and rode in a drizzling rain to the old Great Western station, where the car in which he and those who were to go East with him stood on a spur track, with a group of neighbors and friends assembled about it. Just before the train pulled out, Mr. Lincoln appeared on the rear platform, and in a voice that he could with difficulty control, said:

'My friends: no one not in my situation can appreciate my feelings of sadness at this parting. To this place, and the kindness of these people, I owe everything. Here I have lived a quarter of a century and have passed from a youth to an old man. Here my children have been born and one is buried. I now leave, not knowing when or whether I may ever return, with a task before me greater than that which rested upon Washington. Without the assistance of that Divine Being who ever attended him, I cannot succeed. With that assistance, I cannot fail. Trusting in Him who can go with me and remain with you and be everywhere for good, let me confidently hope that all may yet be well. To His care commending you, as I hope in your prayers you will commend me, I bid you an affectionate farewell.'

He reëntered the car, choking with his tears. The train moved, and the old friends of Lincoln and his wife went home in the rain, and wondered how the Lincolns would enjoy life in the White House. Frequently the train stopped and Lincoln made short speeches. Once, at least, before going out, he lifted Mary to the car seat, and she 'fixed him up' a little before he showed himself.

But he grew more serious as he neared Washington and ended the journey under stress of a warning that sent him into Washington by night and attended only by a single companion, Ward Hill Lamon. It was an inglorious ending of a none-too-brilliant tour. But at length it ended. Mr. Lincoln took the oath of office and the Lincolns found themselves at home in the White House. Then Washington stood agape, and at the first public reception there entered the room a very tall man with a little plump woman on his arm, and Mr. Lincoln said, 'Ladies and gentlemen, here is the long and short of the Presidency.'

Mary Lincoln had arrived. She had refused the most brilliant man in Springfield under the conviction that he would never be anything more than a senator, and she wanted to be the wife of a president.

Spanish Spirit in Painting

(*Continued from page 13*)

for miles to where finally a mountain range incloses the slightly rolling expanse of plain and the city of Granada is at one's feet. To northwest is the summer palace, the beautiful Generalife, to northeast the Sierra Nevada in eternal snow.

When the Moors were ejected from Cordova they retired to the great stronghold and palace in Granada. The Alhambra reflects the brilliancy of the Moors with its lion-fountain court, a throne room of over one hundred and fifty-two designs in raised and perforated arabesques of primary colors, halls with stalactitic honeycomb vaulting, and pools reflecting horseshoe arches or tiled domes of rainbow hues. It is wrought in the magic of a 'goldsmith' architecture, more like a dazzling piece of jewelry than an abode.

No wonder Boabdil wept when he had to leave the Alhambra to others, even though his mother taunted him by saying, 'Weep not like a woman for what you could not defend like a man.'

Toward the northwest again is Aragon, the battle ground of Spain, and also the region of Goya, himself a fighting painter. He did much to clarify to court and people the terrible conditions of the day. He satirized by lurid color and dramatic lighting the court and other phases of life such as the bullfight—the worst thing on earth next to war. At La Mancha are the windmills that Cervantes mentions in *Don Quixote*.

We left Spain via Barcelona, a city of modern, even modernistic, thought, life and art. But still it has the most mystic cathedral in the world to me.

Although Spain is too rapidly approaching a Twentieth Century aspect, a sense of the primitive is still quite prevalent there. Wild scenery, ancient monuments, unsophisticated mankind, attract the visitor to this land of adventure and art, of African and Berber, of Moor and Christian.

Horses, Judges *and* Judging

By WILF P. POND

IT IS one thing to look at a horse show, and quite another to understand what is going on. Even if one is conversant with the rules and regulations laid down for the direction of the judges, there are still many irrational complications. Nothing is more needed in the horse-show world than a new list of carefully remodeled rules, with several new rules added.

How many people have any idea of the eccentricities possible under a strict administration of the popular 'touch-and-out' in an obstacle test? If a contestant 'touches' a fence with any one of its legs or feet, it is automatically retired from the contest, which continues until all but the winner have been eliminated. The title 'touch and out' supplies the rule. A horse is at liberty to refuse any jump (a cardinal fault in most jumping and hunter classes), to act atrociously, throw its rider, lie down in the ring, roll over and play dead, and yet, if the fences are cleared without a touch, no rule retires the horse; and, further, if the owner of such an ill-performing animal should care to make a protest to the last court of horse-show appeal, goodness only knows what would be the result!

How much easier and more satisfactory it would be if the event were called 'fault and out,' with the 'faults' set forth in the rules. The 'faults' would be: touching the fence with fore or hind feet; refusing to jump; a fall by either horse or rider whether at a fence or not.

In most catalogs too little time is accorded this event. At a recent national gathering it was given fifty minutes with no less than sixty-one contestants; several of them made perfect scores and so had to be sent around again until all but the winner had committed 'touches.' This, naturally, threw all the following classes behind; everything was late, the final contests being witnessed mainly by empty boxes.

The judges should order only four fences for those 'tied' at perfect scores; if more ties ensue, the cash prizes should be divided; and if the prize is a trophy it should be left to the owners of the horses to come to agreement. Recently, horses went over thirty-two fences before the final tie, which unnecessary hard work-out incapacitated both animals for the remainder of the show.

UNDOUBTEDLY the public desires to see hunters jump fences. If so, why must we have the wearisome, time-wasting examination of each class for what is called 'conformation,' or classification according to bodily symmetry and to types of disabilities that militate against a horse's going well across country. Audiences yawn, and also those judges for whom the novelty of being the central figure in the ring has worn off. There is no reason why an early morning class should not be called and each horse given a percentage figure representing the value of its 'conformation,' this decimal to be added to other points when the actual classes are judged.

This is important when it is remembered that horse shows are largely educational, and that it was the national gathering in New York which, upward of half a century ago, taught American horsemen what is correct and what incongruous in horse equipment, and in carriages and other vehicles.

An illustration of what perfect manners are in a riding horse may be instanced in the mount of the wife of an ex-master of the famous Meadow Brook Hunt of Long Island. She rode this horse (which, by the way, was bred, raised and broken by her husband) into the national ring, and took the regulation fences and then the pen jump, clearing all perfectly. Now, in the pen jump, the horse is taken over the front fence, turned quickly as soon as he lands inside the pen, and then jumped out over the side fence; the fences are four feet six inches in height. Having noticed something peculiar about this exhibit, I went to meet the lady riding out of the ring, to find the horse had no bit in its mouth but had been ridden on the bridle headpiece through the trying test.

An amusing incident at the important Brockton gathering was when two very well-known champion horses were antagonists. The lady owning one of them disagreed with the judge, not hesitating to tell him so; she also said that she would never exhibit before him again. The judge, however, was perfectly correct, and said with a smile: 'Madam, these two horses have now met four times this season; on the other three occasions, as the judges were not agreeing, I was called in as referee; in each of the three cases I gave the verdict in favor of your horse. Today, however, I cannot do so; your horse is not going as well as usual.'

IN ANOTHER case there was a very nervous mare, winner of several championships, which had to be handled 'just so,' as the saying is. One day the judge mounted to ride, and the first thing he did was to pick up the curb rein. Away went every chance of the mare winning! Yet the exhibitor could do nothing, say nothing. If the judge had not mounted the mare she would probably have been awarded the blue. The judge is a man with years of experience, and has bought and sold many horses.

Nearly every loser wishes the judge to tell him exactly why his horse did not win. If the judge is foolish enough to say: 'Oh it was straight and too long in the pasterns,' or something of that sort, the exhibitor makes a bee line to the man who sold him the horse; the seller hints that he has seen the judge dining with the owner of the winning horse—and away go reputations all along the line.

As a matter of fact, every sympathy should be shown judges; and the greatest care should be taken to make rules clear and plain. These men are men of standing; they give time, work, and knowledge without expecting or receiving pay; and yet there are few horse-show committees who will back them up when trouble arises, though the judges may be in the right. Judges should have the admiration of the more sensible and sportsmanlike element connected with horse shows.

The Great Lakes-St. Lawrence Ship Channel

By D. M. LeBOURDAIS

—Ewing Galloway Photos.

Rapids in the channel about fifty miles southwest of Montreal.

THE proposal to improve the St. Lawrence River, so as to enable ocean-going vessels to proceed to the head of the Great Lakes, has been referred to by competent persons as the greatest economic project of the 20th Century.

This matter has been discussed for a good many years, but the fact that a considerable portion of the proposed improvement lies wholly within the Dominion of Canada is no doubt responsible for the failure to get beyond that stage. In 1909, however, an international joint commission composed of three members appointed by Canada and three by the United States was given jurisdiction over waterways common to both countries, and for the first time provided an avenue whereby this problem might be approached.

In 1919 the Great Lakes-St. Lawrence Tidewater Association was formed, not of individuals but of states, and included Illinois, Michigan, Minnesota, Wisconsin, Iowa, Ohio, Indiana, North Dakota, South Dakota, Idaho, Montana, Wyoming, Colorado, Nebraska, Missouri and Washington, whose legislatures made financial contributions toward the cost of educating the public to the great possibilities of the Great Lakes-St. Lawrence scheme. The Mississippi Valley Association with twelve member states has been coöperating with this organization, making a total of more than half the states in the Union in favor of a great natural outlet to the sea.

The portion of the United States which can be most economically served from ports on the Great Lakes comprises about one-third the total area; approximately one-third its population; a similar proportion of its wealth; and one-third to one-half its productive capacity. From this area come the following percentages of the country's staple products: Corn, 65; wheat, 74; flax, practically 100; cattle, more than 50; hogs, 57; horses, 60; butter, 54; eggs, 54; cheese, 57; apples, 21; beet sugar, 53; wool, 47; coal mined, 36; coal reserves, 72; copper, 39; lead, 46; iron ore, 85; and zinc, 74 per cent. It comprises the greater part of the states of Montana, Wyoming and Colorado; all of North Dakota, South Dakota, Nebraska, Kansas, Minnesota, Iowa, Missouri, Wisconsin, Illinois, Indiana, Kentucky, Michigan, Ohio and West Virginia; as well as the western portions of Pennsylvania and New York. An area similar in extent lies adjacent to the Great Lakes in Canada.

In the manufacturing field, too, the area economically tributary to the Great Lakes holds a high place. Illinois, for instance, is the third state in the Union from a manufacturing standpoint, being surpassed in this regard only by New York and Pennsylvania. It leads all states in the slaughtering and meat-packing industry—which also takes a leading place in Indiana, Iowa, Kansas and Missouri; it also leads in the agricultural implement and zinc smelting and refining industries. Ohio is the fourth manufacturing state, leading all others in the production of rubber goods (other than belting, hose, boots, and shoes), of which it produces 49 per cent of the total of this classification in the United States. Ohio likewise ranks second among the states in products of steel work, rolling mills, and blast furnaces. Indiana also takes a foremost place in the latter industry; while most of the automobiles produced in the United States are manufactured in Michigan.

A look at the map will show how these populous, wealthy and productive states are clustered around the Great Lakes, or farther

Evening silhouette of a Great Lakes freighter passing St. Mary's lighthouse on way to locks at Sault Ste. Marie, Michigan. Above—Freighters on the Welland Canal.

inland, and thus farther removed from ocean connections. It will also be observed how the St. Lawrence River points directly at the British Isles and Central Europe. Liverpool is but 2,785 nautical miles from Montreal, as against 3,107 from New York.

A carload of freight destined for Liverpool from Chicago at present must go by rail to New York, a distance of 912 miles, and be then transferred to an ocean boat, the total distance being 4,019 miles; whereas by way of the St. Lawrence the distance would be only 3,867 miles; and once the consignment was loaded upon the boat at Chicago it would not need to be touched again until it arrived at its destination. Water transportation is cheaper than rail; but in this case the greatest saving would not be in the difference between the water carriage from Chicago to Montreal and the rail haul between Chicago and New York, but in terminal charges.

By opening the Great Lakes to the ocean, the United States will be provided with 2,700 miles of additional coast line containing many excellent harbors and a dozen magnificent cities, to say nothing of making accessible to the world's commerce the richest and most productive part of the country—in fact, its very heart.

WELL might the proposal to implement this great scheme be referred to as the greatest economic project of the present century! Nothing in the history of the Republic can be compared to it in the prospect which it offers for the economic advancement of the whole nation, because the good of the whole is inextricably combined with the welfare of such an important and extensive section as that affected by the Great Lakes-St. Lawrence route.

Opponents of the project assert that ships will not use the route even though it should prove successful from an engineering standpoint, and argue that canal-borne traffic has shown a decrease as compared with railway traffic. In this connection traffic statistics for barge canals and for rivers formerly navigated by river steamers are freely quoted; but these figures have nothing to do with the case. The only fair comparison by which a ship channel may be judged is with another ship canal.

Another argument used against the St. Lawrence route—and a more valid one, as far as it goes—is that it is available for part of the year only. But many extravagant statements have been advanced regarding the length of time the river and lakes are closed to navigation by ice, and also concerning the alleged difficulties and dangers due to ice and fogs. It is a matter of record that the average date of opening of navigation at Montreal is April 24; and the average date of closing November 25. The Erie Barge Canal does not have a longer season, and yet even in its limited field it has proved worth while.

The volume of traffic carried each season on the Great Lakes also provides a criterion by which the value of a part-year navigation route may be measured. In Europe the Baltic ports, which are closed by ice during four to six months of the year, manage to handle a satisfactory volume of business during the navigation season. There is no doubt that should it be found desirable the season on the St. Lawrence might be lengthened by the employment of ice breakers and by the maintenance of an international ice patrol and ice signal system.

Early American Spellers

(*Continued from page 9*)

speak, the title-page, but the sale continued in spite of it; Webster was often twitted about it.

To Webster is due the great dictionary which is commonly referred to simply as Webster—'according to Webster,' as they say. While Webster in this enterprise made an enduring contribution to learning in America, his income was derived mainly from the little speller. It has been well said that to multitudes his books 'have been of lasting benefit, not only by the course of early training they have furnished, but by those precepts of wisdom and virtue with which almost every page is stored.'

Webster's dictionary and his speller contributed greatly to the uniformity both in spelling and in pronunciation which marks American speech. No other country enjoys over so wide an area such uniform speech as does America. The differences are trifling as compared with European lands where one dialect in Germany or France or even England varies so greatly from another that the natives of different parts are not able to understand each other.

Caleb Bingham published his little speller, *The Child's Companion*, in 1792, followed by *The Young Ladies' and Gentlemans' Spelling Book* in 1799. This latter work was enlivened after a manner by the introduction of a series of poems by the Reverend Isaac Watts on such timely topics as 'Against Pride in Clothes' and 'Against Evil Company.' These were illustrated by rather rude cuts, it being the assumption that children would read the poems and profit by their warnings. Isaac Watts himself wrote a spelling book popular in England from 1720 to 1750, but he did not include therein poetic efforts like those mentioned above.

The early speller had many features which are not found in the present-day manual. Words sounded alike and spelled differently, and those spelled the same but pronounced differently, received special attention. The hard words came in for particular treatment as also abbreviations and Biblical names.

TODAY spelling as a separate exercise has been abandoned in many schools. Much attention, however, has been recently paid to the securing from business letters, from newspapers, from ordinary correspondence, of a list of the words which are most frequently used. It has been found that the following fifty words are used more frequently than any others:

> *the, and, of, to, I, a, in, that, you, for, it, was*
>
> (These twelve words make, on the average, thirty out of every hundred words that you commonly use.)
>
> *is, will, as, have, not, with, be, your, at, we, on, he, by, but, my, this, his, which, dear, from, are, all, me, so, one, if, they, had, has, very, were, been, would, she, or, there, her, an*
>
> (These fifty words run fifty to the hundred in all ordinary writing and only one, *very*, is of two syllables.)

The demand today is that before learning to spell *Constantinople* the child must learn to spell the words in common use. It is a reasonable demand. The word *morning* or the word *respectfully* is vastly more useful than *Constantinople*, and occurs in writing a hundred times as often. While spelling today is apparently only incidental to reading and geography, yet it does receive careful attention. Psychologists agree that it is better to give words in natural sentences, so that the child will feel some reason for desiring to learn how to spell the word. Some psychologists say that it would be more desirable to have the spellers not in print type but in a special cursive type, like ordinary writing, so that the child would see the form which he is to reproduce. Long ago first readers and spellers were printed in cursive type; the right thing was done by instinct and not by psychology.

Making Education a Service

(*Continued from page 7*)

sublime faith in the essential goodness of human nature. It was his contention that every great human need is satisfied when it has been made sufficiently apparent. As a rule when Dr. Conwell wanted something for one of his enterprises he had only to state the need, at least during his later years. The services and funds he enlisted were generally voluntary.

UNDER Dr. Conwell's direction Temple University was the first institution of academic stature to hold regular night courses for students compelled to work during the day. It was the first to carry the university to the student. For many years it has had a standing offer to establish a class at any point in the city most available to a group of students, and at any hour of the day or night.

In view of the work now in full swing to perpetuate Conwell ideas it is interesting to note that on several occasions he attempted to give Temple University to the city of Philadelphia as a city college. The last time the offer was made—with the approval of the board of trustees—the property holdings of the university were appraised at about five million dollars. Today the plant is worth approximately seven million dollars. It has operated in spite of decreased grants from the state with a constantly increasing student body. It is planned to raise eventually a twelve-million-dollar endowment.

Some time before his death Dr. Conwell told me in answer to a question that the list of young men he had put through college out of his lecture and literary earnings was close to thirty-three hundred. More than ten thousand students in all got some pecuniary help from him. He kept a record of the number, but he did not retain a list of the names. In spite of this, the 'Conwell boys' were never forgotten, and they did not forget. Nearly every one communicated with him at least once a year, and most of them were in constant correspondence with him.

(*This is the first of two articles on this subject by Mr. McGarry. The next will follow in an early issue.*)

HISTORIC FONTAINEBLEAU

By
SOMMERVILLE STORY

OF THE beautiful royal palaces in France, many prefer Fontainebleau—not because of its charm artistically or architecturally, but because of its exquisite setting in a lovely forest and its close association with three of the most interesting monarchs of France.

Although Fontainebleau existed when Francis I came to the throne, that magnificent monarch was the real creator of the chateâu. It was at Fontainebleau that Francis in 1539 received Charles V, and one can but faintly imagine the scene when the Pericles of France in all his grandeur received the rival who aspired to rule over the whole of Europe.

After Francis, Henry IV did much to enlarge and embellish Fontainebleau, after which it was left much as it was until the time of Napoleon, who in turn did a good deal of restoration work. Napoleon III and Louis Philippe also spent huge sums on its restoration.

The foundation of the palace goes back to the time of Louis VII, who turned a hunting lodge into a fortified chateâu in the 12th Century. François I razed the old building, all but the Donjon, and rebuilt on its site. He brought numerous famous artists from Italy to aid in the decoration of the palace—Rossi, Cellini, Serlio, and others—and to him was due the apartment known as the Galerie de François I, containing allegorical and mythological compositions about the monarch's life and adventures.

Owing to many changes and additions Fontainebleau is mixed in its style and architecture, and less imposing than other chateâux of its period. But the interior decoration has won the admiration of all artists and connoisseurs. The gallery of Francis I, measuring 192 feet, and with gilded walnut ceiling, divided compartments, trophies, coats of arms, salamanders, and other rich decorations, the tapestried walls and painted pillars between the windows, is a beautiful hall. The Salle des Fêtes, when filled with the gallants and the belles in the costumes of the 16th and 17th Centuries, must have held visions of splendor as fine as any the world has ever seen.

Interesting figures in the world's history played their parts in the palace of Fontainebleau during the centuries.

After the rebuilding by Francis I, the long list of historical events connected with the palace began. In 1536 James I of Scotland visited Fontainebleau to see the French King's daughter Madeleine, whom he subsequently married. Elizabeth of Valois, the daughter of King Henry II, was born here in 1545. Betrothed to King Edward VI of England, who died before he could marry, she wedded King Philip II of Spain. Here, too, in 1560, Francis II was married to the unfortunate Mary Stuart.

Catherine de Medici, while regent, and her son Charles IX spent much time in the palace.

Louis XIV signed the Edict of Nantes at Fontainebleau at the instigation of Madame de Maintenon. To visit Louis XV, Peter I of Russia came to Fontainebleau. Here the sentence of divorce against Josephine was pronounced in 1809; and in 1813 Napoleon made the Pope sign the famous Concordat by which he resigned the sovereignty of the Roman States. The Cour des Adieux, is the scene of Napoleon's farewell to his 'Old Guard' before his retirement to Elba.

The Straight Left Arm

(*Continued from page 8*)

you will note that Vardon is not alone in not keeping the left arm absolutely straight at the top of the swing. In fact most of them have a little bend at the elbow. But what you would also learn, if you could make the examination, is that though the arm is slightly bent, the elbow joint is quite firm if not rigid. A slight bend is made for comfort, especially with the distinctly upright swingers. But the arm straightens as soon as the club is started down.

Conceding then the importance of a straight left, what about the most practical methods of achieving it? Here is my best suggestion. In starting the club back from the ball, practise making the left arm do most of the work. In other words, begin by a push from the left shoulder. This starts the arm straight in the first place, and furthermore it checkmates one of the strongest counter movements against keeping it straight, and that is allowing the right hand to take too big a part in the beginning. Where this is done, the player is almost sure to lift the club too abruptly up from the ground.

This bringing of the club up instead of swinging it more around behind the body is a very common fault. The average person in trying to hit a golf ball for the first time will bring the club up too quickly and then strike at the ball with a chopping motion. Of course, in doing this the left arm is bent almost to a right angle at the elbow. The novice presumably knows nothing of the importance of keeping the left arm as near straight as possible. The natural tendency is to lift the club with the right hand, and one of the first steps toward a correct golf swing is to learn to overcome this tendency. The way to do this is to work along the lines suggested above of making sure that the left arm does most of the work in starting the club back.

I HAVE already referred to the importance of having the left arm straight at the moment of impact between the club head and the ball. It may be well to point out some of the reasons. One source of trouble with a good many players lies in smothering the ball; that is, the ball is hit clean enough but after traveling a short distance it ducks down, frequently failing to clear rough or other trouble in front of the tee. At other times the ball gets up, but the shots take a wild hook landing far to the left of the fairway.

The cause of both these sources of trouble is that the left arm bends partly down and partly in toward the body, and in so doing allows the right hand to turn too much over the left. Where this bending takes place just as the club head strikes the ball, the shot is smothered. If delayed a fraction of a second the ball is brought up, but it takes a wide hook. Keeping the left arm straight at the moment of impact is the best preventive for such trouble, together with maintaining a firm grip on the club with the left hand.

This matter of a firm grip with the left, which of course results in making the left wrist firm, also is a factor in any function that a straight left arm at the moment of impact performs. It is this: A correct snapping forward of the right wrist just as the club head is coming to the ball, usually spoken of as 'putting the wrists' into the stroke, is a big factor in getting distance on a shot. This motion introduces additional leverage to that afforded by the general swing, and where there is a lever in action there must be a fulcrum on which it works. The left hand and arm provide this fulcrum. That is, they should, but it is necessary that the left arm be straight and fairly firm and stiff to do this.

I want to call attention, however, to a very important matter on this point. Do not get the idea that the hands are to stop their progress on the general swing in order for the left one to act as a fulcrum for the right. This is rather a common fault, even in the long game and much more so in shorter strokes. The player practically stops the forward movements of the two hands, and tries to do the work of hitting the ball with a pure wrist and forearm action. This is wrong from first to last whether he is playing a full drive or a short mashie pitch. The hands must go on through. With the short shots, the wrists want to be kept fairly stiff, but for the longer ones, an effort should be made to snap the club head forward with the right hand as explained above, but in either event see that the hands move on through.

Keeping the left arm straight as I have advised will not, of course, absolutely guarantee a straight shot. There are too many other things that may bob up to cause trouble. But it will certainly minimize the danger of getting off the line. It is, to my way of thinking, the chief fundamental to keeping the ball straight, and if a player acquires the knack of keeping the left straight, he will eventually find it easier to correct other troubles that cause him to get off the line.

'Wild Weed' *Found on* Best Tables

By JOHN SLOAN

The process of threshing mustard leaves a stubble like a cut-over grain field.

BOTH as a *salsa piccante* for the table, and as a medicinal herb, mustard has occupied a place long antedating the beginnings of written history. Hippocrates made use of it in his medicine, and the cooks of ancient Rome had it in their kitchens.

The name now applied to both plant and condiment comes to us from the French word *moustarde*, modified for modern use into *moutarde;* but this word had its origin in the mixing of the crushed mustard seeds with must, or unfermented wine, the Latin name for which was *mustum.* Eventually, the word for the mixture came to be applied to the seed and then to the plant. These derivations, however, had little to do with the establishment, more than a quarter of a century ago, of an important industry in the warm little valley of middle California.

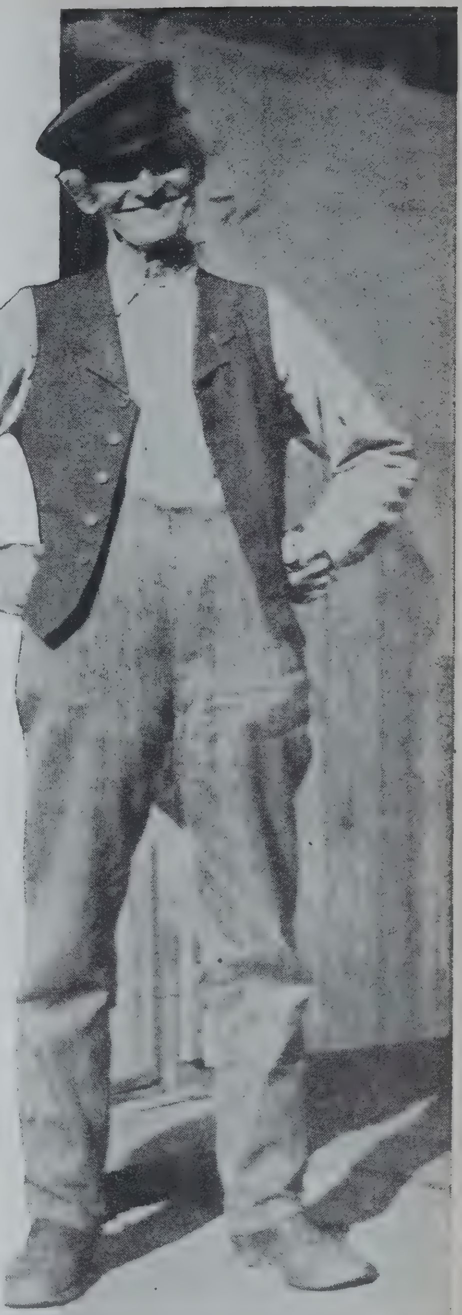
This valley comprising about twelve thousand acres all told, of which not more than five thousand acres have ever been planted to mustard, produces 90 per cent of all the mustard consumed in the United States or manufactured and exported from this country. Something like ten million pounds of mustard seed are marketed every year in the United States, of which the Lompoc farmers produce better than 90 per cent, or around nine million pounds.

Mustard seed is of two varieties, the black or red (Austrian) and the yellow (English or German). One is of about the same value as the other, and the plants growing in the field are virtually indistinguishable except to the eye of a mustard expert. The seed is sown broadcast, as much as sixty acres being seeded in a day. Thereafter, there is nothing to be done to the mustard crop—unless it is flooded with irrigating water—until it is cut with a reaper, much as hay or grain is cut. Cutting takes place just as the seed pods, which are similar to those of the radish, begin to dry, and before they open, so that the seed will not be lost. The cut mustard brush is piled on sheets of canvas about sixty feet square, and so carried to the threshing machine, the same thresher that is used in the threshing of wheat or barley.

To those who are accustomed to consider mustard as merely a 'wild weed' growing on waste lands or as a yellow-brown paste used with cold meats at table, the varied uses of mustard seed and its value as an agricultural industry will be surprising. It is estimated that the total sales value of the products of mustard seed throughout the world is nearly three million dollars a year, considerably more than half of which sum is paid for the oils developed from mustard seed for medicinal and mechanical purposes. It is interesting also to note that in the realm of medicine mustard is the only emetic which is also a stimulant to the heart and to the respiratory organs. Many a person who has taken poison, either by accident or with intent, owes his life to this peculiar quality of mustard.

The FISHERMAN *of* Little Traverse Bay

By IVAN SWIFT



I ASKED him about his health one day and he said, 'My keel is good, but my old engine is little weak. If I get new engine I go hundred-fifty year. My father live hundred-four—then the boys have to choke him with crackers!'

Alexander MacGulpin came of Scotch-Irish descent with, if we judge by his accent, a strain of French. In his own words he tells us, 'My father-father was genuine Scot—come from Glasgow to Quebec long time 'go. Them's where I get the name *Magulpang.*'

There was further evidence enough, in his looks and mental make-up, of the gifts of at least three good races; and lifelong association with American Indians added a touch of something more silent and inscrutable.

Knowing him as I did, from almost daily meeting as he went to his work and I went to my school, for many years, I have to guard against too much fervor in a convincing record of his personality. Familiarity with the man did not breed contempt, and, prophet as he was, he seemed to be with honor in his own country.

His country, it happened, was the Mackinac district, where he was born about 1830. He always lived in the vicinity of it and seemed to get more out of it because he was imprisoned in it. It was commonly understood that in an existence of nearly ninety years he was never more than a hundred miles south of his birthplace. He remained where his task was and met it like a man.

HE WAS history in himself—of the country, its people, thought and industry. Many are that, perhaps, but few indeed are so honest and lucid and good reading. Art was his handmaid and he could convey to others the true spirit of the time with an amiability that credited nature with beauty, and labor with dignity.

Just what the contribution of Alex MacGulpin was is hard to say beyond the statement that he preserved the best traditions, and foresaw the new tendencies, with confidence and cheer.

'It's all faith,' he said to the priest. 'All faith. Every morning for eighty years the sun come up in the east. She's coming up tomorrow, I believe. I got my kindling to build fire tomorrow morning. It's all faith, Father!'

This made him a tremendous agent for good in a period of struggle, fear and superstition.

When asked the secret of his long life and good health, he answered that he always made it a rule to 'get up at twelve o'clock at night and eat one pie and smoke a pipe.'

He was not the first great man to answer unanswerable questions by indirection, sometimes shockingly.

A talkative drummer on a train once suggested that if Alex had got up earlier in the morning he might have seen the ground hog looking for his shadow on Candlemas Day.

'No, gentleman,' replied the old man; 'when I'm working on the lake and in the wood I always make a rule never get up before three 'clock in the morning. If you see ground hog shadow three 'clock in the morning—she's moonshine shadow!'

That settled that little argument.

Whatever he was, MacGulpin has become a legend as measured by his neighbors, his words a sort of gospel, his example stimulating. There seems to be no going back of his decrees, no refuting the findings of his experience—earning his bread in sweat. This *earning* seems to have been his secret and solution—the thing that let him breathe well and fear nothing. His faith was logical. As he put it, he had '*had* everything and was no longer afraid of *catching* anything.'

EVEN in his younger days he told the priest:

'Some men can't steer the boat. They run on the rock; the church come, show them the deep channel. Then they run on the sand—cry "Help, help!" The priest come, read them the chart. That's good. But, Father, I'm gov'ment pilot for thirty year. I can steer the boat through Saint Marie River like a snake, never touch nothing, come out Lake Superior. I work for my bread, I pay my debt, I know the deep channel, I can read the chart. I'm going to meet you in the Big Watair, by grace of God!'

In practical life he was a trusted and reliable aid to the Federal Government and missionaries of all denominations, as interpreter, pilot, guide, messenger and peacemaker; as a neighbor he planted vines and flowers where they would bless those of less imagination, for whom the day was sufficient; as a father he provided well, advised and entertained with wit and kindliness and made himself remembered with affection; as a citizen he counseled tolerance with the varied natures of men and patience with the poor and distracted. His sympathy was unfailing, his indignation terrible to the oppressor, his logic final with priest or publican.

He was too sane to feel obliged to be busy constantly, and on his days of vacation called himself a *resorter*. Once in midsummer a husky, overfed hackman remarked:

'*Resorter* nothing! A man that ain't got money might just as well go jump and say, "here goes nothin"'!'

Alex looked down upon the slouching figure with a smile of pity.

'Listen to reason, man. The best thing in the world don't cost nothing. Them *resorter* come thousand mile, pay thousand dollar, to see the tree, the sea gull, drink the spring water. It don't cost me nothing, twelve month the year. Look up the sky some more, not down your feet so much, you feel better. Yes, I'm *resorter* today.'

He never seemed to get the idea that he would be a pillar of the struggling church if he stood with it. Somebody had to mow the lawn and paint the house, and the better the day the better the doings. His wife could 'go to church and say her pray and read the Bible—and she would open the Gate' for him. He also modestly affirmed that, 'A bad apple on a plate only spoils the good apples.' He would pick flowers in the woods, fish for perch in the harbor and watch the sea gull on Sunday—and take his chance.

His was, until his death on the shore of Little Traverse Bay a few years ago, a dramatic record of the days of King Strang and the Mormons, the smugglers, the fur-traders, lumbermen and fishermen, as well as of the social lapses and advances. He faced the facts impersonally, remembered clearly and reacted reliably. He wrote no word, could read English only imperfectly, received no more for his *menage* than a bird for its song. Being an unpaid counselor he was a free and frank one; being no slave he adventured with delight upon the precious philosophies of his employers; but being human and witty he was not penalized for his liberties, unless perhaps retention in menial tasks was the price he paid. If so, he paid it with dignity and grace.

Whatever may be said about MacGulpin, and however well it be said, the interest begins with his own stories in his own tongue, of vivacity and inflection. The written word is inadequate but these few stories, common to this old philosopher's daily conversation, or soliloquy, may be repeated for their good sense, if not their true sound. Here is one called 'The Creation of the World':

'You ever hear about the time Christ make the world? Well, I suppose in first place he make up his mind. Then he make the sky, with the sun in the sky, the moon and all the little star in the sky. Then that's all finish. Then he make the watair, with the wave and the whale, and the fish and the eel and the pollywog and the seaweed. That's all finish. Then he make the land—the tree and the flower, the rosebud and the wintergreen, and all the bird and animal—the crow and blue jay, the bear and deer and woodchuck and porcupine, the toad and the spider. Then he make the man and woman and all the people—the French and Scot and Injun and Polock, the policeman and preacher. Then he make the no-see-um and the cheese-skipper. Then that's all finish.

'He say, "that's a good job." Well, it *is good* job. But he's got some small piece leave over. He think long time, "what I do them scrap I don't know." Bimeby he say, "I know what I'm going to do them scrap—I'm going *make a lawyer*, so all the rest of the people have to work hard to feed her!" That's the way Christ make the world.'

This may not square with tolerance, but our opinions must attach to our own experiences, and his perhaps were unique. Again, a good story-teller does not spoil his chance with conservatism.

Suggestion *and* Witchcraft

J. M. CREED, of Sydney, N. S. W., draws an interesting analogy between Suggestion and Witchcraft. Writing in *Notes and Queries* he says: 'I have used suggestion in my medical practice for upwards of forty years, and my experience has convinced me that its influence over the human mind is unquestionable. Maladies quite irremediable by ordinary remedies are marvelously cured under its influence.

'We have heard that witchcraft was used for benevolent as well as for malevolent purposes, and that many of those indicted for witchcraft acknowledged their guilt, but were quite unable to give any explanation of the source of their convictions.

'With modern suggestors who use hypnotism it is different: if intelligent, they always appeal to psychology for an explanation.

'Suggestion is now conscious; in the days of witchcraft it was often unconscious.

Mrs. Nesta H. Webster—Historian

By FRANK R. WORTHINGTON

MRS. Nesta H. Webster is known throughout the civilized world by her writings. In England many claim her acquaintance but few really know much about her. I, who know her well, count myself one of a fortunate few. Some days ago I took an American to see Mrs. Webster and we had tea with the famous writer and her family. On leaving the house he said: 'Can that charming and gracious lady be Nesta H. Webster, the historian who wrote *The French Revolution?*'

Mrs. Nesta H. Webster is the youngest of a family of fourteen, seven boys and seven girls. Her father was a wealthy banker of Welsh descent. Mrs. Webster's mother was a voluminous and gifted writer, solely on religious subjects.

For an accepted historian of the front rank, it seems curious that throughout her education history should be the one subject she did not like; in fact she cordially disliked it. But then history is not usually written in the arresting manner of Mrs. Webster's *French Revolution*—a history book is generally as dry as the dust of those whose acts it chronicles.

She began to write at the early age of seven. She has always felt compelled to write. Something within her has always urged her on. She wrote novels, plays and short stories in rapid succession. All went into a trunk; she published none of them.

When in India she met and married Arthur Webster of the Indian Police. He was then one of the best polo players in the country, a remarkable big-game shot and a thorough all-round sportsman. Mr. and Mrs. Arthur Webster have two very charming daughters and it would be difficult to find a jollier family anywhere.

Her husband was ever urging her to publish something. Mr. Webster had a great admiration for his wife's work and argued that there was little use for her to write unless she tried to do something with what she wrote.

At length she finished a novel which she called *The Sheep Track.* She was quite prepared to offer it in turn to all the London publishers but, true to herself, she took it first to John Murray, the recognized head of the publishing trade. She was very politely received and told that the manuscript would be read and a decision reached within ten days. She was all impatience. On the tenth day the postman delivered a registered packet. She recognized it at once as her precious manuscript returned. She brushed aside a feeling of bitter disappointment, made up her mind to whom she would take it next, and opened the parcel. Inside she found a letter. To her unbounded delight she read that John Murray would be very pleased to publish the book but would Mrs. Webster shorten it by a few thousand words? *The Sheep Track* was a little too long.

The book was published in the spring of 1914, was most favorably received, and quickly ran into five editions.

As is so often the case with those who tread the path of fame, a very trivial circumstance set Mrs. Webster on her way. The family was spending the winter in the Swiss mountains, and one snowy afternoon she wandered down to the hotel library in search of a book to while away a dull hour or so. Among the usual rows of Tauchnitz volumes, she chanced to find a small book of essays written by Jubert de St. Amand on the women of old France. She turned the pages idly but soon became engrossed in the romantic story of the Comtesse de Sabran and the Chevalier de Boufflers.

That chance happening upon a book of romantic essays led Mrs. Nesta H. Webster to become an historian. She felt a strong desire to know more about these two people. On her return to London she commissioned a French bookseller to get for her all the available books on the subject.

AS SHE read page after page the strange fascination which the two lovers held for her increased, but as at that time she was still writing her novel *The Sheep Track,* she had no thought of making them the subject of a book. In fact, she had little hope then of ever publishing anything.

However, as already explained, wise fate decreed otherwise. With *The Sheep Track* published and doing well, she turned her mind seriously and with enthusiasm to the study of the Chevalier de Boufflers and the Comtesse and to the times in which they lived. To the disappointment of publishers and booksellers she decided to leave the ranks of novelists for the less popular band of biographers. She argued that truth being stranger than fiction, a real love story would be far more wonderful than any novelist could invent.

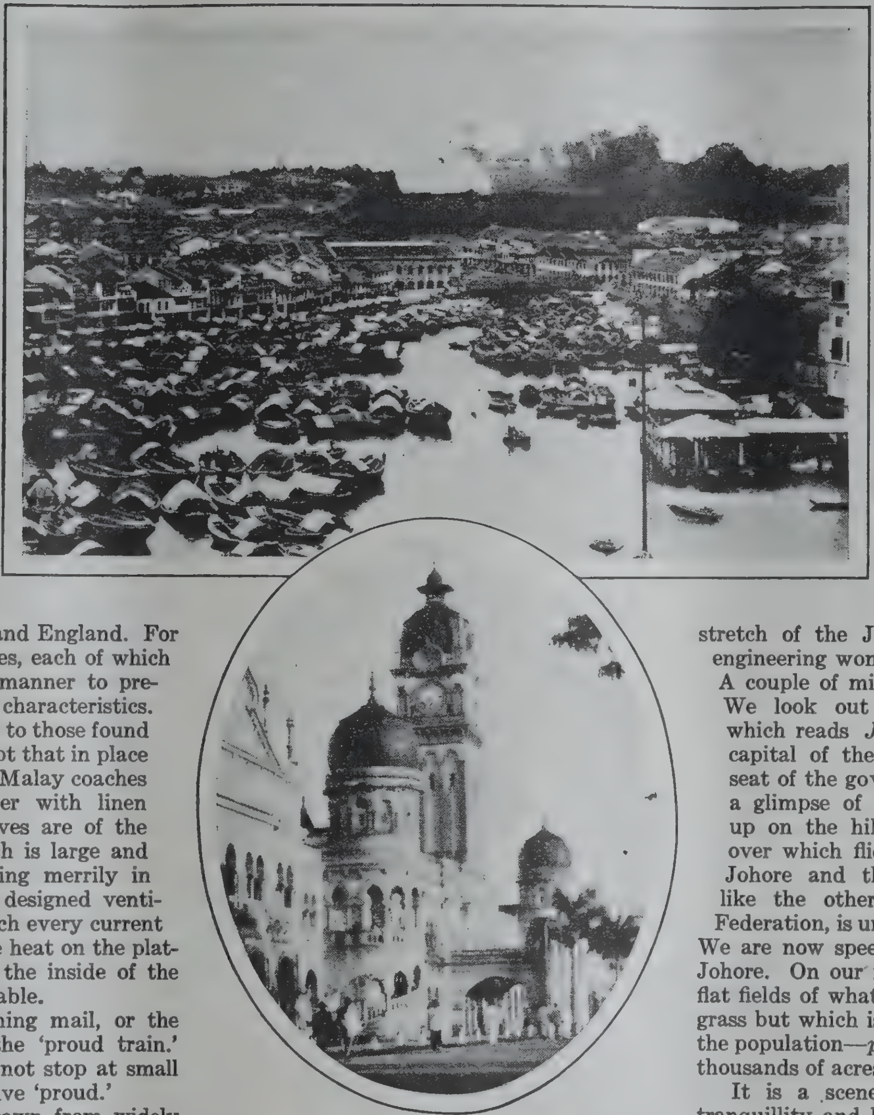
So Mrs. Webster began to write her second book *The Chevalier de Boufflers.* His doings and those of the Comtesse de Sabran made a strong romantic appeal to her. She wished to reconstruct faithfully the scenes through which they passed and was determined that the story should be absolutely true in every detail. She embarked upon the book with no idea of ever becoming an historian, but as she worked she found that in order to follow the adventures of her hero and heroine during the French Revolution it was necessary to make a close and thorough study of the period. When *The Chevalier de Boufflers* was published it immediately attracted attention.

The book had taken her two years to write and hardly was it finished before Mrs. Webster began her first contribution to history, *The French Revolution.* Even before she had completed *The Chevalier de Boufflers* a new light had dawned upon her. She realized that all she had read before about that sinister period was wrong, that every incident of the revolutionary drama had been totally misrepresented to the world; that seen through the eyes of contemporaries it bore no resemblance to the French Revolution of history books.

Thus did Nesta H. Webster the novelist become Nesta H. Webster the historian. But her story does not end here. Some say it is only begun. Many think that like Florence Nightingale she is the bearer of a lamp; that by the light of her lamp we shall see, if indeed we have the courage to look, what is going on around us.

A Railway Trip in MALAYSIA

By SIDNEY R. SMYTH



—Photos, U. S. Rubber Co.
Upper—Sampans on Singapore River, with Fort Canning in background. Oval—Administration building and railroad depot of the Federated Malay States Government in Kuala Lumpur.

TANK Road railroad station, Singapore—terminal of the Federated Malay States Railway. A wooden platform with a tin shanty 'waiting room,' an air of old paint and a smell of tar, which has nothing of oriental atmosphere, but reminds one more of a watering station on a Midwest prairie.

The traveler is not encouraged by the surroundings. The train itself looks grimy and uninteresting, but by the time the northern terminal, Penang, is reached, the traveler, if he is observant, will have seen not only the life of Malaya, but also that of India, China and England. For this is a country of all races, each of which manages in a marvelous manner to preserve its own racial characteristics.

The coaches are similar to those found on railroads at home, except that in place of plush-covered seats the Malay coaches are upholstered in leather with linen covers; the seats themselves are of the armchair type. The coach is large and airy, electric fans humming merrily in the roof while specially designed ventilators are employed to catch every current of air. Compared with the heat on the platform, about 110 degrees, the inside of the coach is cool and comfortable.

Our train is the morning mail, or the *kreta sombong*, meaning the 'proud train.' Being an express, it does not stop at small stations, hence the adjective 'proud.'

The passengers are drawn from widely different spheres of life. A couple of European youths, rubber planters from an up-country estate who have just finished spending their month's salary in Singapore and have borrowed enough from the hotel to pay their fare back, are among them. Tin and rubber—that is all one hears in this country.

In a seat across the aisle are four Chinese in the rich robes of the upper class. They are *towkays*, or merchants, men who can probably count a million dollars for each one which we have. This is a country of wealth and the Chinese seem to have assimilated most of it. Down the car is a youth, the colors of his garments matching those of the rainbow all blended, without the bizarre effect which one would naturally associate with such a costume. In his red fez gleams a diamond of such size and luster that every woman who sees it gasps with envy. The youth gazes with bland indifference while he puffs his cigaret; he is a Malay *anak*, scion of a ruling house, childlike in simplicity and demeanor.

Through the window we catch a glimpse of a scene right out of a fairy tale. A strip of water, azure blue, is studded with tiny islands on which palm trees sway gently in the breeze, while in the background lies the dense green jungle unbroken as far as the eye can reach, except where tall minarets gleam out from amid the foliage, and where a glimpse of lawn and flower garden gives an impression of an English countryside. It is the palace of the Sultan of Johore, who is one of Asia's wealthiest and most progressive rulers.

Everyone gets out here, a roadside station with no more exciting name than 'Woodlands.' Our planter friend comes to our rescue and tells us this is where we board the train for Penang.

What a din! A jargon which must have been similar to that heard at the tower of Babel! Along the platform we see every race under the sun. Chinese hawkers call their wares, *Tamil kadee* men come along with their trays of ice water and gaudily colored drinks of sweetened liquids, which are eagerly bought by the native travelers. We realize now that we are in the East, thousands of miles away from the humdrum of everyday existence, transported to a land where every movement seems impregnated with color and romance.

Our new train pulls in and we notice with surprise that the toy-like engine has been replaced by a giant locomotive of the Pacific type, complete with headlight and cowcatcher. We resume our seats and the train pulls down to the causeway which crosses the two-mile stretch of the Johore Straits, one of the engineering wonders of the modern world. A couple of minutes later we again stop. We look out and see the signboard which reads *Johore Bahru*. This is the capital of the state of Johore and the seat of the government. Again we catch a glimpse of the sultan's palace, while up on the hillside we see the regency, over which flies the flag of the state of Johore and the Union Jack. Johore, like the other states of the Malayan Federation, is under a British protectorate. We are now speeding through the state of Johore. On our right and left stretch long flat fields of what looks like very tall green grass but which is the sustenance of life for the population—*padi*, a swamp rice of which thousands of acres are grown in the country.

It is a scene of incomparable peace, tranquillity and beauty, the emerald green of the *padi* fields fading into the darker green of the jungle which looms in the distance. Overhead the morning sun beams down from a sky of the purest blue. It is a tropical land at its best, so our planter guide, for by this time such he has become, tells us. He naïvely adds, 'We get rather fed up with the sun and the jungle and *padi* fields after a few months, and begin to hope for a "leave" when we can get home and perhaps see a little snow and feel the sting of a fresh sea breeze.'

Suddenly we plunge into a semigloom. We have just entered the jungle. The railroad cuts a tunnel through the dense foliage. Giant trees loom from the thick undergrowth, strange birds flit from branch to branch and now and then we catch the sheen reflected from the swiftly moving body of some wild animal frightened by the roar of the train. A few feet away from the shining track—triumph of civilization—roam tiger, wild elephant, and tapir.

Gradually the jungle gives way to a semblance of order; the trees take regular shape and form themselves into straight lines like soldiers on parade; the undergrowth of thick foliage is lacking, its place being taken by a carpet of brown leaves. People in gayly colored dresses are flitting from tree to tree, pausing at each for a moment and then continuing to the next. We are going through a rubber estate. A modern gold mine, if we are to judge by the price of rubber. The people we see are Malay tappers collecting the latex which has been running since sunrise, when the trees are tapped, but which ceases to flow when the sun gets warm, owing to the heat's vulcanizing the rubber and automatically stopping it. Luncheon is announced and we go back to the dining car to try our first meal on this interesting train. Our planter advises us to try the curry. We do and have our eyes opened as to what a curry really is. Rice in long puffed beads which pile one upon the other. The Chinese boy brings the curried chicken, every bone withdrawn and yet the chicken retaining its shape. After that come the side dishes: Baked plantain (a large banana), dried sweet potatoes, especially prepared yams, granulated fresh coconut, peanuts and at least a dozen different spices and roots. A little of each is added to the rice and the whole mixed up—and a dish of marvelous flavor and rich delicacy is the result. The dessert is simple, *gwala malacca* made from sago and cane sugar flavored with coconut milk, which all makes a very wonderful pudding. Whatever else has been forgotten in this far-away land, the epicurean art has not been lost.

The heat has become terrific. The thermometer in our coach registers 110 degrees Fahrenheit; and as it cannot be any warmer walking around than sitting still we decide to make a tour of the train.

There are sixteen coaches not including the refrigerating cars where the food is carried. These coaches are divided into first, second, and third class. The first class is occupied mostly by Europeans and high-caste Malays and Chinese. In the second-class compartments there is a heterogeneous mixture: Malays, Tamils, Chinese and Eurasians are but a few. Some are eating lunches of dried fish or curry; others are preparing for the afternoon siesta. As we enter the coach everyone seems to be talking at once, but there is something strange about the conversation. Despite the different nationalities with their different languages, there is no discord in the steady hum of conversation. We ask our guide to explain. Simple . . . everyone is talking Malay, the lingua franca of the Far East from Shanghai to the Persian Gulf. With a knowledge of Malay, the simplest language in the world to master, you can travel anywhere in the East and converse with the Chinese merchant or the Indian water carrier.

Every few miles we see a little bungalow with wide verandas and with tennis courts overshadowed by palm trees. Europeans are either sitting or reclining on long chairs, watching ocher Europeans swat tennis balls while Tamil kiddies rush around and retrieve them. Where two or three persons of the same color gather together a club will be formed, and if one of the three is a Scot the clubhouse will also become the headquarters for a local lodge of the Caledonian Society.

The setting sun presents an aspect of sublime beauty. As it nears the horizon we can actually see it sink, and suddenly as we swing around a horseshoe curve our breath is taken away by the beauty of the sight which meets our eyes. To our right and in a slight hollow lies a city which appears as if it had been plucked from the *Arabian Nights*. Tall minarets stab the sky. Countless windows sparkle like jewels and the entire city is a mass of glistening white. It is Kuala Lumpur, the city of marble and the capital of the Federated Malay States. We rattle over the points outside the station; trains rush past, the air of bustle and life reminding us somewhat of the Pennsylvania station in New York. Brakes grind. Half our journey over, we shall rest for the night in this city beautiful.

Street in the Chinese quarter of Singapore, with laundry hung out to dry.

Part of a rice-growing plantation.

As we step from the train we see a sign 'Hotel' across the platform. We enter a vestibule which leads into a reception room. Again the contrast. Except for the white-coated Chinese boys moving swiftly about, we might be in New York, Chicago or Paris.

The hotel is large and airy with a veranda running around three sides. There are no windows; in case of rain the 'chicks,' screens of bamboo, are lowered. Plenty of air adds to the coolness—and in this country your leisure moments are spent in trying to keep cool.

Our train leaves at 8 a. m. About 6 a Chinese boy brings in a tea tray with fruit and bread and butter. 'Morning tea.' Our first morning or two we regarded it as a nuisance; now we look upon it as a luxury.

Breakfast on the train is a meal which would do credit to any hotel in the world—fruit, eggs, bacon, and the most delicious coffee imaginable; and the cost is surprisingly low, about forty cents in American currency.

The country through which we are now speeding is more civilized than that in the lower end of the Peninsula. Rubber trees extend for miles and miles along the track, broken here and there by *padi* fields, sugar plantations or coconut groves. The villages and towns we pass seem to be thickly populated and the entire country wears an air of prosperity.

The rubber trees thin out and the ground becomes broken as we enter the great tin-mining area in the state of Perak with its mile after mile of ground covered with mines which produce 75 per cent of the world's supply of tin. Modern methods are everywhere in evidence.

Rising sheer above the train is a huge mountain; we hook another locomotive on, for we are about to cross the famous Taiping Pass. Below as far as the eye can see stretch acres and acres of jungle, rubber trees and *padi* fields intertwined by two great rivers. Now and then we catch a glimpse of the Straits of Malacca. We begin to feel chilly. We descend the Pass and come to a stop in the city of Taiping—'the city of eternal rest.' A Tamil porter dozes on a truck loaded with mail sacks blissfully unconscious of the fact that the train is in, until aroused by a well-placed kick from the station master.

The railroad track skirts the water's edge, and looking across the narrow strait we see the Island of Penang, with its capital, Georgetown, the second city of British Malaya. The word *Penang* in the Malay dialect means betel nut, arising from the large number of those nuts which are to be found on the island.

A ferry takes us across the harbor to the island, and after a short ride in a ricksha through streets lined with beautiful palms we arrive at a palatial hotel, and our journey is over.

CHATS WITH OFFICE CALLERS

'The late Theodore Roosevelt used to tell a story about some cowboys who, after hanging a supposed horse thief, discovered to their dismay that they had executed the wrong man,' said the ***Westerner.*** 'One among them, noted for his tact and diplomacy, was chosen to break the sad news to the victim's wife. ' "Be you the wife of Jake Smith?" he began. "Yes," the woman replied. "No, you ain't neither; you're his widow," said the messenger. "I got his body out yonder in the wagon. We hung him for hoss-stealin'. But don't you go fer to feel bad about it, because he wuzn't the guy we wuz lookin' fer. The joke's on us." '

* * *

'A long time ago I heard a lecture on the Money Question,' said the ***School-Teacher.*** 'In it was this statement: "When you and I give a promissory note we have to pay interest on it; the banker draws interest on his."

'At the close of the meeting I approached the speaker to make him prove this statement. I admitted readily that we pay interest on our notes. But I could not understand how banks draw interest on their notes. It seemed absurd.

' "Have you a bank note in your pocket?" the speaker asked. I had, and at his request read, "Bank so-and-so will pay to bearer." Up to that time I had been thinking of the bank paper as money and not as a note promising to pay money.'

* * *

'I have just finished perusing a powerful attack on "the demon debt which masquerades among the ignorant as wealth," ' said the ***London Advertising Man.*** 'It was written by Professor Frederick Soddy and is entitled *Wealth, Virtual Wealth and Debt*. Without exaggeration, I can truly acclaim this book as one of the most startling I have ever read. Drawing his conclusions from the laws of the physical universe, and conceiving money "as the servant and not the master of man," Professor Soddy reaches the conclusion that our money system is "an elaborate confidence trick."

'The author of this arraignment is a man who has held a unique position among the scientists of the world. Professor Frederick Soddy is known as professor of chemistry in the University of Oxford; he was the Nobel laureate in chemistry in 1921 and is the author of a number of books, including *The Interpretation of Radium, Matter and Energy, Science and Life, Cartesian Economics*, and *The Inversion of Science*.

'The settlement of indebtedness by check between those using the same bank is merely an affair of bookkeeping which dispenses altogether with money. The money thus freed may be used over again by a banker, who can, and does, lend it. But, again, the money itself need not be used for this, as a check book serves the same purpose everywhere, so long as the bank's reputation for solvency remains good. The original money is thus used over and over again.

'It certainly does seem odd to a tyro, the professor goes on to say, to discover that the law proceeds with the utmost severity against a fraudulent counterfeiter for uttering new money tokens, but allows banks to create them wholesale to lend at interest, a far more profitable business.

'This professor wants to put an end to the so-called trade cycle. Uniform prosperity whereby famines and droughts are reduced to their real local significance is his objective.

'When democracy understands that the production of wealth is really an affair of scientific engineering and not primarily one of how to make pieces of paper bring in interest, it will have learned something which lies about as near to the root of economic freedom as it is at present possible to get. That is the conclusion Professor Soddy reaches.'

* * *

'Surprising figures are bunched when the annual turnover of the handbook octopus is totaled,' said the ***Racing Enthusiast.*** 'As an instance, in Cincinnati for years about 150 handbooks were in operation, openly or covertly. By and large the average turnover was estimated to be $500 a day. This average was struck because some of the big "books" would run into thousands, and some of the "pikers" would scarcely reach $100.

'This amounted to $75,000 a day; $450,000 a week. In summer the "play" ran about double that in winter. In the summer six months the turnover amounted to $10,700,000; in the other six months it totaled about $5,350,000—a grand total of more than $16,000,000 that filtered through the fingers of these off-color bookmakers in the period within which I made this study—about one year.'

* * *

'Let me explain the real meaning of the term "drug addict," ' said the ***Government Agent.*** 'I read De Quincey's *Confessions of an English Opium-Eater* and, like many others, thought that people used narcotics for some pleasurable effect, that they did it because they enjoyed it, and that they had formed the "habit" through frequent and regular enjoyment of that effect.

'The truth is that drug addiction is not a habit; it is a disease. Even if the addict once used the drug for the pleasurable effect, he no longer uses it for that reason. He clings to it because its misuse has set up a diseased condition, in which the withdrawal of the drug, except under experienced medical supervision, entails suffering.'

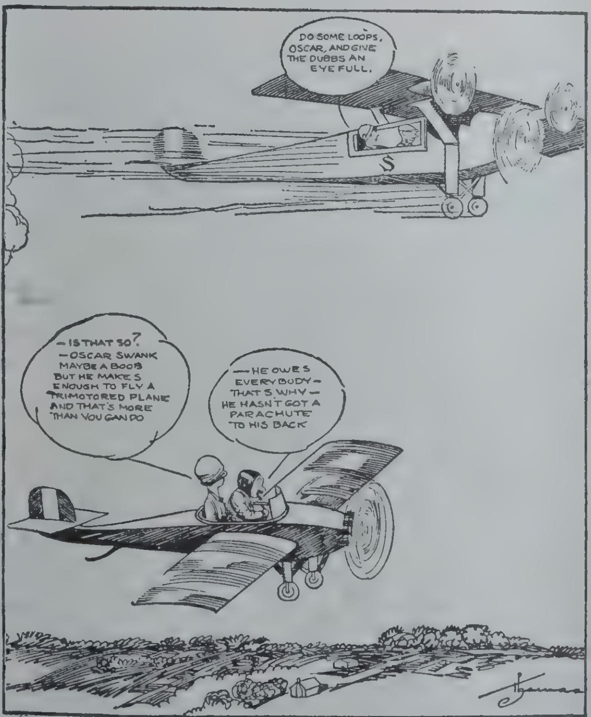
* * *

'In the early days of the operation of Pullman cars,' said the ***Conductor,*** 'the Pullman Company received all the revenue from the sale of seats and berths. In addition the railroads generally paid the Pullman Company mileage for the use of the cars, in event the revenue derived from such sale did not reach the specified minimum amounts. As the Pullman business grew, railroad participation in the Pullman earnings commenced and has steadily increased.

'They are saved the expense of inside cleaning of the cars, and the cost of their maintenance. The average haul of Pullman passengers is several times the average haul of coach passengers.

'The Pullman surcharge, which threatened at one time to become a burden of large proportions upon the traveling public, was imposed as a war measure when the railroads needed financial assistance. In June, 1918, Secretary McAdoo, who was director-general of railroads, put into effect a surcharge of 16⅔ per cent on Pullman travel, explaining that he wanted to discourage civilian travel in order to have railroad equipment free for the transportation of soldiers and supplies to the seaboard.

'In December, 1918, the director-general revoked this order. After the Transportation Act of 1920 became a law, the Railroad Labor Board announced that the advance in wages granted to railroad employes would require $618,000,000 more annually than had previously been paid. The Interstate Commerce Commission, in an effort to see, among other things, that carriers would receive increases to take care of the advance in wages, instituted a 50 per cent Pullman surcharge. The money from this surcharge goes to the railroads and not to the Pullman Company.'



DO SOME LOOPS, OSCAR, AND GIVE THE DUBBS AN EYE FULL.

HUMAN NATURE WILL REMAIN THE SAME.

CAN YOU TELL ME?

Question. What is the salary of the governor of Tennessee?

Answer. The salary of the governor of Tennessee is $4,000 a year.

* * *

Q. What is the Dyer Act?

A. The Dyer Act which amends the China Trade Act of 1922 was approved February 26, 1925, and concerns corporations organized under the original act.

* * *

Q. What became of Sarah, sister of Abraham Lincoln?

A. Sarah Lincoln was married to Aaron Grigsby in 1826 and died a year and a half later.

* * *

Q. Where did the Indians obtain the flint for their arrowheads and what was their method of shaping them?

A. Among the Apaches every tribe had its factory in which arrowheads were made and in which only certain adepts were allowed to make them for the use of the tribe. Boulders of flint were collected and broken into pieces with a sort of sledge hammer made of a rounded pebble of hornstone set in a twisted withe which held the stone and formed a handle. Such flakes of the flint were selected as from their angles of fracture and their thickness would form the basis of an arrowhead. The master workman, seated on the ground, laid one of these flakes on the palm of his left hand, holding it firmly down with two or more fingers of the same hand, while with his right hand he placed his chisel or punch on the point that was to be broken off. A helper, sitting in front of him, then struck the chisel on the upper end with a mallet of very hard wood, flaking the flint off on the under side below each projecting point that was struck. The flint was then turned and chipped in the same manner until the required shape and dimensions were obtained; all the fractures were made on the hand, the yielding elasticity of the palm enabling the chip to come off without breaking the body of the flint. No metallic instruments were used in the work, the punch or chisel being made of a piece of bone or sometimes of the teeth of the sperm whale. It was about six or seven inches in length and one inch in diameter with one rounded and two plane sides; this gave one acute and two obtuse angles to work with. The operation was usually accompanied by singing, the strokes of the mallet being given in time with the music. Materials for the manufacture of implements and utensils and for building were gathered from the surface of the ground or quarried from the rock. The largest quarries so far examined are those at Flint Ridge, Ohio, in the suburbs of Washington, D. C., at Mill Creek in southern Illinois, in northeastern Oklahoma, in Wyoming, and in the State of Hidalgo, Mexico.

* * *

Q. When, how, and why did the Democratic Party of today separate from the old Federalist and Republican parties and take the name 'Democratic'?

A. The Democratic Party, originally the Democratic-Republican Party, is the oldest of the existing political parties in the United States. Its origin lay in the principles of local self-government and repugnance to social and political aristocracy established as the cardinal tenets of American Colonial democracy, which by the War of Independence became the basis of the political institutions of the nation. The evils of lax government, both central and state, under the Confederation caused, however, a marked anti-Democratic reaction, and this united with the temperamental conservatism of the framers of the Constitution in the shaping of that conservative instrument. The influences and interests for and against its adoption took form in the grouping of Federalists and Anti-Federalists and these, after the creation of the new government, became respectively, in underlying principles, and to a large extent, in personnel, the Federalist Party and the Democratic-Republican Party. The latter, organized by Thomas Jefferson in opposition to the Federalists dominated by Alexander Hamilton, was a real party by 1792. Its general attitude was one of opposition to all centralizing tendencies in the interpretation of the Federal Constitution (Strict Constructionists). They wished the National Government to remain weak and regarded the states as sovereigns in an extreme sense of that word. The Democratic-Republican Party gained full control of the Government, save the judiciary, in 1801, and controlled it continuously thereafter until 1825. After 1801 the commercial and manufacturing elements of the Federalist Party, being dependent on Jefferson for protection, gradually went over to the Republicans (as the Democratic-Republican Party was also called); moreover, administration of government naturally developed in the Republican ranks a group of broad constructionists. These groups fused and became an independent party calling themselves National Republicans (standing for protective tariffs, internal improvements, and so on) while the Jacksonian Republicans soon organized into a compact party and came to be known simply as Democrats. It should be borne in mind, however, that the Democratic Party of Jackson was not strictly 'identical' with the Democratic-Republican Party of Jefferson although it adhered to the orthodox tenets of the old Anti-Federalists (the strict construction of the Constitution and the limitation of the powers of the Federal Government), wherefore some writers date back the origin of the present Democratic Party only to 1828-29.

* * *

Q. Please give me some information regarding the Volstead Act. Was it vetoed by President Wilson?

A. The National Prohibition Act, popularly known as the Volstead Act, passed the House of Representatives July 22, 1919, by a vote of 287 to 100. It passed the Senate with slight amendments and without a roll call on September 4, 1919. The conference report to Senate and House was adopted in the Senate October 8 and in the House on October 10. The measure then went to the President who vetoed it, because he did 'not approve that part of the bill with reference to war-time prohibition'; recommending that Congress 'separate these two questions and effectively legislate regarding them, making the proper distinction between temporary causes, which arose out of war-time emergencies, and those like the constitutional amendment of prohibition, which is now the fundamental law of the country,' he returned the measure with his veto message on October 27. The House on the same day passed the bill over the President's veto and the Senate did likewise on October 28, on which day the measure became law applicable by its terms immediately for the enforcement of the War Prohibition Act, and 'when the 18th Amendment goes into effect' for the carrying out of the purposes of that amendment. The Act fixed ½ of 1% alcohol by volume as the test of intoxicating liquor and delegated the power to make regulations for the carrying out of its provisions to the Commissioner of Internal Revenue, subject to the approval of the Secretary of the Treasury. The United States Supreme Court sustained its constitutional validity in two decisions in June, 1920.

SOMEBODY WANTED A SMOKE.

BRIEFLY TOLD

Lepers so often suffer from other diseases that only about three per cent of them die from leprosy itself.

Millions of European insects, resembling small fighting monoplanes, are being 'trained' and multiplied by Dr. L. C. Howard at the Government laboratory in Arlington, Massachusetts, under an appropriation of $10,000,000. Within the next few years these parasites will be loosed upon the country districts to wage a bug-eat-bug campaign against the deadly corn borer.

At a recent English flower show, exhibit was made of a rose whose coloring changes from pale yellow to yellow deeply splashed with red, the change depending on whether it is cold or warm when the bud opens.

If the stamps used in the United States in one year were placed end to end, they would extend 250,000 miles, or ten times the circumference of the globe at the Equator.

Because the ear of a dog can detect sounds above the audibility of the human organ, German police are equipped with whistles that are totally inaudible to the human ear but can be heard distinctly by the dogs that assist in police work.

The fine art of lying is cultivated in Gascony, in southwest France, and such has its reputation become that for hundreds of years a whopper from any source was called in France a 'gasconade.'

In the four minutes required to play Rubenstein's 'Staccato Étude,' a Chicago pianist found that he exerted a force of 14,700 pounds on the keyboard.

It requires from twelve to fifteen gallons of water at one time to quench the thirst of an elephant.

To obtain two ounces of poison used in the curing of snake bites, two hundred diamond-back rattlesnakes are killed.

The fairy humming bird of Cuba, two and one-fourth inches long, is the smallest bird in the world.

There are fourteen pairs of twins, ten girls and eighteen boys, among the nine hundred pupils in one school in Dundee, Scotland.

There are, on an average, a hundred tornadoes every year in the United States, in which 250 people are killed, and eight million dollars lost in damage to property.

The government of Brittany has established an agricultural school for the farm girls of France, in which the girls are taught gardening, dairying, the care of poultry and pigs and the care of a dormitory and a dining room.

Dr. Thaddeus L. Bolton, head of the Department of Psychology, Temple University, states that cows, horses, monkeys, and dogs laugh and that smiling is a cultured or refined form of laughter in man.

Scientists have discovered sixty-six kinds of birds which eat the cotton boll weevil.

Billy Sunday has turned down offers amounting to $2,000,000 from vaudeville and motion picture concerns, he announced recently at Ocean Grove, New Jersey.

The world's largest one-piece table is thought to be that used for community dinners at Glen Grayland, Washington. Having been made from a section of spruce log which floated into the harbor, this table has a diameter of more than eleven feet and will easily seat thirty-five persons.

Public school pupils in Kent, England, have built an open-air swimming pool during their spare time.

A mushroom twenty inches in diameter and weighing more than ten pounds was found recently in Pergine, England.

Five former presidents of the United States were living in 1861, the largest number in the history of the country.

More than 5,000,000 pounds of American confectionery was eaten by the Europeans last year.

Mme. Thible was the first woman to make a balloon ascension when, on June 4, 1784, she went up to a height of 9,000 feet.

A LAST PRECAUTION

Because of the demand for their hides few alligators live a natural lifetime.

There are only six public libraries in British Columbia.

According to Dr. George A. Smith of New York, insane people are much happier than sane people.

White flowers, experiments indicate, are usually sweetest, while yellow, red, blue, violet, green and orange are next in the order named.

Nicholas Pike brought the English sparrow to America in 1850 to rid the trees of the devastating caterpillars which were very numerous at that time.

In a collection of 711 specimens a Cincinnati professor has flutes made of gold, jade, a ram's horn, and glass.

One-eighth grain of nectar can be obtained by a bee draining sixty different flower tubes in a single clover blossom.

According to Albert Baler, forest ranger, a meteor severed and set fire to a tree in the Umatilla National Forest.

L. F. Griffith of Rosendale, Missouri, claims that 741 English sparrows were found to have been killed or injured in his yard by hailstones during a recent storm.

According to an official of the United States Coast and Geodetic Survey, the pyramid form of building construction used by the Egyptians is the least liable to be disturbed by earthquakes.

All the scientific learning of the twenty-five visiting British surgeons touring American medical centers availed them nothing when confronted on a diner by corn on the cob. Unfamiliar with the vegetable served in this state they were unable to eat it until the steward gave them a demonstration.

In the zoological gardens of Leipzig is a crane with an artificial leg made of aluminum which it uses with perfect ease.

The often repeated and untrue story that the Greek cynic, Diogenes, lived in a tub is believed to have originated from a remark made by Seneca, who wrote of Diogenes three hundred years after his death saying: 'A man so crabbed ought to have lived in a tub like a dog.'

The perfect square meal, containing the proper balance of vitamins, according to British dietitians, includes cold chicken and egg sauce, new potatoes, salad, corn flour mold, fruit salad with cream, whole wheat bread, butter, and lemonade.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the importance of new methods in solving new problems.

* * *

There are clubs for father, mother, sister and brother, but where is the club for the family? So asks William Matthew Holderby, who writes of the menace of the coming generation to America. Mr. Holderby is a leader in the work of the Christian family crusade, holding that the greatest error in modern life is the development of the individual as a unit of society, rather than of the family. The menace faced in the coming generation, he points out, might be great enough to destroy America. (p. 1)

* * *

The booster is a useful character. Without him, many of our outstanding qualities and characteristics would remain unknown. Unfortunately, he is apt to overdo his art and devote his eulogies to trade and commerce *in toto*, ignoring the natural beauties of the country about which he is so enthusiastic. Such a one met Charles J. Finger, when the noted writer of adventure tales was visiting in Missouri with a party of friends. In order to set the matter right, Mr. Finger points out some of the attractions of that great state not so well known that contribute to the peace of mind and happiness of the average individual: Flower-dressed hills, quiet valleys, fields of red-gold wheat, Roaring River, strange caves—a miniature paradise for those who would enjoy the singing world in all its beauty. (p. 3)

* * *

Although the great lecture *Acres of Diamonds* was delivered literally thousands of times by its author, Dr. Russell H. Conwell, it was never given the same way twice. It was the custom of Doctor Conwell to crumple up his notes and throw them in the wastebasket. When a sermon became important enough for publication, the preacher dictated it from memory. One of his achievements was the building of a university in garrets, cellars, shops and office buildings. William A. McGarry, well-known magazine writer, tells of his personal recollections of this notable man. (p. 6)

* * *

Of all the instructions which the golfer must observe to play a successful game, none is more important than that of keeping the left arm straight on the back swing. A low golf score requires complete coördination of all the rules, and failure to observe any one of them will add unnecessary strokes to the total. Jim Barnes, expert golfer, explains the function of the left arm in relation to the club head; and describes how to secure the best results. (p. 8)

In 1783 a schoolmaster at Goshen, New York, named Noah Webster, brought out a speller as the first book in a comprehensive work on English for schools. A grammar and reader both followed later, but the speller was the most popular book ever issued from the American press. Approximately one hundred million copies were sold and as late as 1880 it was still issued in large numbers. Louis C. Karpinski tells of the spellers which influenced early American life. (p. 9)

* * *

Primitive, provincial and mystic as compared with matter-of-fact Western Europe, the Spanish are self-reliant and proud, keeping aloof from other civilizations. These characteristics are reflected in the art of this gallant people. One can trace the spirit in their paintings. Reginald C. Poland, author of this article, is director of the Fine Arts Gallery of San Diego, California. (p. 12)

* * *

Of the wise King Solomon it was said that he knew three thousand proverbs. Only four hundred are included in the twentieth book of the Bible, which we call *The Proverbs*. Even in David's time one of these recognized adages, a sort of condensation of wisdom, could be cited in a public plea as today a lawyer will cite a legal precedent. All of life and its problems appear in the sayings of the great King. (p. 14)

* * *

On October 8 and 9, 1840, two young people, a tall, lanky youth and a plump, vivacious belle, went to a circus at Springfield, Illinois, and saw their first elephant! They also stared at a giraffe and Bengal tiger and were entertained by an exhibition of the new dance known as the 'waltz.' Little more than two decades later, these two were to enter the White House, described by the husband as 'the long and short of the Presidency.' Mary Todd at the time of her marriage admitted that her husband might not be handsome but predicted he would some day be President. William E. Barton presents interesting side lights on Abe Lincoln's courtship. (p. 15)

* * *

A waterway from the Great Lakes to the ocean which will permit the Atlantic liners to sail from Middle Western ports will add 2,700 miles of coastline to our country. The distance between Chicago and Liverpool via the St. Lawrence is only 3,867 miles, whereas via New York it is 4,019 miles; and at the latter port the cargo must be transferred from box car to hold. Incidentally, water transportation is cheaper than rail. The St. Lawrence project has been called the greatest economic enterprise of the 20th Century. (p. 21)

REMARKS BY OUR READERS

Ketchikan, Alaska.

There is a difference between the Alaskan sourdough, so-called, and the actual Alaskan. I write this because I have been inspired by your 'Office Chat' of August 27 on the sourdough. Today you are chatting with a real Alaskan.

The sourdough was a pioneer in the territory, but his life, hopes and ambitions were elsewhere. The Alaskan looks on the place as his home. He expects to live and die there. Home interests and permanent institutions are his aim. Southeastern Alaska, the panhandle of the territory, especially responds by offering him those possibilities. The climate is equable and moderate the year round; and the resources are ample to support the population of a state.

Lumber, fishing, and mines are among Alaska's wealth. Alaskans are becoming convinced that they must displace the nonresident type of ownership in their industries. They want to invite home interest. One important objective is the creation of an Alaskan port, enjoying transcontinental railroad rates. There is such a railroad now ninety miles from a flourishing Alaskan town, in Canada. Carload lots with seals unbroken could be shipped in from eastern United States, and then transferred by ferry; but so far this idea has died through utter neglect.

E. L. SAMPSON.

In the August 20 issue in an article referring to the old Mission buildings of California entitled 'America's Passion Play,' by John Sloan, appeared a sentence which read: 'Some years ago an effort was made by leaders of intellectual life in California to have the state restore these missions, but members of a creed with headquarters in Boston blocked the movement.'

Judge Clifford P. Smith, manager of committees on publication for The First Church of Christ, Scientist, Boston, Massachusetts, authorizes this magazine to say that the Christian Science Church took no such stand at any time. 'I feel quite sure that there is no basis in fact for the statement in question except as individual Christian Scientists may have expressed their individual views,' he says.

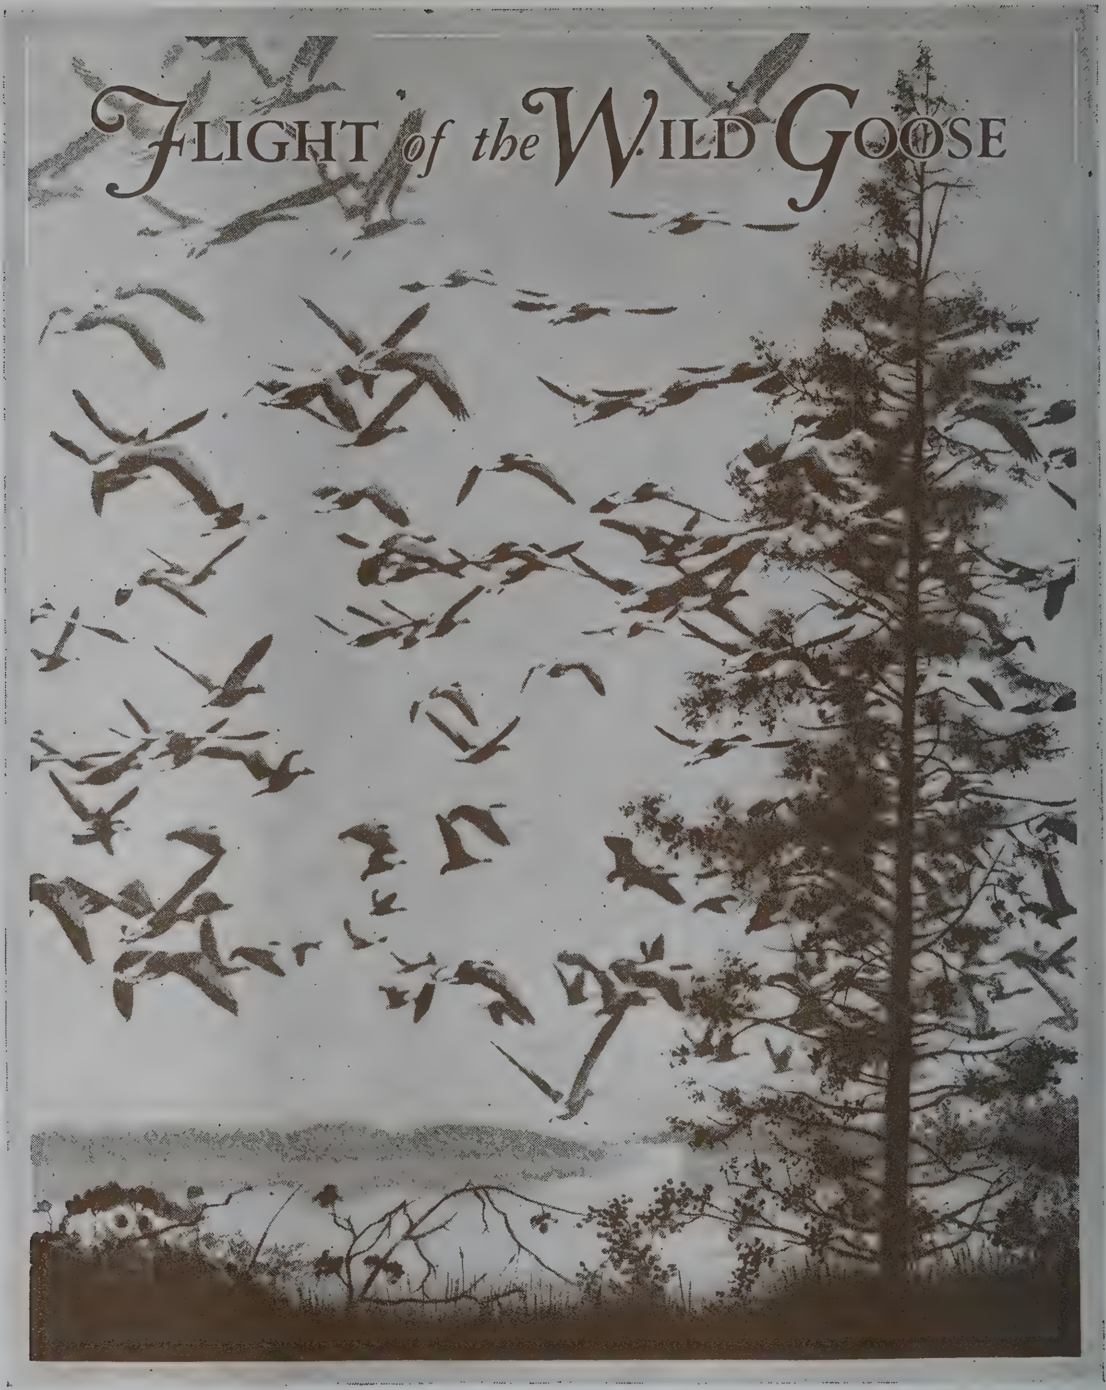
FLIGHT of the WILD GOOSE



BY WADE VAN DORE

BRIEFER days, and wind and rain,
Start the goose chains south again
Loudly clanking through the sky.
Now autumn, letting go the lead,
Meditates no trivial grief,
And I ask myself, shall I?

SLOWLY is gray disclosed on boughs.
The earth is covered with such mows
The chill winds reap of ripe leaves here.
It's not I suffer loss of these.
My task is that the simple goose
Has power to be wild and loose,
While wingless I must stable here.

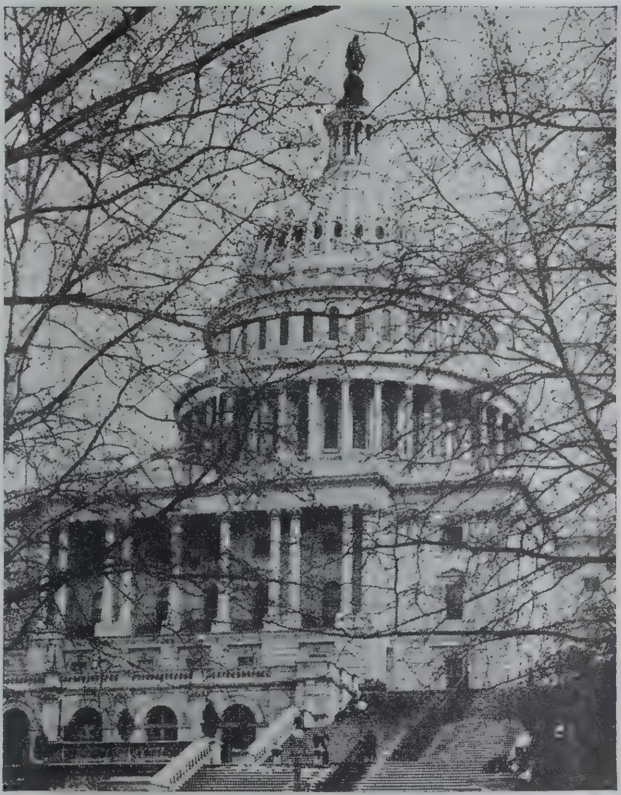
Clearing the POSTAL Deficit

By CLYDE KELLEY



—*Harris & Ewing.*

CONGRESS can and should come to the aid of the United States Post Office Department, Congressman Kelley says in this article.

The postal service needs a new and definite policy which will prevent Revenue from ousting Service as the keynote of the organization.

Ways and means are possible by which the Department may show a favorable balance sheet and still continue to render the free services which, while costly, are so important to the nation.

IN DECEMBER when Congress assembles I will insist that consideration be given my bill to declare a postal policy for the nation.

My proposal is that Congress proclaim the post office as having been organized for service, not for revenue, though of course, financial considerations have their proper place in the conduct of that immense public enterprise.

The question of how much money is to be made out of the business of carrying and distributing the mails and doing all the things that are necessary in this mighty enterprise, must be subordinated to that of effective service.

Efficiency should be the primary consideration; and if after the people have been given incontestably good and satisfactory service there remains a balance to be turned into the treasury, well and good. But service should be the controlling and impelling idea in a business of this character.

My idea is that we are requiring the post office to carry too heavy a load.

We require it to perform all sorts of free service which, if paid for, would add perhaps one hundred million dollars a year to the revenue. Then we accumulate a deficit and say that the revenues of the post office have unfortunately been insufficient to cover the expenses. In all fairness we should not charge this gratis service against the income of the system.

The paid-for service in the department is nearly always self-sustaining and self-financing. It is not good business to do an additional hundred million dollars' worth of business and then charge the cost to that portion of the enterprise which really pays its own way.

I am not demanding that free service be discontinued, but I am demanding that payment for this service be made from the public treasury and not from the revenues of the Post Office Department. If this is done, we shall be able to tell exactly what it costs to administer the business of the department which is self-financing.

The educational value of the post office is immense. In fact it is the greatest democratic university in the world, an instrumentality for the diffusion of knowledge and the distribution of necessary information. So I am in favor of continuing the policy of making it an agency through which the people can obtain access to world information at the smallest possible cost.

Our people are always ready to pay for education. An ignorant democracy is an impossibility, and so I believe the service the post office is performing for the people should be expanded rather than restricted.

THOSE who differ with me by insisting that the post office should annually present to the nation a favorable balance sheet resort to all sorts of expedients in their efforts to keep down the cost of the distribution of mail and at the same time make the service more efficient. Hence it was found advisable to put a service charge on parcel post; this added substantially to the burdens especially of the farmers.

Then it was apparently necessary to increase the price of post office orders, to make an advance in third-class rates in general and to cause anxiety to business by additional imposts in every grade of the service except first class.

If my plan were adopted it would be possible not merely to leave rates as they were before the last 'readjustment' but to reduce them substantially.

There is no real reason why the cost of distribution of Congressional and departmental mail should be charged against the revenues of the post office. This is a kind of impost that no private enterprise in the world would tolerate.

I am not in favor of discontinuing

the franking privilege of Congress. If anything, I would extend it. The purpose of the franking privilege is not to save members of Congress the cost of postage. It is to provide a means through which the people can be correctly and swiftly informed of the progress of public business in both Houses.

The franking privilege is very rarely abused. I am aware that some persons are in the habit of accusing congressmen of making too liberal use of the privilege, but the fact remains that it is utilized only when the use is justified by the law and by the requirements of public business. That members of Congress pay for their own private postage is shown by the fact that the post office in the House office building during the last session reported an average income of two thousand dollars a week.

CITIZENS of the United States are entitled to all information concerning their business affairs as conducted in all the departments. Hence every member of Congress is given a certain quota of documents which he causes to be sent to his constituents.

These documents are in the main of very important educational value. I refer especially to those of the Department of Agriculture, which has become an immense information-distributing organization. Farmers who study what this department has to tell them inevitably become more proficient in the business of tilling and cultivating the soil.

Uncle Sam uses his post office to keep the farmers informed regarding the best uses to which the soil can be put and the best methods of production. For this splendid service no charge should be made against the receipts of the Post Office Department. It is unfair to ask parcel post, for instance, to bear any share of the cost of administering the part of the service referred to above.

FARMERS are the greatest patrons of parcel post in the country and therefore are required to bear the brunt of any additional cost in the administration of that part of the postal service.

Through the free distribution of departmental and Congressional information a free school is brought to the very homes of the farmers who live in the remotest parts of the country.

But, I repeat, it is unfair to charge to the revenue of the post office the administration cost of this exceedingly important and necessary section of the postal service.

Every department of the Government has information to which the people are entitled and it is the duty of all heads of all departments to see that this information is distributed.

I would not have it disseminated in a reckless, extravagant manner, without regard for cost. Indeed the rules of all departments forbid a wasteful and improper use of postal facilities.

Then there is the free carriage of county papers.

When this method of distributing local publications was adopted, the view was that the Post Office Department should help any movement calculated to disseminate needed information among the people who live within limited boundaries. I see no reason for changing that policy, nor for charging the cost of administering the system to the revenues of the post office.

Nobody wants to limit or restrict the rural free delivery service. On the contrary we all want to see it expanded and made more and more useful.

It cannot be denied, however, that the system is very costly when measured by dollars and cents, but it is worth all we pay for it.

We have a huge deficit in our rural delivery revenue. Those who believe that each branch of the service should be made financially self-sustaining are met with a poser here.

If we required the farmer to pay the cost of rural delivery, we should be compelled to establish country rates which no farmer would pay. He would return to the custom of going to his own local post office for his mail. But on the other hand it is manifestly unfair to charge this deficit to the revenues of the postal service and then solemnly to declare that we have an adverse balance for the whole system.

The theory on which the rural free delivery was established was a highly enlightened and patriotic one.

IT WAS an agency which not only gave the farmer rapid access to the news of the world without requiring him to travel several miles to get the needed information, but brought the urban dweller and the ruralist into more direct contact with each other. This theory has been fully justified by the experience of the system.

But again I say the cost of administering should not be charged against the revenues of the Post Office Department.

To meet the deficit in the rural free delivery service a special appropriation should be made annually and charged against the general revenues. There should be no objection to this, more especially as all the people share in the benefits of the rural free delivery system and should, therefore, all make a contribution to its cost.

Those who founded the post office system never troubled themselves about the revenue it would produce. The paramount thought in their minds was that it could be made a very valuable factor in the promotion of world progress and would contribute largely to world civilization. It has had exactly these beneficent effects To handica it and cripple it by imposing un necessary costs of administration woul be little short of a crime.

Congress made provision for speci exemptions for religious and fratern publications which are not conducte for private gain.

This policy should be continue Though naturally it costs more t distribute these publications than wha we collect from them, they have a educational value which in a republi like ours should be very highly e teemed. But again, it is unfair to charg the cost of this service to the gener postal revenues.

A special appropriation should b made from the general funds to mee the financial needs of this work.

TO MEET the situation in general would charge up to the House, th Senate, the Executive and every othe branch of the public service the cost c distributing franked mail. Then would have Congress in the regular wa make the appropriations necessary t meet these accounts. The same polic should be adopted in relation to a mail which is carried below cost.

I am informed that the policy outline has been adopted in Australia

There the railroads are owned by th government, but the postmaster-genera must pay the cost of carrying the mail over government-owned highways. Thi is fair to the railways and fair to th post office.

When one considers that the cost o administering the Post Office De partment in this country would pur chase the entire wheat crop of th United States at one dollar a bushel some idea of the magnitude of th business can be acquired.

To a man who has had some share i shaping the modern postal policies o the nation the idea that the post offic is merely a cold business institution with the collection of revenue as it supreme motive for existence, is sorel repellant.

I AM hoping that we may get sub stantial reductions in third- and fourth class mail before the end of the firs session of the Seventieth Congress But this cannot be done if we continu the policy of charging against th legitimate revenues of the post offic the cost of free services. I am partic ularly anxious to see the servic charge on parcel post dropped.

A living wage must always be th policy of the postal service.

Let us state authoritatively tha the post office was organized for servic and not for revenue.

Such a national conception of thi great agency would stimulate interes in the enterprise and give the peopl a new view of their biggest busines organization.

Two VILLAGES *in the* FAR NORTH

By D. M. LeBOURDAIS

WE WERE at anchor when I awoke. When I went on deck I saw that the schooner was lying some distance out in a broad stream. The south shore, heavily covered with spruces and cottonwoods, rose steeply. Through the trees I could see a number of buildings, two or three quite large, along the edge of the plateau. That was Noorvik.

We rowed ashore in the dory. We followed the path beside a tramway which led from the landing place up the slope to the village. Although still quite early, the sun was high, for we were north of the Arctic Circle and it was July. By the time we reached the plateau we were bathed in perspiration. It was not only hot but humid. At every step we were met by fresh swarms of mosquitoes which buzzed and hummed about our heads in impotent rage, baffled by the all-enveloping nets we wore. We halted at a quite-modern cottage.

A splendid breakfast had been prepared for us and the climb up the hill had prepared us for it. Because of the heat we were invited to eat in our shirt sleeves.

Breakfast over, we followed our host, Mr. Chance, outside to see the village. Noorvik means 'transplanted.' Some nine or ten years ago representatives of the U. S. Department of Education in the district became aware that the Eskimos in certain places along the south shore of Kotzebue Sound were becoming demoralized by contact with whites and they devised the plan of a model village exclusively for Eskimos.

By presidential proclamation an area of about 225 square miles was set aside on the Kobuk River some 40 miles above its mouth. It was a timbered region and the Bureau of Education supplied a small saw-

Where HAWTHORNE Wrote

By JULIAN HAWTHORNE

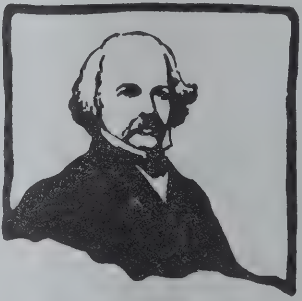
AMONG the early emigrants from Old England to New England were ancestors of Nathaniel Hawthorne. They fought as soldiers, sat on the bench as judges, and subdued the wilderness as farmers; but in every generation, one or more of them took to the sea.

My grandfather lived, when he was ashore, in a little frame house on Union Street, Salem, neighboring the docks; so that his wife when he sailed away might have waved a handkerchief to him from the bedroom window, as he stood on his quarter-deck. But in his thirty-fourth year he was seized with yellow fever in Surinam, and died there.

His widow was left with three children—two girls, and the youngest a boy, named after his father, 'Nathaniel.' She dwelt in the little house in seclusion, and the children grew up apart from other children. The family lived, at various times, in other houses, leased or lent to them by relatives; but did not own any.

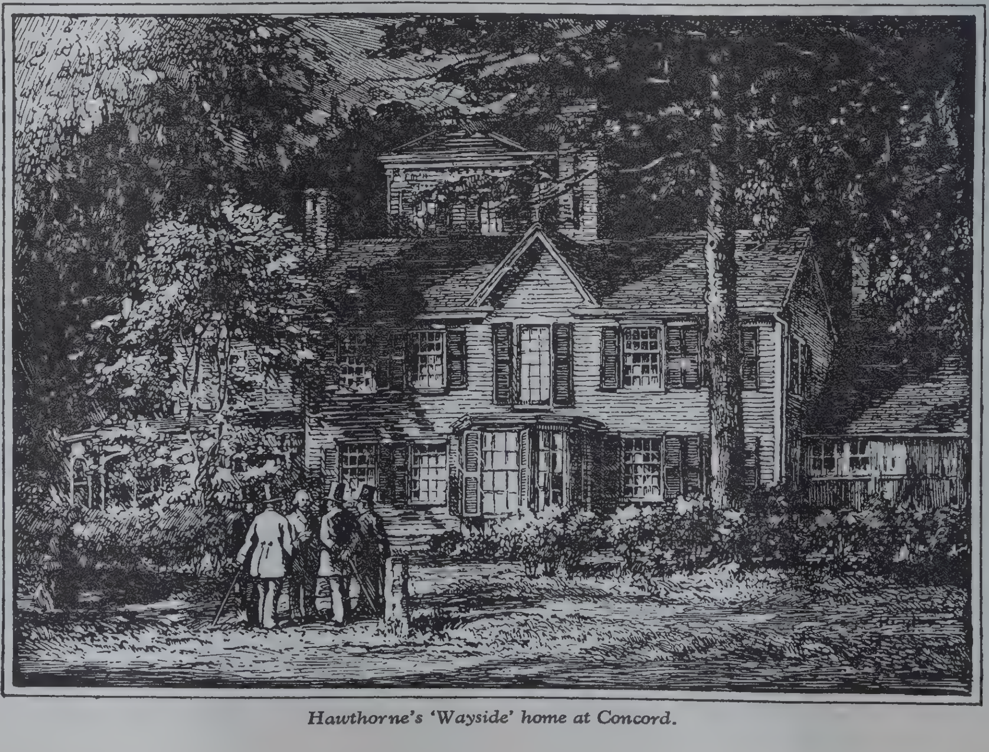
During father's tenure of surveyorship of the Salem customhouse, we lived on Mall Street; and it was there that *The Scarlet Letter* was written. There, too, my grandmother, when her strength began to fail, came to live with us; and there she died, in the room below the one in which the book was taking form. The money which the book earned enabled Hawthorne to rent a little red house in Lenox belonging to Mr. Tappan, a friend of his; and we never returned to Salem. But after two years, Hawthorne bought from Amos Bronson Alcott a small frame building in Concord, on the old Boston highway. And to that he came in 1852, designing to take up his permanent abode there. It was the first house that he had ever personally owned.

It was very old, as age goes in New England. The original builder hewed his timbers from solid oak; some were twelve inches square. One of these crossed the ceiling of the room which we occupied as 'parlor' and also as dining room; the door opened from it into the kitchen. The ceiling was so low that a man could lay the palm of his hand upon it; and the old beam was cased in a sheathing, which was also old.



The master of 'Wayside.

The house stood, and it still stands, facing the highway, and not more than two or three paces from it. It was of the simplest design: a plain oblong structure, with a gable at each end, lying sideways to the road. The chimney went up through the center of the house, and the stairway, narrow and twisting, clung to it like a vine. The house stood at the foot of a steep little hill, a hundred or so feet high, tree-grown; from the hill summit, the forest receded, with a downward slope, to the margins of the River Musquetaquid, a couple of miles northward. In front of the house was meadowland, divided by a brook, and extending beyond to a great pine forest.



Hawthorne's 'Wayside' home at Concord.

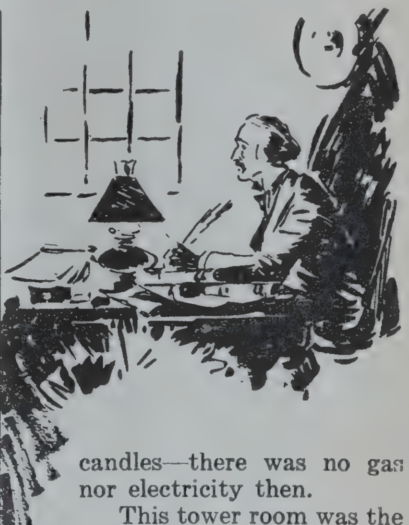
Hawthorne had written a pamphlet on the career and character of his old friend Franklin Pierce, with the view of helping him into the White House in Washington. When Pierce got in, he cast about for an agreeable and remunerative post for Hawthorne, and selected the consulship at Liverpool. Hawthorne accepted it, after some hesitation; but soon after his taking up his consular duties, Congress diminished the emoluments of the office by about nine-tenths; he would probably have made more money had he stayed at home and continued writing books. But the friends he made and the things he saw in Europe were compensation. Be that as it may, he left The Wayside after occupying it for only a few months; and during the seven years of his absence it was given over to my mother's brother, Dr. Peabody, who in lieu of paying rent kept it in order.

DETACHED from the house, and at a distance from it, on the west, of perhaps a dozen or fifteen yards, was the barn, a typical New England creation, and perhaps not of a date much more recent than the original house itself. It was spacious within, and quite undecorated without; and as we never kept cattle, it was left to ruminate over its past; swallows built their nests under the eaves; it was unpainted, and its seams gaped and its roof leaked, but it stood firm, as its massive skeleton promised. It was important to the children, who played in it and climbed into its lofts and sequestered some of their treasures in it.

Moreover, hay, in the season, was stored in it, and exchanged for work done on the farm by Irish laborers in the vicinity. For we grew our own fruit and vegetables, and would have kept poultry (as we did in Lenox) had the conditions been more favorable. But Hawthorne, after our return from abroad, had no disposition for farming, and was already less robust than in former years. He caused to be planted an avenue of larches, which he had imported from Norway, along the path through the meadow down to the brook, and also along the path toward the Alcott place, which ran inside the fence along the highroad. They flourished exceedingly. On the other side of this path were three hollows, grass-grown, each about twelve feet in diameter and of half that depth. They were understood to have been dug as cellars for three huts which had formerly stood there, but of which no trace or memory had survived. Hawthorne had always been fond of sunflowers, and he planted them in these hollows; he would often pace along the path for the sake of musing over them. They lifted their great golden disks to a surprising height.

—Darling Photo.

Path to the 'Ridge' at 'Wayside' where Hawthorne used to pace to and fro while composing his romances.



A memorable feature of our estate was the apple orchard. The trees were planted on the steep hillside behind the house, the lower part of which had been terraced for the purpose. The crop was abundant; we always had several barrels of apples in the cellar—a large subterranean cavern—reached from the kitchen by a rickety wooden stairs, and not free from rats. To enter it was an adventure, but I was never unwilling to undertake it, for the split salt cod was hanging from a nail on the way down, and it was easy to tear off a strip of it as you passed. Salt raw cod, brought by Gloucester fishermen from Newfoundland Banks, is very good for a boy. The apples were made into pies, deep and excellent, and also into pandowdies, the manner of creating which is a secret of the old New England housewives, now, I am sorry to say, irretrievably lost. I could give the recipe, but it would be as from an onlooker and eater only; there are refinements which only the maker could know, and that from inheritance only. All that an ordinary person could see of the matter was apples and pastry; but the pastry was not the thing that commonly bears that name; and the apples were occultly prepared, and then followed a transaction entirely original and unprecedented, from which came forth, after a due interval of seclusion, a dish that was the ambrosia of the Olympian gods in a brown earthenware bowl, twelve inches in diameter and three or four deep. It is served cold, for breakfast, and a cross section of it looks like mottled eastern marble from Cathay. I was capable of consuming the entire bowlful at a sitting, besides a pile of genuine buckwheat cakes (now also lost to sight and knowledge in the abyss of the past). These cakes were broad, thick, light, and brown, and were treated with antique molasses from Jamaica in the West Indies, dark brown in color, dense and slow-moving as one poured it out of the jug.

Our return from Europe had been in June, 1860; Uncle Peabody relinquished the house to us in good condition; but the children being no longer babies it was necessary to make enlargements, and besides my father, urged on by my mother, resolved to build a tower; to write in the top room of a tower, uplifted above the earth, had always been a dream of his, and my mother made up her mind that then was the time to realize it. Some months were spent in making and revising plans; my mother was an artist, and she knew something of architecture; my father made an occasional suggestion. Thoreau might have been consulted; he had made a survey map of the estate, and he had proved his ability to build a log hut on the shore of Walden Pond; but my mother perhaps thought he would be too utilitarian in his conception.

In due time the great work was begun, and it turned out to be greater than was anticipated. The tower was to ascend in the angle formed between the body of the old house and the west wing, and a room comparatively large was designed below it—the drawing-room, handsomely proportioned, and beautified with the prettiest wall paper and grained woodwork that were available. It looked grand and imposing, the only drawback being that its window on the north was compelled to look out on the hillside, which rose only a yard or two from it. We received company in it; in the evenings it would be lighted with candles—there was no gas nor electricity then.

This tower room was the outstanding feature of the remodeled house. A narrow stairway went up to it, but the only way to get into it was through the floor. The aperture was covered by a sort of hood, rising through the floor and furnished with a door, through which you emerged from darkness into light. Within, a standing-desk was contrived against the side of the hood, for Hawthorne sometimes liked to write standing. There was an ordinary sitting-desk against the south wall of the room, between two windows. On the three other sides of the room were also windows, so that there was a free outlook in every direction.

One of the windows on the south (overlooking the meadow) gave access to a platform, which had been built over the gap between the north slope of the roof of the old house and the vertical wall of the tower. On this platform one might sit at evening, and watch the sun go down and the stars come out. The tower room, rising above the entire structure, was visible from afar, and gave character to the building. After my father's death in 1864, the room was assigned to me; and to save time and trouble I often omitted the dark and narrow staircase, and got into the room by climbing up outside and entering burglariously through a window.

My mother often consulted with the artificers and gave (*Continued on page 20*)

How MACHIAVELLI Missed His CHANCE

By HARRY PENCE

A FEW months before Christopher Columbus set foot in the New World which he believed to be India, Lorenzo the Magnificent, most admirable of the Medici, died in Florence, Italy, then the center of art, literature and learning. Two years later that city deposed his son and set up a republic, governed by a Council of Ten.

Niccolò Machiavelli was a Florentine nobleman of good education, appearance and manners, then twenty-five years of age. He entered the service of the republic as secretary of the council and was sent on a number of diplomatic missions, which he handled with varying success.

Eighteen years later the Medici returned to power; Machiavelli, with others, was dismissed. He was accused of conspiring against the new régime but either the evidence against him was weak or he was not regarded as sufficiently formidable an enemy to be dealt with drastically, as was the established custom of the day.

IN FORCED retirement, he devoted himself to authorship, and, while engaged upon a history of Florence and other ambitious works, he composed *The Prince*, rewriting and elaborating it throughout a number of years and giving out hints about it calculated to arouse the curiosity of his ruler, whose patronage he sought.

It was never designed for publication, as the following extract, characteristic of the entire work, will make clear:

'Therefore it is unnecessary for a prince to have all the good qualities I have enumerated, but it is very necessary to appear to have them. And I shall dare to say this also, that to have them and always observe them is injurious, and that to appear to have them is useful; to appear merciful, faithful, humane, religious, upright, and to be so, but with a mind so framed that should you require not to be so, you may be able and know how to change to the opposite.

'And you have to understand this, that a prince cannot observe those things for which men are esteemed, being often forced, in order to maintain the state, to act contrary to fidelity, friendship, humanity and religion. Therefore it is necessary for him to have a mind ready to turn itself accordingly as the winds and variations of fortune force it, yet, as I have said above, not to diverge from the good if he can avoid doing so, but, if compelled, then to know how to set about it.'

In those two paragraphs is concisely expressed the entire Machiavellian philosophy. The following is more specific:

'Upon this a question arises: whether it be better to be loved than feared, or feared than loved. It may be answered that one should wish to be both but, because it is difficult to unite them in one person, it is much safer to be feared than loved, when, of the two, one must be dispensed with. Because it is to be asserted generally of men that they are ungrateful, fickle, false, cowards, covetous, and so long as you succeed they are yours entirely; they will offer you their blood, property, life and children, when the need is distant; but when it approaches they turn against you. And that prince who, relying entirely upon their promises, has neglected other precautions, is ruined; because friendships that are obtained by payments, and not by greatness or nobility of mind, may indeed be earned, but they are not secured, and in time of need they cannot be relied upon; and men have less scruple in offending one who is beloved than one who is feared, for love is preserved by the link of obligation which, owing to the baseness of men, is broken at every opportunity for their advantage; but fear preserves you by a dread of punishment which never fails.'

Certainly nothing new, especially to the ruler, the second Lorenzo, grandson of Lorenzo the Magnificent, and son of the crafty and cruel Pietro de Medici.

But Niccolò Machiavelli would have recoiled from this extreme application of his creed. He wasn't cast in heroic mould. With more skill and courage, he might have become his own hero, strutted out his little day, been assassinated and forgotten.

It seems incredible that the renowned literary critic and historian, Henry Hallam, and the even more celebrated essayist and historian, Thomas B. Macaulay, should have taken this book seriously and feelingly defended its author.

'Few books have been more misrepresented,' says Hallam. 'His crime was to cast away the veil of hypocrisy.'

Macaulay wrote, 'The character of Machiavelli was hateful to the new masters of Italy. His works were misrepresented by the learned, misconstrued by the ignorant, censured by the Church, abused with all the rancor of simulated virtue by the minions of a base despotism and the priests of a baser superstition. The name of a man whose genius had illuminated all the dark places of policy, and to whose patriotic wisdom an oppressed people owed their last chance of emancipation, passed into a proverb of infamy.'

But when all is said, Machiavelli's *The Prince* remains a splendid side light on the age and environment of which it can be regarded as a faithful interpretation.

After all, only a small-minded scoundrel could have written it as it has come down to us. There is one chance—a fanciful one, but not unreasonable—that a cruel joke has been played on Machiavelli. What is regarded by many as the most literal and exact translation of *The Prince* is by W. K. Marriott, who says, 'It was plagiarized during Machiavelli's lifetime . . . and its text is still disputable.'

HALLAM says, 'His history of Florence is enough to immortalize the name of Machiavelli. Seldom has a more giant stride been made in any department of literature than by this judicious, clear and elegant history.'

He wrote other books, among them, strange as it may seem, some rather clever comedies. This gives us a clew. The polished elegance and seriousness of *The Prince* palls. Brief as it is it becomes laborious. It is unrelieved by any touch of lightness such as a writer of comedies might well have imparted to it, to its great improvement.

The utter absence of anything of the sort invites the suspicion that it may have been there but was deleted. With a few deft touches *The Prince* might readily have been converted into a cynical bit of political satire more trenchant even than Dean Swift's *Gulliver's Travels*.

It would have cost its author his life, no doubt. Niccolò Machiavelli thirsted for fame. He wrote for the gratification of the mighty of his day and for the plaudits of posterity. He wrote of things as he saw them. His vision concerned the present. It was impossible for him to visualize any other possible order of things. Never could he have imagined that the crusading monk, Savonarola, would today be revered by a world which doesn't know or care who Cesare Borgia really was, or *if* he ever was.

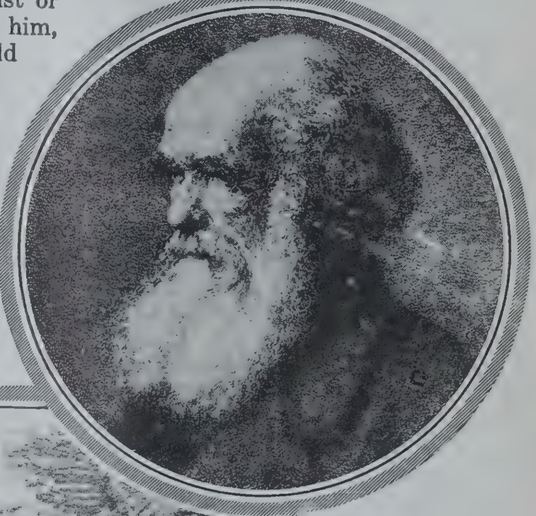
But could he have realized that there would come an age which conferred its honors upon doers of good and keepers of faith, and that by casting away the veil of hypocrisy and devoting his patriotic wisdom to giving an oppressed people their last chance of emancipation he might have insured his own immortality, Niccolò Machiavelli would have put forth one of the greatest as well as one of the most significant books of all time.

Village of Down, Where Darwin Lived

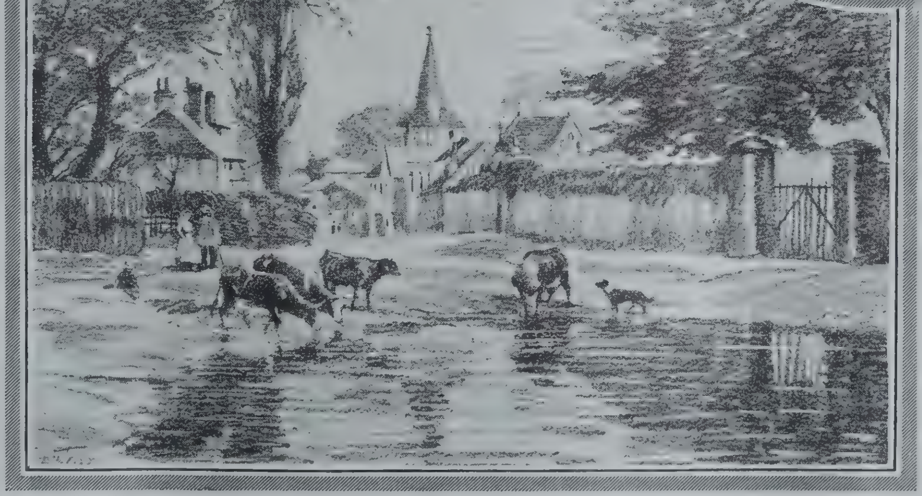
By HUGH A. STUDDERT KENNEDY

THE road thither is all "ups and downs," and winds prettily through a park of high elms. There is also a way to it along pleasant country lanes and field paths.' So did a writer describe it forty years or more ago, shortly after Darwin's death, and so it is today. London is steadily expanding southward, as it is in all other directions, but the red tiled roofs and stucco of the new order have not yet appeared over the hills to the north, nor invaded the firs and the link grass of the heaths around the village of Down. The little church with its quaint octagonal spire still sleeps behind its elms and yews, as it did four hundred years ago when Henry VIII was king, and on its worn floor, in the dim light of old stained glass, may still be seen many brasses placed there in memory of successive lords of the manor, great men, and great crusaders before Crécy was fought on the fields of France.

And about a quarter of a mile from the church, along the village street and past the pond, is Down Court where, for so many years, Charles Darwin lived and labored and took up arms manfully against a sea of troubles. It is an old-fashioned house, set well back from the road, and may be known by its white front covered with clusters of ivy. On the right of the old front door is the library which Darwin built for his books and where, in the latter years of his life, he read and wrote; on the other side is a smaller room which was used previously as a study and in which most of his more important works were written. The drawing-room at the back looks out upon a lawn shaded with mulberry trees, such as many country rectories possess, and on a veranda covered with creepers, of many kinds and hues. In the far corner of this lawn, carefully railed in, is a little grass mound; it marks the grave of Darwin's favorite dog.



Charles Darwin (1809-1882), member of the French Academy; recipient of the Prussian Pour le Merite.



Down, which has succeeded in evading the aspect of modernization.

This little mound has always seemed to me strangely typical and revealing. The great world knows Charles Darwin from the cold categories of the *Origin of Species* or the *Descent of Man;* it reviles him or lauds him accordingly as it condemns or endorses the revolutionary theory so intimately connected with his name; it dubs him atheist or blasphemer and will have none of him, or hails him as a pioneer in a field of license from which he would have withdrawn himself with a shudder. But it is only a very small world that has taken the trouble to follow him to this little village of Down in the weald of Kent, to see what manner of man he really was.

There are still some who remember him well, who remember the regularity with which the gaunt figure with long white beard and stooping gait might be met as he made his way toward the heath on his daily walk. Francis Darwin, his son and biographer, has recorded that he never missed these walks whether it was 'wet or fine.' Some few of the villagers, like thousands in the great world outside, looked askance at him, but for the most part they had, through many years, known him too well, had come in contact too often with his many acts of kindness and rather diffident charity, not to appreciate him at his full worth. When the bells rang out from the little steeple of a Sunday morning, and when the people made their way to church, they never found him there; but the good parson of Down knew how much he owed to the master of Down Court, and how many good works in the parish had been maintained through his help and influence.

There is something peculiarly pathetic about Darwin's so-called agnosticism. It may be too much to assume that he 'wanted to believe but could not,' and yet the anxiety he always evinced, this man who hated dogmatism, lest his opinions should influence the religious faith of others, seems to point that way. As a young man, he was a believer in Christianity as he found it; indeed, when he went to Cambridge, it was with the idea that he would take orders. Then, later on, came his famous voyage on the *Beagle*, and during the two years which elapsed between his return and his marriage he reflected 'very deeply,' as he tells us, on religious questions, with the result that—in his own words—'disbelief crept over me at a very slow rate but was at last complete.' The world today with its larger and saner

HEAD HUNTERS *and* Others

By WILLIAM L. STIDGER

IT WAS a scorching hot day when I tramped the jungle trails of Borneo to the Dyak *compoong* with a missionary friend who was in the good graces of the natives. Without him I would never have dared take the trip.

The temperature was 130 degrees in the shade of the palm trees. With a heavy Graflex over my shoulder and a belt with an automatic, I felt as if I were carrying a ton.

The Dyak *compoong* which we were to visit was in the midst of its harvest festivals. It is at this time that they send out their marauding parties on head-hunting trips. The night before our arrival the young bloods of this particular *compoong* had brought in six heads from a neighboring tribe. They were ghastly to look at, covered with flies, hanging in a row with about a hundred skulls that had been taken in former raids.

We spent most of the day with the Dyaks. Their *compoongs* are built about ten feet above ground. Each has the shape of a large platform and is made of bamboo tree trunks set an inch apart. In the center is a common gathering place, around which the single rooms of individual families are built. Every door opens upon this common square.

A bamboo ladder that can be pulled up at night leads from the ground to the platform. I saw a group of girls coming in with bamboo tubes of water strapped over their shoulders. They were well formed, firm and solid in their limbs, and with remarkably straight shoulders owing to the fact that they carry all their burdens on their shoulders. With the exception of a piece of loin cloth these eight or ten water girls were innocent of clothing.

When I tried to get a photograph of them, there was a confused cry such as might have come from a crowd of American girls surprised by a camera man, and they scampered away.

I asked my missionary friend to act as ambassador and persuade them to let me take their pictures, but the Dyak 'beauties' were obdurate. In other words—like woman of any clime or land, they needed coaxing.

'The white man may take our pictures if he will let us adorn ourselves in the dresses the Dutch women at the post gave us,' they announced, peeping at me from behind doors. 'But I want to get them just as they are, just as they live, just as they carry their water tubes,' I suggested.

No! They would not let me take them in native costume.

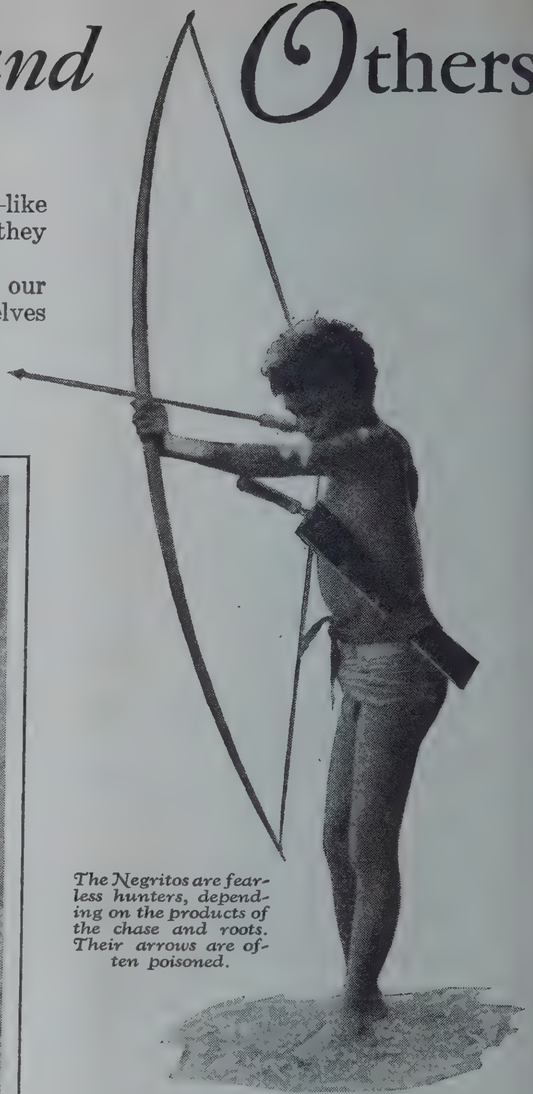
I finally had to give in.

After a while they appeared, giggling and happy, all dressed, much to my amusement, in discarded nighties given by the women of the Dutch settlement. Though some of these gowns were in shreds, this was their idea of being dressed up. I was permitted to take the photographs.

The head-hunting custom is fascinating to a peace-loving American. The Dyaks go after heads with several motives.

(*Continued on page 21*)

While the men of the Negrito tribes go out for game, the women remain with their pots and pans. This girl is carrying water.



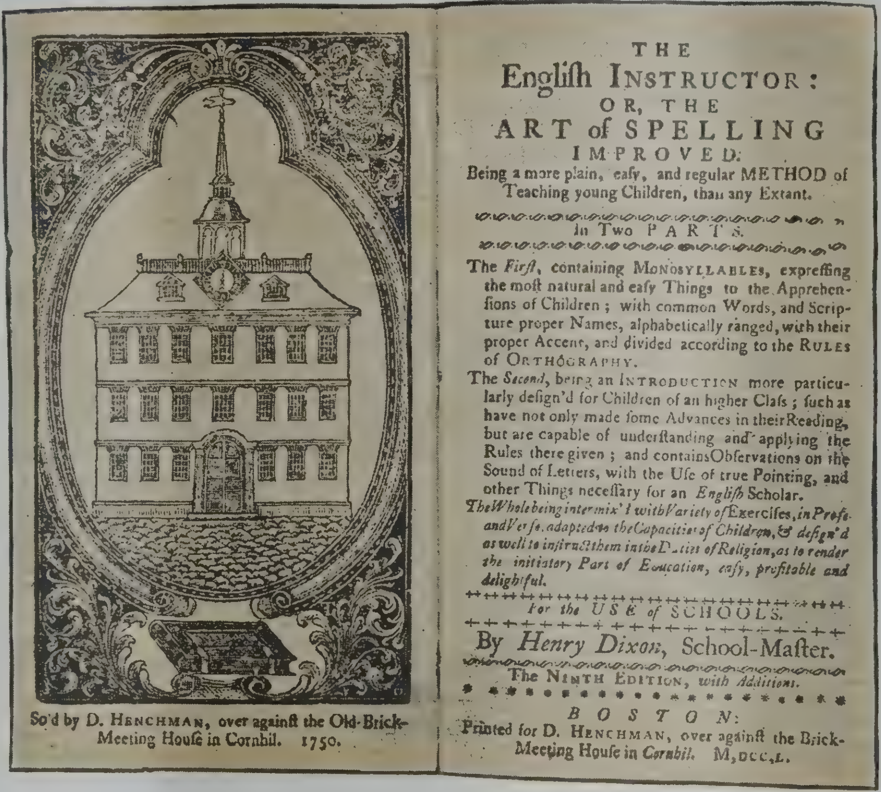
The Negritos are fearless hunters, depending on the products of the chase and roots. Their arrows are often poisoned.

The verandas are the important work-places of the native dwellings.

Early AMERICAN Schools

By LOUIS C. KARPINSKI

THE first schools of the New World were established in Mexico, where devoted friars spent time and energy in learning the Indian languages in order to convert the natives. However, schools as a means of popular education were foreign in the 16th Century to Spain and, in consequence, foreign to Mexico. Few families came to the Spanish New World, since America was (for the Spanish adventurers) largely a road to wealth, an enterprise to acquire gold and silver. Nevertheless due credit should be given to the Spaniards who in 1539 introduced the printing press to the New World, and in 1553 set up the first American University in Mexico City.



So'd by D. HENCHMAN, over againſt the Old-Brick-Meeting Houſe in Cornhil. 1750.

THE
Engliſh INSTRUCTOR:
OR, THE
ART of SPELLING
IMPROVED:
Being a more plain, eaſy, and regular METHOD of Teaching young Children, than any Extant.

In Two PARTS.

The *Firſt*, containing MONOSYLLABLES, expreſſing the moſt natural and eaſy Things to the Apprehenſions of Children; with common Words, and Scripture proper Names, alphabetically ranged, with their proper Accent, and divided according to the RULES of ORTHOGRAPHY.

The *Second*, being an INTRODUCTION more particularly deſign'd for Children of an higher Claſs; ſuch as have not only made ſome Advances in their Reading, but are capable of underſtanding and applying the Rules there given; and contains Obſervations on the Sound of Letters, with the Uſe of true Pointing, and other Things neceſſary for an *Engliſh* Scholar.

The Whole being intermix'd with Variety of Exerciſes, *in Proſe and Verſe, adapted to the Capacities of Children, & deſign'd as well to inſtruct them in the Duties of Religion, as to render the initiatory Part of Education, eaſy, profitable and delightful.*

For the USE *of* SCHOOLS.

By *Henry Dixon*, School-Maſter.

The NINTH EDITION, *with Additions.*

BOSTON:
Printed for D. HENCHMAN, over againſt the Brick-Meeting Houſe in *Cornhil.* M,DCC,L.

Public schools, as we know them, were first set up in New York and Massachusetts. The Dutch were first in Europe in devotion to public education. To the Dutch must be accorded a great share in opening public schools in New England and in New Amsterdam.

Washington Irving gave a fine account of the Dutch schoolmasters of early New York. Irving was a competent historian and his account, disguised as a novel in story form, presents accurate historical information, well worth reading today as history and as literature.

The first schoolmaster of old New York was Adam Rolands, or Adam Roelantsen, whose teaching activity extended from the spring of 1638 to that of 1642. Rolands functioned also as sexton, as a church reader or precantor, and as court bell ringer, and possibly as gravedigger. This versatility demanded of the school-teacher had a bad effect upon poor Adam. The name of this first schoolmaster of New Amsterdam appears in the court records as a defendant in suits for slander, for not paying his laundry bill and for even more reprehensible actions. After leaving the teaching profession Rolands became attached to the court, with which he had an unfortunate familiarity, and later acted as jailer. Rolands was no credit to the profession. The Dutch successors of Rolands were fortunately better men, although the varied duties of the office did not attract men of the highest caliber.

The Records of the Virginia Company reveal the first missionary enterprise in the United States, five hundred and fifty pounds having been given in 1619 by an anonymous Mr. 'Dust and Ashes for educating the Infidles Children.'

Later 'Mr. George Ruggle lately fellowe of Clare hall in Cambridge . . . by his will bequeathed 100 li. for the educacion of Infidelle Children.'

Plans were made for bringing Indian children to England and for establishing a school in the Virginia plantations, but these plans were never completed. An usher, Mr. Dike, was appointed in March, 1622, to serve 'in the free schoole intended at Charles Citty in Virginia . . . ' It was agreed that 'if he can procure an expert writer to goe over with him that can with all teach the grounds of Arithmaticle whereby to instruct the Children in matters of Account, the Companie are content to give such a one his passage . . . 100 acres of land' and permission to charge tuition.

Books also were to be provided by the company, but 'their Parents are to be aunsweareable' for the books. Unfortunately Mr. Dike got a better job in England and did not come to Virginia.

Carpenters were sent to build the free school but the great Indian massacre of 1622 put an end to the project, and public schools in Virginia were delayed for several generations.

In Massachusetts the first school to be established was authorized on April 13, 1635. 'Likewise it was then generally agreed upon that our brother Philemon Pormont shall be entreated to become schoolmaster for the teaching and nurturing of children with us.' Philemon Pormont was married in England to Susanna Bellingham and with wife and two children arrived in Boston in 1634, being admitted as 'freeman' directly after his appointment. As part pay Philemon received in 1638 an allotment of thirty acres in Brookline.

Apparently Pormont was only a writing master. In 1636 Daniel Maude of Emmanuel College in Cambridge University was chosen 'free schoolmaster.' To Mr. Maude was also granted a plot of ground. Both Pormont and Maude found teaching an insufficient means of earning a livelihood. The former made a venture into Maine and finally sold real estate in Boston; the latter left Boston for Dover where he engaged doubtless as pastor probably combined with teaching.

The general Court in Boston in 1647 passed the so-called 'deluder' law relating to public education and formally establishing public schools. This act reads as follows: 'It being one chief project of that old deluder satan to keep men from the knowledge of the scriptures, as in former times by keeping them in an unknown tongue, so in these latter times by persuading from the use of tongues . . . It is therefore ordered that

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

The Goal of Life Is Experience

ALL that we are here for is to get experience, and the product of experience is character. We think we are doing a number of new things and leaving the old behind; but what we are really doing is this—we are constantly returning to the old things, bringing our increased experience with us, and discovering after all that the 'old' things are the newest in the world. There is really nothing new, but the old is seen at new angles; the old objects are reached by new methods; the facts are approached by new generations.

> *EXPERIENCE is preparation. It is preparation to know the Truth when we meet it. Everything that helps make a man a little freer is headed along the highway of Truth. This does not mean books and ideas only; it means mechanics and commerce and science. Even the motor car is an element in the liberation of mankind and will rank higher than many a philosophy in its effect on human destiny: it is freeing more men, freeing them into more diverse regions, than most book systems do. We are mixing our experiences more than ever before, which ought to result in our making swifter progress toward the twin Objects of Experience—Truth and Character.*

There is nothing new except new appreciation, new understanding; and these are the result of experience, and the result of experience can only be character.

That statement by itself may have no practical bearing, but it is capable of endless application, and its clear understanding would liberate us into a great deal of useful knowledge. The routine of life is crushing unless we have an interpretation. In the Bible there is a pessimist who saw the ceaseless round of life and wondered what it meant. 'One generation passeth away, and another generation cometh but the earth abideth forever. The sun also riseth, and the sun goeth down, and hasteth to his place where he arose. The wind goeth toward the south, and turneth about to the north; it whirleth about continually, and returneth again according to its circuits. All the rivers run into the sea; yet the sea is not full; unto the place whence the rivers come, thither they return again.' What is the use of it all?

Experience, that is the answer. One class goes out of the school of life, another class comes in; the school remains. What is the answer? Experience. That is what the school is for. Take the rivers mentioned by the pessimist. They ran into the sea; they returned in clouds of rain; they cleansed and watered the earth. It was a ceaseless round, but it was accomplishing something. The rivers needed to be run into the sea for their own cleansing; then they came back to keep the earth fruitful. Why? That the human business of Experience might keep moving on.

The basic things, then, are very old. Nothing ever useful passes away. If a light-headed group comes along and imagines that they have found a new morality, and if they draw to their books and plays and strange philosophies a following of other light-headed groups, serious people are inclined to believe that the old morality has passed away—the good old type of goodness, they say, is gone! It is a rather foolish position to take and causes needless worry.

When the false prophets of commercial bookmaking have been forgotten, there will be enduring quality found in a straight saying like that which Irving Bacheller once made: 'Either you have the old morality or you have none.' There is not anything new in the basis of human life. The seeming newness is confined within the reactions of our own experience in learning the reality of the old.

Now, there is a basis, something that remains unchanged, and it is the chief object of life that we should find it. Because people do not find it in one lifetime, it has been thought that a lifetime is not the full term at school, but only a day's session. However that may be, it is perfectly clear that the highest result of life is that men should find the basic truth about things.

How do we know when we have found it? How do we know when we have not found it? What should be our attitude toward the things we are doing while we are trying to find it?

We shall know that we have reached Truth when we are free. We shall know that we are on the right road toward Truth when the things that we are doing make men a little freer than they were.

We shall know whether we are on the right road by examining what our motives are. Mistakes may be committed with right motives, but the general direction is right when the motive is right. These are things that we may be perfectly sure of. These principles belong to the very basis of things.

In some instances we are doing right things in the wrong way, and because the method is wrong and the wrongness begins presently to show in wrong results, people are quick to draw the conclusion that the whole thing is wrong. They want to wipe it all out.

They want to overturn all the machinery of social or political life. Well, if that were the right thing to do, then it would be the right thing to do. May we never be fearful of the cost of the right thing, but may we also remember that the cost of the right thing is not high in those values that count!

It will be one of the great surprises of human experience, when the Truth comes everywhere, to see how near we were to it all the time and did not recognize it. It will be a great surprise to see how little were the changes to be made in our exterior mode of doing things.

The Navy Is Criticized

IN 'PUNISHING' Rear Admiral Magruder for criticizing the Navy, Secretary Wilbur sets an excellent precedent. He does not demote or transfer Magruder to some minor post, as has been done in similar cases in the past. Instead he requests the admiral to elaborate his criticism. He instructs him to submit promptly 'a full and detailed plan for the reorganization of the Navy and the Navy Department.' Few can quibble with such a decision.

Admiral Magruder's charges are serious. 'There is a rotten condition,' he declares. 'The Navy is spending $300,000,000 and getting $200,000,000 worth of navy. War extravagances have never stopped. I see it constantly.' Force is added to Magruder's charges by the fact that he is not criticizing individuals; rather he is assailing a system. 'There is no criticism of any person or official,' he states. 'There is simply a criticism of bureaucratic methods and red tape. Everybody knows what a bureaucracy is, and we have a corker in the Navy.'

These are strong statements. If they prove true, drastic reform is needed. Secretary Wilbur's action gives Admiral Magruder exceptional opportunity for instituting such reform.

Medicine Advances

ADVANCES in the science of medicine seldom receive the newspaper attention given prize fights or comic strips. Thus a recent announcement by Dr. W. L. Aycock of the Harvard Infantile Paralysis Commission reached comparatively few newspaper readers. The announcement was, however, of vast importance. The germ of infantile paralysis, Dr. Aycock declared, had at last been definitely classified. It is difficult to overestimate the significance of the discovery. With the germ at last classified, scientists can now turn their attention to finding a suitable animal to yield an antitoxin; and the dread scourge of childhood will pass into the category of conquerable diseases.

Ruddy Autumn

ANOTHER autumn is here, and the countryside once more is arrayed in colorful costume. Hills and vales have a heightened beauty. The flat farmlands have the charm of crazy-quilt patterns, with dark-brown wheatfields, new seeding coming into light, and woodlands and pastures giving varied tinges. October is a month for travel. It comes with a blaze of wild glory that takes one's breath. Autumn colors run rapidly through tree tops as far as we can see from the hillside, scarlet on chestnuts, flaky orange on apples, yellow on birches.

And who can view an autumn morning without pausing to honor its rare beauty? Those dew-impearled gossamers on bush and grass! Built in the night they silently collect the falling dew. They are wondrously exquisite from spike to spike of thorny hedge across woodland trail. Who taught the spider his pattern? These are the days to wander forth upon the high roads and the low roads to feast the eyes on Nature's grandeurs. It is not necessary to uproot the trees and the bushes. Visit open fields and shrouded forests, but bring home all glorious nature only in your memories. Then the beauty will be there to greet you again next season, when Jack Frost paints it all anew.

Sense or Censor?

PROBABLY most of what the objectors have to say about censorship has a grain of truth in it. Seldom does any course, taken to prevent an evil, itself escape evil. Nevertheless, in this practical world, censorship has become somewhat established. Government chemists censor adulterants and poisons. Legitimate business censors fakes. Traffic laws censor certain careless tendencies on the part of motorists. Parents censor the greed and the temper of children. As to the theater, there are still young men who seek information concerning the plays to which they may invite young ladies—a sort of private censorship known in colleges, schools and many business offices.

Censorship discussion nowadays centers largely on the movies, and the great outcry against it comes from the film folk. The propaganda against is greater than the propaganda for, which fact in itself is significant. Opponents threaten the country with many dire results if national censorship should ever be established.

The value of censorship is in the presumption that it would lead producers to do their own censoring first. By the time the public pays its millions to see a picture and form its own opinion, the producer's purpose is served: the admissions have been paid. That is what he wants. And it would satisfy him most abundantly if that sort of thing could go on forever. It is the judgment that may be rendered *without the previous expenditure* that rouses his objections most.

The statement is made by the publicity men of the movies that pictures have taken a turn for the better. Maybe so. But as one observer puts it, the damage done by the movies is not the demoralizing but the dementalizing of its patrons. You park your mind outside with your car, and bring to the screen your eyes and your emotions.

Can censorship stop the trivializing of the pictures? Probably not, so long as our greatest strings of newspaper, magazine and picture producers insist on treating the public as a child with a twelve-year-old mind.

John Singer Sargent *in* Boston

By JANET MABIE

AS LONG as he lived, home in America to John Singer Sargent was Boston. For eight or ten years he had a studio in an old building in an unpretentious Columbus Avenue neighborhood. This neighborhood enormously lacked the sumptuous tone which characterized his Tite Street surroundings in London where his studio was also his home. Sargent had no home in Boston more personal than an hotel apartment; yet many believe he loved Boston best of all the cities in the world.

It was doubtless directly from his father that Sargent inherited that keenness of insight, that quality of searching for truths, which was often to become the despair of sitters. Later the effect of an ingrained scientific habit of mind was to become one of the chief characteristics of his work. Variously it was to win him extravagant praise and violent criticism. From his mother, undoubtedly, he had some flair for painting. If, when he was a child, she saw in him a potential great artist she spoke of it little, but she made it early possible for him to draw and paint, sometimes side by side with her. And she made a rule that the boy might commence as many sketches in a day as he desired but he must finish *one*.

In 1888 the artist made what was one of his most successful visits in Boston from the point of view of the work he accomplished during it. For instance, it was then that he painted a portrait of Mrs. John L. Gardner, then in the heyday of her amazing, almost epic, social reign. Undoubtedly Sargent baffled Mrs. Gardner. It was said of her that she could be more terrible than an army with banners when she was not pleased, and certainly it could not please her at all to be mystified by a painter of her portrait.

Sargent was impartial with his analyses of sitters, and when the sitters did not like what he said of them upon canvas they generally masked their chagrin in ice and fire and locked up the portraits, because they could expect no tempering of the artist. It is perhaps a generous tribute to him, for all the frequent difference of opinion that undoubtedly existed between him and Mrs. Gardner, that there remained always a charming friendliness between them and that Mrs. Gardner liked, herself, to show people the Sargents which hung in Fenway Palace.

Sargent was nevertheless charming with women. That, especially, exasperated those who had been dissatisfied with his portraits of them. There was, for instance, the woman who complained, with a mixture of bitterness and rage, 'But, Mr. Sargent, you have given me a red nose,' and found nothing at all to say when the artist said cheerfully, 'But, Madam, you have one.'

—Herbert Photos.

John Singer Sargent, R. A.

Women tried being hypocritical with him when he was painting them. They smiled like cats and tried to overlay, with some dissembling haze whose alchemy only they knew, little changes in expression that otherwise gave away petty sins. But they never could fool Sargent and when they became wroth he, shrugging and smiling absently a little, murmured: 'But one must paint as one sees.'

With men who sat to him Sargent was equally faithful to what he saw. He loved truth, but he did not consider himself a great painter. To him the denominator of knowledge was infinity. He was not trying to be witty when he said to an important sitter, as he finished a portrait, 'There! It is all done but a few little things, and when you carry it home you can finish those yourself.'

And to the last he was the sort of man who could step back from a flawless painting, as he often did, glower at it and mean it deeply when he exclaimed ferociously, 'Damn it, damn it, I must learn to draw!'

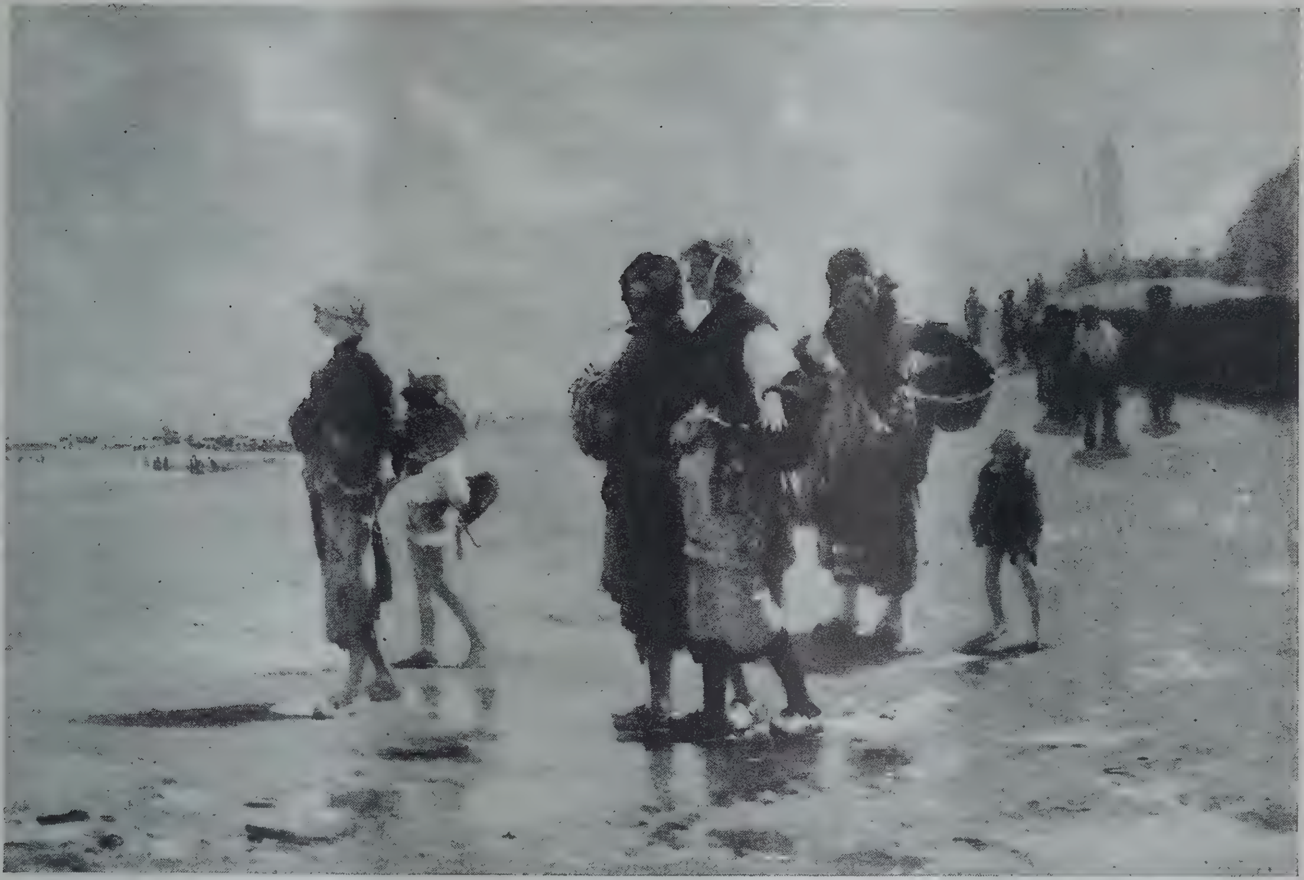
Sargent was intrinsically one of the kindest men in the world; he was gentle for all his great stature and often ferocious concentration of expression. You could block out the forbidding curtain of bushy brows and see eyes that were piercing but lustrously deep and filled with peace. Sargent's success never went to his head, but he had the manner of his world even when he was stopping to speak to an urchin scuttling through long golden shadows upon the Public Gardens in the late afternoon.

He could go and stand upon the bridge over the little lagoon and watch children ride in the swan boats, and he appreciated, with the children, that the boats were not creaking contrivances of modern manufacture, but that they were of vermilion lacquer, with sails of silver, and that they were sailing seas made of sapphires that the queen of the fairies had ordered melted up expressly for such a purpose.

He always went to the symphony concerts when he was in Boston. He liked to arrive a few minutes before the hour. People liked to see the burly figure, straight and commanding, stride down the aisle and to see the man who pleased their idea of what a great artist should be, smiling quietly and bowing this way and that to his friends.

For week ends he loved the North Shore. He took along his things and sketched. He loved shimmering flowers and blue firs and cloistered peace to be found in copies of great Italian gardens. He would do a water color in a blue and gold morning and would ceremoniously 'beg leave' to present it to his hostess.

He played chess too in Boston. The narrow, steep streets of Beacon Hill knew him in the chess hour of late afternoons when the Charles River basin was a bowl of rose-beaten silver. He acquired proficiency in chess as he



—Copyright, Detroit Publishing Co

The 'Oyster Gatherers of Cancale,' by Sargent, part of the permanent collection of the Corcoran Gallery of Art, Washington.

did in the music of Ravel and Debussy, Grieg and Satie. Nothing that he did ever seemed to be done with an effort.

He loved humanity and he perceived that humanity was often encountered in curious places and guises. He knew, for instance, that bellboys in his hotel listened outside the door when he played his piano—and he smiled. And if, going out abruptly, he discovered one of them standing there, with a silver pitcher in which ice water had long since ceased to be, he smiled directly at him, perhaps wagged a mock derisive finger and made some casual, humorous remark that took from the boy any latent sting of discovery.

Thus it is possible to hear this estimate of the man Sargent and his music and individuality from one of the bellboys who has been in service long enough at the hotel to have acquired a well-defined impression of the artist.

'We liked to know that Mr. Sargent's piano was being moved in. That meant he would stay several weeks, months maybe, and that there would be lots of music. He played—oh somehow—I don't know much about fine music, but when he played people like me were glad to listen. Lots of musicians come here. They're no treat. But Mr. Sargent didn't play like the rest. I don't know what he played. I guess it was fancy things. When people came to see him, there was always lots of music. Sometimes duets. He loved to play duets. I guess he got rested playing the piano. Sometimes, when I'd take things to his rooms, he'd come in while I was there and he wouldn't say much, but he'd look tired and I mostly wouldn't get back to the corner by the elevator before I'd hear him start in, wonderful chords and runs, like silk—know what I mean? It wasn't often he was sad. He was good-natured, and when he wasn't he didn't let on. He didn't seem to me like the kind of man that'd get down and be selfish or mean to anybody. He was a big man, in more ways than one, I guess.'

IT WAS possible frequently to see him around the lobby. He liked shaggy clothes, often green or bronze, that had a little blur of fuzz over them and a trace, elusive as a half-forgotten thought, of the perfume of peat. His voice was low and genial, sometimes bantering. His hands were apt to be full of letters and English papers.

He was shy, excrutiatingly shy. He had common sense and he knew it was necessary for him to appear at private views occasionally. Sometimes it was too much for him, although he intended to be dutiful, and he exploded on the threshold of a roomful of folk purring and waiting to acclaim him, and dashed precipitately away.

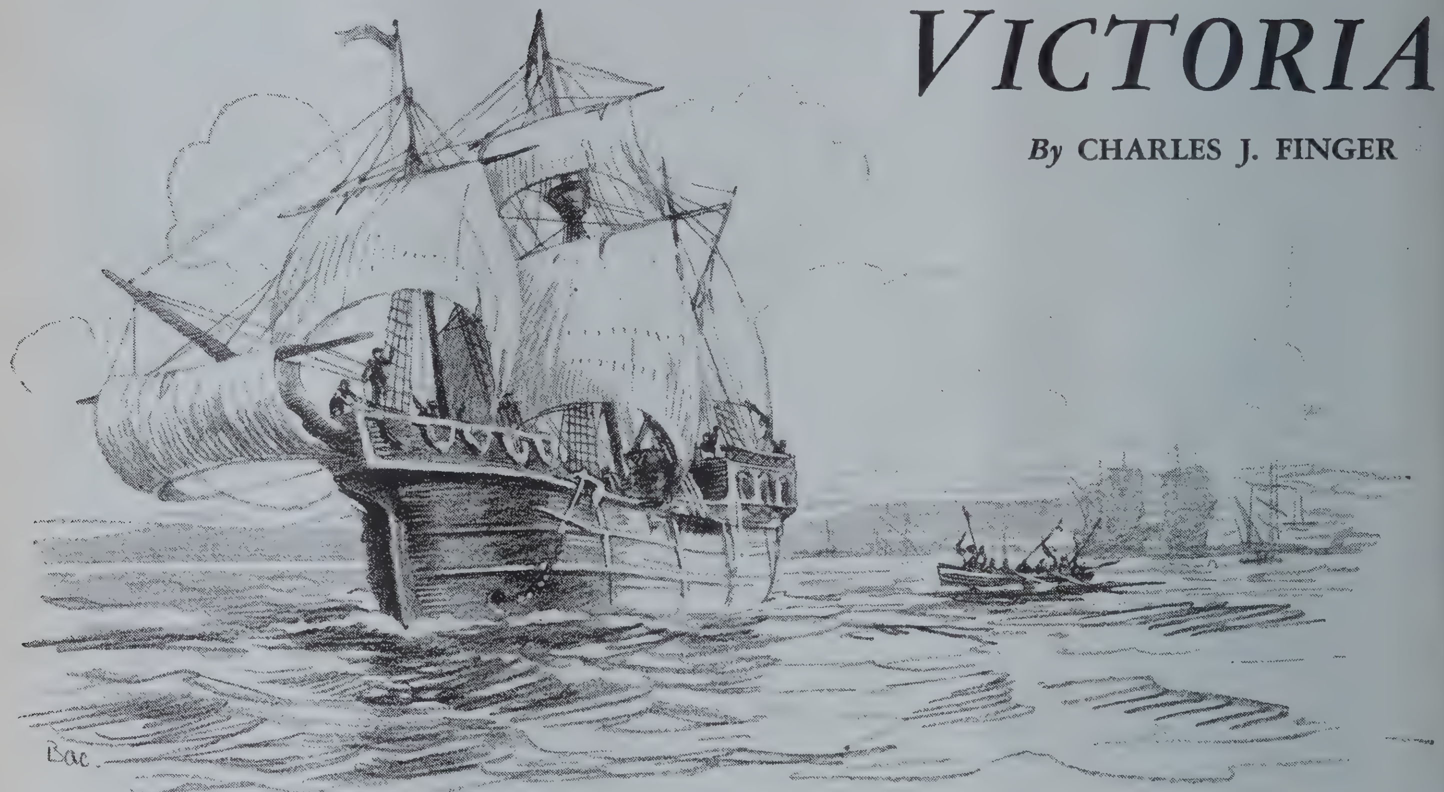
He detested private views, but he had it impressed upon him if he was too reluctant that it was ridiculous to think even an established artist could always remain unseen.

He insisted that a man ought to be able to look like a kangaroo if he chose so long as he did his work faithfully, or that it was preposterous to suppose people should really need to see him when there were so many other artists, but often his modesty was painstakingly defeated. Sometimes by cajolery, sometimes by the exercise of a firm hand. And when every dodge had failed him he would turn up, hesitating and uncomfortable. He became quite tongue-tied and a great disappointment to those who thought epic witticisms should tumble from his lips.

He felt, for instance, when a woman asked him, as she pointed to the 'Apollo and Muses' panel at its private showing before it was placed in the rotunda of the Boston Museum of Fine Arts, that he had replied accurately when he said, 'Just blokes dancing, Madam,' and that her astonishment must be a mistake.

The VOYAGE *of the* VICTORIA

By CHARLES J. FINGER



SYNOPSIS

In the month of April, 1926, THE DEARBORN INDEPENDENT commenced to publish a series of articles on Magellan and his voyage, the story ending with the death of Magellan and an account of the way in which the fleet became a mere piratical outfit. But the story of Magellan did not follow the beaten track, nor, in the usual way of historical essays, was Magellan set on an impossible pedestal as a perfect knight. Instead, he was shown in his true colors, as a man of pertinacity, a hero, and a rascal all mixed up, and as a person not without his ulterior motives. It was also shown that, contrary to the usual belief, the cost of the fleet was defrayed not by the king of Spain, but by the merchants De Haro and other men of affairs who had in mind not the expansion of empire, but commerce. The advancement of trade was the idea behind the expedition, as it had been behind the expeditions captained by the Cabots, and Pizarro, and Cortes. New markets, not the flag, formed the incentive.

The story also showed that there are reasons for believing that the Magellan Strait had been known before Magellan started on his voyage, and that he possessed a map showing not only the strait but also the Falkland Islands. Indeed, in the New York Public Library is kept a copper globe on which the strait is indicated, which globe was certainly made before the expedition started. Another curious and little-known piece of history which the author laid bare is that the first individual to encompass the world was a native of the Philippine archipelago, named Enrique, a slave. For Enrique had been bought by Magellan in a slave market in the Indies, when Magellan was serving as a captain in the Portuguese service. Captain Magellan took his purchase to Europe, and when the Magellan expedition sailed, the slave was on board the *Victoria*. On reaching the archipelago, after crossing the Pacific, the slave found himself among his own people, and quite properly deserted. Magellan himself was killed in Mactan, in a native quarrel with which he had nothing at all to do, but in which he foolishly took part. It was also shown, and this is another strange and little-known piece of history, that the existence of the archipelago comprising Banda and Borneo and Java and some of the Philippines, and perhaps Australia, had been known to a lone wanderer named Varthema, an Italian, who carried the tale to the Portuguese fleet in which Magellan was captain.

After Magellan's death the crews revolted against Carabello, and chose the knightly Sebastian del Cano as commander. There were then only two ships left—the *Victoria* and the *Trinidad*. But the latter being in unseaworthy condition, the men agreed to route it to Spain by way of Panama. The *Victoria*, under Sebastian del Cano, set a course westward and finally reached Spain by way of the Cape of Good Hope. The chapters that follow take up loose ends, and begin on December 21, 1521, when the two ships parted company.

SEBASTIAN DEL CANO, man innocent of self-seeking, skilled navigator, who had held himself free of all entanglements through tragic and awful circumstances, faced the terrible journey in a wretched little craft with confidence. Twenty days of sailing, with heavy weather and a foundering sea, brought them to Ombay Island where it was found that the *Victoria* was leaking badly. The pumps, though kept going night and day, were quite inadequate. So the ship was beached and careened, the work taking two weeks.

On January 25, 1522, they reached Timor. Offshore they sighted a trading junk that proved to be from Luzon. The *Victoria* hauled alongside, making signs of friendliness, and invited the chief to board the ship. No sooner had he set foot on the deck than he was seized and bound, being told that he would be held prisoner until his people had ransomed him with livestock. The trick was successful and the natives brought load after load, whereupon the chief was released, and, by way of solace for indignities suffered, was given some of the trading trinkets. Moral obligations were not in the men's minds. The men of the *Victoria* were not so much pirates as robber-knights of the sea, depending for their sustenance on brute force and trickery.

Until the middle of February, Del Cano stood along the Timor coast; then, having reached the furthermost point, he held due west until the island of Savu was sighted, when the course was set south-southwest for the passage across the Indian Ocean.

The authorities are at variance as to what happened in the neighborhood of Timor, both Oviedo and Gomera making reference to a mutiny and the execution of those guilty of insubordination. There may have been trouble and an expressed determination on the part of some to go no farther because of the unseaworthiness of the ship, but Pigafetta mentions no executions. According to his account, forty-seven men left Timor, fifteen died from disease while crossing the Indian Ocean, two deserted, and as thirty reached the Cape Verde Islands—or with Pigafetta included, thirty-one—the complement of men is fully accounted for.

Alvo's diary, a plain and straightforward account, hints at tormenting experiences. Heavy seas tried the old ship sorely, and time after time it was necessary to drift under bare poles while hasty repairs were made. Scurvy broke out and starvation rode with them before they were in the neighborhood of the Cape of Good Hope, in the middle of May.

THERE a storm carried away the topmast and some of the sails were torn to rags. Shivering men, their fingers numbed and their bodies ill-clad, long accustomed to warm climates, became indifferent sailors in those cold latitudes. They were reduced to rice for their food, too. And two good seamen were lost in the persons of Lorenza de Irema and Martin Magellan before they touched the Cape Verde Islands.

Although that was Portuguese territory, Sebastian del Cano put in there and sent a boat ashore for provisions. The tale he ordered told was that the *Victoria* was part of an armada in the American trade, homeward bound. At first all went well, with one boatload of food taken aboard the *Victoria*.

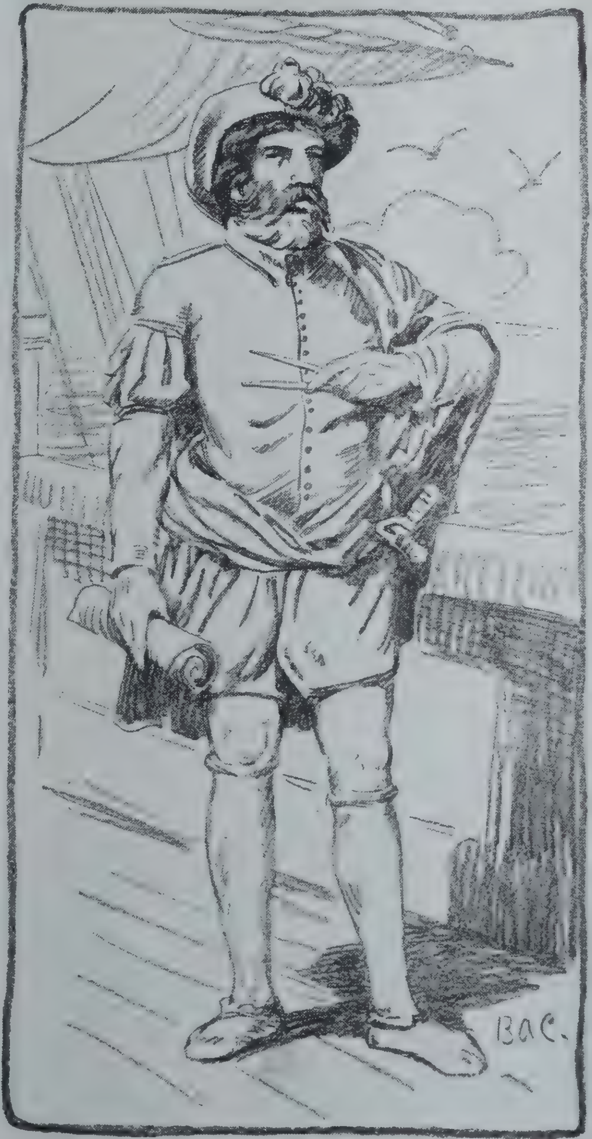
But on the second trip things did not go so well. Some sailor, grown mellow with wine and good company, talked too much, and, what was worse, offered cloves for sale, and then the secret was out, for it was well known that America produced no cloves. But the *Victoria* had not dropped anchor and was rolling in the light wind, ready to put to sea, a circumstance suspicious in itself. So a boat came from ashore and officers called on Sebastian del Cano to surrender; he made some equivocal reply. But when two caravels were sighted, getting under way, the *Victoria* lost no time in putting the port in her wake, homeward bound, though her crew were reduced to eighteen Europeans and four natives.

At last, with hardly a hale man in the crew, they saw San Lucar de Barramedas again on Saturday, September 6, 1522, three years lacking twelve days from the time they had started. The first ship had circumnavigated the globe. On Monday they were at Seville.

From this account and that, we picture the scene—the sunshine and the color, the crowds pouring from street after street to see the wonder, pushing in haste to the mole in an endless line, all eyes bent on the ship that was like an apparition, so battered and patched, so storm-worn and sun-blistered.

Then the men came ashore, famine-wasted men with shrunken limbs, hollow-cheeked men with ragged beards, men whose skins were like parchment and whose eyes had a strange, far-away look as though they saw visions; men who walked strangely over the worn stones because secure footing was a thing new to them after those three sea years; men once stalwart who were unrecognized by those who pressed about them and called their names aloud; men unable to walk who were carried on litters by their shipmates; men whose faces were scarred with disease, who were crippled, who were vacant-eyed as if walking in their sleep. And with them was Sebastian del Cano, the good knight who had suffered silently, and who had taken up the burden when the voice of duty called. He had won, but was not at all boastful of his deed.

I have referred to them as men, but as the world counts things, many had hardly passed out of youth. The oldest of the survivors was only thirty-nine years of age, a Greek named Nicholas. Five were boys: Juan de Bubileta aged seventeen; Juan de Arratis, who was eighteen; a Portuguese lad, Vasco Gomez, who had shipped at the age of fourteen; Juan de Santandream then aged nineteen, and a boy named Martin de Issurraga who was fourteen when he joined the fleet. Of the others, the mate of the *Victoria*, Miguel Sanchez de Rodas, was still in his thirties; Diego Gellego had shipped at the age of twenty-two; Francisco Albo, the mate who kept a diary, was thirty-five; Antonio Ros was twenty-four; Juan Rodriguez was twenty-three when the fleet sailed; the mate of the *Concepcion* was in his twenty-fifth year, and a Portuguese seaman named Francisco Rodriguez was in his middle thirties. Then there was the barber, Hernando de Bustamente, twenty-nine years of age.



Sebastian del Cano, the first man to sail around the world.

YOU picture that little procession winding its way through the crowd, making its pilgrimage to the church barefoot, because of vows and promises. You picture the curious crowd—old crones who sought sons, and who fell into high-wailing lamentations when they found their fears confirmed—loud-mouthed fellows who bawled inquiries about friends who had left for the mysterious land on the other side of the world—friars elbowing trading Jews in black skullcaps and striped gowns—a mounted man or two, tall and slender—those who ruled *hoi polloi*—olive-skinned Moors, solemn of manner—a monk or two—beggars—loafers from wine shops and market place who had laughed when the expedition started—ragged men with oxen and panniered donkeys—on the edge of the crowd groups of girls in gay-colored shawls, bright-eyed with excitement.

A few days later the thirteen who were detained at Cape Verde arrived. They were Maestre Pedro, supernumerary of the *Santiago*; the carpenter of the same ship, a man named Ripart; formerly of the *San Antonio* there was Juan Ortis de Gofegar, purser; of the *Concepcion* there were Gomez Hernandez, a seaman; Roldan de Argote, the gunner; and Pedro de Churduza, a page; of the *Victoria* there were Martin Mendez, the clerk; Felipe de Rodas, a seaman; two boys named Pedro de Tolosa and Vasco Gallego, and two servants named Juan Martin and Simon de Burgos.

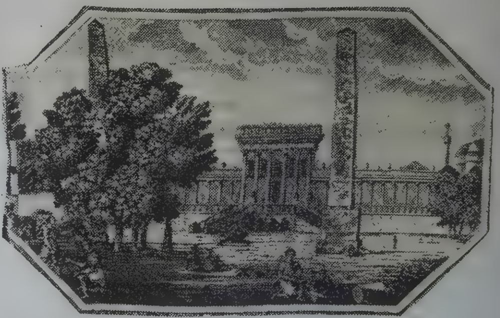
French chintz showing Napoleonic influence—ruins of ancient temple.

Old Time Cottons

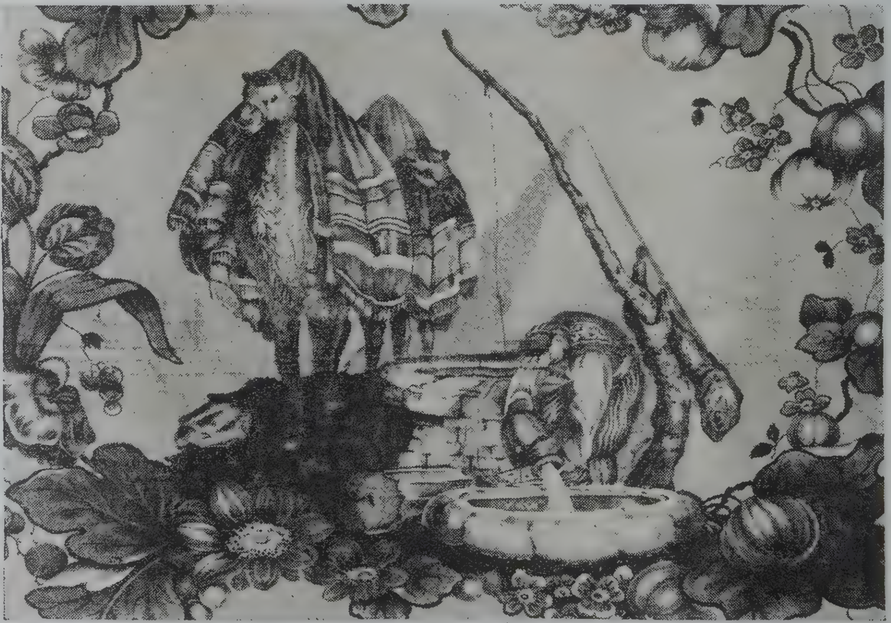
By
MARY HARROD NORTHEND



Another print of Napoleonic Era, portraying scene laid in Italy.

IN THE first place, it is necessary to correlate the term 'printed cotton,' which the print collector invariably will employ in speaking of his treasures, with the more familiar but less exact 'printed chintz.' Chintz is a word of Hindu origin—*chint* is the original derivative. The early form of the word in English usage was 'chint.' The plural 'chints,' in time, became mistaken for the singular 'chint'; and so we find the newer form 'chintz' as singular and 'chintzes' as plural. These are commonly employed to designate cotton cloths printed in a number of different colors and often glazed.

THE present vogue for chintz draperies, loose covers for chairs and settees, even tablecloths, has once more made the quaint old word one of common usage, covering a wide range in quality and design. The original definition would have been 'a painted or stained calico from India.' From this definition it becomes apparent how in due course chintz became known as an English fabric. The imagination cannot fail to picture the caravans of rich spices and jewels and choice robings which the East India Trading Company conveyed from the Orient to European shores at such great cost of time and money. Among the more elegant silks, satins, and velvets came calicoes—the printed and stained calicoes of India. To this day in England, one buys calico, not cotton cloth. A world of romance is woven into its transition from East to West. It is barely possible that a few fragments exist of the real 'Indiennes' or 'Sismoises,' that were first fabricated in Europe.



A test of French origin, Egyptian period design. Note perspective of pyramid in background.

Mention is made of the industry in England in the 16th Century, but there is no record of the first English chintz printer, or 'calico printer,' as the trade card reads in the old print at the British Museum: 'Jacob Stampe, living at ye Sighne of the Callico Printer in Hounsditch prints all sorts of Callicoes, Lineings, Silks stulls New or Ould, at Reasonable Rates.' This was in the reign of King James II of England, near the end of the 17th Century. The Dutch and Flemish emigrants from the Continent introduced the industry into England. It is likely that the Dutch were the earliest exponents of the art in Europe, although there is some trace of it in Russian contemporaneous records.

The French periods of production are clearly defined because of the law which was enforced up to the year 1759, when the manufacture of such stuffs was authorized only by royal decree. Abraham Frey of Geneva, who had printed furniture coverings at Corbell for Madame de Pompadour, in defiance of the law, opened an establishment near Rouen, in upper Normandy, in 1758; and in Alsace, as early as 1746.

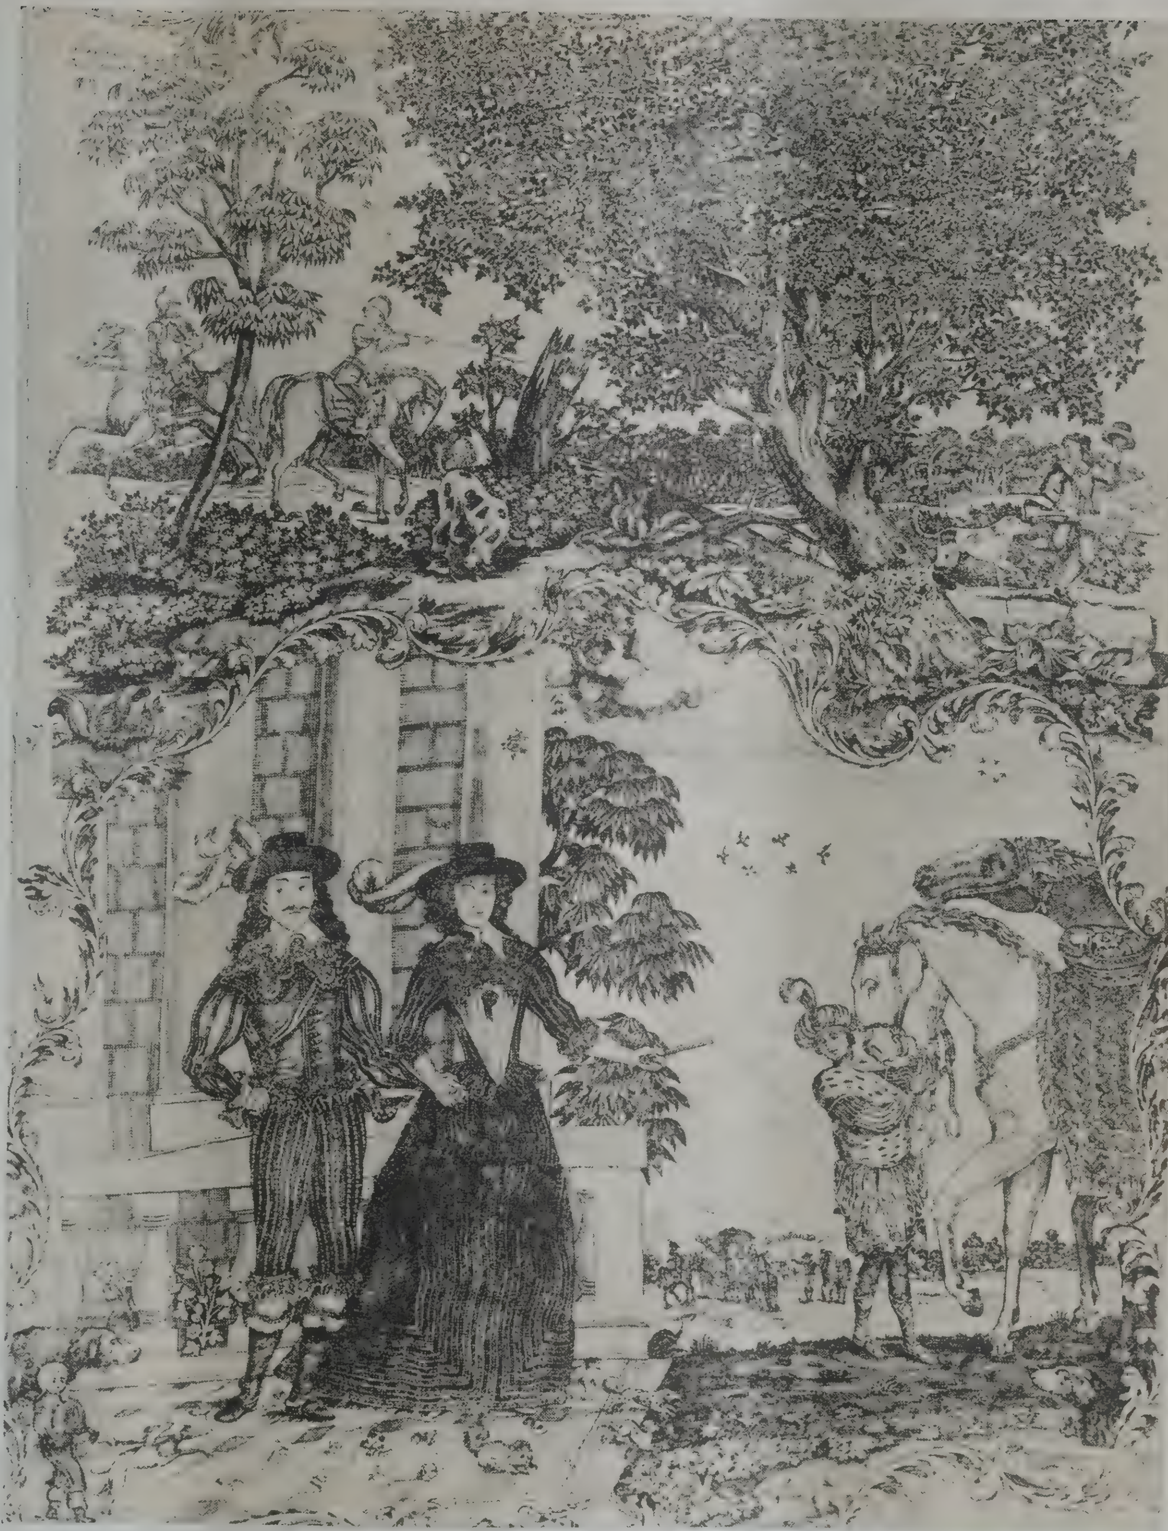
Samuel Koechlin of Mulhouse conducted a factory which for a long time had the almost exclusive control of the French market. Koechlin made many improvements in the infant industry, chief among them being the discovery of a red acid—'*mordant rouge*'—by means of which a solid red color could be printed. One of the severest handicaps of the early printers was the limited color range. Green was another trying color, because it was necessary to use a blue impression over a yellow.

The majority of early manufacturers in France were of German birth or descent. The man whose work is of greatest importance in its bearing on the trade was Christophe Phillipe Oberkampf. He was a naturalized Frenchman born at Wiessenbach, Bavaria, in 1738, and died at Jouy-en-Josas, near Versailles, in 1815.

Oberkampf, with a capital of only six hundred francs, obtained the right to open a factory in an abandoned building he had hired at Jouy. His models were the Persian and Indian cottons which had only the outline printed and the subject matter painted by hand. To print the colors he constructed machines and perfected processes invented by his father, by means of block and cylinder. He was mechanic, designer, printer, dyer, engraver as well as merchant. He was so successful that he sent agents to England and Germany and even to Persia and India to study the best processes, especially those of dyeing, which were known only to the East.

He soon surpassed all rivals and as the material became fashionable in France, he was honored by an edict of Louis XVI, in 1787, making his works of royal manufacture. He was obliged to close the works during the Revolutionary rule but later, in the Empire period, the industry flourished and reached its zenith. In 1809, he was awarded first prize in the first class of the decennial prizes instituted by imperial decree at Aix-la-Chapelle. In the year 1815, the invasion of France by her allies caused the destruction of the workshops of Oberkampf, and his own death in consequence.

In 1818 work was resumed at Jouy and an improved two-cylinder process adopted; but by this time the printed cotton and linen industry had spread throughout France and the former distinction of the '*Toiles de Jouy*' was lost in the multitude of cheaper productions. The age of machinery brought degradation to the art and from 1830 there was little of interest historically or artistically. With modern methods came the inartistic imitations of the Victorian Era. America is hardly to be considered in the early history of the industry, although today American fabricators are turning out reproductions of the old and some modern variations of which we can be justly proud. There are a few specimens of the early American cotton printing which will survive the tests of art and time, notably a wonderful old quilt in the Metropolitan Museum of New York.



Ups and downs of royalty. In upper section Charles I hides in tree from Cromwell's men. Below—Charles II and Henrietta are in their heyday.

The quality of the goods manufactured at Jouy was always excellent, the material being well dyed. Even in the 19th Century there was a rage for floral designs of small bouquets and disjointed sprigs on sanded backgrounds, as though the flowers had been plucked and cast upon the cloth. The Oberkampf factories supplied the best of these, and their furniture coverings and other fabrics for hangings were not less sought after. The Norman manufactures were patterned closely after Jouy and are difficult to distinguish in both quality and design.

The designs followed in great measure periods of the nation. In the time of Louis XVI and Marie Antoinette, the shepherd's crook and pipes were frequently used in decorative and ornamental designs. During the Napoleonic Era came the Egyptian period characterized by the Sphinx, the Pyramids, Isis and Osiris, and other Nile gods and goddesses with gaudily bedecked camels and military trappings; after the campaign in Italy classic scenes, views of ruins, temples, palaces and triumphal arches, formed the prevailing *motif*. Again after the Consulate and during the Empire, the Greek and Roman influence is shown in mythological depictions, historic episodes, medallions and cameos representing warriors and lawgivers. In the period of the Restoration under Louis XVIII and Charles X scenes from the fashionable romances of the period (Sir Walter Scott's among them), village weddings, pastoral scenes, ladies and their lovers, brigands and roisterers, figure profusely. Thus it is quite easy to fix approximately the date of a piece by the design. Furthermore, the methods of workmanship give *prima facie* evidence of the time of execution.

At first the stuffs which were rather coarse and loosely woven were printed by means of wooden blocks, some of which are still in existence. These blocks were handmade, and as a design was usually in four sections, four blocks with the outline were necessary, the design being then reproduced the requisite number of times. A length of cloth was stretched upon the table; a boy dipped the blocks in the dye tub and handed them to the printer who applied them at marked intervals on the cloth, striking the block with a wooden mallet to stamp the dye firmly into the threads of the material. At first only the outline was printed and the colors painted in by hand as in the imported specimens. As the dyestuffs were discovered, separate blocks were applied.

The first impression was styled *'moule,'* or mold. The second block was known as *'entrure,'* the entering color. When it became possible to use a third or fourth color, the blocking was called *'rentrure,'* or reentering of the mold. *'Piccotage,'* or purling, was invented as a novelty and greatly beautified the background. Brass wire points planted by means of a punch, as in the bristles of a brush, in interstices of the pattern and dipped in the ink or dye, produced the finely dotted or sanded background effect. In 1809, Oberkampf brought out a variation by executing the design in white on a colored background. In 1818, a process was invented whereby two cylinders acted simultaneously: one cylinder in relief stamped the *'entrure,'* and the other printed the *'moule,'* or outline.

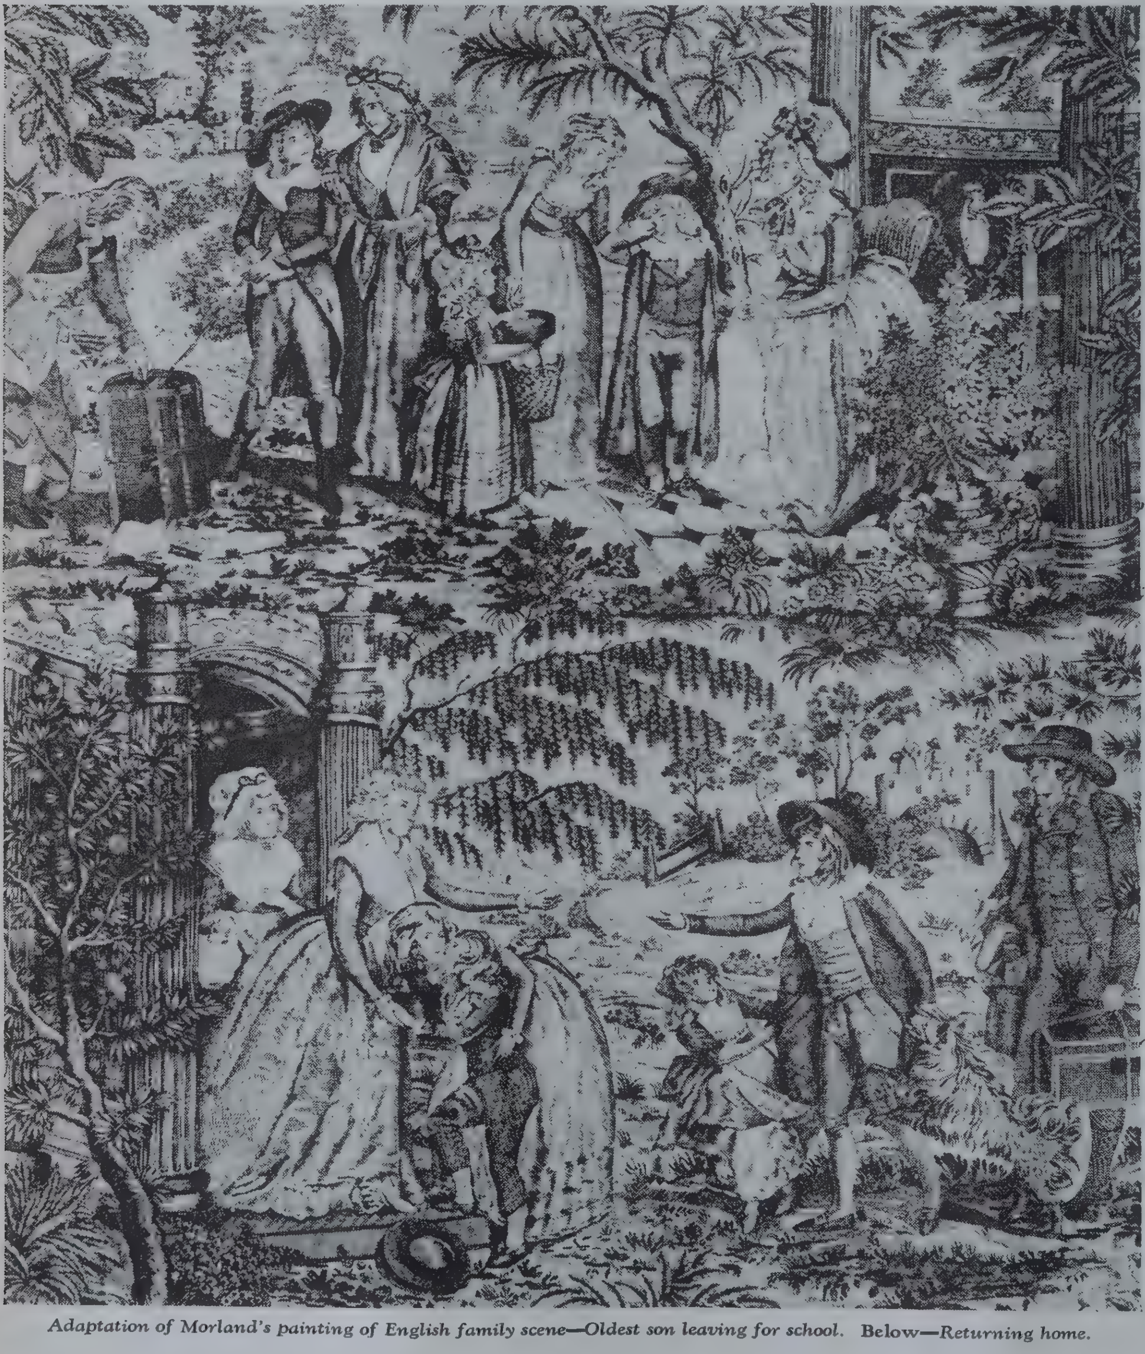
The early hand-blocked designs were crude in a measure, indistinct or blurred, and were used principally for hangings and curtains, the textiles being of a coarse, rough finish. During the last quarter of the 18th Century important strides were made toward better finished, finer materials and more delicately executed and artistic designs. The invention of the Englishman Arkwright made available home-produced calicoes of the fineness of the imported Indian cottons at much lower cost. Then the cylinder printing and the discoveries of new dyes, giving a more extensive range of colors with full rich tones, opened up a much broader market for the wares of the calico printer.

The heyday of prosperity came with the closing of the 18th Century and lasted through the first quarter of the 19th. At this time the vogue for printed cottons ranged all the way from palace draperies to cottage bed quilts and from the peasant woman's petticoat to milady's garden-party frock. As DeFoe, in his *Tour*, wrote of the century-earlier English vogue, 'they crept into our houses, our closets, and bed chambers, curtains, cushions, chairs and at last beds themselves, were nothing but Callicoes.' And in this, the early part of the 20th Century, we might easily subscribe to DeFoe's delightful exaggeration.

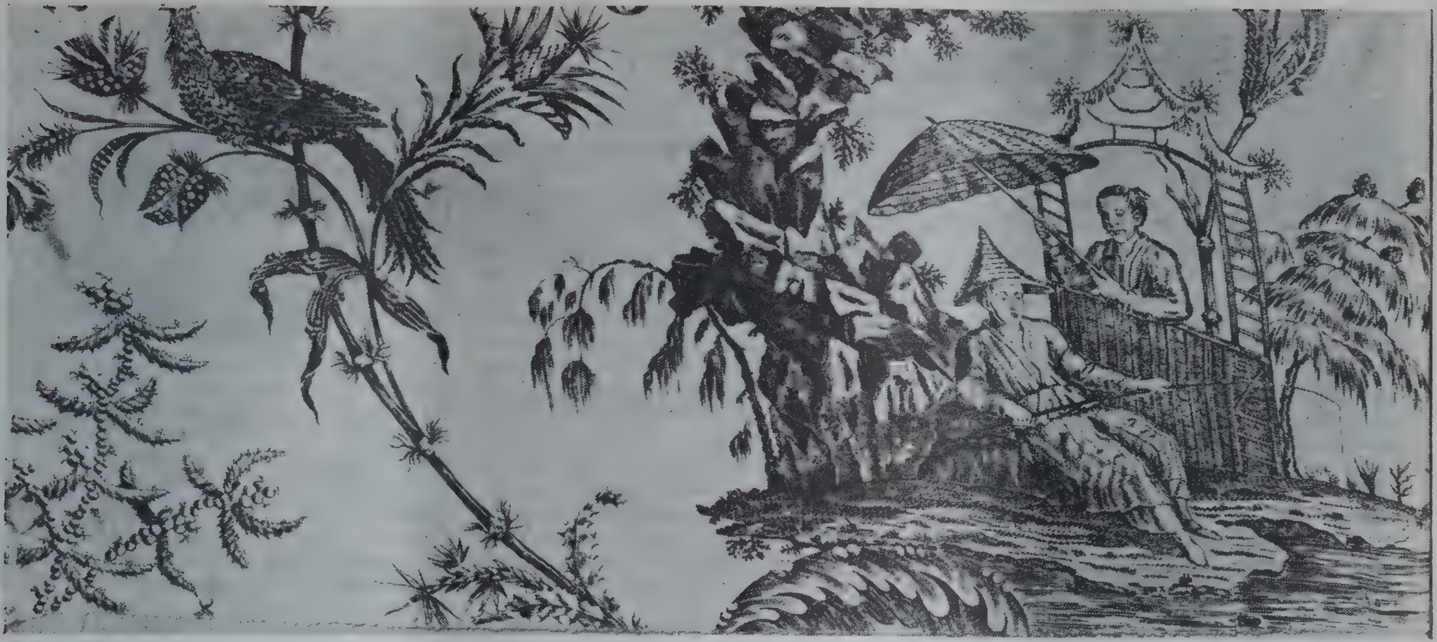
Fitting close to the chapter on the history of the French development of the printed textiles is perhaps a list of some of the more important pieces extant. From Jouy there came first *The Fables of LaFontaine*, after designs of J. B. Oudry. *The Village Festival* and *The Doves, The Occupations of the Manufacture, The Balloon Ascension*, in 1783, and *The Federation* in 1790, are among the earlier productions. Among the later designs taken from historical and literary subjects *The Four Quarters of the World, The Farm, Paul and Virginia* are best known.

The English fabricators copied largely from French designs so that it is difficult from the design itself to name the origin of any one piece. The texture is a better test because the French in their early efforts used the imported materials, which were finer, and when they began to manufacture their own textiles they used an admixture of linen and cotton. The French specimens are more rare as the period of production was shorter than in England, and it was never commercially developed in France.

One of the accompanying illustrations, the camels, answers the expert's test of actual French origin. It is of the Egyptian period in design. The richly caparisoned animals stand by a well in an oasis while the driver fills his water bottles for the next lap of the journey. The floral design surrounding this scene is in rich reds, blues, and purples, and it creates the floating island effect generally employed in scenic de-



Adaptation of Morland's painting of English family scene—Oldest son leaving for school. Below—Returning home.



From the golden age of English chintz printing—Chinese Chippendale. Perfection of art shown in grace of vine and pheasant.

signs. A faintly outlined pyramid gives a suggestion of perspective astonishingly real, showing that the designer was truly an artist.

In the ruins of ancient temples is an illustration of the Roman influence on French production.

What was France's loss, occasioned by the prohibitory laws affecting weavers and printers, proved to be England's gain. With the advent of William of Orange and Mary, French and Dutch refugees swarmed into the country bringing with them a superior craftsmanship. A goodly number were printers and silk weavers, who settled around London and quietly established themselves in their respective trades, the silk weavers at Spitalfields, and the calico printers at Richmond, Bow and Old Ford.

The competition of the imported Oriental 'chint' was an incentive which soon caused very close imitation and eventually Anglicization of even the name *chint*. At the end of the 17th Century the printed stuffs were dear in price; an old diary of 1690 records this: 'Gave thirty-three pounds ($165) for one parcel of Atlass, etc. I gave to dear wife,' and 'thirty eight pounds ($190) for one India quilt for bed.'

In 1631 the East India Company was allowed by royal proclamation to import among other things printed 'cakkucies,' under which heading were included several kinds of Indian cottons; these were used for the most part in the better class of work. The home-woven materials of this early period were like coarse canvas and were doubtless either destroyed by subsequent owners or covered up by a newer material; in some cases old horsehair-covered walnut chairs, apparently Victorian, have been found to reveal successive coverings. It is in this way that most of the very few surviving fragments of the earlier crude type have been preserved.

Not until the last quarter of the 18th Century were home-produced fabrics generally used. The new and improved processes of the mid-century printing brought the printed cottons into such high favor that the silk weavers, observing the effect upon their market, were forced to protest. This they did with increasing vigor.

This ill feeling vented itself in riots and street demonstrations. Weavers of silks and woolens marched to Westminster in a body, and asked for a ban on the production of chintzes. They tore the gowns from the backs of women on their return route. Eventually Parliament temporized and actually passed an act forbidding 'printed cottons' to be bought or sold, after first imposing heavy taxes. However, taxes were evaded and foreign stuffs were smuggled in and the act had to be repealed in a short time, when the trade again flourished.

The golden age of chintz printing by handwork was the decade corresponding with the Chippendale epoch in furniture; in fact it is the Chippendale influence which makes the printers' product of this period the golden age of art. The change from the Queen Anne design of intertwining spirals and delicate floral combinations is marked in the introduction of the Chinese atmosphere so prevalent in all art of that time.

THE exotic bird patterns are the finest of all, but the flowers and foliage, the vases and porcelains, all depict Oriental designs. Pinks, blues and grays and brilliant orange and reds are the predominating colors. This parallelism of furniture and textile art is borne out by the transition from the Chippendale through the Gothic or architectural school (the Spode plates bear the same quaint mixture of ruined churches and rococo floral ornamentation) to the Hepplewhite and Sheraton periods.

These latter designs are distinguished by vertical stripes within lace-like ribbands with the elimination of architectural detail and reversion to flowers as subject material. The cornflower and carnation, prunus flower and oak tree are suggestive of the Chinese influence, while the rose and bachelor's-button mark the trend away from the East to the more English taste in art. It may almost be said that this departure from old lines, due to the cheapening of the market and commercialism in general, put the seal on chintz printing as an art. Real craftsmanship has been defined as the work 'of one individual or a small group of workers who are so closely associated in the bonds of craftsmanship that the work may bear the impress of a definite personality.'

The canons governing this craft differ radically from those of other decorative textile works. The weaver of silks and woolens is confined to solid patterns which will appear in his transverse threads; but the printer of cloths is like a painter of pictures—he is fancy free and can stamp on his cotton the most delicately intricate and colorful subjects. This will be demonstrated by scrutinizing some of the accompanying illustrations.

In soft brown and white is the fine portraiture of King Charles II and Henrietta his Queen, in riding attire, with their roan and white steeds champing at the bit and pawing with impatient hoofs at the door. What relationship there is in dimension between the grand royalties and the tiny dogs on the carpeted ground has the writer guessing. It may have been necessary even then to create impressions of grandeur by false comparison—at any rate the distant equipage and mountain view bear out the theory that the artist knew whereof he painted, and quite probably he was rewarded for his loyalty in perversion. The upper portion presents the other side of the picture. King Charles I is hiding in the thick branches of the tree while Cromwell and his men with bloodhounds are tricked off the trail to the apparent amusement of the smiling monarch.

The technically exquisite portrayal of the English family scenes in the double-paneled picture is an adaptation from Morland's painting of the departure from home of the eldest offspring and his subsequent return from school, events which count in the life of an English family. The color scheme is red and white, indicating an early period.

The choice titbit of the lot is the Chinese Chippendale in rose, red and white. The fine shading of the scene and expressive pose of the figures is art *par excellence*. The beautiful pheasant poised gracefully on the slender curving branch of an exotic flowering vine is lacking his head—the fragment has been so denuded—but the effect of the whole is the embodiment of grace and typifies the best in the art of the printer of chintzes in the Chippendale period.

Where Hawthorne Wrote

(*Continued from page 5*)

sound advice in emergencies; my father, who found the racket inimical to composition, would climb up on the hilltop and follow his fancies to and fro on the path along its brow which his feet wore among the roots of the pines and the huckleberry bushes and sweet fern. When I revisited Concord twenty years after, traces of that path still remained. At other times he would stand, his hands behind him, contemplating the work going forward, thoughtful, a little amused, silent. Perhaps he remembered the old proverb, 'When the house is built, death enters in.'

He was only fifty-seven or fifty-eight years old; but age, in the last century, had a way of overtaking one betimes, and he died at fifty-nine. But when the carpenters at last withdrew and came no more—they painted the house all over a golden brown, first—and he could inhabit it in peace, he seemed content; he sat down by the wayside of life, to remove no more. It was his own place, as far as any on earth could ever be.

Hawthorne went up in his tower, with pens and paper, and stayed there three or four hours every day; and in the afternoons he would mount the hill, and from below we could catch glimpses of his figure pacing to and fro, in his old suit of dark clothes, with his soft felt hat on his head. The ascent to the hill was made by a circuitous route, slanting up the southern front under the laburnam trees, and round the bare forehead of the ridge, which sloped sharply down on the west to the Alcott's place below. We put up a bench there from which to see the sunsets; and there was another bench halfway along the path, underneath the great white pine tree; on both these my father and mother would often sit side by side, conversing and thinking of the past and the future; the children never invaded them there. Once in a while they would stroll down the path to the brook, beneath the Norway spruces.

Twice or thrice they walked down to the Emerson house, to sit in one of his weekly receptions, or farther to the town hall to hear him speak; and my mother would come to the school dances, to look on at the waltzes, polkas, quadrilles and mazurkas, and to smile at her children when they caught her eye. In 1862 Hawthorne journeyed to Washington, and sat for a while in the tall President's room at the White House, and was afterward conducted within hearing of the guns at the battle front. But he never willingly left his home, and it wasn't easy to get him to the Saturday Club, glad though he was to meet Emerson, Lowell, Holmes, Longfellow, and the rest. He was done with roaming; he had made his place, and there he would stay.

One summer, however, his wife prevailed upon him to go with his son to Mount Desert for a couple of months, perceiving that he needed the sight and sound of the ocean: it was virgin territory then. It was a pleasant time, but he was more than ready to return. During these years he was trying to give form to his Romance of Immortality; he could not satisfy himself, and finally he wrote the essays on England and the Continent, first printed in the *Atlantic*, and afterward gathered in the volume which he called *Our Old Home*.

I remember the evening when the title was chosen; we were all in the old dining room, after supper, and my sister had been playing some old English ballad music on our little cottage piano, brought from abroad. He was pacing meditatively to and fro in the little space, and proposed that we should suggest a name. We offered one after another, but he shook his head. Suddenly he stopped in his pacing, and said, 'Our Old Home!' with an intonation of finality. In an inward region of his mind he could not forget, or help loving, the ancient place from which his forefathers came; the root from which he sprang had been planted there a thousand years ago, and its essence lived in him still.

Village of Down

(*Continued from page 7*)

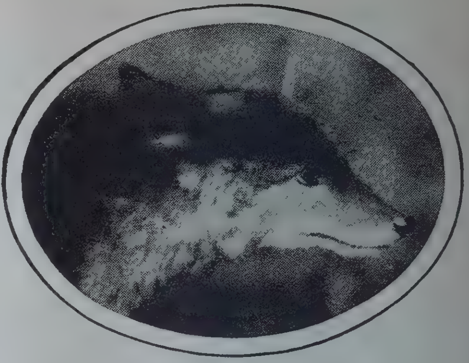
views is inclined to interpret this statement more justly than the world of fifty years ago. It may not agree with Darwin in many things, but it is more than ever inclined to agree with the man of Tarsus that faith without works is dead, and to admit that this 'tolerant, unaggressive agnostic who sympathized with and helped in the social and charitable influences of the English Church in his parish,' was not deficient in works.

In spite of the fact that he considered his day's work done at 12:15 and 'went out for a walk,' it is probable that it was on these walks round about the village of Down and across the heaths of Farnham that most of his work was done. He often refers to them in his writings. Was it not on a day in early autumn, when the air was fresh and soft after a scud of rain from the south, that in a walk across Farnham downs he learned the story of the Scotch firs? They were old friends of his; he had seen them there on the hilltops for years; but now some inclosures had been made, and there had begun to spring up all around the trees a great host of little firs.

'On looking closely between the stem of the heath,' he says, 'I found a multitude of seedlings and little trees which had been perpetually bowed down by the cattle. In one square yard I counted thirty-two little trees, and one of them, with twenty-six rings of growth, had, during many years, tried to raise its head, and failed. No wonder that, as soon as the land was inclosed, it became thickly clothed with young firs. Yet the heath was extremely barren . . . Here we see cattle absolutely determining the existence of Scotch firs.'

And so these walks of his were not idle. He would often come back from them 'very tired'—for the last forty years of his life was 'one long struggle against the weariness and the strain of ill-health'—but happy, and greatly refreshed with a store of new thoughts.

Time has abated the harshness of the storm which raged around Darwin and his theories. I know no better way to see it all in a just setting and a great calm than to pay a visit, say of a summer evening, to this little village of Down where Darwin lived.



A Cunning Thief

By E. R. GAMMAGE

There are thieves *and* thieves. Some of them are human and some are animal, but their various traits and characteristics compare strikingly. The term 'honor among thieves' is often heard; but the coyote corresponds to the other kind of thief that can boast no such quality and, like him, will do the most dastardly deeds under cover but is ready to cower and give up completely when caught, like the sneak that he really is.

The coyote is one of the smallest of carnivorous mammals, but to supplement this he is possessed of a great cunning which counts his size no great handicap. In fact, he is the most cunning of all thieves and is on the alert every moment. I have tried numerous times to secure some good still-life photographs of him on the prairie but because of his ever-watchful eye and his lightning speed I have never been successful in my attempts to get close enough to him for a good view.

I did, however, succeed in getting him at one time with a motion-picture camera; this was on the plains of Jackson County while the cowboys were endeavoring to catch him alive. I accomplished this feat with the aid of special lenses and a platform on a truck, which enabled me to photograph him at his speed of thirty miles an hour. Whether I shall ever secure him with a stationary camera is still a question.

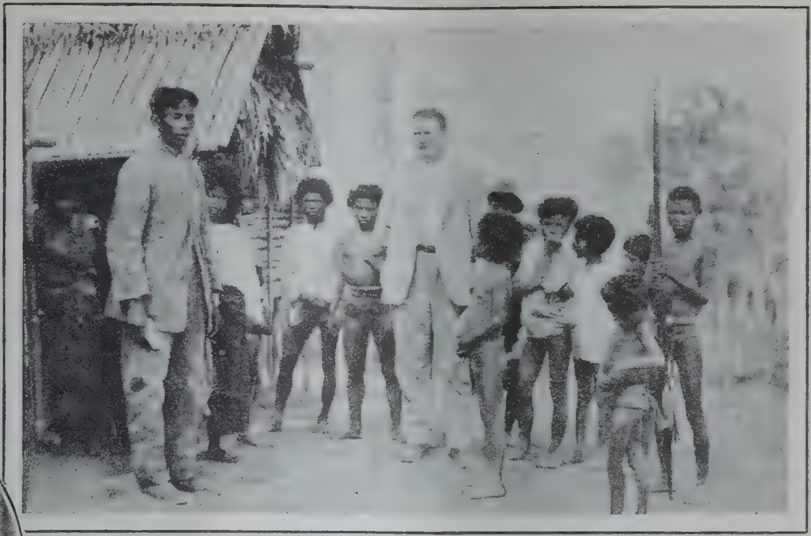
Our domesticated dog, as we all know, is a descendant of the wild wolf. The wolf is native to many countries and inhabits nearly all of Europe, Asia and North America. We do not, however, find him in Africa and South America. Fox and jackal, which are closely related to the wolf, are not found in the two last-named countries, either.

If a farmer is fortunate enough to catch him and to turn his fur into a garment of utility and beauty, the wolf is a friend, but if he must wage a fight against his thieving nature and his gluttonous appetite, he is an enemy of the worst kind, for he preys upon sheep, chickens, goats, small pigs and the young of all other animals. He will gather his fellows together in a pack and give chase to a man, some of the old Texans stating that he will actually attack.

In America, we have a common species of wolf which inhabits the territory extending from Greenland to Mexico. The varieties of this family include black, gray, red and timber wolves and the two varieties of coyote—the timber and the prairie coyotes.

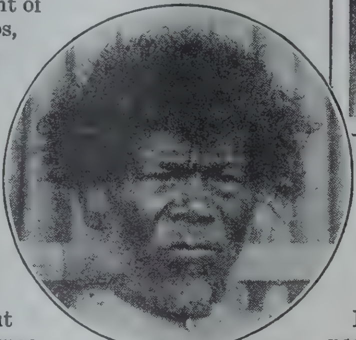
Head Hunters and Others

(*Continued from page 8*)



The stature of the majority of Negritos is less than five feet, as shown by this comparison with a white missionary.

First, it is a kind of game like our football. A gang of young Dyaks will challenge a neighboring village to a head-hunting contest. A time is set, 'officials' are appointed; and a period for the 'game' is allotted. The tribe that has the most heads at the end has won the game. This type of head-hunting has the element of sport about it with, perhaps, a type of finality about defeat that allows no argument and needs no umpire. When a player has 'lost his head' that is final. He is out of the game and from that time is merely a 'point'—part of the 'Score' in the reckoning.



Tribesman who aided the author.

Second, there is the element of courtship about head-hunting. A young Borneo Dyak who has fallen in love with a bonny brown-bodied belle would not think of proposing marriage if he had not a head or two to his credit. No boy is considered eligible or self-respecting, unless he has taken a head or two. Indeed, he is liable to lose his own head at the hands of his possible father-in-law, if he dare propose without having taken the preliminary step of getting one or two to indicate his manhood. In case the girl is spirited, she may demand that he produce half a dozen heads, or even a dozen, before she will marry him.

To be a 'go-getter' among the Dyaks in Borneo is something of a risk, for the fellow whose head you are after will try to get yours—and to get it *first!* He, too, may have proposed to a bonny Dyak belle!

THE third significance of head-hunting is a religious one—without doubt the most propelling of all motives. On harvest festival days, certain selected warriors are sent forth to get heads so that the gods of harvest and sun and rain may be propitiated. The heads are offered in sacrifice, which guarantees good crops for another year.

There is also an idea that every victim of a Dyak's sharp knife will be a personal servant in heaven for the victor, and this adds zest to head-hunting. It is impossible for the Dutch Government to stop it. A trained warrior with a long, sharp knife on a bamboo stick will cut off a head at a single stroke. The Dyak cuts the head off at the neck. It is art to leave the jaws intact and unbroken by the stroke.

Of a decidedly different savagery are the Ainu Indians of Japan, who are white people.

They are the original inhabitants of Japan and occupied the islands when present-day Japanese came swarming from the Malay Islands. All the mythology of the Japanese people centers around the bravery of the Japanese in driving out these white aborigines.

I was told that these Ainu Indians are a sterile race and can no longer reproduce; there are only a few thousand of them left and they will soon be one of the many vanished races. They have been driven to the upper end of the northern island, Hokkaido; and I was told that it would take a week to get there.

I arranged for the trip. The party consisted of fifteen, the largest party of white people that had ever visited that part of Japan.

We found the Ainus white and bearded, very unlike their conquerors, the brown and beardless Japanese. It was a revelation to me to discover a race of white men on the islands of Japan.

They live in grass huts, with a hole in the top to let out smoke; but owing to the fact that their huts are always full of smoke, a large percentage of them are blind, or partially blind. Their huts look much like our Indian tepees.

The bear is worshiped as their god. In nearly every village there was a live bear in a frail bamboo cage, against the day of sacrifice. Those old bears looked mighty restless in their frail cages and I wondered that some of them didn't lunge out and escape.

The Ainu will go up in the mountains and catch his bear. He will then bring him home and fatten him. Every day the Ainu prays to this bear. He prays that the strength of the bear, and its courage, may enter his own limbs and body and soul. He kills him gradually. First he cuts off the bear's leg, praying that the strength of that leg may enter his legs. Limb by limb the Ainu kills his god.

Of the wild tribes of the world, none interested me so much as the Negritos of the island of Luzon in the Philippines.

They are Negroes. They have thick lips, curly hair, wide cheek bones, and they look exactly like our American Negroes except that they are dwarfs. They are so small that two of their warriors could stand under my extended arms.

They live in tree tops like monkeys and eat honey and nuts, with wild fruits and coconuts in season. Now and then they kill animals with their huge bows and arrows.

They carry huge bololike knives, and look ferocious, but they are as harmless as children. This is because they have been underfed for so many centuries that they are small of stature and gentle of disposition.

They live in the mountains of Luzon about three hundred miles from Manila. I organized an expedition to visit them in their native haunts. The trip entailed a long train ride and a fifty-mile hike up the sides of a mountain through jungle trails on a hot tropical day when the thermometer registered 125 degrees all day long.

I could not eat. I could hardly breathe, it was so hot. But the rest of the party spread a lunch under the trees. As they ate, an old man, hideous and blotched with sores, approached and looked on.

'There is the most hideous human being I have ever seen. I have traveled in South America, in Africa, and all over the South Seas, and I have never seen a human being nearer an animal than that old beast,' said one of the newspapermen in the crowd.

I looked around and, sure enough, there beside me, squatting within reach, was a half-animal, covered with scars, dirty and ferocious looking. We all agreed that he was the most hideous human being we had ever seen. He was about seventy-five years old.

Suddenly the old fellow disappeared, and when he came back he carried in his arms a bundle of huge palm leaves. These he spread out on the ground in the shape of a bed and pointed to me. Seeing me ill he intended that I should lie down.

He disappeared again, and returned with a great bamboo tube of spring water. He came up to where I was lying, flipped the tube of crystal water from his shoulder, and filled a sort of a bamboo cup for me to drink.

As he smiled down on me I decided that he was not so ugly as I had thought.

After lunch was over one of the party took a sandwich and handed it to the old man. He looked at it with hungry eyes but did not eat it himself. He took it away and gave it to a mother with a child at her breast.

He came back and they gave him another sandwich. This one he gave to an old woman who was peeping timidly from the bushes.

They gave him a third sandwich. He took this to a hungry old man.

They gave him a fourth, a fifth, and a sixth, and he gave them around until every man, woman, and child of that crowd of starving Negritos had been fed. Then he partook himself.

And yet, only a few moments before, we Caucasians in our wisdom had decided that this ugly old man was the nearest to an animal of any human being that we had seen.

Two Villages in the Far North

(*Continued from page 3*)

mill outfit which the natives soon learned to operate. They cut lumber to build cottages for themselves and also for the teachers' residence, hospital, church and school. Eventually the village provided homes for some three hundred people.

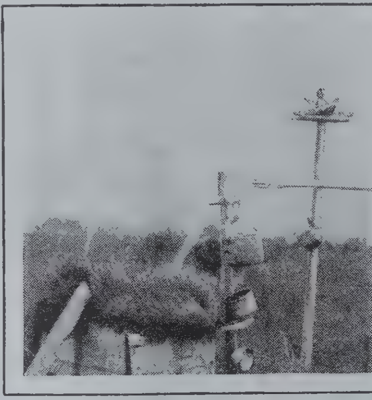
A small electric light plant was installed by means of which the natives were able to light their houses at an average cost of seventy-five cents a month.

No whites were allowed in the settlement aside from the teachers and the doctor and nurse at the hospital. The natives have organized their own coöperative store which acts as a clearing house for all the financial transactions of the community. The stock is owned entirely by Eskimos and a native manager is employed on salary. So far the store has shown a good profit each year, besides rendering to the people a service such as could not have been duplicated by white traders.

Caribou crossing the Yukon, seen from a steamer. Sometimes the animals migrate in such large numbers that the boat is compelled to tie up until they pass.

We had a botanist in our party and we spent the forenoon roaming through the woods gathering specimens. Alaska is a land of flowers. The subsoil is frozen perpetually to bedrock. It is covered by from a few inches to two or three feet of unfrozen soil which produces in the long summer days a vegetation as luxuriant as that generally associated with the tropics. We identified seventy different varieties of flowering plants in a forenoon, including primroses, bluebells, forget-me-nots, irises and wild roses.

The thermometer stood at seventy-six in the shade when we returned to the house at noon and a haze hung over the valley of the Kobuk such as may be seen on sultry July days in the so-called temperate zone.



An Eskimo grave.

There are reasons other than good management for the success of Noorvik. Most of the Eskimos in Alaska live along the coast where the land is open tundra. What wood they have drifts in from the sea and is never sufficient to heat large houses. Therefore their homes consist largely of holes burrowed into the sides of hills, roofed over with drift logs and sods. These are heated by lamps burning seal oil. For the sake of economy they are generally small and crowded. Noorvik, being in a timbered area, is well supplied with material for building substantial frame or log houses and with fuel to heat them. It is a good region for game; and on the tundra a few miles distant the natives run reindeer. Obviously a higher scale of living is possible here than along the coast.

We were able to see the contrast at the village of Napakiagamute, Hooper Bay, near one of the mouths of the Yukon River. Napakiagamute consists of about fifteen or twenty dugouts and is the home of some two hundred natives. The huts are about ten feet square at the base and slope upward to an opening about two feet square in the roof. Leading to the entrance proper is an alleyway of poles so low that one has almost to crawl on hands and knees.

On entering and becoming accustomed to the gloom, sleeping platforms are seen on two sides of the hut. In the center is a fireplace. All around on the rafters are hung dried fish. Other fish are piled in heaps in the corners.

Napakiagamute is well located for fish. There are three or four varieties of salmon. Their principal fish, however, is the needlefish, or nine-spined stickleback. It is about the size of an ordinary match, and abounds in the small tidal streams that run into the river channel from nearby sloughs.

The people of Napakiagamute are among the most primitive in Alaska. The region in which they live supplies plenty of food but they are not able to provide for themselves that degree of physical comfort which natives in most other parts of the country have attained. Nevertheless, they seem just as happy and contented.

It would be hard to find people happier and more care-free than Eskimos, no matter how poor they may appear to be to eyes accustomed to other ways of living. They are jolly and pleasant and greatly enjoy a joke.

The Yukon delta is one of the world's great breeding places for wild fowl. Last year H. B. Conover, an ornithologist from Chicago, spent some weeks there collecting bird specimens. Most Alaskan Eskimos have heard of Seattle. To them it represents all of the outside world. Therefore the people of Napakiagamute asked Conover if he had come from Seattle.

'No,' said Conover, 'I come from Chicago.'

'Chicago big village?' was their next question.

'Yes, be-eg village!' Conover replied with appropriate gestures.

'Chicago be-eg village like Seattle?'—doubtfully.

'Aw! Chicago five times as big as Seattle!' retorted Conover. And then they laughed. That was a good joke! To them (although they had never been there) no place could be bigger than Seattle. Even to suggest such a thing was the very essence of humor. And so they usually met Conover with the sally, 'Chicago be-eg village!' and then would roar with laughter.

Many of the Alaskan Eskimos are experts in basketry and ivory carving, some displaying very great artistic ability.

Much of the ivory used by the Eskimos in their carving is obtained from deposits left over from the feasts of thousands of years ago. It is the custom of inhabitants of the Bering Sea Islands to kill walruses, eat the blubber, and toss the gleaming white tusks in dumps outside their igloos. This has been going on for centuries all over the islands.

Ivory-hunting white men have created a demand for both new and old ivory with the result that these old kitchen middens are being prospected and worked for their valuable contents. Shafts are sunk on sites of almost forgotten camps and villages. The strikes are invariably rich. On one island alone they have dug out each year for four years thousands of dollars' worth of fossil ivory. These discoveries of the ivory mines have changed life for certain families of Eskimos. Instead of faring forth miles to sea, to spear their meat, they dig out the fossil ivory, sell it to the white trader and buy a greater variety of food.

This fossil ivory is almost as valuable as the new. Some carvers prefer to work with the age-old ivory. Many beautiful ornaments are made by the natives and some whites.

The Eskimos bury their dead in small wooden boxes placed on the surface of the ground with a few sods thrown above. Nearby on a pole are suspended the few personal belongings, and occasional carved figures to denote the prowess or virtues of the departed.

Napakiagamute is perhaps the muddiest place I have ever seen. The people go about bare to the thighs and must certainly remain wet most of the summer. Yet they do not appear to be aware of any particular discomfort. Like their fellow humans the world over they doubtless believe that where they live is the most favored spot in the world.

Voyage of the *Victoria*

(*Continued from page 15*)

Then royal curiosity had to be satisfied and there was a state reception of all the returned men, after Sebastian del Cano had been called to a prior conference to which he took, by royal command, 'two the most discreet and wisest.' After that an official was appointed, in the person of the Alcalde Leguisamo, whose work it was to examine closely Del Cano and Hernando Bustamente and Francisco Albo touching the affair at St. Julian.

As part result of that investigation, Alvaro de Mesquita was released from prison and a small pension awarded him. But the chief duty of the investigator was to clear up muddled reports, and to find out why there had been friction between the captains appointed by the king and Magellan; why Magellan had caused Mendoza to be killed by Espinosa, and whether Espinosa had been paid blood-money; why Quesada was executed; why Cartagena had been abandoned; why Magellan sailed such and such a course, and whether he had it in mind to deliver the ships to the command of his Portuguese friends. At the end, Sebastian del Cano was granted a special coat of arms in commemoration of his services, with the motto *Primus Circumdediste Me.* Also by royal order he was granted a pension of 500 gold ducats a year for life, though no provision was made for its payment and Del Cano got nothing but honor.

HE WAS a man of admirable qualities, loyal to his commander and never careless of the lives or happiness of those under him.

The cargo of the *Victoria* consisted of 26 tons of cloves, nutmegs, mace, cinnamon and sandalwood, no account being taken of the portion allowed the crews. All that went to Christopher de Haro who realized a sum equivalent to nearly $26,000; it will be remembered that the original cost of the fleet and fittings was in the neighborhood of $25,000.

As for the *Victoria* and her end, we have to go to Oveida, the historian, who became interested in the voyage when he met Del Cano at Court. He says, quaintly, 'that unique, that famous ship, the *Victoria* . . . the track she followed is the most wonderful thing and the greatest novelty that has ever been seen from the time God created the first man and ordered the world unto our own day. Neither has anything more notable in navigation ever been heard or described since the voyage of the patriarch Noah.'

And the little ship died fighting. As if despising dreams of a life of indolence after all that gallant boisterousness, she sailed on a voyage to the West Indies and returned. Then followed a voyage to Cuba in which she made her port in safety. But after that she disappeared when homeward bound, and with her all on board. We picture her running into heavy weather and a raging sea in mid-Atlantic, battling strongly the while with her ancient enemy, and then, weakened and overcome, settling to her well-earned repose.

(*The next and last installment of this series by Mr. Finger will appear in an early issue.*)

The Groom *Is* Frightened: *The* Bride Enjoys It

By WILLIAM L. STIDGER

THE groom is frightened, the bride enjoys it, the mother cries, the father laughs louder than usual to cover his feelings, and the preacher is expectant! That about sums up the feelings of the participants at an average wedding.

And universally, bride, groom, witnesses, and preacher want it short.

'Cut out all the extra frills,' is the usual admonition from the nervous groom. 'I don't see how I'm going to pull through unless you trim it down a lot.'

The preliminary steps leading to a wedding in the parsonage or the church are interesting.

One day the telephone in the preacher's home or office rings and a nervous male voice says, 'Doctor, are you going to be at home next Saturday about six o'clock?'

'Yes, I'm expecting to.'

'Well, I've got a little job for you to perform at that time!'

He tries to make his voice sound as if the whole affair were a casual thing he happened to think of as he grabbed the phone; the truth of the matter is, it takes almost as much courage for the prospective groom to ask the minister to perform the ceremony as it does for him to propose.

When the average groom approaches a minister to request that he officiate at his wedding ceremony, he acts as if he were committing some heinous crime. He seems to feel ashamed to ask a minister to marry him to the lady of his choice.

Come to think of it, this young chap has a threefold session of important interviews about this time, and they all make him nervous: He must ask the girl; he must ask her father, and he must ask the preacher. If he is as nervous about the other two as he is about the minister, I often wonder how he gets through all of these interviews. It ought to be good training for a newspaperman.

Some of them do it by wire. I once received a wire which read like this:

'Doctor Stidger: Nell and I want to get married next Sunday afternoon; and, of course, we want you to do the dirty work. Will you help us out?'

I HAVE tried to analyze the nervousness of the prospective groom, but it is beyond me.

A hulk of a college football player who has plunged into a Yale line without a quiver will stand like a trembling child at his wedding ceremony. The preacher begins to worry how to carry him out if he faints.

I have married soldiers who won medals for bravery in France, but in the face of the ceremony they trembled like aspen leaves and perspired until they wilted their white collars. From the sighs of relief when it was all over, you would think they had been through purgatory.

'Why is it that a girl is always calm and self-possessed at her wedding and a man so nervous that he can hardly stand up?' I am often asked.

Getting married is always a glorious adventure for the bride. She has been dreaming of the event all her life. It is romance to her. Not so to the man. The marriage ceremony is a thing to be hurried through.

It is a means to an end. It is like a train taking him into the Yosemite. He doesn't enjoy the trip in, but he knows that when he gets there, it is going to be a little taste of Paradise. So he is willing to go through with the trip in order to arrive.

It is considered extremely important by the women present that the groom should kiss the bride immediately after the ceremony. The minute the parson gets through his final prayer, the groom is traditionally, among women folk, supposed to kiss the bride.

TO THE women this is vital. Sometimes the poor groom gets excited and forgets this important matter.

Then you can hear audible comments from the women all over the room at the parsonage or the church, 'He didn't kiss her!'

Then the women giggle or comment about this omission as if it were an ominous indication that the groom doesn't really love the bride after all.

'I don't think he cares much for her if he forgets to kiss her on their wedding day!' said one sharp-nosed female of the unmarried variety one day at a wedding that I performed.

The groom usually performs this kissing act perfunctorily. It is a public display of affection that is distasteful to the average man; he goes through with it, usually, because he has been warned against forgetting it by his bride.

She knows how the average woman looks upon this first married kiss; and she is not going to have her nervous groom forget that important moment and have all the women of the neighborhood saying, 'John forgot to kiss Elizabeth at the wedding!'

The bride answers the questions in a clear and unwavering voice, while the groom answers as if he is afraid somebody is going to arrest him for yelling. Frequently in his nervousness he answers at the wrong place; or, even more frequently, he does not answer at all until his bride or the preacher prompts him. The bride usually does it with a nudge.

Not one groom out of a hundred hears a word the preacher says, or knows what the preacher is talking about. It is a dim, hazy dream to him, but the bride enters into the spirit of every modulation of the preacher's voice and into the sacred meaning of every phrase in the beautiful ceremony.

The one phrase that seems to get the heart of the bride more than any other in the entire ceremony is, 'Until death us do part.' I have seen many a beautiful young bride express a sudden and deep emotion when the preacher came to that part of the ceremony by a new light in her eyes or a pressure of her groom's hand.

Making EDUCATION a SERVICE

By WILLIAM A. McGARRY

A STOCK challenge to ministers of all creeds and faiths throughout the history of religion has been the failure of the church to reduce the power of prayer to an economic basis. Even where there is no intent to be cynical or to commercialize things of the spirit, men of literal minds have argued that if prayer has any power there must be a law to govern it. Since no such law is discernible to the majority of human beings, churchmen are taunted with the assertion that prayer is without response and that any apparent answer is merely a coincidence.

If the late Reverend Dr. Russell H. Conwell had not been so occupied with what he regarded as more fruitful fields it is possible that he might have shed a great deal of light on this question. Dr. Conwell, who was inclined to understate in order to avoid the charge of exaggeration, nevertheless went far beyond the ordinary claim for the value of prayer. Repeatedly he asserted that economic benefits had been gained by his congregation at Grace Baptist Temple, in Philadelphia, through the power of united prayer. While he did not lay claim to the discovery of a law, he did insist on the existence of a cumulative return in material as well as spiritual benefits, which he believed was measured only by the faith of his flock.

Alexandropol,

Looking like a lost world

Sympathy next to love,

The Story of Christ. His Sympathy

Then & now.

One of the rare sermon notes of Dr. Conwell.

More specifically, it was stated by Dr. Conwell on many occasions that the physical health and material well-being of his congregation had increased out of all proportion to the general national averages, as a consequence of what might be termed coöperative prayer. To the best of my knowledge he never made a detailed record to prove this statement, and he was far too wise a man to place undue emphasis on individual cases. Occasionally, however, he did refer to individuals without revealing identities, and anyone acquainted with the business and professional life of Philadelphia could check the general statement for himself.

The congregation to which Dr. Conwell ministered was one of the largest of the denomination in the country, with a membership of about three thousand. His church was located in the heart of one of the older residential districts of the city. This district included some of the two-story workmen's homes for which Philadelphia is noted, and also many larger dwellings of the type generally occupied by prosperous small merchants. The mansions of North Broad Street, however, had disappeared. Some large dwellings had been turned into boarding houses. It was still a substantial neighborhood, but not a wealthy one, and it is probable that a real estate expert would have said it had lost much of its residential character in the last fifteen years of Dr. Conwell's life.

Yet there is no doubt that the average wealth of Dr. Conwell's followers was considerably greater than the average of like sections, even though it was lowered by the large number of poor to whom he ministered. In other words, while the general aspect of the section indicated a falling off, actually there was an increase. This was illustrated in one way by the fact that virtually every board or commission in the city of a philanthropic nature contained members of his congregation. Conwell men were to be found on public and semipublic committees—there was always at least one on the board of education. They were in organizations depending for their guidance on men of wealth with time to spare and a real interest in civic matters.

Two other points of evidence were the unusually large number of young men in the congregation who had made outstanding business progress, and the large proportion of very wealthy men who remained in the neighborhood after others in their class had gone in for vast country estates. One of these men was quoted once as saying, when asked why he did not move into the country and begin to rest a little, that 'Conwell won't give me time to move.' He was only partly serious, of course, because the secret of Dr. Conwell's ability to get so much help was that he never tried to compel it. His aids were always volunteers.

I have outlined the extent of the social service contributed to the whole city by Conwell men because it throws a great deal of light on the spirit animating the members of the congregation in their dealings with one another. And without attempting to analyze the supernatural, I say tha spirit was and is an integral part of the mechanism through which, in Dr. Conwell's opinion, the power of coöperative prayer made itself manifest. As he saw it, his followers prospered spiritually, physically and materially because they had placed themselves in position to prosper, developing by prayer a mental attitude of peace and charity that eliminated minor vexations and left the mind free for important decisions.

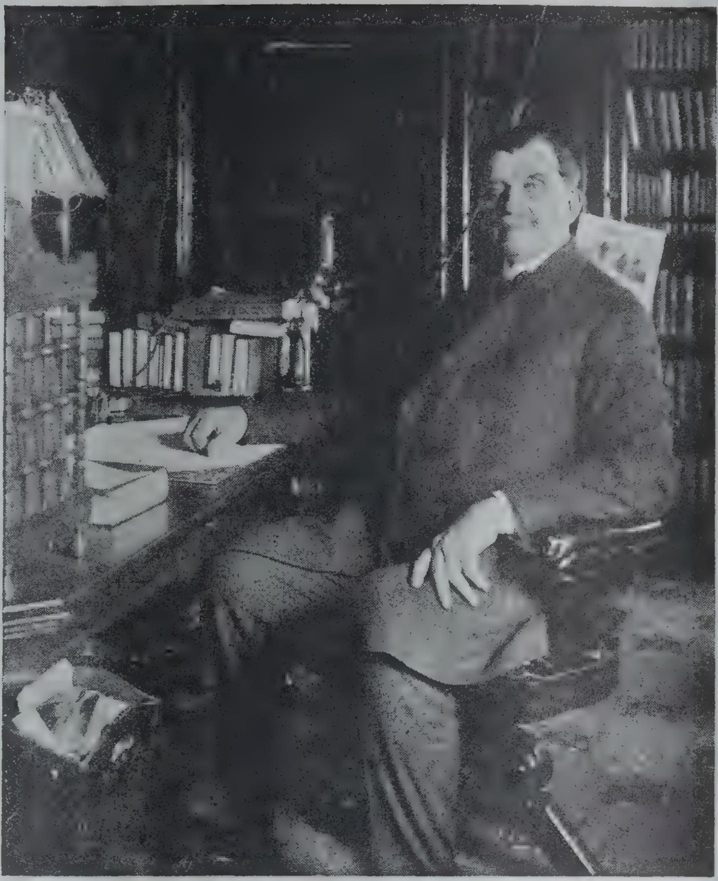
During one of my interviews with Dr. Conwell some years ago I commented on the preponderance of men from his congregation in the philanthropic organizations of the city. 'That is our surplus of good will,' he said. 'It helps to explain why my people are so happy and content. If only we could make the world realize that friendliness is a tangible thing, carrying its influence far beyond the limits of direct contact, we could eliminate a great deal of human misery. So many of our troubles are of our own making.'

The same idea was expressed in several of his public utterances. In common with many other men of great personal influence, Dr. Conwell had a marked touch of the mystic in his make-up. He believed in many things—apart from the realm of the supernatural—for which he was unable or unwilling to furnish an explanation. One of these beliefs was that every man is swayed to some extent by the things other men are thinking—the unspoken things. Again and again he referred to the unseen but potent force of cumulative thought, and undoubtedly he saw this as another part of the mechanism through which the response to prayer functioned.

But Dr. Conwell was not limited to explanations that had to be taken on faith. The Reverend Dr. William Dyre McCurdy, who was Dr. Conwell's assistant from 1917 until the latter's death a short time ago, believes that many of the economic benefits claimed for prayer by Dr. Conwell could be traced through forces within the range of human understanding, and traced so that anyone could follow them.

'The congregation of the temple under Dr. Conwell became a sort of coöperative organization,' he says. 'When Dr. Conwell said that prayer yielded material as well as spiritual returns he had this in mind. Not only that, but he referred to it frequently. From time to time, and particularly during periods of business stress and unemployment, it was his custom to ask from the pulpit for the names of men and women in need of work. He would tell them that no one need go without employment or any of the necessities of life when a thousand fellow members of the congregation were willing to help him.

'Some of this mutual help came under the attention of Dr. Conwell and myself, but by far the greater part of it was without our knowledge of the specific details. Dr. Conwell was a very friendly man, and he had so thoroughly established the spirit of friendliness in the congregation that every service at temple was followed by at least an hour of social intercourse. I doubt if any other congregation of equal size could boast as many personal friendships. Naturally Dr. Conwell contended that much of this spirit was due to the unity established in prayer, which engendered a spirit of friendship. This in turn led to a mutual helpfulness that could not but be reflected in the fortunes of the members.'



Dr. Russell H. Conwell in his study.

Still another influence in the material well-being of the congregation was Dr. Conwell's own advice in personal and business matters. It was not generally known, but, according to Dr. McCurdy, it is a fact that many of the most successful business men in the congregation never made an important decision without consulting the famous preacher. Far from being annoyed by this, Dr. Conwell took a keen delight in it, and the harder the problem presented to him the greater he enjoyed helping to find the solution.

'His acumen in business matters was universally recognized,' Dr. McCurdy points out. 'Without a sound business training he could not have built the great university and three hospitals, in addition to his private charities. As a rule his advice was based in sound economic reasoning. But there were times, particularly when he was giving advice to young men, when Dr. Conwell assumed the rôle of prophet with results that often seemed uncanny. One case in point is that of a man who is now the owner of several prosperous stores. Shortly after I joined Dr. Conwell he came in one day seeking advice. He had just been graduated from Temple University and had taken a position.

'I remember watching Conwell as he sat in his characteristic attitude, eyes closed, massive head nodding, listening to the boy's story. When it was ended there was a moment of silence. Dr. Conwell seemed to be waiting for more. Finally he turned with an impatient gesture of his hand and asked,

' "When will you own the business?"

'The youth almost fainted. But when he suggested that his ambition had not gone so far Dr. Conwell became all action. He told the boy how to go about getting control of the business, where to borrow money after he had saved as much as possible, how to expand it later.

'Of course it is easy enough to look back over the record made since by this young man, and to say that it was a perfectly logical and natural development. The original proprietor wanted to sell out after a short time, but there was nothing at the time to indicate this. So it was with the other steps that became easy to see as the time arrived for them to be taken. Conwell saw them all in advance.

'Another man is now one of the leading textile manufacturers of Philadelphia, and his progress was foretold step by step. If Dr. Conwell had been interested in self-advertising he could have reeled off hundreds of names of men he had helped—men who were willing to testify to the value of his advice in business matters. But even when some of them sought to make these facts public he checked them.'

It was not only a lack of interest in the limelight for himself that influenced Dr. Conwell in this course. Few men even in public life have had a more profound understanding of how the public will react to new things. Dr. Conwell knew that the slightest taint of commercialism has ruined many movements for good, and he avoided it scrupulously. This does not mean, of course, that he was not a supporter of commerce. Some time before his death he made the following statement relative to business education:

'The best education is an education in the most useful things of life. The most useful education is the one most useful to humanity, and consequently the most profitable to the individual. The greatest number of human beings in a civilized community are engaged in business, either manufacturing or commerce of some kind. Therefore, the highest honors of a university should be given to the man whose education has made him the most useful in business. Without business, civilization would cease, as business is necessary to the support of every phase of modern life.'

In this connection Dr. McCurdy recalls that as early as 1900 or thereabout Dr. Conwell predicted that the next war would be fought in the air and under the sea. In the same lecture he prophesied wireless, and about the time radio began to develop in a national way he said the time would come when people in their homes could see a play in a distant theater.

He would analyze the discoveries to show that all scientific progress is merely the product of skill and patience. The wonders of science seemed to him relatively simple things in comparison with the wonders of prayer. He believed it was far more important to influence the hearts of men than their minds.

An interesting side light on the capacity of Dr. Conwell's mind is furnished by Dr. McCurdy. 'I was puzzled for some months after I joined him,' he said, 'in trying to determine when he prepared his sermons. It is true that his talk was extemporaneous, but even so some preliminary thought was necessary. When I put the question to him he told me at first he didn't know. Later, after some thought, he said he prepared new sermons while lecturing on *Acres of Diamonds*.

' "Every once in a while," he told me, "I get *Acres of Diamonds* going unusually well. I then forget all about it and prepare my sermons. The lecture becomes automatic." '

Dr. Conwell never carried more than a single page of notepaper with him to the pulpit.

Early American Schools

(*Continued from page 9*)

every township in this jurisdiction, after the Lord hath increased them to the number of fifty householders, shall then forthwith appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children, or by the inhabitants in general, by way of supply, as the major part of them that order the prudentials of the town shall appoint; provided, those that send their children be not oppressed by paying much more than they can have them taught for in other towns; and it is further ordered that, where any town shall increase to the number of one hundred families or householders they shall set up a grammar school, the master thereof being able to instruct youth so far as they may be fitted for the university . . .' Even as early as 1642 an act was passed requiring that children and apprentices be taught to read and also that the same be brought up to learn 'some honest, lawful calling, labor, or employment, either in husbandry, or some other trade, profitable for themselves and the commonwealth, if they will not or cannot train them up in learning to fit them for higher employments.'

In these ordinances may be recognized some of the fundamental principles of the American public schools, 'the corner-stone of the American nation.' No institution more truly represents the free spirit of America today than the public school, the high school and the state university. No greater tribute has been paid to any educational system than is being paid today to the American schools by European nations, which are revising and changing their systems to make them like our schools.

THE Boston Latin School continues today in active operation, having been known during many years as the Grammar School or the Latin Grammar School. In those good old days to go to school meant to learn Latin; anything else was largely accidental. Even arithmetic was considered in the category in which are music and dancing in modern education. Arithmetic was largely taught by separate teachers, reckoning masters, who served also as town clerks.

The curriculum of the Boston Latin School in 1789 included:

First year: *Cheever's Accidence; Colloquies of Corderius* in Latin and English; *Aesop's Fables*, same; *Ward's Latin Grammar; Eutropius.*

Second year: *Clarke's Introduction* (to Latin); *Ward's Latin Grammar; Eutropius,* continued; *Selectae e Veteri Testamento Historiae*, or, *Castilio's Dialogues.*

Third year: *Caesar; Tully; Ovid; Vergil; Greek Grammar* . . .

Fourth year: *Vergil; Tully; Greek Testament; Horace; Homer* . . .

All Latin and Greek!

Today it is believed that knowledge of science, of nature and of art, as well as Latin and Greek, contributes to a real education. This change in the curriculum is the logical outcome of the program which began in the schools of Massachusetts and New Amsterdam three hundred years ago where all the children of all the people were given the opportunity for education.

Bedford *and* John Bunyan

By PAUL TYNER

—Photos by Burton Holmes from Ewing Galloway.

Rural English cottages on a road near Bedford.

Left—Bridge over the Great Ouse River in Bedford.

THE city of Bedford, an hour's run from London, enshrines the memory of John Bunyan who while imprisoned for his faith gave to the English-speaking world from the dire environment of a common jail the deathless allegory of *The Pilgrim's Progress.*

Local appreciation of Bunyan in Bedford is hardly less keen than that of Shakespeare in Stratford on Avon. Of many memorials, perhaps the statue of John Bunyan in St. Peter's Green is the most outstanding.

A few miles outside of Bedford is the hamlet of Elstow in which is the cottage in which Bunyan was born and the 'Moot Hall' in which he danced as a youth before taking up the trade of a traveling tinker. The hall is evidently a remodeled old Elizabethan 'Tithing Barn' and, as is the case with such spacious and substantially built structures in many parts of the country, had been adapted to the uses of a community meeting place. Both buildings are carefully preserved and present undoubtedly very much the same appearance as in Bunyan's own day. The cottage reminds one a bit of the Burns birthplace at Ayr. It contains numerous portraits of Bunyan with copies of his books and several manuscripts while the furniture consists of close replicas of the original furnishing of the cottage.

The Methodists of Bedford recall with pride the frequent visits to the town of John Wesley and point to the local Wesleyan congregations as evidence of the response of Bedfordites to his earnest and ardent exhortations.

St. Paul's Church—whose lofty spire is a striking landmark from the Embankment—adds picturesqueness to the view with its pretty churchyard. Within is the pulpit of white stone in the Lady Chapel, from which Wesley's famous 'Assize Sermon' was delivered in 1758.

Archeologically speaking, probably St. Peter's Church near the Embankment is the most important edifice in Bedford. This is the church which gives its name to St. Peter's Green of which the center is occupied by the Bunyan statue. One sees at a glance that the church is of very ancient date. Traces of the big fire that marked the attack of the Danes on the town in 1010 are still perceptible.

Old-time workmanship may be studied in the fine Saxon doorway, in the belfry, and in a fine Norman porch on the south side of the building. Here is found a beautiful window erected by his fellow townsmen to the memory of that prince of war correspondents, the valorous Captain Frederick Burnaby of *A Ride of Khiva* fame. He was killed, it will be remembered, while fighting against the Arabs at Abu-Klea on January 17, 1885. Although a brave soldier and a brilliant pen-picturer of battles, Burnaby was no militarist and his friends have recognized the fact in the inscription beneath this window: 'They shall beat their swords into ploughshares and their spears into pruning hooks.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. Will you please give me a list of the presidents of the United States?

Answer. George Washington, John Adams, Thomas Jefferson, James Madison, James Monroe, John Quincy Adams, Andrew Jackson, Martin Van Buren, William Henry Harrison, John Tyler, James Knox Polk, Zachary Taylor, Millard Fillmore, Franklin Pierce, James Buchanan, Abraham Lincoln, Andrew Johnson, Ulysses Simpson Grant, Rutherford B. Hayes, James A. Garfield, Chester A. Arthur, Grover Cleveland, Benjamin Harrison, Grover Cleveland, William McKinley, Theodore Roosevelt, William Howard Taft, Woodrow Wilson, Warren Gamaliel Harding, Calvin Coolidge.

* * *

Q. How many Negro soldiers were enlisted in the Union Army in the Civil War?

A. President Lincoln stated in his message on December 8, 1863, that there were a hundred and fifty thousand colored men in the Government service, fifty thousand of whom had borne arms in battle. The inscription upon the back of the frame of the tablet of the monument on Boston Common by Augustus St. Gaudens to Colonel Robert Gould Shaw and his Negro soldiers states: 'One hundred eighty thousand such Americans (of African descent) enlisted under the Union flag in 1863-1865.'

* * *

Q. I should like to get some information on the battleship Wolverine.

A. The U. S. S. *Wolverine* has been in the naval force of the United States on the Great Lakes since 1844. It was originally named the *Michigan* and bore that name from 1844 to 1905. It was the first iron vessel built for the Navy, and the fifth steam-propelled man-of-war. For fifty years the vessel was the most powerful fighting unit on the Great Lakes. At the time of the commissioning of the *Wolverine,* protests were frequently made by the British Government to the effect that the ship's armament violated the Rush-Bagot Treaty of 1817. This matter was the cause of contention intermittently for many years between the two countries. The boat served to protect the lake borders from attempted raids and from transportation of arms from Canada by Confederate agents during the Civil War. She also guarded Johnson's Island in Lake Erie where a large number of Confederate prisoners were held. The gunboat is now in the possession of the City of Erie, Pennsylvania, which city offered to take care of the ship after the Navy Department had announced its intention of junking it together with three other ships of like class.

* * *

Q. Do army titles carry any salary when conferred upon a person not in active continued service? For instance, does Colonel Lindbergh draw a salary?

A. Commissioned officers on the retired list of the Regular Army receive retired pay by due process of law. A federally recognized officer of the National Guard not in the Federal service receives drill pay for attendance at drills and, if in command of an organization, a certain extra allowance for administrative purposes. When called for active duty for a fifteen-day training period, he receives training pay. If a National Guard officer is called into the Federal service he receives pay and allowances exactly the same as does a Regular Army officer. A reserve officer draws no pay nor allowance except while on active duty. In the case of Colonel Lindbergh, he would receive no pay in his capacity as a reserve officer, except when called to active duty. While he is commissioned in the National Guard of the State of Missouri, his commission as such has not yet been federally recognized, there being no vacancy for him in that grade. Therefore, he would receive no pay as a National Guard officer.

* * *

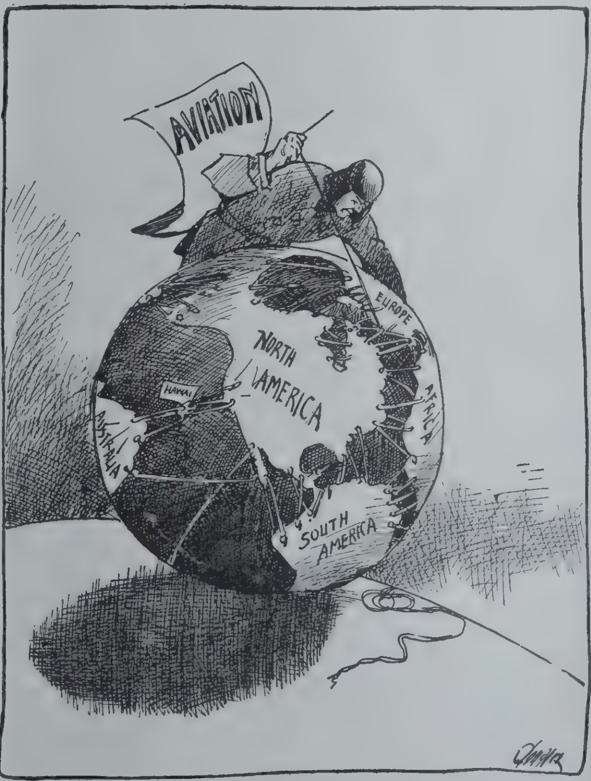
Q. Who were some of the first owners of the land on which the White House stands?

A. The White House grounds were owned by two different parties. The north half, by Samuel Davidson, and the south half, by David Burns. The dividing line would now run directly through the White House.

* * *

Q. During the World War what religious sects in the United States were exempt from active warfare under the Selective Service Act?

A. The Selective Service Act provided that members in a well-recognized religious sect on May 18, 1917, whose creed forbade participation in war in any form, would be required to serve only in a capacity declared by the president to be noncombatant. Under the classification system, therefore, registrants claiming relief from noncombatant service under this provision were not placed in a deferred class on this claim alone, but were classified, their classification entering into the records like that of other registrants; but for the purpose of designating them their names were accompanied in all records by the insertion of a cipher. The administration of this regulation was left to the decision of the local boards; that is, no list was prepared of religious denominations recognized as existing on May 18, 1917, and professing a creed opposed to war in any form. No report has ever been required of the boards showing the creeds thus recognized. However, from materials gathered in the Census Bureau it appears that the principal creeds professing such a tenet are these: Brethren in Christ; The Yorker, or Old Order Brethren; United Zion's Children; Christadelphians; Amana Society; Churches of Christ; Church of the Brethren (Conservative Dunkers); Old Order German Baptist Brethren; Brethren Church (Progressive Dunkers); German Seventh Day Baptists; Church of God (New Dunkers); Friends; Mennonites. From a comparison of the total number of claims made for noncombatant classification with the estimated total number of registrants from the above creeds, it appears that the entire body of registrant creed members availed themselves of this privilege. Under a presidential regulation the following military service was declared to be noncombatant: Service in the Medical Corps wherever performed; any engineer service or any service in the Quartermaster Corps in the United States; and certain specified services in the two last-mentioned divisions in the rear of the zone of operations. Under this regulation persons ordered to report for military service who had been granted noncombatant status were assigned to noncombatant military service 'to the extent that such persons are able to accept service as aforesaid without violation of the religious or other conscientious scruples by them in good faith entertained.'



—Donahey, *Cleveland Plain Dealer.*

PULLING THEM TOGETHER.

CHATS WITH OFFICE CALLERS

'I used to drive a car along a road in Luzon,' said the **Major,** who had just been transferred. 'I was a sergeant then. At a certain place a big half-tame carabao used to step out into the road and dispute my pathway. I knew enough not to argue with him. I always took a detour through a field. I hated to give in to the old rascal, but he had a spread of horns of about eight feet which were like young oak trees. I knew what he could do to my car if I angered him. He would just naturally take it on his horns, me with it, and toss us into a field. So I drove around.

'One day the old car wouldn't work and my captain ordered me to use a big truck. It was a three-ton truck, loaded to the full. When I got to the familiar spot where I met Mr. Carabao every day, he was right on the job with head lowered.

'I drove up to him slowly. He turned, still with head lowered threateningly. Suddenly I shot on all the gas I had, picked that carabao up, carried him about fifty feet, and then stopped the truck. He dropped off the fenders, took one look behind him and started to run. I tooted the horn and he cut through a fence without stopping. He never disputed my way again. In fact I never saw him again.

'All of which shows that even a carabao may form habits that will become dangerous if not carefully watched.'

* * *

'The Peace Palace at The Hague is most interesting,' said the **Diplomat.** 'One recognizes the shrine when afar off. It stands in the suburb of a quaint old town, with barge-bearing canals, peaked Renaissance roofs and red-brick dwellings, all painstakingly true to type. The great building stands well back from the road in the midst of a twenty-acre plot with a lodge at the heavy iron gates and sweeping driveways leading to the door.

'The grounds are elaborately landscape-gardened with sunken rose plots and beautifully ornamented ponds reflecting Greek pagodas, Roman vases and formal shrubs breaking into native woods in the back.

'The building itself is not what one expects. In the first place, it belongs exclusively to none of the established types. It is Roman inside and out in its low, round, heavy arches. Its roof and façades are Renaissance with many a borrowing from those old buildings in The Hague that date back three hundred years. Yet it goes still farther afield and imposes on these its two towers that are distinctly Byzantine. Thus a strange and somewhat incongruous effect is produced on the observer, an effect that is likely to be a bit disquieting.

'Andrew Carnegie, whose experience in public buildings cannot be said to have been inconsiderable, gave this building as a homing place for the dove of peace. He accepted the competitive plans of L. M. Cordonnier, a French architect, with whom he later associated J. A. G. Van der Steur, a Netherlands architect, and the Peace Palace resulted. Americans who are familiar with the Pan-American Building in Washington, probably the most satisfying public building in America, are likely to feel that European artists have here not done so well. Yet from the ends of the earth men and women of many nationalities come here and gaze.'

* * *

'Some day some one will write the romance of our western commerce,' said the **Ship Captain.** 'Even in these latter days there is abundant material. Take, for instance, the pioneer days of California.

'Older than the Golden State to which its steamer brought news of statehood, the Pacific Mail has flown its flag on the seven seas since April 12, 1848. Its first vessel, the side-wheel steamer *California*, carrying masts and sails in case the engines should fail, cleared from New York for San Francisco on October 6, 1848.

'Two years later the *Oregon* steamed through the wide-thrown portals of the Golden Gate on October 18, 1850, bearing the news that California had been admitted to the Union. With flags flying and masts decorated with bunting, the *Oregon* was received by a city which suspended all business for a holiday that lasted nearly a week. It is recorded that as a flag was being raised in the plaza a knot caught the halyards at the top of the pole, and that two hundred dollars in gold dust was raised in three minutes to pay a sailor to climb the pole and free the flag!

'These ships were equipped with side-wheels and paddle wheels; yet one of them, the steamer *Colorado*, clearing from San Francisco, crossed the Pacific Ocean. The steamer *California*, mentioned above as one of the first to pass through the Strait of Magellan, had accommodations for only a hundred passengers, but she carried four hundred gold seekers some of whom paid as much as a thousand dollars for mere sleeping and standing space on deck, bringing their own food and bedding.

'Sometimes a steamer would bring as many as fifty thousand letters, a holiday being declared in Monterey and San Francisco whenever one of these ships came into either port. When the *California* reached Monterey, she ran short of coal, and was fueled with wood, for the cutting and loading of which the captain paid soldiers, civilians and sailors ten dollars a day.

'When the steamer arrived on "letter days," men stood in lines hundreds of yards long, and paid five to twenty dollars each in gold dust for places in those lines, so that they might receive their much-traveled letters from loved ones at home.'

* * *

'I have no hesitancy in saying that the improvement of general conditions under prohibition is marked in any community,' said the **Man from a Southern City.** 'Even with the handicap under which Government agents are working, I have every confidence in the final result. Numbers of people thought they were going to die immediately when they got to a place where they could get no more whisky. It will take that class of people some time to make up their minds that they will have to do without it, but I think that enforcement is getting better and more complete day by day.

'Many of those opposed to the enforcement of this law suggest that it be modified to permit the manufacture and sale of wines and beer. While there is no danger of that modification being made by Congress at any time in the near future, it appears that if the American people wish to abandon the hope of prohibition in effect and retain only the name, with an expensive organization, the manufacture and sale of beer and wine would be a successful way to do it. There would be a dozen grogshops in every block, and most of them would be used as a subterfuge for places to sell every alcoholic beverage the mind of man could devise. The effect of real prohibition in diverting the funds of the poorer classes from the purchase of liquors to supplying the home with necessities would be defeated.

'Those who now connive to belittle the enforcement of this law may think they are advancing their cause, but, as a matter of fact, they are holding conditions at a point which presents America to the world as a nation of people who are not willing to abide by the mandates of their own self-chosen government.'

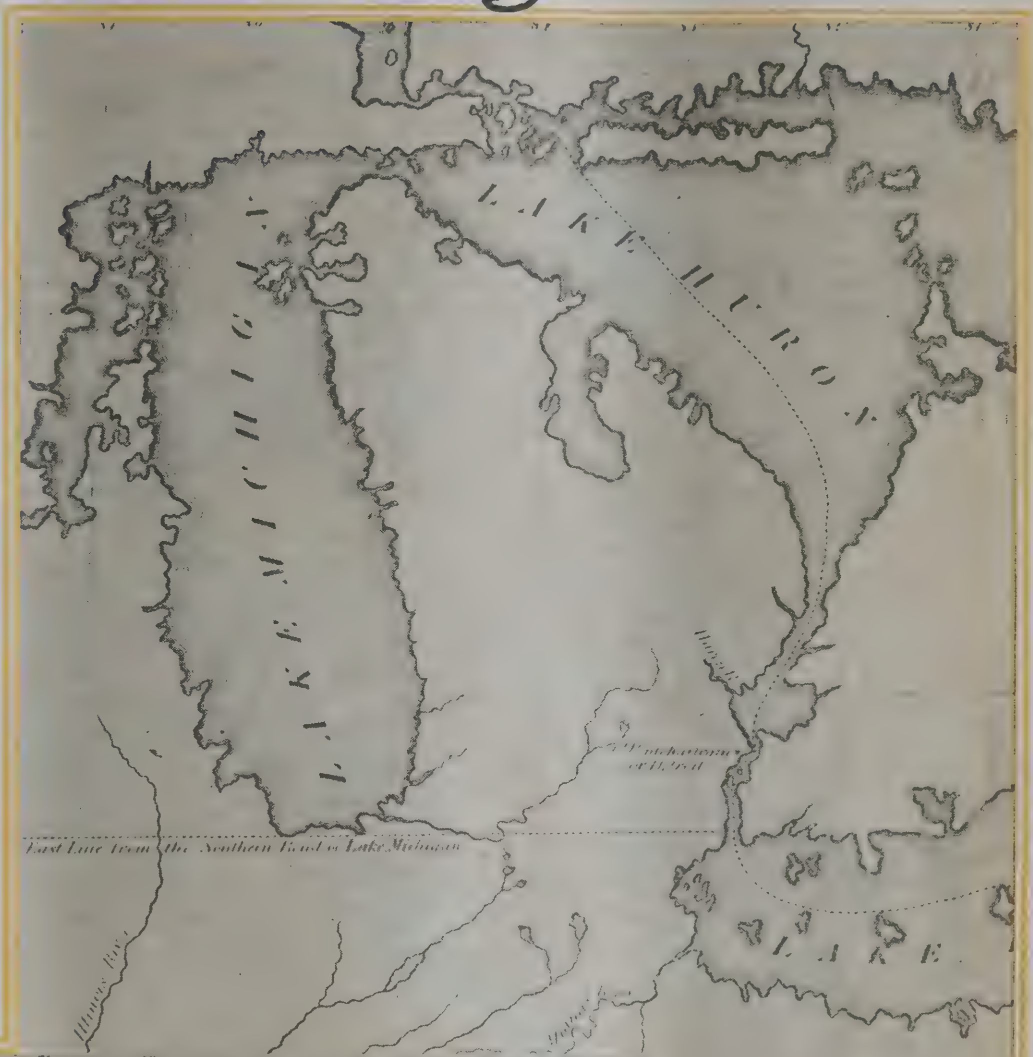
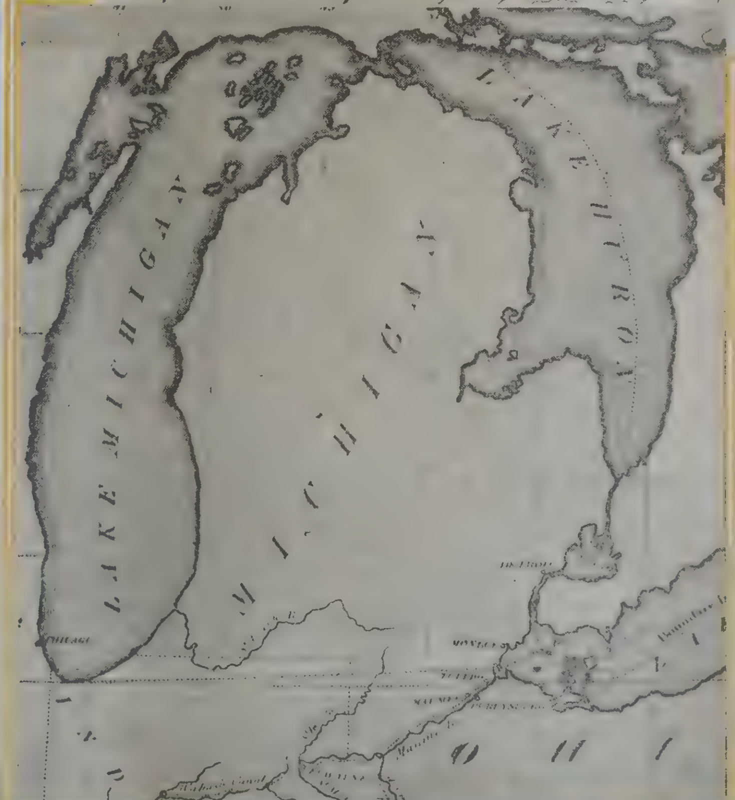
EVERY AGE HAS ITS GLORY.

The WAR to Win TOLEDO

By
E. L. McCOLGIN





Three of the Great Lakes according to Mitchell's map of 1755. Left—Recent survey of the same territory, with two dotted lines, one running from the southern bend of Lake Michigan due east and the other to North Cape.

THE so-called Toledo War of 1835 between Michigan Territory and Ohio State over the sovereignty of a strip of land, including the city of Toledo, is the only case of collision between two units of the American commonwealth.

The famous Northwest Ordinance of 1787 specified that the State of Ohio, which was to be formed when it had 60,000 people, should also include the land 'lying north of a line drawn east and west through the Southern Extreme of Lake Michigan,' known as the County of Wayne of the Northwest Territory, until it also had 60,000 people and was thus eligible for statehood.

On a map in the State Department (which guided the Congressional Committee that framed the Northwest Ordinance of 1787), there was a pencil line from Chicago to a point between what is now Monroe, Michigan (north of Toledo), and Detroit. This was doubtless Mitchell's map, the standard map of the day, which unfortunately placed Lake Erie more southerly and the tip of Lake Michigan more northerly than their true positions. This marked map indicated the intent to include what is now Toledo in the State of Ohio.

Ohio was made a state in 1802 in violation of population requirements and Wayne County mandates of the Northwest Ordinance. There were only about 45,000 people in Ohio instead of the specified 60,000 and Wayne County, which included Detroit, instead of being temporarily attached to Ohio, was joined to Indiana Territory, whose seat was at remote Vincennes.

Thomas Jefferson and his partisans were responsible for the Ohio statehood effort. The Wayne people were opposed to Jefferson's party. It was feared that their inclusion with Ohio would prejudice Jefferson's chances. In 1805 the Detroit people were mollified by the creation of Michigan Territory from the County of Wayne.

When the Ohio Constitutional Convention met its only idea was to accept the Ohio-Wayne boundary line specified in both the Northwest Ordinance and the congressional enabling act. However, a hunter named Wells, who had been a prisoner of the Indians near Chicago, appeared among the delegates and warned them that Lake Michigan extended much farther south than the maps indicated and that there was danger that Ohio might accept a northern boundary that would deprive her of the western end of Lake Erie.

The apprehensive delegates inserted a proviso in the new constitution that the 'line drawn east and west through the Southern Extreme of Lake Michigan' should in no event strike Lake Erie below the northern cape of the Maumee River, the location of Toledo.

Congress, in its zeal to get Ohio into the Union without the inclusion of federalist

Detroit, passed over these boundary discrepancies when ratifying the Ohio constitution.

Congress again violated the Northwest Ordinance by admitting Indiana in 1816 with its boundary 'ten miles north of the Southern Extreme of Lake Michigan,' thereby giving Indiana the sites of the present cities of Gary and Michigan City at the expense of Michigan Territory. Michigan's delegate in Congress prejudiced her claims to Toledo by failing to protest the Indiana boundary, because the land there was regarded as practically worthless.

Governor Cass of Michigan had the Washington government undertake in 1817 the determination of the Michigan-Ohio boundary. The General Land Office had a line run by a surveyor named William Harris. When Governor Cass learned that Harris had been supplied with the Ohio Constitution instead of the Northwest Ordinance as a guide for the survey, the line was protested to President Monroe who good-naturedly had John Fulton run another line in exact accord with the wording of the Northwest Ordinance.

THE Harris Line gave Toledo to Ohio, and the Fulton Line gave Michigan the advantage. There was about four hundred square miles between the two lines. Here was the basis for what Sir Lucius O'Trigger would have termed a 'pretty quarrel.'

Neither Michigan nor Ohio pressed the boundary issue until about fifteen years later when the Wabash Canal from Fort Wayne and the Maumee Canal from Cincinnati were started toward Lake Erie. Both of these canals would naturally utilize the mouth of the Maumee River at Toledo as their port. Meanwhile the disputed territory had been governed by Michigan. The Great Black Swamp, south and east of Toledo, cut it off from Ohio.

A public meeting was held in Toledo in November, 1834, to memorialize the Ohio legislature to claim Toledo.

Governor Lucus of Ohio called the attention of the legislature to the apparent desire of Toledo to become an Ohio community. The legislature created Ohio townships in the district between the Fulton and Harris boundary lines and named three commissioners to return and mark the northerly or Harris Line.

Governor Cass had been made Secretary of War by President Andrew Jackson and Secretary Stevens T. Mason was acting governor when Ohio took action. Mason had the Michigan legislative council pass an act prescribing severe punishment for anyone who attempted to exercise other than Michigan official functions in the disputed zone. He also ordered General Joseph Brown to call out the Michigan militia and assume field operations, stating he was not waiting for instructions from the Secretary of War in Washington.

Warned by the rumbling from Michigan, Governor Lucus of Ohio, accompanied by his military staff and boundary commissioners, reached Perrysburg, below Toledo, on March 31, 1835. He had General John Bell enlist about 600 volunteers from northwestern Ohio. Governor Mason and General Brown arrived in Toledo with between 800 and 1,200 Michigan militia, about the time that the Ohioans gathered in Perrysburg. Sober, responsible citizens of the region were appalled at the imminent risk of the respective 'generals' ordering their embattled farm hands to shoot at each other over a quarrel in which the Federal courts clearly had jurisdiction.

Both Michigan and Ohio historians agree that the Michigan troops, away from home influences, became a drunken crew that terrorized the whole countryside. Men, women and children were constantly being dragged from their homes and flogged regardless of sex and age.

Before hostilities could actually occur between the opposing armies, Richard Rush of Philadelphia and Benjamin Howard of Baltimore, who had traveled day and night, arrived on the scene as commissioners of President Andrew Jackson. Governor Lucas acquiesced in the peaceful overtures of the commissioners, but when they informed Governor Mason that President Jackson, his official chief, forbade the use of force until Congress could pass upon the question, Mason swore that he would resign rather than obey.

Governor Lucas disbanded his troops and named S. Dodge, an Ohio canal engineer, to make the Harris Line survey under the peaceful direction of the Ohio boundary commission. However, Mason spurned the proposals of the commissioners as 'dishonorable and disreputable.' Rush and Howard then returned to Washington in disgust to report to Jackson.

The Ohio survey parties working upon the Harris Line speedily found that Governor Mason and General Brown were determined to prevent the line from being run. Surveyors were assaulted, arrested and jailed without bail. Governor Lucas called the Ohio legislature into special session in June, 1835. The legislature created Lucas County out of the disputed area and directed that court be held in Toledo upon the first Monday in September at any convenient house in the town.

MASON was perfectly furious when he learned what had been done and redoubled his raiding efforts in the border country. Ohio sent three agents, skilled in politics, to Washington to interview President Jackson. Jackson was quick to recognize that since both the Indiana and Illinois boundaries also had the same defects as Ohio's in respect to the Northwest Ordinance, he must either support Ohio or incur the political enmity of three states with thirty-five electoral votes. Jackson would not risk these votes although he was personally sympathetic to Michigan because ex-Governor Cass was his Secretary of War.

Jackson ousted Mason on the ground that his zeal had overcome his prudence, but Mason defied the President and continued to issue General Orders as the Executive of Michigan.

The President let the Ohio delegation know that he would veto any bill admitting Michigan to the Union that failed to specify the boundary desired by Ohio. Mason mobilized 1,200 Michigan militia in and about Toledo in an effort to prevent the Ohio tribunal from functioning. Colonel Vanfleet with a handful of Ohio guardsmen had been detailed to assist the new court.

It was agreed that since no hour for assembling the court was mentioned in the law that one hour was just as good as another. At one a. m., the judges and officials, Colonel Vanfleet and twenty troopers set out for Toledo, which was reached about three a. m. Court was convened at once in a school building that stood 'well out of town.' The court clerk qualified himself and three county commissioners were appointed.

The troops from Detroit returned there, arriving on September 10, and celebrated the anniversary of Perry's Victory upon Lake Erie instead of the one that they did not win over Colonel Vanfleet and the Ohio court.

When Congress assembled, delegates from Mason's government sought the immediate admission of Michigan as a state. With the acquiescence of President Jackson, Congress made Michigan's admission conditional upon acceptance of Ohio's boundary views. Ohio, Indiana and Illinois, all of whose northern boundaries were jeopardized by Michigan's claim, swung Congress to this course.

In 1837, the people of Michigan, anxious for statehood, ignored Mason, as he had Jackson, and held an unofficial convention that accepted the boundary line claimed by Ohio, and obtained admission. Congress gave Michigan all of the Upper Peninsula.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION,
ETC., REQUIRED BY THE
ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, the Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1927, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business manager are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 27th day of September, 1927.

BRIEFLY TOLD

Dried grasshoppers are considered a delicacy in Calcutta, India.

A bread line for cats has been established on Centre Market Place, New York City, where the alley cats are fed milk and beef.

In place of the ceremony of shaking hands some Chinese have the custom of wagging their clinched fists.

Colorow Point, 2,000 feet above Clear Canyon, was the spot selected by the Ute Indians to which went an Indian who had committed any unforgivable crime against the tribal laws, to pay the death penalty by leaping from the cliff.

High and low tides may be predicted two years in advance for any port in the world by a recent calculation invention, consisting of 15,000 parts.

To protect itself from its enemies, the swellfish can fill its body with water or air in balloon fashion.

The natives of the village of Kolungani in South India offer thousands of sheep each year as sacrifices to the goddess Muthumalai Amman. The animals are sacrificed, after a special animal reared by the temple authorities, by those who have any ailment or unsatisfied want; but if an animal sneezes before the deathblow it is considered a sign that the goddess does not want it, and it is spared.

The British and Foreign Bible Society reports that the Bible has been printed in 593 languages.

The daily breakfast of the United States Navy requires sixty-two tons of food.

A Brussels antiquary gave a banquet to his colleagues at which he served bread made from wheat found in one of the pyramids, believed to be three thousand years old, and butter made during the reign of Queen Elizabeth.

The Reverend Andrew Knox, a missionary in Alaska, returning from a trip into the interior, found that his dogs had exhausted their food supply of dried fish and had eaten the walls of his church, which were made of walrus and reindeer hides.

There are nineteen sons of presidents living in the United States: John Coolidge; Charles and Robert Taft; Theodore, Kermit, and Archibald Roosevelt; Richard and Francis Cleveland; Russell Harrison; Chester Arthur; Abram, James, Irwin and Harry Garfield; Ulysses and Jesse Grant; Lyon and David Tyler; and Webb Hayes.

The perfumes of fruit, flowers and leaves of the orange tree are all different.

New shoots of the bamboo grow at the rate of nine inches in twenty-four hours during the rainy season.

The Cleveland police department uses a 'caution car,' an automobile equipped with loud speakers on the roof, to cure persons of jaywalking. Once addressed by a loud voice from an unseen source, 'Don't do that again. Cross the street at regular crossings,' the jaywalker seldom repeats his offense.

The electric chair is not used as a method of capital punishment in any European country.

The sardonic laugh, the forced, artificial, sneering, mocking laugh, derived its name from Sardonia, an island in the Mediterranean on which the ancients claim a plant grew that screwed up the face of a person eating it and made him appear to laugh.

Hipparchus, the Greek astronomer of more than two thousand years ago, cataloged 1,080 stars; fixed latitude and longitude; determined the length of the year, the obliquity of the ecliptic, and the eccentricity of the earth's orbit; measured roughly the distance of the moon from the earth; discovered the precision of the equinoxes. These discoveries waited many centuries for explanation.

A woman's false teeth, lost while she was swimming in Lake Waubesa, Wisconsin, were found some days later by her husband in the stomach of a fish he had caught.

The natural color of skin or fur and the figure of wild animals change when they are kept in captivity.

A watch invented by an English watchmaker is wound by the movement of the wearer's wrist. A special arrangement is supplied to prevent overwinding.

Bluebeard, a big spider in the backyard of a citizen of Macon, Missouri, has been found to be a reliable weather prophet. If he is industrious and active it is a sign of fair weather; if he refuses to work, of rain.

An army order written on a sheet of parchment by Napoleon in 1812, commanding the French military authorities in Moscow to shoot down on the spot all persons found setting fire to the city, was found in the possession of a private book dealer in Russia.

The road followed by the dead to the Elysian fields was pictured on a sarcophagus of the old empire of Egypt now in Berlin.

The building crane derived the name of 'derrick' from that of a 17th Century hangman who made his own gibbets.

Because of the shortage of ready money, eggs are used as currency in Samoria, Russia, 20 fresh eggs being given for a quart of vodka, 12 for a pound of sugar, 3 for a loaf of bread, 2,000 for a suit of clothes and 300 for a pair of shoes.

When a couple on Blasket Island wish to marry during the stormy winter months they signal to the mainland, there being communication only a few months of the year; a priest appears on the mainland, reads his ritual and blesses them and they take their vows without hearing a word the priest says and without his hearing their vows.

To obtain the skins for raccoon coats more than a million raccoons are killed annually.

The Savoy Hotel in London has installed three drinking fountains, copied after the famous Benvenuto Cellini Fountain at Florence, for the dogs of guests.

The military annals of the United States show that beginning with 1860 and ending with the World War of 1917-18 the United States Army has participated in fifty wars.

An English automobile driver is awarded a diploma by the National Safety First Council if he has driven his car one year free from any blameworthy motor accident.

Mount Vernon, the home of George Washington, was named in honor of Admiral Vernon under whom Lawrence Washington, once owner of the estate, had fought in a war against Spain.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses Experience as the goal of life.

* * *

Uncle Sam's postal deficit has caused many sleepless nights among conscientious public servants who believe that the business of the post office should be operated at a profit. Congressman Clyde Kelley believes that the deficit could be wiped away easily if debits, now charged against the post office, were assessed against other funds. One such debit is the franking privilege. (p. 1)

* * *

On the Kobuk River in the Arctic is an Eskimo village, Noorvik, from which all whites except teachers and medical men have been barred. Its residents are contented and thriving. By way of contrast, the village of Napakiagamute, near the mouth of the Yukon, has been created by the natives themselves, two hundred persons living in about twenty dugouts. Yet its residents seem just as happy as those under the government wing in Noorvik. (p. 3)

* * *

'I felt that "Hawthorne's Own House" ought to be written,' said Julian Hawthorne, 'to complete the Concord picture. No one has ever done it, and no one but I could do it. It gives a more intimate picture of Hawthorne. The Wayside was the only home he had ever owned in this world; and if it was not in all ways his ideal, he was happy in it; and that is as much as mortals can expect of mortal habitations.' (p. 4)

* * *

At least two great observers, Macaulay and Hallam, find more to Machiavelli than the Machiavellian idea of statecraft. Was *The Prince* written by the noted Florentine in the form we know today—or has it been tampered with? Why is it so dissimilar to the other works of Machiavelli? (p. 6)

* * *

Down Court is in the Village of Down; it is an old-fashioned house, set well back from the road and distinguished by its white front covered with clusters of ivy. In the far corner of the lawn, carefully railed in, is a little grass mound; it marks the grave of Charles Darwin's favorite dog. (p. 7)

* * *

'Everyone save thee and me is a little queer,' said the Quaker; and of all queer people, he might have added, the Dyaks of Borneo, the Ainu of Japan, and the Negritos of the Philippines are most queer. Dr. William L. Stidger describes his impressions of them. (p. 8)

* * *

The first schoolmaster of old New York was Adam Rolands, who was also sexton, church reader, court bell ringer, and possibly gravedigger. The court records show him defending suits of slander, not paying his bills, and later becoming a jailer. Incidents in the development of the public school in America are related in an interesting vein by Louis C. Karpinski. (p. 9)

* * *

When his feminine patrons protested about their portraits, John Singer Sargent shrugged his shoulders and remarked: 'But one must paint as one sees.' When one of the society matrons complained that he had given her a red nose, the only satisfaction she got was—'But, Madam, you have one.' Sargent's days in Boston afford a new side light on the great painter's character, as revealed by Janet Mabie. (p. 12)

REMARKS BY OUR READERS

Tampa, Florida.

William E. Barton's 'Nancy Hanks, the Mother of Lincoln,' takes me back to my boyhood days when we washed at the bench and ate a 'snack.' The illustrations recall the log rollings and the wood choppings of Cumberland County, Tennessee. Barton could not flavor his articles with this touching human element except for his life in Morgan County and his contact with 'God's people' of the Cumberland plateau.

HARRY G. SABINE.

Mitchell, Nebraska.

I wish to comment on a statement in your good paper, THE DEARBORN INDEPENDENT, issue of September 3. Under the heading 'They Watch Through Eternity' there is an article on our soldiers who died in France. The writer says, 'Row on row they sleep; and so they will remain throughout eternity.'

Will they? Let us examine a few Biblical references. In John v, 28, 29, we read that all who are in the grave shall hear His voice and come forth, some unto life eternal and some unto damnation. In Revelation xx, 13, we find that the sea gave up the dead which were in it, and death and the grave delivered up the dead which were in them. All persons, good or bad, will be resurrected; no one will sleep on throughout eternity, not even our soldier boys in France.

J. G. GOMPERT.

Monteagle, Tennessee.

I enjoyed the very interesting article on 'The Stone of Destiny' in the issue of August 13. The writer says no one knows how the stone got to Egypt or Ireland, but it got there. Much has been written on the 'Stone of Scone' as it is often called. It may interest your readers to know of the legend (which many believe) which says that this stone was carried to Egypt first, and then to Ireland by the Prophet Jeremiah, who had with him Baruch, his secretary, and the granddaughter of his daughter Hamutah, the mother of the King Zedekiah whose eyes were put out by order of the King of Babylon. It is believed that this great granddaughter of the prophet married one of the five Irish Kings, and that through this marriage Queen Victoria became a true descendant of King David. His name, I have read, is at the bottom of her family tree.

A gentleman I knew went to England merely to see the 'Stone of Scone.' *Tea Tephi, A Romance of History*, by Col. A. C. L. Totten, is a beautiful story on this subject.

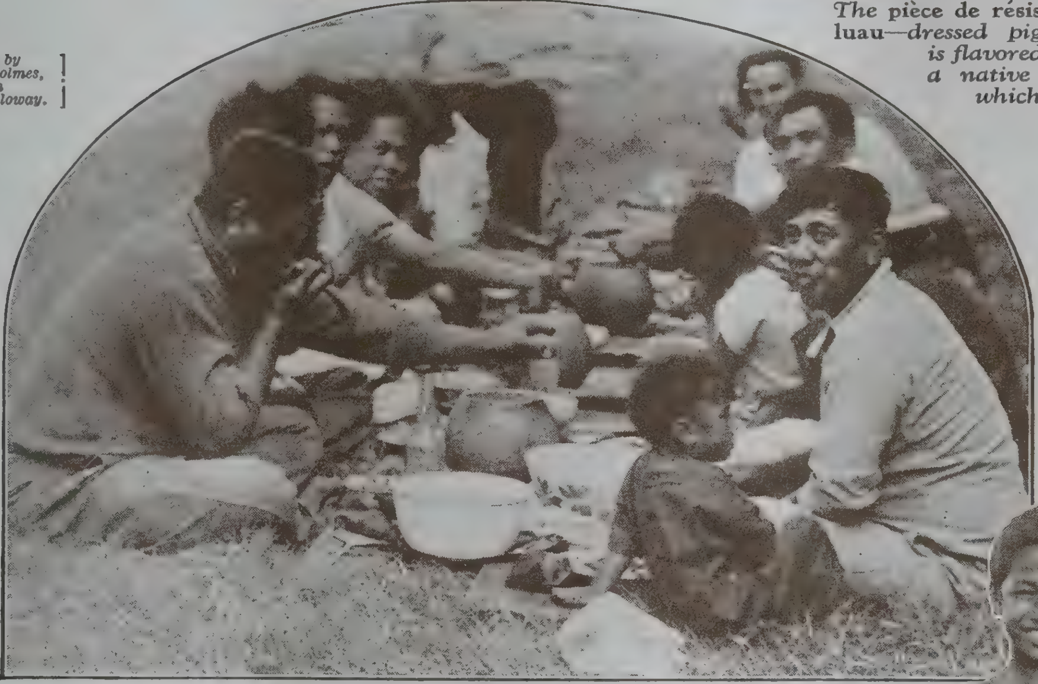
J. RHETT BACOT.

Sitting in *at a* 'LUAU'

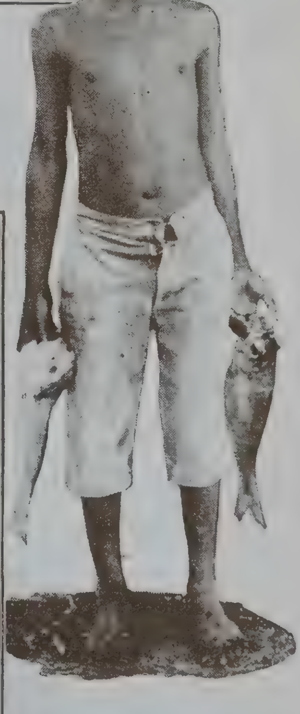
It *Is* Exclusively *an* Hawaiian Feast, *Rarely Open to* 'Outsiders'

The pièce de résistance of the luau—dressed pig. The meat is flavored by ti leaves, a native plant, with which it is roasted.

[*Photos by Burton Holmes, from Ewing Galloway.*]



Every one for himself! The luau, managed in 'picnic fashion,' does not prohibit the 'boarding house reach.' For a setting these Hawaiians have selected a cool place near the beach in the vicinity of Honolulu. The natives consider their ceremonies at the time of a luau almost sacred, so that seldom if ever before have the details been photographed.



Fish, usually mullet, forms an important part of the luau. It is kept in a wrapping of ti leaves while being broiled.

Smell the roasting meat! A piece of corrugated iron, laid over hot rocks, serves as a stove. To hasten the cooking, and to brown the meat, the cooks place hot stones inside the carcasses.

Right—Heating the stones that will be used to cook the feast. In localities where stones are not plentiful the meat is roasted on spits over fires in trenches.

THERE are days which occur in this climate, at almost any season of the year, wherein the world reaches its perfection, when the air, the heavenly bodies, and the earth make a harmony, as if nature would indulge her offspring . . . These halcyons may be looked for with a little more assurance in that pure October weather, which we distinguish by the name of the Indian Summer. The day, immeasurably long, sleeps over the broad hills and warm wide fields . . . The tempered light of the woods is like a perpetual morning, and is stimulating and heroic. The stems of pines, hemlocks, and oaks almost gleam like iron on the excited eye. The incommunicable trees begin to persuade us to live with them, and quit our life of solemn trifles. Here no history, or church, or state, is interpolated on the divine sky and the immortal year.

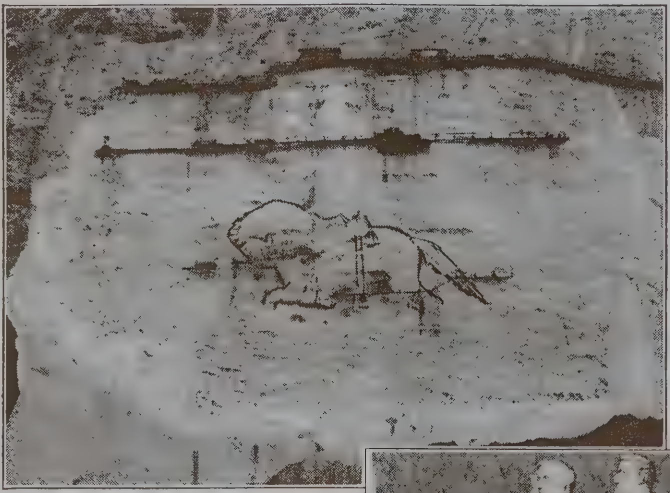
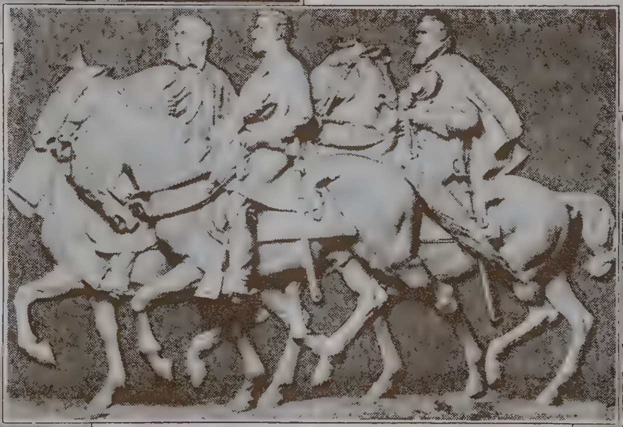
What Hath MAN Wrought?

Confederate Ideals Live *In* Mighty Stone Memorial



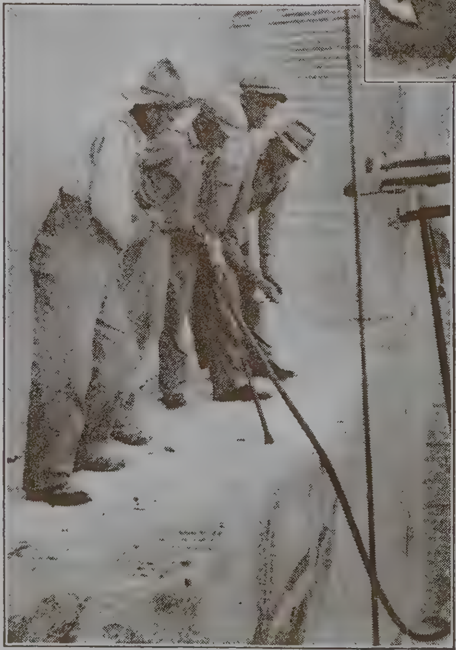
On Stone Mountain, largest solid body of exposed granite in the world, is being carved a practically imperishable monument to perpetuate the inspiration of Robert E. Lee. Here the picture is seen emerging. The specks which are men on the scaffold illustrate the size of the undertaking.

The stupendous mountainside picture is carved by the combined forces of men, machinery and gunpowder. Here the men are planting a charge to knock out a lump of granite under the neck of General Lee's horse. The Great Sphinx could be placed on the neck of General Lee's horse and would not conceal Jefferson Davis' face. So skilled are these men in the use of explosives that they cut the rock with almost as much precision as a grocer would cut a head of cheese.



Augustus Lukeman's master model for equestrian figures of Jefferson Davis, Robert E. Lee and Stonewall Jackson. This monument is not to glorify the ideals of military conquest nor physical beauty, but rather loyalty to principle, devotion to duty and sacrifice of self. That is the ineffable symbol it will kindle in the hearts of youth.

Here are shown the workers fighting hard rock on the sheer face of the granite mountain. They are roughing out the outlines. The memorial will comprise an infantry group, a cavalry group and an artillery group, which together will form a stupendous military panorama sweeping across the precipice a quarter of a mile or more. The size may be conceived when it is noted that General Lee, from the top of his head to the feet of his horse, will be as high as a ten-story office building.



Stone Mountain stands solitary and alone on a plain in Dekalb County, Georgia. Here the men at work on the memorial are 'giving her the gun.' Some of the big jack hammers used in drilling big holes go into the granite fifteen feet. So heavy are they that four husky men are required to handle them when they go into action. The compressed air used to operate the drills is generated at the foot of the mountain and piped up to the work in a five-inch pipe line.

This immense steel trestle runs along the face of Stone Mountain, seventy-five feet above the neck of General Lee's horse. From it working scaffolds are suspended by steel cables. The trestle is five hundred feet above ground and four hundred feet below the summit of the mountain.

Where the THRILL Comes In

By CHARLES J. FINGER

IF YOU are to see the really Wild West—the West of Bret Harte and Captain Mayne Reid and Eugene Manlove Rhodes—you had better 'get busy.' For it is disappearing rapidly. There are some untamed stretches still, very much as they were when 'Wild Bill' Hickok played bad man, and when that romantic rascal, Frank Stevenson, rustled cattle on the Mexican border, and when George A. Custer rode down the valley of the Little Big Horn with his gallant two hundred and twenty.

One of those stretches lies in Wyoming, south of Mount Cloud. Another is the sweep of Nevada country west of Salt Lake and south to the Rulston Desert. A third is the stretch beginning in the Staked Plains, taking in the Sacramento Mountains in New Mexico, crossing the Old Lava Hollow and ending about Bill William's Fork, north of the Cactus Plain in Arizona.

A little beyond that you come to the Grand Canyon, which is stupendously magnificent but approachable as all the world knows. It has become a place where the luxurious may patronize nature. But there's small profit in doing something that every man may do and in seeing something every man may see. To do and see the rare thing, especially when the appetizing sauce of difficulty goes with the doing—that's where the thrill comes in.

Here is a guide to a desert trip; and if you are daring enough to take it, you may see a corner of the world exactly as it was when the Aztecs lived, and when the conquistadors played their high-handed game. When I say *if you are daring enough,* I do not mean that you will face death by murder or starvation, but that you must be prepared to encounter heat and sandstorms and tracts of old lava and cactus lands and grassless wastes, and perhaps some uncomfortable hours of thirst. Yes, I faced all those and more, thirty years ago, when I rode with Pat Garrett and others in the same territory; also when I went into the Mescalero Apache reservation with Australian Billy Smith, pugilist, philosopher and high-hearted companion.

As to the way, first, get to Sierra Blanca, which is a station on the Texas and Pacific Railway where the desert proper begins. Next, head your auto into the Salt Basin between the Guadalupe Mountains and the Findlay Mountains, and travel north until you come to a place where it is so lonely and the silence so profound that you can shut your eyes and believe yourself out in space.

If you get there in the noonday blaze, which would be the best time, you might imagine yourself to be in the Sahara Desert or in the South American Atacama. One place is as much like another as one pin resembles its fellow. It is a world of yellow soil with scanty tufts of wiry grass. It is a world of vast horizons. It is a world where the hot air quivers and shakes. The far-off mountain, violet and purple, stands sharp and clear-edged against the sky, looking as if it had been cut from cardboard, a two-dimensional thing. Nor does it appear to have its roots solidly planted in the earth, but instead, because of the mirage, it seems to rest on a luminous cushion.

The immensity of things begins to dawn upon you. You are in the middle of a dun, illimitable sea under a steel-blue sky—you are a speck in creation, a queer little bundle of whims and passions and obstinacies with a quench-less thirst for wealth and place, a mite saturated with self-love! Perhaps that realization of one's littleness, the coming of that self-searching moment when the inner man asks unanswerable questions and wanders in ever-widening spheres—perhaps that experience is the greatest thing that can come of any journey.

Once, at the place I have in mind, when the air was so still that the smoke of my pipe rolled upward in fairy rings, a 'dust-devil,' as such miniature whirlwinds are called, formed itself. They often rise up, only to fall exhausted and to die almost immediately. But in this case the whirling grew stronger and the sand cloud reached higher and higher, spreading meanwhile at base and top, until it reminded me of some monstrous Arabian genie struggling to be free.

Before I saddled my horse the sky had changed from blue to yellow-green; from the southwest a leaden cloud came up. At a leap came the storm, blinding and terrible; first wind and dust; then dust and rain; then thunderings to shake the earth, and lightnings that darted from horizon to horizon. When the storm ended the land had become a shallow lake from which nothing stood forth except low thorny scrub and twisted cactus. The phenomenon is alarming to one new to the country, but there is no real danger. The passage of a few hours brings things back to the normal.

From the Salt Basin you will do well to turn northwest by west to take a look at the Rio Grande country in the neighborhood of Fort Hancock. To be sure, a more melancholy-looking country would be hard to find, but it is well worth seeing if only to get your perspective right in connection with the boundary river which bears so fine a name. Because, in spite of all the sea chanties about 'Sailing Away for the Rio Grande,' the river is not navigable.

When adventurers belonging to Cortez' army marched north in their search for the mythical Seven Cities of Cebola somewhere in New Mexico, they crossed the Rio Grande without thinking it worth mentioning as a river.

I remember once when I was camping out with a troop of horses not far from Fort Hancock that a man came riding. He was a sorrowful young man, evidently new to the country if one judges by his dress which was too cowboyish for anything outside a motion picture. He was loaded down with grub, water canteen, shotgun, and six-shooter, and he carried besides a pair of field glasses. He asked me the way to Fay, Texas, and I told him, assuring him that he could not miss it if he took the trail to the right where the roads split. In answer he said, very mournfully, 'You don't know what I can do in the way of losing myself in this God-forsaken country!' He made a little map of the place because he could not trust his memory, and presently went on much cheered after eating some of the stew I had made.

I stayed on at the place a couple of days, resting my horses, and was about to take the trail when who should ride up from the very direction from which he had come before but my melancholy man. I asked whether he was riding around because he enjoyed the scenery, whereupon he told me a mournful tale of how he had followed my instructions as he thought, but had evidently taken a cattle trail down to the river bed, and then another trail up the other bank.

So he had crossed into Mexico and had ridden without knowing that he was in a foreign land until he came to the village of Presidio, where he caused mild excitement by trying to buy a United States postage stamp with the use of those contortions and gesticulations which silly people call sign language.

While touring in this neighborhood, you should see the little town of Ysleta, which is one of the oldest in the United States, for it began as a village of Tigua Indians in the year 1680 and has always been more Indian than Spanish. There was a time when it was completely isolated, what with the surrounding desert and the activities of the fierce Apaches and Comanches. Its last adventure was on September 17, 1880, when its

Hiking in the Mountains

By DOROTHY E. PILLEY

THERE are three ways of enjoying the mountains—trail hiking, independent cross-country traveling, and mountain climbing. They shade off into one another, of course. Many mountain ascents begin with trail hiking upon the lower slopes, and often another welcome trail is available to lead the tired climber home again. Cross-country travel, too, in any mountains which deserve the name, will often demand from the hiker a great deal of the climber's special technique, if he is to deal safely with the obstacles he encounters, extricate himself from difficulties, and bring his journey without mishap to its appointed end.

I want to describe all these kinds of journeys, and to bring out, if I can, the differences in charm. The most familiar is what I have called the 'orthodox trail hike.' Its peculiarity is its restfulness to the mind. However long and strenuous, a clearly marked, well-trodden trail, an easy and certain way leading to the desired destination, gives such a day a quality of mental repose which is vastly alluring—perhaps by contrast with days which demand pathfinding on new ground.

Such a day I spent crossing Triple Divide in Glacier National Park. One leaves Cut Bank chalets early, if one is wise. After three miles the trail forks and begins its ascent. As it rises, it lifts the traveler from time to time above the curtain of timber which has all but completely hidden the landscape.

Before long the upper reaches of the valley open out. The lake below seems nearer. Deceptively near, the switchbacks can be discerned crossing and recrossing the white thread of waterfall that rushes out from beneath one snow patch to plunge under another at the head of the valley. And now in the lap of the valley a dim gleam begins to awaken. Under the vertically streaming sunlight another lake can just be discerned. We go up and come to a stream just above the lower snow patch. Now is the hour for one of the leisurely lunches which trail days allow. Little or no uncertainty as to the length of journey remaining can mar one's pleasure, if the map has been duly studied. Up the switchbacks we go to the divide. The last stretch has a charming surprise to offer. We mount the final switchback, cross the stream for the last time, and then suddenly, not more than a long stone's throw away, behold the pass itself.

This is the Continental Divide. The valley from which we have just mounted is that of Atlantic Creek; ahead of us is Hudson Bay Creek. Beyond the peak which juts up truculently on our left is Pacific Creek. Standing thus on the orographical hub of North America, one is tempted to speculate.

Triple Divide Peak is linked with Norris Mountain by a wall of precipices, gaunt, bare, hopeless, utterly forbidding even to the most optimistic climber. They stretch in awesome and terrific grandeur for more than a mile. Our way lies along the crest of the moraine that bounds the snow beds at their base. By stepping onto the snow and paralleling the path, we can lighten the labor of the descent. To the properly shod person, few things are more delightful than running down firm and moderately inclined snow—the motion half a slide and half a walk.

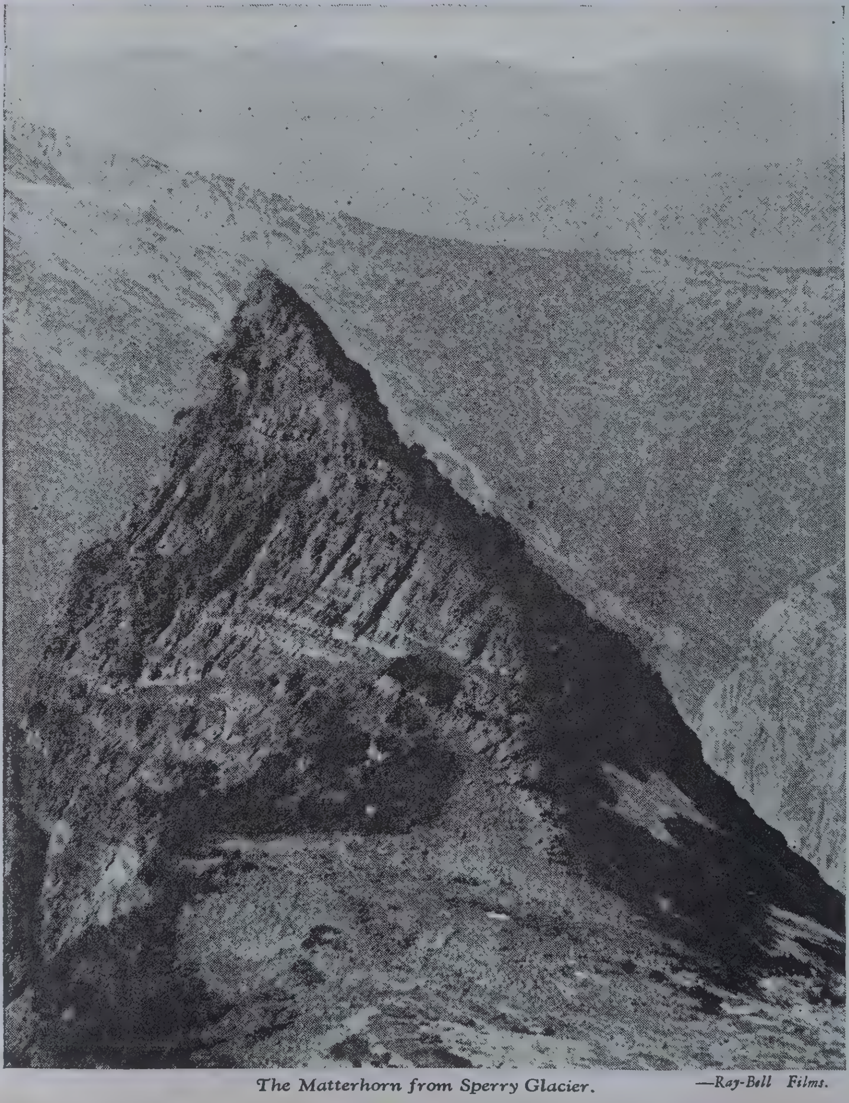
Below, the trail winds in generous loops over grasslands threaded with murmuring rivulets, and then through underbrush. With a final twist it curves under a rock wall, where thunders a sudden and direct plunge of waters.

Soon we are below the timber line again, the upper reaches have become a memory, our thoughts are set upon arrival. The trail turns and turns in the woodlands, dropping steadily; at length a glimmer of light breaks through the trees ahead; we come suddenly to the head of Red Eagle Lake and over against us on a bluff at its foot are the gay green tents of the camp.

STEFANSSON'S saying that everything which has to be added to the explorer's heroism has to be subtracted from his intelligence applies even to a simple holiday hike such as I shall next describe.

The Hidden Lake country, also in Glacier National Park, lies between two well-traveled trails: Gunsight Pass to the south, and Logan Pass to the north. From Sperry chalets, perched like an eagle's nest on cliffs overlooking the McDonald and Flathead country, a good trail leads up to Sperry Glacier. The passage of this ice field is the first stage of our journey.

The root of glacier difficulties lies in the fact that these ice sheets move. Ice flows like very stiff tar and splits open into large fissures which may be anything from an eighth of an inch to eighty feet wide and a few feet to a mile long; they are commonly as deep as the ice. On a high glacier the depth may exceed a hundred feet. Every winter a layer of snow falls on the glacier which covers over these fissures ('crevasses' as they are called) masking them completely. As summer advances, this cloak of snow wears through. The crevasses widen with the movement of the glacier and it becomes quite easy to step unawares through the thin surface sheet. It gives way with the suddenness of a trap door, precipitating the traveler into an abyss of darkness. Sometimes in hot summers all the snow vanishes, whereupon the real structure of the ice glacier is revealed. When this happens it is easy to avoid the crevasses.



The Matterhorn from Sperry Glacier. —*Ray-Bell Films.*

The invisible crevasses under the snow are the dangerous ones. They compel the climber to tie himself to his companions with a rope and to carry an ice axe with which to probe the surface snow in all doubtful places. But the rope is an added danger unless it is properly handled. Cases have been known in which its only effect was to jerk companions and all into the crevasse.

On Sperry Glacier, when we traversed it, the crevasses were apparent. Deep noble clefts some of them were, their walls passing from white to sky-blue and blue-black darkness, according to the depth. At the foot a little pale-green lake nestled amid the moraines, and far beneath, the jade waters of Avalanche Lake seemed to sleep.

The next stage of our route lay plain before us. A spur from the divide held up a green wall rising to an inviting saddle. Behind the spur must lie Hidden Lake. This side offered no difficulty; but what was the other side like? We might find, for all the map told, precipices steep enough to cut us off completely.

We went up to the saddle in a lively mood. The green slope, though steep, was a walk, not a climb. At the top came a little stone-strewn plateau which we crossed; then at the edge of a snow slope which tilted downward, we halted. Miles of our route lay suddenly all before us and we could sit down and enjoy the prospect.

Such moments have a peculiar dramatic thrill. The slight glimpses we had been able to gain from other summits of this south slope of the Hidden Lake valley had prepared us for trouble. We had surmised the existence of cliffs which would take much time in the descent, but now in the space of half a second came the realization that we were mistaken.

No difficulty of any kind separated us from Hidden Lake. We could see our route practically all the way to Logan Pass itself. The rest of our journey could, if we wished, be an affair of loitering. It may perhaps help to explain this sudden relaxation of tension if I add that two attempts to visit Hidden Lake in just this way had both resulted in fatalities. The fatalities might have had no bearing upon the nature of the country; yet this information had undoubtedly added a sinister flavor to our expectations. And instead of finding a rock-walled pit, we were looking down into a veritable paradise. A short slope of snow, a few yards of pleasant boulders, and then the grass began. The whole west and north sides of Hidden Lake are open park, the green expanses nicely broken by low bands of rock and dotted by dark clumps of trees.

We wandered happily down the grassy glades and along the shore, noting the activities of bears whose special sanctuary this almost unvisited valley must be. Acres of turf had been torn up by them in quest of roots. So fresh were some of these excavations that we almost expected, as we rounded each corner, to come across a silvertip clawing and grubbing

(*Continued on page 24*)

OLD-AGE COMPETENCY

By C. P. VARY

MAKING provision for the latter years of life, like many other things which people know they *should* do, is, more often than not, either left undone or undertaken so late in life that the task is a hardship. Actuarians for insurance companies have presented this graphically under the heading: *The Fate of 56.* They dolefully predict the expectancy of 100 men, aged 25 years, to be after 40 years, or at the age of 65, as follows: 1 rich, 3 well-to-do, 8 comfortable and self-sufficient, 32 dead, and 56 wholly or in part dependent upon others for their support.

Such a large percentage requires innumerable young people, willingly and otherwise, to share their homes, even their lives, with dependent elders. This sharing may be just, it may be equitable, it may be logical, but it is seldom pleasant for either young or old. Such a relationship, whether it is entered into in a spirit of love and affection or for purely economic reasons (the latter is often the case) too often degenerates into a sullen tolerance through frequent bickerings and real or imagined interference of one generation with the other. This condition is too general to require exposition. It probably would not occur at all if it were not economically necessary.

The distressing aspects of dependent old age are continually before us; economists and sociologists volley and thunder; yet the fifty-six go marching on to their fate. People know that they ought to save; they continually plan to save; they perpetually fail to save.

Can they be made to save? Probably not. Can they be interested to the point whereby at least some of the fifty-six may be brought to save? Unquestionably. It is being done, and being done in no little degree.

Let it be said flatly that gratuitous pensions for the old have little if any effect in interesting people to acquire old-age competency. The prospect of a pension probably weakens the determination to save as much as any single thing in our present economic scheme. If ever the shadow of a thing is mistaken for the thing itself, it is the consideration of an unaugmented old-age pension in the light of a *competency.*

To be sure pensions usually keep their recipients from becoming public charges. The donors frankly limit them so that they will do no more. If they did less, nothing could be said in their favor.

Administrators of pension funds generally admit that the prospect of a pension does not reduce labor turnover; does not discourage the organization of labor; does not mitigate the likelihood of strikes; does not suffice as a disciplinary instrument; does not greatly increase employe loyalty. Nearly all pension administrators agree that there is absolutely no moral obligation to an employer to provide an old-age competency for any employe. If the latter is too shortsighted or improvident to provide it for himself he cannot morally expect any shelter for his, and his wife's, declining years other than the almshouse. 'Then why pay any?' one asks. The answer is surprising. 'We have to, on account of public opinion.'

It would seem that if there exists neither legal nor moral responsibility to pay pensions, public opinion would not suffice to exact such a toll from industry. The payment of industrial pensions has not resulted from any close study of the question. This is confirmed not only by the obvious lack of benefits, but by the ill-considered manner in which most pension systems have been undertaken. Proprietors of the six or seven hundred recorded pension systems in operation in the United States apparently agree on one thing with respect to pensions. If they had the question to settle again their systems would be radically different.

How blindly these pension systems were instituted is further illustrated by the fact that scarcely any of the companies now paying pensions in the United States have funded one cent of their accrued pension liability. One such company—and not the largest either—would require $42,500,000 to fund its pension liability. Another, which employs about one-fifth as many men as the former, would require nearly $11,000,000.

THIS accrued liability is not difficult to compute or foresee. It is merely necessary to know the age and employment date of each employe. Then, by applying the rules of a pension system, the accrued liability is immediately determined for each employe. No more ability is required than that necessary to use a compound interest table.

If a pension director is asked outright what, if any, pensions return to the company which pays them, a long and involved answer is sure to result. Through it runs one slim thread of opinion, to-wit, pensions increase efficiency by permitting production to flow at a speed and promotions to take place with a frequency compatible with the endurance and ambition of youth.

The director of one of the largest industrial funds in existence, after expressing this opinion, was asked why he did not replace the forty-five clerks in his department with five or six posting machines and operators that not only would do the work of the forty-five but would require only about one-seventh the floor space. He admitted that the equipment would do the work and pay for itself within a year, but said he could not authorize it because most of the people in his department were incapable of any other work and, if replaced by machines, would be out of a job!

EVERY active, normal individual knows that the surest proof against minor ailments, mental and physical, is *work.* It matters not in what field a person's interests lie, be it the erection of skyscrapers or the painting of china, let him rise at his wonted hour of the morning, proceed to his place of business, and engage in his task; the neuralgia or indigestion which threatened on his arising will then either disappear or become endurable.

In the same manner but to a vastly greater degree, this panacea, *work,* operates to delay the encroachment of old age. Remove it from a young man and he becomes prematurely old; remove it from an old man and he becomes senile.

Most pension systems require an employe's retirement on or before his seventieth birthday. A comparatively large percentage of retired men are able and usually desirous of continuing some form of work suited to their abilities. Once he is retired, it is well-nigh impossible for a septuagenarian to obtain work of any kind. To be sure he has his pension which will probably average forty dollars a month. In this day of concentrated population and high cost of living, the average industrial pension about covers the cost of space occupied and food consumed by the pensioner. His pension is in no sense a part of his estate. Should his wife survive him, the pension, in industrial cases at least, will not contribute to her care or comfort after his death.

From the close scrutiny to which present-day pension systems are being subjected it would appear that industry is slowly awakening to their inadequacy. Other means of providing old-age competencies—means which allow employes free choice in the matters of where, how, and with whom they wish to spend their declining years—are being put into practice by some of the larger industrial concerns. One such plan is in operation in the Ford Motor Company. It permits employes to continue working as long as they choose or are able; and their competencies can be included in their estates.

The plan is basically simple. It centers around an investment fund in nowise connected with the stocks or bonds of the company. This fund yields an interest rate sufficient to encourage saving and discourage speculation. The policy of the company allows continued employment, with adequate wages at tasks suited to the declining endurance of employes up to the point where they no longer desire to work.

The plan is taken advantage of by twenty to twenty-five per cent of the company's employes. The men have between twenty and twenty-five million dollars of savings on deposit.

Participation in the company fund is subject to very few rules, each one of which is calculated to further the end of the plan, which is—*thrift.*

First, no obligation, either expressed or implied, is placed upon employes to invest. Any amount of periodic saving may become a burden if compulsory. The most efficient saver is the one who saves voluntarily and consistently. The employe who may be induced to save systematically by any means other than coercion, irrespective of the amount with which he starts, is almost sure to become thrifty and self-reliant. The means used to attract employes' savings to such a fund are, simply, relatively high rates of interest and entire security of the principal.

ASIDE from self-indulgence, the greatest deterrents to saving are the constant speculative promises of high returns held out to small investors. It is axiomatic that the more slowly money is saved, the greater is the owner's temptation to invest it in enterprises promising a greater return than is consistent with safety. Unscrupulous real estate and stock investment companies take heavy toll of wage savings.

The ambition of a great number of wage earners to go into business for themselves is another consumer of savings. Annual surveys of business failures indicate that between seventy-five and eighty-five per cent of them occur for reasons *within* the control of the principals, or for reasons which they should have foreseen. Savings of wage earners figure heavily in these failures.

Although the stipulated rate of interest of the Ford investment certificates is only 6 per cent, the actual return has been 16 per cent, paid semiannually, for a number of years. Interest at the rate of 10 per cent per annum was paid for the first half of 1927.

Not more than one-fourth the wages of an employe may be invested at one time and that investment must be made on pay day, or during the two days following. Thus, an employe may not borrow any large sum of money at lower rates and invest it in the fund, nor may he return money to the fund faster than at this specified rate if he takes any part of his savings for use. He may withdraw any part, or all, of his account as he wishes, but experience has shown that employes will do this only under greatest exigencies.

INTEREST does not compound and must be received in cash by a depositor upon the stated date of payment. He may only reinvest his interest, however, up to one-fourth his wages and this on the regular pay days. This regulation serves a double purpose. It gives the investor tangible proof of the advantages of saving by allowing him to taste the fruits of his thrift and it keeps the fund from pyramiding.

Of equal importance to the so-called superannuated employe with the forming of the habit of thrift and its resultant savings is the stimulation and inspiration of continued occupation at normal and adequate wages.

In the Highland Park plant of the Ford Motor Company there are ninety-one men, aged from seventy to eighty-eight years. Under the industrial pension system, these men would have been retired from one to eighteen years ago. They are earning an average daily wage of $7.13 for eight hours' work. Of the entire group, only three receive the so-called minimum wage of $6 for eight hours. Interviews with these employes, whose stated age is over seventy years, make it evident that the thing which they look forward to with the greatest dread is not death, but the inability to continue their daily work.

They do their work, which consists for the most part of the manufacture and assembly of the lighter portions of the company's product, in clean, well-ventilated departments.

It is safe to say that these employes bring to their appointed task a pride of accomplishment and a determination to give a satisfactory account of each hour worked not surpassed by many of the younger employes. Many of them could retire and live in idleness on their savings, but they will have none of it. Though youth is no longer theirs, by virtue of their work they still retain many of the attributes of youth, the joy of accomplishment, the inspiration of daily association with their fellows; the pride and self-respect which go hand in hand with self-support; a living which is something more than mere existing.

Shrineshire—In Old England

By T. CAMERON TAYLOR

SHRINESHIRE, England, is a composite of several shires. The central point is the city of Northampton, county town in the country of the famous Pytchley Hunt. Shrineshire is that area which will be included in a twenty-five-mile circle.

A day around Northampton can be a full day indeed! Through a lovely land one reaches, easily within an hour, giving due appreciation to things worth seeing, a quiet little village named Long Buckby. There is not much to distinguish it from the run of English villages; but look at it slowly, picture it in an earlier and even quieter time, and remember that from that village came the mother of Longfellow.

The villages are important in Shrineshire! If you are motoring, with Northampton as your center, you can reach Little Brington in half an hour if you wish to travel at twenty miles an hour, even, through such scenery. There's a wonderful old church at Brington. The Washingtons attended it in post-Sulgrave years, and on a tombstone there you will see the Stars and Stripes of the family which gave to America its first President.

Another easy half-hour's run; another village. Flore, this is. There is a cottage here which made history. You have no difficulty in locating it. It is 'Adams Cottage.' The roof is deep-thatched; the windows are of the tiny, lead-trim panes. In this Cottage was held the first meeting of Friends, and the founder of the meeting had a son who, emigrating to America in 1635, was great-grandfather of our second President.

From Flore the run to Ecton is short—a matter of a few minutes only. Just a village pretty much like the others, but renowned, no less! Here in his hearty day flourished Thomas Franklin, blacksmith, skilled in the founding of bells, but bound by no precise margins as to calling, and conscious of ability but not of restrictions. We know he became skilled in the law; that his common sense and courage made him a power in his neighborhood; that in general he accounts, almost fully, for his amazing grandson, our own Benjamin Franklin.

Have I indicated sufficient to justify the title? You have not completed the circle yet. Only a matter of a two hours' run has been accomplished, only a small sector of Shrineshire covered. But that is America's sector of this wonderful area whence Shakespeare, Bunyan and Cowper likewise sprang.

The VOYAGE of the VICTORIA

By CHARLES J. FINGER

SYNOPSIS

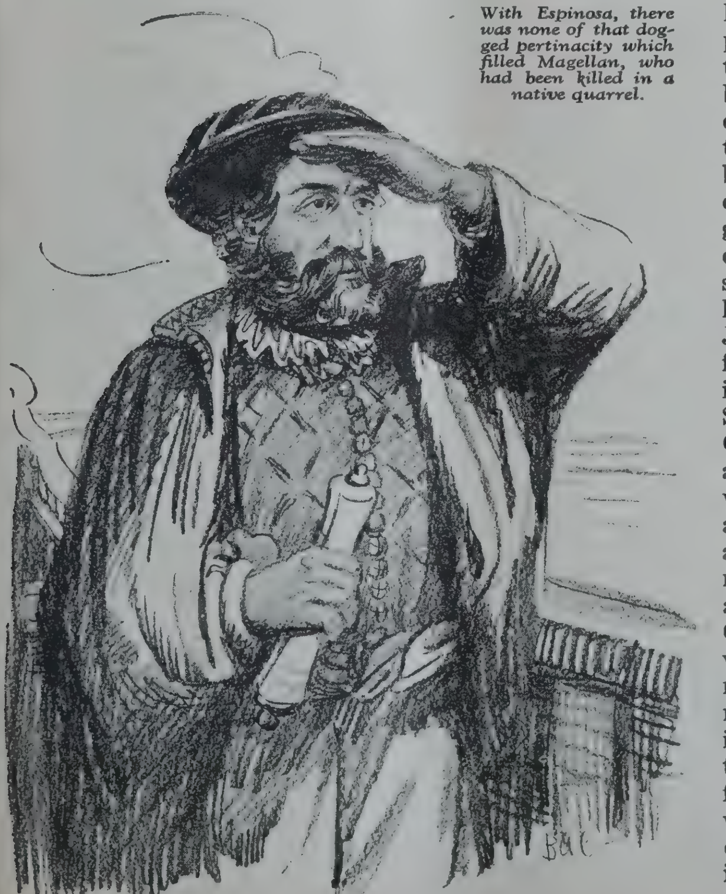
After the *Victoria* had completed her voyage round the world, and Magellan's name had been inscribed in history, one sequel remained to be told, the adventures of the sister ship *Trinidad*. Of Espinosa and his fifty-four men, only three finished the journey.

The END *of the* TRINIDAD

LONG months after all the excitement was over, and when the wonder of the first voyage around the world had lost its sharpness to fall into place as a familiar thing, there came a thin ghost of the first enthusiasm when three men whose very existence was hardly suspected found their way into Spain. They were Espinosa, who had stabbed Mendoza in the San Julian mutiny, and two sailors named Ginez de Marfra and Juan Rodriguez. The story they had to tell was one of dreary toil and hardship. It was the tale of the last voyage of the *Trinidad* and the fate of her crew.

After the *Victoria* left the island of Timor, Espinosa and his fifty-four men had their hands full with the crippled *Trinidad*, but while repairs were being made, Espinosa, following the example of Magellan, became involved in local politics. The Giolo chief, pursuing his peculiar statecraft, had incurred the enmity of some neighboring tribes and now sought the help of the Spaniards to overcome them. Espinosa sent out a little detachment of men, and Giolo's enemies were easily subdued. It was only a tribal disagreement after all. But in return for the loan of soldiers, the native chief had given Espinosa a gang of laborers, and the men worked so well that when the little campaign was ended, the ship was ready for launching.

As there was much to dispose of, because of the surplus stock left by the *Victoria* in addition to the cargo which the *Trinidad* in her weakened condition could not take, Espinosa decided to build a trading station with the surplus as stock, leaving a few men in charge, with the idea of sending out a merchant ship to clean things up when he reached Spain. So the trading station was built and stocked and fortified while the *Trinidad* was being prepared for sea. Then came the choosing of five men to run the station. To have taken charge of such an adventure would have delighted the soul of Master Carvalho; and, indeed, he asked for the post, but he was then on his deathbed and his days of rough combativeness were numbered. But Luis de Molino was glad enough to accept the stewardship, remembering his part in the St. Julian mutiny and fearing the result if he landed in Spain. Juan de Campos who had a taste for trade was made clerk and treasurer, and a couple of sailors named Diego Arias and Alonzo de Cota, together with a gunner named Pedro, announced their willingness to stay on the island, having found life as lived with the natives of this Malaysian island much to their tastes.



With Espinosa, there was none of that dogged pertinacity which filled Magellan, who had been killed in a native quarrel.

That left a crew of fifty-four to work the *Trinidad* across the Pacific to Panama with approximately fifty tons of spices, cinnamon, cloves and valuable woods. So on April 6, 1522, the *Trinidad* lifted anchor, eastward bound. But she carried the elements of failure with her, for her captain was a hard-headed ignoramus who could not write his own name, who knew nothing of seamanship, who lacked character and was all uncertainty. The check to disaster was Juan Bautista Poncero, a skilled pilot who had been friendly with Sebastian del Cano. Doubtless the erratic course of the *Trinidad* is to be accounted for by clashes of opinion, Espinosa's notions colliding with Poncero's knowledge.

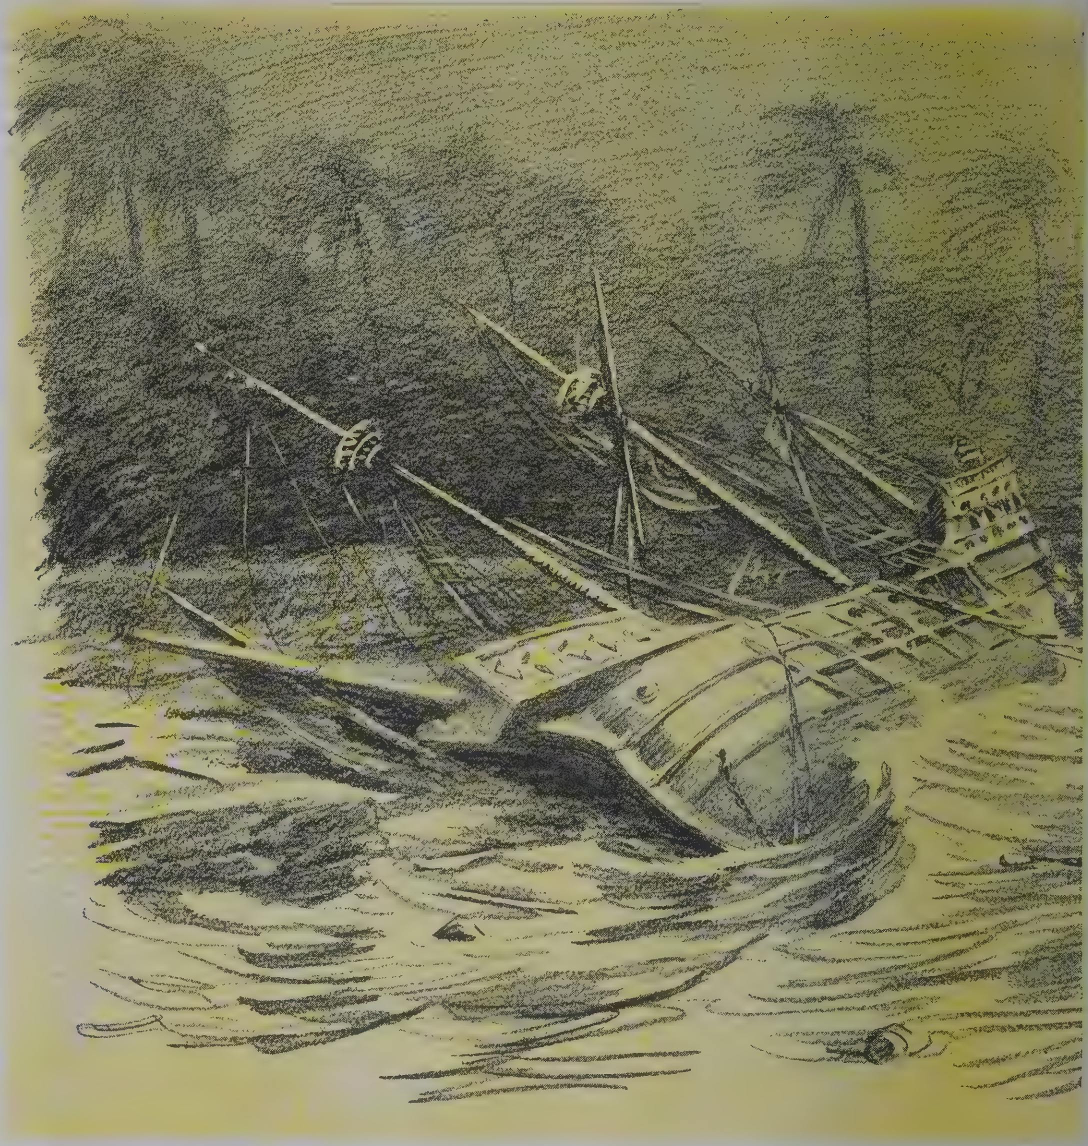
Their course from Timor took them north, past the western coast of Gilolo, through the channel between Morti and Rau, thence to the north of Morti Island. There they stayed for nine days, laying in fresh provisions, taking on water and gathering fruits; they then left on either the twentieth or the twenty-first. There was no Albo to keep record. Open sea having been gained, the course was set at east-quarter-north, but, in consequence of strong head winds, it was presently changed to north-northeast, until two islands were sighted, which they named St. Anthony. They may have been what are now known as Warwick Island and Warren Hastings Island. Touching the most northerly of the Ladrone Islands they impressed a native as deck hand, and then most unaccountably struck a course northeast until they gained 43 degrees north latitude.

AS MAY be seen by reference to a map of the Pacific Ocean, they were then headed in a general direction which, if followed, would have made them the discoverers of southern Alaska. There seems to be no way to account for the course except on the supposition of clashes between Espinosa and Poncero. Still, with all the erratic movements, had they set their course right even then they could have made Panama with little more sailing distance than what was necessary in returning to their starting point. For return they presently did.

With Espinosa, there was none of that dogged pertinacity which filled Magellan. Poncero was well able to calculate distances; so every man could have known how far they were from Panama or from Mexico, where, as they knew, there were Spanish settlements. But Espinosa weakened where Magellan's obstinacy would have carried him through. He did not know his own mind. He lacked determination.

So, halfway between starting point and destination, Espinosa gave the word to return to Timor, and the *Trinidad* was put about. Certainly their plight was serious enough. They were reduced to rice as fare, and they were afflicted with scurvy; so, without proper vitality, rough weather that might have been met with determination brought immense difficulties. Then a gale took away their mainmast and part of the poop—and so they gave up in despair.

The first land touched on the return trip was the island of Saipan, where the stolen native deserted, taking with him three sailors. Four years later, in August, 1526, one of the three was found by Captain Salazar. He was Gonzalo de Vigo, originally a ‘glass’ boy* on board the *Concepcion*. His companions had died. He was a youth given to observation, for he told his rescuers a great deal about the islands, stating correctly the number of them, their products, and the ways and customs of the inhabitants. He had learned the language of the natives and went with Captain Salazar, acting as interpreter.



The lightened ship capsized and was driven ashore to sail no more.

When the *Trinidad* touched the Island of Dui, it seemed impossible to continue the journey. Of the crew thirty-two had died from sickness and there were left only nineteen, none of them in health. Nor was there semblance of authority or of discipline. Men had no confidence in their leader and he had no confidence in himself. It was a ship in which men neither dreamed nor hoped, a ship of despair.

As they lay at anchor, information came from natives in the lurid light of which Espinosa saw nothing but trouble. For there were serious complications and intricacies. It was learned that soon after the *Trinidad* had left, eastward bound, seven Portuguese ships had sailed into Ternate under the command of Simon de Brito, a hard-fisted adventurer given to tyranny and baseness, one who was not long after beheaded by his own people for his misdoings.

De Brito got on the trail of Espinosa at the island of Banda where his fleet had anchored to trade. There they saw a white man, a Spaniard, who turned out to be one of those left by Espinosa in charge of the trading station in Timor. He was seized. A little questioning revealed all, and swift action followed. De Brito of the mailed fist and the wolf's heart was direct and emphatic. He was in authority, and by the papal bull all this was Portuguese territory, and Portuguese influence would permit no rivalry. Nor would free lances or buccaneers be tolerated. So at once he set sail for Timor and seized the trading station and its contents; and then, by way of bumping all natives into economic righteousness, he laid the hand of authority on the island ruler, calling upon him to explain his relations with Spaniards when the whole world knew and agreed that Portuguese influence was dominant. The honor and repute of Portugal, he declared, deserved greater consideration. There was an effect of stiffness and angularity about him that the chief found irresistible.

The immediate result was that the flag of Portugal was hoisted, and the native monarch acknowledged his new master. As for those who had been left in charge of the trading station, one had died, Luis de Molino had taken to the jungle, and the gunner, a seaman, and also Juan de Campos, the luckless adventurer who was found at Banda, were put in irons.

Learning all that and dismayed at the complexity of things, Espinosa did not know which way to turn. There seemed no course open but an appeal to the enemy. Calling Bartolomew Sanchez, a kind of ship's clerk, he sent him with instructions and a letter to De Brito, recounting something of the plight of the *Trinidad*, and asking for help and leniency. But De Brito had quite another part to play in the drama and made no reply, keeping Sanchez as prisoner or hostage. On reflection Espinosa decided to surrender, and took the *Trinidad* a few miles, hugging the coast. De Brito checkmated his move by sending a ship toward the

---

* A kind of timekeeper, the term ‘glass’ meaning hourglass. The boy kept count of the turns of the glass as the sand ran out, and then at stated hours struck the bell, calling: ‘One hour passed in two turns, and more will pass if God will. Let us pray to God to grant us a good voyage, and to her, the Mother of God, who is our advocate to deliver us from pumping out water, and other troubles. Forward ahoy!’ In answer to that, the watch on the forecastle shouted, ‘What says He?’ and ordered the boy to recite a Lord's Prayer and an Ave Maria. The quaint custom seems to have been followed by all the early Spanish navigators.

Trinidad, and so it came about that at Benacora the *Trinidad* sighted a caravel sailing briskly, on board of which were Portuguese officers and armed men. It was capture and not surrender, and matters had passed entirely out of Espinosa's hands.

The caravel took possession, the Spaniards being too disheartened to stiffen their backs, and the *Trinidad* was worked to Ternate, where the unloading of her confiscated cargo commenced. But before the cargo was transferred to shore a squall broke, and the lightened ship capsized and was driven ashore to sail no more. Instead of an innocent-looking surrender, De Brito had to his credit a dashing operation without the loss of a single man, the capture of a ship, the impounding of her cargo, the destruction of a trading and semimilitary base and twenty-three prisoners, for the runaway Molino gave himself up.

But the Spaniards had to be further discredited in the eyes of the natives. They had to be taught that Portugal, not Spain, stood on star-crowned heights. They had to learn that the credentials of De Brito and not Espinosa were valid. To that end Espinosa and his men were set to work to build a fort with the timbers of the old *Trinidad*, man and master toiling side by side, Espinosa laboring shoulder to shoulder with his slave, Anton Moreno. Prestige was shattered beyond repair. Social considerations were swept away. Quite ruthlessly De Brito flattened things out. And that he acted harshly with deliberation is very clear not only from the treatment accorded his prisoners but from a letter he wrote to his king, which read in part:

> 'So far as concernes the master clerk and pilot, I am writing that it would be more to your Highnesses service to order their heads to be struck off than to send them to India. I kept them in the Moluccas, because it is a most unhealthy country, in order that they might die there, not liking their heads to be cut off, since I did not know whether your Highness would be pleased or not . . .'

De Brito was a man very direct, very emphatic. For him, men at his command were no more than animated puppets.

The little band of miserable prisoners was shipped west toward the end of February, 1523—twenty-one of them, for De Brito kept two who were carpenters. And from that time it seemed as though the Spaniards were sports of a malignant fate determined that they should know nothing but their own sorrow. It was as if an evil spell had coiled fatally around them. Four were drowned on the voyage to Banda, the junk that carried them being lost in a storm. The remaining seventeen were held in Banda for four months before they were delivered to Albuquerque at Malacca. There they were in prison for five months; four died in chains, the luckiest being Moreno, Espinosa's slave, who was confiscated by Albuquerque's sister. The twelve who were left were shipped in two batches in separate ships bound for Cochim. Only one ship showed up at that port and it bore nine prisoners; the other three, Luis de Molino who executed his own master, Bartholomew Sanchez and Alonzo de Cota, had been drowned. For the nine there was sad disappointment, for at Cochim it was found that the ship designated to take them to Europe had sailed, so that their hopes for an early end to all that specialized and cruel treatment swiftly vanished.

But two, the pilot Poncero and a Genoese sailor named Leon Pancaldo, still had something of courage in their hearts. For the *Santa Catalina*, a trading ship bound for Portugal, being in the roads, both men broke away at night, swam to the ship and stowed themselves away, neither knowing of the action of the other until they were discovered when the ship was at sea. As they were expert seamen their way was easier for a time; they were put to work until the ship reached Mozambique when they were handed over to the authorities to be returned to Cochim. But Poncero found the relief of death and Pancaldo stowed away on another ship bound for Portugal. Reaching Lisbon he was put in prison, but when his story reached royal ears, he received his pardon and was permitted to leave for Genoa, his own town.

Of the seven left at Cochim, three died in captivity, and at last, a more compassionate viceroy ruling, the four were shipped to Europe. They were Espinosa, Ginez de Marfra, Juan Rodriguez the deaf, and Ance or Hans, the German gunner. No sooner had they reached Portugal in the year 1525, than they were transferred from chains on board ship to a prison cell ashore, and there Hans died.

For seven months Espinosa, Mafra and Rodriguez lay in prison before there was investigation. Then Espinosa and Rodriguez were released. But Mafra was detained longer, being under suspicion of peculiar knowledge of the strait and the way to the Spice Islands. That was because certain charts had been found in his poor belongings. Satisfying the authorities at last that the documents did not belong to him, he was given his liberty.

But Espinosa's cup was not full with his release from prison. In due time he presented himself before the India House and asked for his pay, but was informed that he had been cut off from the payroll at the time of his capture by De Brito on the ground that he was no longer in the service of Spain.

Magellan had been killed in Mactan, in a native quarrel with which he had nothing at all to do. Sebastian del Cano, chosen commander by the crew, completed the first voyage around the globe, and received a pension of 500 gold ducats. Since no provision was made for its payment, Del Cano got nothing but honor.

And now Espinosa, finally reaching home after harrowing adventures, found that he had been off the payroll for some time, and not even honor awaited.

On Choosing One's Career

THERE is something almost pathetic in the wistfulness and the demanding eagerness with which young people challenge us to give a word of counsel, a word of advice which shall solve the problem of their careers.

Whether the young man and the young woman really believe that anyone can solve the problem for them is a question. Perhaps somewhere in the background of the mind there is a sense that the best any friend can do is just to let it be brought out and turned around in discussion. But what every mature person knows is this—none of us knows enough of all the elements involved to give sure counsel in personal matters.

The report of experience and observation is this: oftener the career chooses the person than the person chooses the career. To one who makes himself, there are a thousand who are made by circumstances they did not foresee. 'There is a destiny that shapes our ends.'

This does not mean, of course, that we are the sports of fate. It may mean that, deeper than our intellectual conception of what we should like to be, there is a spiritual direction toward what we were meant to be, and in this sense what we were meant to be is usually just what we are; we would not be anything else.

The whole question is suggested by two persons who were recently seen. One has come late to his career. For nearly a quarter of a century he has kept himself ready to use his opportunity when it came, and for a quarter of a century it seemed to him that his opportunity would never come; there were months when it almost seemed that the quest would end in heartbreak. The glow had gone, the vision had vanished, nothing remained but sheer grit—then the opportunity came, and the man was ready to embrace it. Of course, it had nothing of the halo about it—for him—that it might have had twenty years before. To the world of onlookers there is a great thrill in the story, but not for him; he knows by what painful steps he toiled up to it, he remembers how often he was on the verge of letting go, how often indeed he did let go but was carried on by the sheer momentum of his effort. It all makes for modesty and sincerity in him, but it is very different from what the onlookers conceive it to be. Behind the scenes, success is a very plain experience.

> *EXPERIENCE is the harvest of life, and every harvest is the result of a sowing. The experience which young people most crave is that of success in some service for which they are naturally fitted. And they wish it at once—immediately. Youth wishes to touch a magic button and command success without apprenticeship. But nothing ripens that is not first planted, and the very desires, the impatience, the dreams, the ambitions of youth, are by way of a planting which shall come to fruition—sometimes after these desires are abandoned and forgotten. For the sown seed goes on growing whether we remember it or not. The wisdom of life is to keep on planting.*

The other person is young, high-spirited, brilliant with the new ideas and the modern vision, restive and impatient, believing that there must be some secret spring which if discovered and touched would, presto! bring about the desired success in service. Not at some future time, but now—bring it to pass next week!

It is rather difficult to say to such a person (probably it is unnecessary even to try to give youth a glimpse of middle-age experience) that all this straining at the tether, all this brilliant impatience, all this generation of high effort, is not solid performance at all, but practice, training. The efforts seem so real, so final—to describe them as only the prancing of the impatient mind and not genuine progress sounds cruel in the ears of the one most interested.

In the deep unwritten wisdom of life there are many things to be learned that cannot be taught. We never know them by hearing them spoken, but we grow into them by experience, and recognize them through understanding. Understanding is a great experience in itself, but it does not come through instruction.

And one of the matters which we understand and which may perhaps be reduced to words in such a form as to help those who are on the brink of life, and those who are wondering why things do not immediately respond to their imperious command—one of the elements of experience which may perhaps be passed across from the more mature condition to the less mature condition is this: Life is a series of plantings, and what your restive desire may be planting now will take root and grow and come to flower at a time when it may be you have forgotten that you ever planted it.

What a man sows he shall reap—it is not a threat, it is a promise. And earnest, ambitious people are sowing all the time. One of the surprising qualities of life is that men reap things they have forgotten they ever sowed. They plant the seed of desire and expectation, but because they do not immediately see the fruit they grow weary of waiting and turn their attention elsewhere; but the seed is a living thing and grows—forgotten or not, it grows, and in due time it comes to flower and fruit.

New Baumes Laws

CALEB BAUMES has given his name to laws which mete out drastic punishment to habitual criminals. Now he would also lend it to laws dispensing mercy to first offenders. As chairman of the New York State Crime Commission, he proposes new measures which would surround an erring youth, should he have to go to prison, with at least a modicum of protection. 'The first offender ought to have every chance to alter his ways and go straight,' he declares. 'I am speaking now of the young man or young woman whose heart is not hardened against society and who has no previous criminal record of any sort. We should like to throw around the prison career of such an offender an environment that would help and not hinder the prisoner's regeneration. To illustrate what I mean—the first offender should not be allowed to come in contact with the calloused criminal, the pervert and the convict with homicidal proclivities.'

It is no exaggeration to state that the Baumes Laws have struck terror into the hearts of the underworld. In New York, where they were first put into effect, crime has shown a marked decrease. Other states have copied them with equally felicitous results. Through the enforcement of the laws, the name Baumes has come to stand for order and stern justice. It is fitting that it should now be associated with mercy and the rehabilitation of unfortunate youths.

Apple Cider

NEVER was that nectar brewed for the gods on Olympus more palatable or more delicious than American sweet cider. When the glow of the year begins to fade, and Autumn stalks through gold-shot woods and meadow mists to keep a tryst with Winter, there comes a time when it pauses, as if regretful of the chilly pact. It is then that the farmer gathers his apple crop. Part he may store in the cellar against a cold night. Northern spies will mellow with age. Russets he will bury in a pit near the woodshed. The windfalls of the better grades he will gather and sack for cider. Then some morning, when the frost has whitened every blade of grass and the hardy sparrows gather about the top rail near the straw stack, he will harness the team and hie away to the mill with his precious load of windfalls. There he will await his turn among others on similar bent. Stone flagons will be passed around filled with the rich amber fluid that now rushes from the presses. Tiny fruit flies will hover over the discarded pulp. A sweet, delicious odor assails the nostrils as the juicy fruit rolls into the hopper. At night barrels loaded with precious juice replace the sacked apples as the farmer starts homeward. He breathes deeply of the free air of the country. From the top of an elevation the low-ridged hills fall away like the ebbing swells of a mighty sea. A silvery creek winds between the hills into the quiet valley. From afar is heard the low of a cow. Over all the splendor, blending its vividness to enchanting harmony, is drawn a dim and indefinable veil of gauzy haze. The late October night descends as a wheeling flight of blackbirds dots the pale, high-arched sky. The scent of smoldering bonfires drifts across the road. It is good to be alive and in the country!

He Brought Death

MILAN ZIGANOVITCH is dead. Who was he? Not one person in a thousand can answer. Yet it was his overt act that brought on the greatest holocaust in human history, that brought death to millions and suffering to millions more. Thirteen years ago in the obscure Serbian village of Sarajevo, Ziganovitch and his companions threw the bomb that killed Archduke Francis Ferdinand of Austria. The World War followed.

The world knows now, if it did not know then, that the death of the archduke was not the cause of the war, that it was merely an excuse for war. There had been bomb-throwers before Sarajevo, there have been bomb-throwers since, and their cowardly acts have not resulted in war. The roots which blossomed so evilly lay deep under the surface. Europe was honeycombed with intrigue. Everything was in readiness for the catastrophe. But a spark was needed to touch off the blaze. The bomb-thrower of Sarajevo furnished that spark. He was an insignificant pawn in the great game of international intrigue, and yet the bomb he threw resulted in the death not of one man but of millions. So much greater were the tragic results of his deed than the man himself that no one had time or thought either to praise or to blame him. Now he is dead, has gone to join those millions who died in the shambles that followed. His very death emphasizes his insignificance. The war can never be forgotten; the man whose act touched off the flame was never known.

Of, By and For the People

GOVERNMENT of the people, by the people and for the people,' remarks Dean Inge, 'is claptrap.' By which he probably means that in his opinion democracy is a failure. But what would the good dean substitute? Government of the people by and for the aristocracy? That has been tried with dismal results. Government by and for royalty, the clergy, the wealthy? All have failed. Democracy in its present stage is not perfect, it is true; but still it is a vast improvement over any other form of government yet tried.

OURSELVES Across the PACIFIC

By WILLIAM L. STIDGER

The flag above Fort Santiago.

An entrance to Manila—a beautiful gate in one of the thick walls which surround the city.

EVENING on the Lunetta. A great bay to the west bathed in a glory of light. Cavite, giantlike against the background. In the foreground, the Rizal monument and the Manila hotel silhouetted against the sky. Here and there a light in the great hotel.

Great four-masted schooners and transpacific ships lay quietly at anchor in the harbor. The constabulary band, led by an American Negro, was playing next to its last selection for the evening. The Lunetta was crowded. Whole families were there: Americans, Spaniards, Filipinos, Chinese, Japanese; men and bloods from the ends of the earth, to hear the music; as indeed they meet three evenings a week.

Little children romped about on the grass lawns. A brown-skinned Spanish lad chased his browner brother, the Filipino, and they laughed together as a fair-skinned, bare-legged American girl tripped one of them up. Filipino women, with their winged gowns about their bare brown shoulders, laughed and listened.

Then suddenly the leader of the band lifted his baton, the band arose, and 'The Star Spangled Banner' with which the band always closes its concert each evening swelled out across the evening air. It was a magic scene; one to thrill the heart of an American far from home.

Everybody arose. American soldiers, just returned from two years in Siberia, stood rigidly at attention, tears in their eyes. Little groups of soldiers could be seen here and there all over the Lunetta with hands in salute as the strains of the national anthem swept to glorious climax.

One was reminded of the 'dawn's early light' of nearly a quarter-century ago when Admiral Dewey sailed into Manila Bay and literally planted the Stars and Stripes on the flagpole of Fort Santiago. I could see that fort dimly outlined in the distance.

Off to my left a group of native constabulary stood at salute with as much pride in their eyes as I have ever seen. Their major stood as rigidly as any of his men.

Filipino boys about to go for a swim in the Pasig River.

One other thing that night on the Lunetta stirred me even more than seeing the soldiers and officers and Filipinos at salute.

That was the sight of little American children ostracized from their native land because their parents' work was in the Islands. I have never asked an American child in the mission fields of China, Korea, Japan, or anywhere else, 'Where would you rather be, in China or in America?' without getting an answer back as quick as a flash, 'In America!'

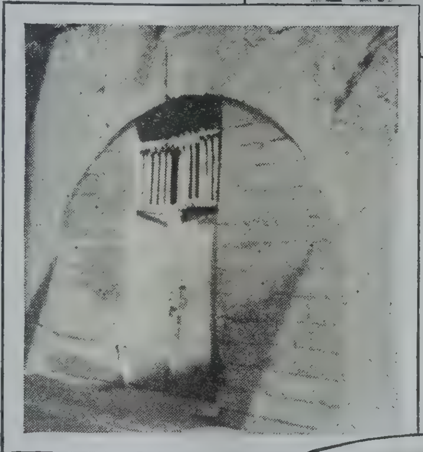
There is a deep sense of national love and pride bred in the hearts of these ostracized children of America. My heart has bled many a time to see their loneliness and their hungry eagerness to talk about America. Every boy in a foreign land will fight at the slightest criticism of his America by a native of the land in which he lives. I am told that during the war the most intense patriots in the Orient were the children.

And so they stood that night on the Lunetta, boys with their little hands at salute, rigidly jerked to attention, their eyes full of tears, their heads lifted in pride as the music of 'The Star Spangled Banner' swept out over their bare heads; little girls with their hands at their sides motionless. It was such a contrast to the jumping about, the playing and confusion in which these children had indulged while the rest of us were trying to listen to the band music during the concert.

After one has traveled all over the Orient and has caught no glimpse of the Stars and Stripes he begins to get hungry for it, especially if, as was the case with me, he has traveled on a Canadian ship. I shall never forget the thrill that came when, for the first time in six months, on the city walls of Manila, I saw the fluttering Stars and Stripes. I stopped! I stood still in my tracks and lifted my hat; tears came to my eyes; and I said, 'Thank God for that Flag!'

Class of native students in one of the thousands of public schools supported by the United States in the Philippine Islands.

Later, all over the Islands I saw the flag. I have been in villages where there was no other white man but myself and where a few people had actually never seen an American, and I have found our flag flying in the breezes: it has thrilled me to the core!



Forbidding gate to a prison in a wall of Manila. The wall is ten feet wide.

Those who have visited Bilibid Prison in Manila will never forget a certain thrill that they had at the close of the visit. I have talked with business men, missionaries, a bishop, doctors, lawyers, men, women, children, and all have admitted the same thrill.

Buglers of the Philippine Constabulary. These natives are trained under American direction and are very proud of their positions.

It must be remembered first of all that this prison has a record of horror and terror such as few prisons on earth have had. Under the Spanish régime its dungeons and cells could tell tales that would freeze the blood with terror: Murders, buried cells into which the Pasig River could be turned by a gate to obliterate forever the memory of a political prisoner, dungeons of starvation, cruelties of unmentionable description—all made Bilibid a name that was spoken in fear and trembling.

But America has made it a model house of reform. It is as clean as Spotless Town. Men attendants dress in spotless white. Every corner is immaculate. Inmates are given both an education and a trade when they are confined within its walls. It has become one of the outstanding show places of Manila.

The one feature of a visit to this prison is to stand on a great platform in the center of the prison yard from which radiate, like rays of light in octagonal form, little sections of walled-in drill grounds.

Suddenly one hears a bugle call. From each set of cells the prisoners march down these radiating drill places in formation. It is one of the most perfect illustrations of machinelike drilling that I have ever seen. A major in the American Army said to me, 'There isn't a regiment in our army that can beat that drilling.'

They drilled for half an hour, each group in its own triangle. One group was dressed in blue, one in white, one in brown uniforms, and one in stripes. Each tried to excel the other in perfection of step. Several thousand prisoners marched as one man to the music. Then suddenly the drilling stopped, a bugle blew and the band started to play 'The Star Spangled Banner.' The entire army of prisoners stood rigidly at attention.

Wall Street's National Daily

By AARON HARDY ULM

ON THE heights of Mount Carmel in the Holy Land two men were taking tea. One, the manager of the Palestine Railways, excused himself as he was summoned by an important call over the telephone. The telegraph operator at the foot of the mountain had a difficult problem.

'This is the longest message I ever saw,' he said. 'And the chap who filed it wants it sent all the way to New York by cable collect. What shall I do with it?'

The manager said, 'O. K.; send it.' For the three-thousand-word telegram was being sent by his guest at tea, Clarence W. Barron. The message told of King Tut's tomb, of the crop and the political outlook in Egypt and of other things. It was a story for *The Wall Street Journal*, a truly significant American newspaper.

Both *The Wall Street Journal* and its proprietor, the man who sent the long message from Mount Carmel, stand alone on several counts. Clarence W. Barron is about the last surviving journalist of the Greeley, Watterson, Pulitzer type—whose newspapers and themselves are, so to speak, one. Unlike most others of the type, Mr. Barron is more than an editor. He is a reporter, working in the ranks at 72 years of age. He was crippled by two accidents that would have sent many a lighter and younger man to bed or to the wheel chair. Yet he chases elusive news facts around the globe, by foot and otherwise, as eagerly as when, a cub, he covered his first assignment for a Boston newspaper more than a half-century ago.

The Wall Street Journal issues from one of those canyons of finance on the lower tip of Manhattan Island. Edited for the national circulation which it has, this paper is rarely seen by the seekers for news sensations and yet it bears mightily on the lives of all of us.

It is only one of the Barron news-distributing mediums. The Barron organization carries on an immense commerce in facts of the kind that are to the wheels of business what lubrication is to wheels of metal. These facts flow through other agencies, too. But it is estimated authoritatively that the Barron organization gives first fluidity on broad scale to 80 or 90 per cent of the basic facts of general import which guide those who conduct the business of the country. And this business amounts to more than a hundred billion dollars a year. Those who have to do with it in a big way must have their news quickly and accurately.

—Ewing Galloway.
Wall Street from the roof of the National City Bank. Trinity Church is at the Broadway end of the street.

A big corporation decides to speed or to cut production . . . The Federal Reserve Board changes the discount rate . . . Exports increase or decrease . . . A change of weather affects the crop outlook . . . Banks become free with loans or restrict them . . . And the prices that you pay or receive thereby go up or down, the employment outlook is rendered good or bad.

And all is based in some measure on facts put forth by the Barron organization, facts that are usually statistical and sometimes superbly exciting. Reports of these facts come to a head more pointedly than elsewhere in *The Wall Street Journal*, a veritable diary of American finance. It is probably the most quoted and the most widely trusted newspaper in America.

The perspective of any picture of this newspaper must include the organization of which it is a part, and its head.

This means going back to the 1860's when a Yankee boy used to lean at night out of a window in his Boston home and study the stars. He now likes to repeat the line which Brashear, the astronomer, wrote for his own tomb where his ashes are mingled with those of Mrs. Brashear:

'We have lived to love the stars too fondly to be fearful of the night.'

For the stars turned Clarence W. Barron toward a career of inquiry via journalism. He made ready for it by learning shorthand, without a teacher, when he was fifteen. Then he worked for a court reporter and for an eccentric writer who said to him one day:

'I'll see that your name is remembered by giving it to a character in the novel I am writing.' In the novel, long forgotten, it appears as 'Major Clarence W. Barron.'

Then the youth got a job on a short-lived newspaper in Boston. One day when the paper came out with a two-column story headed 'Wendell Phillips on Finance,' editors on the older dailies realized that here was a reporter worth salvaging from the impending wreck.

'The other papers had only a few perfunctory lines on the story, which was the sensation of the day,' says Mr. Barron. 'It developed at a meeting of one of these organizations that try to solve with talk all the problems of the universe. It had been organized to give Henry Villard, who later made millions out of railroads, a job as a paid secretary. They were discussing finance when Wendell Phillips came in and stated his views. I took down in shorthand what he said and the sharp discussion that followed. Then I sat up all night to untangle the record.'

The Boston *Transcript* employed young Barron, who, specializing in economic subjects as he had done at school, virtually invented the art of analytical reporting of business news. The industrial boom of the period was causing funds to flow from rich New England into many enterprises throughout the West, notably railroads, often run by promoters who were not always candid with investors.

Barron, as financial editor of the *Transcript*, began making first-hand researches of big enterprises sustained by New England capital. He made a study of the Atchison, Topeka and Santa Fe Railway, with far-reaching results. He studied also the Chicago, Burlington and Quincy, the Union Pacific, and other big properties. He began an agitation, still carried on by him, for full publicity concerning the affairs of such enterprises.

HE WAS the reportorial godfather of the telephone business, having been present at its birth and having followed it as if it were his own child. Theodore N. Vail, who developed the telephone commercially, confided freely in him.

'All of us had at the start only a meager notion of the telephone's possibilities,' says Mr. Barron. 'Vail thought its chief use would be as a substitute for speaking tubes. I remember how he used to tell me that it might be used in communication between one's house and one's stable! Local exchanges and long distance wires were scarcely imagined in the beginning.'

Mr. Barron wrote the first story of the arrangement that suggested the telephone exchange. A burglar alarm company that had an office near the *Transcript* in Boston arranged to relay by messenger boys express calls for business concerns that put in telephones for the purpose. Out of that came the exchange.

His newspaper work caused Mr. Barron to see that even bankers and brokers, relying on their own resources and the newspapers, often operated far behind much news that bore mightily on what they were doing.

He instituted a printed news bulletin service, delivered by messengers, in the Boston financial district and has since then been the banker's trusted reporter.

'My salary during eleven years on the *Transcript* totaled $14,000,' he says, 'but when I quit I was getting fifty dollars a week'—which wasn't bad for those days. The business he and his family now own has a monetary worth running into the millions.

A segment of this business is the news bulletin service he set up forty years ago in the Boston financial district. A final daily summary of financial news items and stock exchange transactions has evolved into a daily newspaper which carries the service throughout New England, Canada and over the country. It is the *Boston News Bureau.*

In the late nineties he established a similar service, with its daily financial newspaper, in Philadelphia—*The Philadelphia News Bureau.*

For both cities he had a working arrangement for the interchange of news with Dow, Jones and Company, which developed an even more extensive service in New York City. In 1902 the founders of the above company, wishing to retire, offered the business for sale. It included a local bulletin service, a ticker service for transmitting news instantaneously by wire, and *The Wall Street Journal.* Barron purchased the business, thus combining the three principal financial news organizations in the East. The combined organization has been greatly enlarged and has long been a national one. This is because of its supremacy in the financial center of the country, Wall Street, the reach of the automatic news ticker, and the position occupied by *The Wall Street Journal.*

ONE finds here the most complete utilization of news material as a salable commodity. A story of big financial import 'breaks' at, let us say, eleven o'clock in the morning. In a few minutes or seconds the facts are being typed automatically on rolls of paper in machines standing by the desks of bankers, brokers, and corporation executives throughout the financial district of New York and in other cities. A little later the news in fuller form will be dispatched on printed sheets by messengers to subscribers to the bulletin services. Then, probably in still fuller form and perhaps analyzed by experts, the news will be published in the three Barron newspapers in evening and morning editions. If of interest to the leisurely class of investors, it will appear again, with further amplification, in *Barron's Weekly*, a financial magazine. The

Sky line of a section of Lower Manhattan across the North River.

Uncle HORACE MANN As I Remember Him

By JULIAN HAWTHORNE

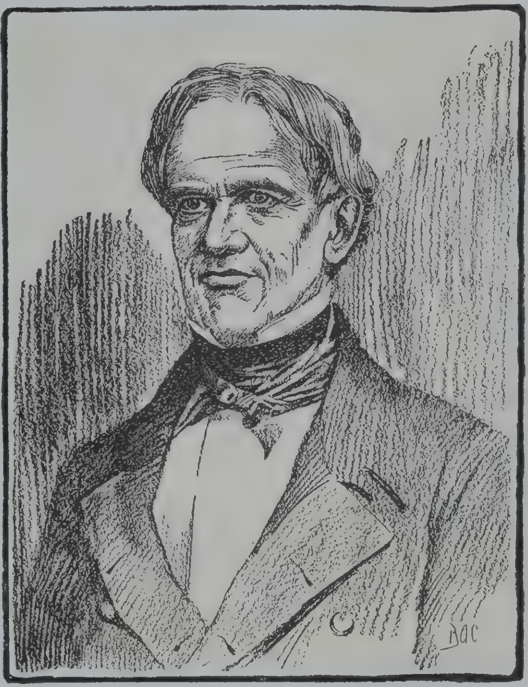
HORACE MANN became my uncle by marrying my mother's sister, Mary Peabody. My Aunt Mary was a good woman, intellectual and attractive, and the marriage resulted in general contentment. Horace Mann had been born in 1796, and was therefore about fifty years of age, and had been active in educational reforms for fully two decades.

He was the author, or one of them, of the Massachusetts school system; had already been secretary of the Board of Education, was a Whig candidate for political preferment, and even aspired to be governor of the state. The people wouldn't go so far as to elect him, but years after his death a bronze statue of him was set up in front of the old State House on Beacon Hill, Boston. That is something!

He wore spectacles of course; his face was long and rectangular, his nose rather large and irregular, and his mouth (my mother admitted) was 'terrible.' But Uncle Horace, whatever the propensities of his nature, was a person of really appalling moral strictness; he was an authentic Sir Galahad in action, however little he might look the part. No typical old maid could be more indignant at the lapses of others. He saw ideals of conduct for mankind with one eye, while with the other he could discern little but evil in the actual community around him. This attitude kept him very busy, but in a state of irritation. His measure of wrong was divergence from his conception of right.

I don't know what his religious faith was, but in Massachusetts at that period most of us attended the Unitarian Church. He distrusted emotion, and loved reason; yet he was driven by emotion. He was addicted to theories, and to 'sayings' derived from them. He was a friend and admirer of George Combe, and after naming his first son after himself, called the second after George. He embraced vehemently the theory of coeducation, was the first president of Antioch College, in Yellow Springs, Ohio, and so a sort of foster father of Sanborn's School in Concord.

If morality be the whole of goodness, my Uncle Horace was a good man. He had fondness for his wife and children; it was mingled with the sense of ownership and control. My Aunt Mary adored him as one of the best and greatest of men, and his children obeyed his law. He was keenly aware of the surface of life, but was unconscious of its depths, so that he was unable much to enjoy communion with my father, for instance: not, however, that the latter ever betrayed, in their intercourse, anything other than amiability. One of the occasions, however, when something was heard to drop, was when, abruptly entering a room, Uncle Horace discovered my father in the very act of smoking a cigar.



'He was to me education incarnate—'

When he breathed the accursed fragrance, and saw the cigar in my father's mouth (or between his fingers, perhaps), Uncle Horace stopped short in his tracks, as one brought unawares to the brink and reek of the Pit.

He snapped, 'Mr. Hawthorne, I am sorry to say that I can no longer entertain the same respect for you that I once had!'

My father smiled sympathetically, but did not throw away the butt, and my uncle withdrew.

As I grew older, I did not approve of my uncle. It was a temperamental aversion. It was confirmed, as I grew in years, by the bogey of 'education,' which attended him as a familiar spirit, and to which I was constitutionally opposed. He was, to me, education incarnate. Not that he ever attempted to become my instructor, but I knew him to be too deep in the plot to put the fetters of learning on dauntless infancy, and I revolted in imagination. To be lessoned was bad enough, but to undergo that outrage at the hands of my uncle would have been quick poison. So, with the injustice of childhood, I bore him a grudge for what he didn't do, but might have done; and also no doubt because his aspect and physical propinquity were distasteful to me. I don't recall his making any effort to capture me. But I once saw him in the act of shaving, and the spectacle, for long afterward, disgusted me with the practice.

His purpose in life was nothing less noble than to rescue mankind from its errors, by making it conform to his ideas. He never suspected that his presence was not delightful to his nephew.

My chief personal recollection of him was in the winter that we spent in West Newton, not far from Boston, from which, in the early summer of the following year, we removed to The Wayside in Concord. West Newton must have been quite a small place then, and probably wasn't looking its best in winter. We had lived for the previous year or two in the loveliness of Lenox, in the Berkshires. My father had written *The House of the Seven Gables*, and the two *Wonder Books;* and it was in West Newton that he was to finish *The Blithedale Romance.* The Manns, it appeared, had there rented a house much too large for them, and what more natural than that they should invite us to share it with them?

IT WAS a shapeless frame structure, painted white, with green shutters, in the prevalent style of the 1850's. There was a long boardwalk down to the gate. Within, the bare rooms were papered with pale paper stamped with diamond-shaped patterns; they were warmed by registers opening through the base of the walls, and emitting a suffocating breath from the furnace in the cellar. They kept us from freezing, but we had known the joy of log fires in the little red house in Lenox. Outside, the snow lay white and bleak.

My sister Una was then about eight; my other sister, Rose, was a baby; I was six. The Manns also had three children: Horace, George Combe, and Benjamin Pickman. We were fairly matched in our ages, the Manns being a little older.

Horace was a shy and silent youngster, dark-haired, and already showing a leaning toward natural history. Before he was twenty he had attracted the attention of the great Agassiz, and was his able assistant in the arrangement of the great museum of natural history in Cambridge. He was serious, earnest and devoted; but his health was never good, and he died in his twenties. He had no social faculty, though he was affectionate in a silent, painful way: he would conscientiously 'make calls' on people he knew, but would sit voiceless and embarrassed all the evening; if asked a question, he would reply slowly (as if to get over as much time as possible) —'Why—I really don't know—whether that is so or not.' His mind was far from being vacant, however, and on his own chosen subject he could be almost voluble.

GEORGE favored his father, and his father made George his favorite. He had the same bleached, dry, straight hair, unhealthy complexion, and spectacles. He was not an outdoor boy, but was bookish and clever, did his lessons well, was a good boy. He acquired early a sort of erudite wisdom, and never got over it. He took a good degree at Harvard, and afterward became principal of a girls' school, where he remained happy and successful until his death, I think, at seventy-five.

Benjy began life under an untoward star; his mother was never robust, and a third son seemed a little too much. Soon after his birth his father, mindful of George Combe, solemnly examined Benjy's head for bumps and general configuration; as the examination proceeded, his solemnity became severe, and he finally declared openly that a child with a head like that was not worth bringing up. His submissive little mother heard the sentence with what equanimity she might, sensible that it was her fault. His Aunt Elizabeth Peabody, always an indomitable optimist, and by far the deepest, highest and broadest of the tribe, protested with confidence and cheerfulness, pointing out that the heads of babies changed shape radically as they grew up, and almost hinting that the great George might not be infallible.

The father's gloom was not lightened, and Benjy grew up—perhaps not altogether to his disadvantage—in the outer courts of the parental consideration. His head did change in shape, but whether for the better was not determined until later, when his genius declared itself in favor of entymology, and he achieved real and lasting distinction in that pursuit. In his later years he occupied an important position in Washington, D. C., as a professor in the Smithsonian, and he flourished among his darling bugs to a venerable age—in fact he may be still alive. He was odd, original and lovable, for under his sardonic and malign humor there was keen ability and fine, independent character, and, moreover, honest affection and good will.

But he was wont to parade his foibles and to mask his virtues, perhaps out of a kind of sensitiveness due to unsympathetic influences in his childhood. He never sought sympathy; his mood was of smiling defiance, and he would perpetrate startling enormities with an air of sardonic humor. One day, soon after our establishment in the West Newton house, Benjy was admitted to participate in the worship of our baby Rose, who lay placid and imperial in her cradle—she was an exceedingly pretty infant. Benjy, in his turn, bent over the crib with apparent interest, when all at once Rose sent forth a piercing scream, and Benjy stepped back with a diabolic grimace. There was a bleeding wound on the baby's fairy little forefinger. What had happened?

'I did it!' quoth Benjy. It seemed a foregone conclusion that such a boy must in due time become a rampant Cain. He was talked to very severely, and the inhumanity of his deed pointed out; but nothing could efface from his little visage the grin of contented wickedness.

At Sanborn's School he was physically smaller than the other boys, but instead of permitting that to discourage him, he used it as a protection against being punched for the mischief he was continually doing his comrades. It wasn't serious mischief, but such as to turn the laugh on the victim, who was prevented from retaliating by the manifest inability of 'Pickie,' as we called him, to defend himself. Thus he became among us a licensed malefactor, never doing any real harm, but by his quick-wittedness making the other party appear foolish.

UPON the whole, he was rather a favorite except with the sufferer of the moment.

Meanwhile Benjy, or 'Pickie,' became possessed of a small wooden printing press, with types and ink. After passing through the period of delight arising from smutching his hands, face and garments with ink, he suddenly made the machine a source of commercial profit. He catered for local custom; every tradesman in the village must have labels printed by Pickie; private persons were also 'sold' on one pretext or another; and he got an order from me for one thousand labels to use in my collection of shells, butterflies and birds' eggs; they were delivered done up in neat little packages of one hundred each.

Pickie received payment, but of course I never collected specimens enough to use a tithe of the labels. I think recognition of this fact added to Pickie's pleasure in the transaction.

He didn't go to Harvard, but instead was attached to an entomological expedition which went to Brazil and was absent several months. Here the youth proved his value; he had found his proper function in life, and the life, energy and curiosity which had hitherto been exercised in childish pranks found their satisfaction in useful work. The collections of insects that he made in the tropical forest won him deserved distinction, and from that time his career was settled. He applied his every faculty to congenial and restless employment, not seeking to make himself a name, but devoting himself to the cause.

Horace Mann died in 1859, probably before he was called upon to recant the verdict he had passed upon his youngest son. The ambition and the achievements of Benjamin Pickman Mann were divergent from those of his father, and perhaps would not have kindled his enthusiasm. The father was identified with a great public enterprise, the final judgment upon which it is still too early to determine.

He was a man of great singleness of purpose, and he believed unfalteringly in himself.

THINGS done for the public are, in intent at least, a measure of civilization. Nothing is of more public importance than is education, which includes in its broader aspects the lifting of mankind to higher levels of thought and deed. All the greater is the responsibility resting upon educators, especially upon those who are founders rather than followers of new systems.

The bronze figure of Horace Mann still stands on the left as we ascend the steps leading to the Boston State House with its gilded dome. The face was modeled from a drawing made by my mother, at my Aunt Mary's request, from such daguerreotypes and *cartes de visite* as were available; but she slightly modified the mouth into nearer harmony with the ideal of masculine beauty. And, in view of the man's lifelong devotion to what he intensely believed to be the welfare of his fellow creatures, we may rest in the persuasion that the countenance of the great apostle of education, as seen in the light of infinite understanding and justice which now illuminates it, may possess or mirror something of the nobility and radiance which he hoped and strove to awaken in posterity.

It is in a man's work, rather than in the trivial imperfections which, in various degrees, impede us all, that we find his reality. One exaggeration tends to correct another; only by tempering eulogy with criticism do we approximate the truth.

For Bigger *and* Better COUNTY FAIRS

By BARTON WINSLOW

BEING placed in a position where fair men bring their troubles, talk shop in season and out of season, and canvass every phase of making agricultural shows into greater successes, the writer at the editorial desk of a fair publication must see some things that impress and cause enthusiasm.

All of which is preliminary to the convincing feeling that in general the fairs, state, district, and county, are moving forward; that out of the warring opinions of the managers, the conflicting interests of the legitimate concessionaire and the crooked and salacious concessionaire, the progressive ideas of the modern-minded exponent and the stuck-in-the-rut man who believes that because things have been right they continue right and prudent—that out of all these things, threshed out to a great degree through the press devoted to fairs and attachments of fairs, there is a steady movement for the betterment and advancement of these institutions so linked with agriculture.

In analyzing the present situation of the county fairs, one is struck with the readiness to adopt praiseworthy ideas which appear to dominate the managers. If one cares to bring into concert the relation of the upward-looking managers to the material success which is manifest on numberless grounds about the country, one can readily establish convincing evidence that the determination to run a clean fair, a fair with progressive ideas, with an ideal in view, is fruitful of money at the gate, the grandstand and the other sources, whence comes the sustenance from year to year.

In this movement—and perhaps it is unnecessary to specify it—the principle of fair-and-square dealing is foremost. In short, the claim is for a clean fair, and the management makes good the claim. The men of these fairs believe that because crooked games were permitted in the old days, and because salacious exhibitions drew throngs in other years, these are not legitimate claims for the patronage of the present or the future, either. They believe that whatever is right is the thing to do. Now, this is not to indicate that there were no managers of the old days who believed that these shows, these games and the rest, were proper fittings for a county fair: but they oiled their consciences with the thought of the income from such sources, and they fallaciously reasoned that there would be no other source for this lost revenue. It was the old-fogy reasoning that tied up a magnificent source of aid and encouragement for the farming industry to an anchor that was not even dragging, but was deeply imbedded in the slush of degraded exhibition effectually impeding any progress of friendship.

Progressive handling, following logical reasoning, is to kill all possible sources of attack upon the fair by removing the drawbacks. It is properly held that permanent success cannot come from an unfair invitation to the farmer and his family. And the old form of invitation to the fair was deceptive. There were exhibits, attractions of legitimate character, racing, band music, and other things of correct form, but if a concessionaire of ill repute came along, his offer of money secured a place.

One step forward is the juvenile club movement. In nearly a hundred county and district fairs of that state, well-organized in a great state body, well-officered and progressive in every angle, the boys and girls of the state by the thousands are brought into a new acquaintance with the dignity of agriculture, and the wealth of achievements that are possible within its scope. There are calf clubs, pig clubs, colt clubs, lamb clubs, canning clubs, sewing clubs, and other clubs, all with the incentive contained to turn new thousands into an honorable, praiseworthy, and remunerative vocation.

For years there has been a decided movement away from the farms. The city with its bright lights, glamour and gayety has been the goal. The turn from the humble highways and byways of the productive regions has been strangely contradictory of a movement urged by our best scientific men to greater advantages for health. But youth is headstrong.

Club work teaches better farming opportunity. There is the stimulus of the competition, the luring interest to study scientific feeding, cooking, sewing, and the strong hope held out that the end of the rainbow is not a delusive one. Personally, the writer can cite several cases that came within his own observation where the club idea brought into useful work boys who had never taken things seriously—had failed to find a single inducement in farming or stock raising before the call came through an admirably combined urge of the theoretical and practical in the form of a calf club. Life took on a new phase when this presentation made its appeal. Great things hitherto hidden from the eye of the juvenile mind were brought within the vision, and the boy went forward—to win in life a definite goal ahead.

AND there are the grain clubs—corn, most particularly. In Indiana this corn club medium has been a remarkable stimulus to the youths of the farm. The competition in the county brings the winner into the sterner competition of a district, and in time the state, if he is successful enough in his application. The state offers trips to the great international show held in Chicago, and thereby again brings before the boy winner the practical lessons that go to make success in his field.

Then, if it is necessary to choose a third factor—or is it an effect of the modernist that has turned to the good of the fairs in the humble agricultural districts?—it is unquestionably the trend toward neatness on the fair grounds. The unkempt form of the old days is departing fast. It has not yet passed away entirely, but it is moving out of the scene at a gait rapid enough to make it certain that another decade will find tumble-down fair grounds a rarity.

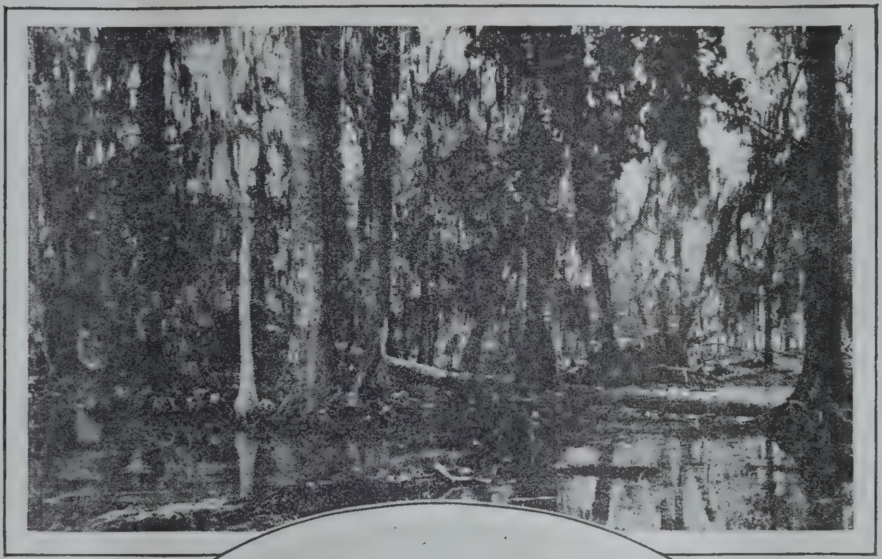
Numbers of county associations have found that cleanliness, extended over the whole area of land within the inclosure, paid well not only in cleanliness of morals but cleanliness resultant from the abolished rubbish and accumulated filth during the fair week as well as before. There are some notable examples of fair grounds run by county associations where the strictness of supervision is amazing. It would be unfair to point out any one of these as an example, because there are many. There is in particular an Ohio county fair grounds where golf is played through the summer season by a private golf club, and where the burden of keeping the plant in prime condition is gladly assumed by those using it. It is a delight to the eye at fair time, or during the other fifty-one weeks of the year. The buildings are trim, well constructed, not palatial, but sufficiently commodious and dignified, and the vast stretches of green that surround them are delightful. No rubbish is allowed to accumulate anywhere on the grounds, but it is carted away as rapidly as it is made. A loose board on the fence becomes an object of attention; a broken limb from a tree is a matter for the custodian's attention, immediately, not soon, with a prospect of delay. Even in winter the grounds seem to reflect the care and attention that are compelled by the management, despite the ugliness of barren, branched trees.

YES, the county fair is moving up along with its big brother, the state fair. The premiums exist as before, with the addition of the club prizes; the band blares away each afternoon; the races are on the track for the entertainment of those who attend, and numerous other attractions are there, remnants from a past era. But there is progressive attendance upon recently disclosed opportunities that means forward moving. The farmer is no longer considered a clumsy dolt to be joked about and plagued with crooks. His advancement has been steady, and his intelligence has brought about quick adoption of the great scientific improvements that have bridged the chasm between city and country.

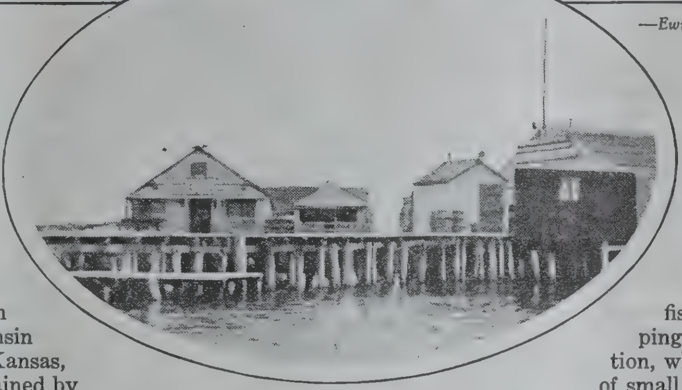
Young people of the farm are as well dressed as their brothers and sisters of the city; they are not behind the times at all. The fair did not do all this, but it presented in a practical way the means of supplementing onerous labor with development toward less brawn and more brain. It is encouraging the youth of the land to a new place in the world, not outside, where the bright lights of the city shine, but right at home, where the greatest possibilities on earth exist, only to be disclosed by energy, perseverance and intelligence. The race to the town has been slackened, scientifically, and the science which turned the trick succeeded because it made attractive the farm and its surroundings. In this work the county fair has been a remarkable agent, not because of the noise of the midway, the disgusting blare of the ballyhoo man, the sensational presentations of the immoral shows, but because these agents of evil have been tabooed and new and admirable forms have replaced them.

The People of the Great Marsh

By JOHN SLOAN



—Ewing Galloway.



Oval—*Part of Manila Village, photographed from a passing motor boat. Above—In the wet jungle of the Louisiana marshland.*

THE largest marsh in the world is in the United States. It is approximately 200 miles long, from 10 to 60 miles wide, and contains from 9,000 to 10,000 square miles of water-soaked land, cut thickly with bayous, rivers, bays and lakes, the majority of them navigable to shallow-draft boats. This great, overwatered plain lies between the Mississippi River on the east, and the Sabine River of Texas on the west, with the Gulf of Mexico to the south. Low bluffs which mark the prehistoric boundary of the gulf form the northern rim. Like a desert in its level topography, but varying from isolated and wooded knolls, called 'islands,' to flat prairies which tremble as one walks upon them, the soil of this marsh is in large part composed of the slowly settling and not yet solidified delta of the Mississippi and other rivers which flow southward into the gulf. Wisconsin and Minnesota, the Dakotas and Kansas, and all the rest of the great area drained by the Missouri and the Mississippi and their tributary streams, have built it up. Some day, after centuries have passed, it will become solid enough for cultivation.

Although it is impossible of cultivation because of the amount of water permeating it, the great marsh supports a population of nearly a quarter of a million; yet the traveler passing through it, and unacquainted with its peculiarities, would consider it uninhabited. But the marsh, like the desert, hides and protects its own. On the surface, it is a vast mat of wild rice, wild oats, and other cereal grasses, green in spring and brown in autumn, the growth higher than the head of a man on horseback, and often completely concealing the cabins which pass for the homes of its indwellers. More than 5,000 miles of waterways cross and recross it; scores of islands dot its southern border; spreading canebrakes offer hiding places to bear and deer and wildcat, with an occasional jaguar, and groves of oaks and willows and alders furnish further cover.

Out of it, carried in ancient cypress luggars, motor freighters, schooners, barges and even rowboats, there went to the markets of New Orleans and other points last year, nearly $25,000,000 worth of products, foodstuffs in the main, and they largely composed of fish, oysters, shrimp and similar gleanings from the waters. A fleet of more than two thousand shallow-draft boats of many kinds play upon its waterways, ranging from motor freighters, carrying as much as fifty tons' cargo, down to hollowed logs, called 'pirogues,' barely buoyant enough to carry one fisherman, one hunter or one trapper. More than a million dollars' worth of furs come out of the great marsh in a single year, mostly muskrat skins.

But it is the people of this great marsh that furnish its most interesting feature to the outsider. Here has grown up gradually a population as much of its own kind as the mountaineers of Tennessee and Kentucky. The marsh is not easy of access, and its widest waterways frequently are so hidden by the high growth of vegetation that a boat is invisible at a hundred yards. Living in villages built on piles in the water at the rim of some bay, or on the hummocks which pass for islands in the marsh, or in solitary cabins set on high stakes in the trembling prairies, these people communicate seldom with the world, and then always by boat.

In this marsh are Frenchmen, Italians, Spaniards, Americans, Greeks, Filipinos, Chinese, and a few Englishmen and Germans. The Filipinos are commonly called 'Manilamen,' and the French are mainly the descendants of the Acadians and other early French settlers of the Louisiana Territory. Numbers of these marsh dwellers arrived there suddenly from other parts of this country and a few notorious criminals have found sanctuary there, though for the most part the inhabitants are merely happy-go-lucky, carefree, ignorant folk to whom the restrictions of close contact with civilization are irksome. Few peace officers invade the huge marsh; there is nothing there to incite theft or other crimes. The traveler is safe in the great marsh; he is most hospitably entertained to the extent of the abilities at entertainment possessed by the marsh people. If he wishes to settle there, he is welcome, so long as he refrains from interfering with the affairs of others.

Honest people are far in the majority in the marsh and the percentage of wrongdoers, either past or present, is small. The habitants devote their lives to fishing, oystering, shrimping, trapping, hunting in season, and the cultivation, wherever there is land solid enough, of small gardens and truck patches. These and similar simple methods of winning a livelihood from soil and sea and rivers, with few wants to satisfy, and no high cost of living to meet, fill the days of the quarter-million in the marsh. Their combined labor results in the largest oyster and shrimp industry of any one section in the world. So valuable was this industry that it kept in existence, up to 1918, the last organized pirates in the New World, who preyed on the oyster men and the shrimpers, until a fleet of armed patrol boats, operated by the Louisiana State Conservation Commission, put the pirates out of business after what came to be known as 'the oyster war.'

One of the most interesting points in the great marsh is Manila Village, probably so named because the first group of oyster tongers and shrimp seiners who established their camp on the present site of this settlement were Filipinos. Manila Village is a cluster of wooden huts, built on platforms set on top of piles, rising ten or fifteen feet out of the water of the upper end of Barataria Bay. At one time, it is said to have had a population of 500, but that was in the days when smuggling flourished along the coast of the great marsh, and when there were other and more profitable means of winning a livelihood than by working all day in the water after 'swimp' and 'o'sters.' Today, there are not more than fifty living on the wide platforms of Manila Village, though on some Saturday nights, when a dance is given there, many more appear.

The shrimp platforms on Saturday nights, during the summer season, offer a dance for pleasure only, in which men and women both take part, many traveling as much as fifty miles to attend the dance, and going back the following morning. Such a dance lasts all night, and as the people of the marsh for the most part are devout Roman Catholics, a priest usually attends the open-air ball, so as to be prepared to say Mass on the Sunday morning. The platform selected for one of these dances—almost the only amusement these hard-working people allow themselves—is cleaned of all the shrimp, and swept as free of dust as possible. Meanwhile notice is passed by word of mouth, from one end of the marsh to the other, that a dance is to be held at such-and-such a shrimp platform on a certain Saturday night. Every family in the section of marsh tributary to the platform owns a boat, sometimes two or three boats, and, unless serious illness prevents, every family in that section will be present at the dance. Children are plentiful in the great marsh, and, as a result, there are always plenty of young folk for every dance, while their elders sit in rows around the platform, discussing the little events of their daily lives, the battles of their fight for a livelihood against the marsh, the prospects of Alfonse or Marie, and the ever-present and most important theme of the price of 'swimp.'

Small freight carrier in the great marsh.

As evening comes and the boats gather in to the platform, the women in their bright-hued calico dresses and ginghams, the men in overalls and corduroy coats, numbers of them wearing red and blue handkerchiefs bound round their heads, make the bare floor brilliant. Gasoline and kerosene torches have been placed around the rim, both to give light to the dancers and to mark the danger line where the platform falls away to the water. An orchestra of violins, now and then a cello, always a bass viol, and occasionally several guitars or banjos, strikes up, and the dance is on, with as many as five hundred dancers on the platform at one time. Each party brings its own food, but the owner of the platform usually supplies the coffee, made in the shrimp kettles, which have been scrubbed and polished until not a breath of the shrimp odor remains. The food brought consists of enough for dinner Saturday night, a midnight lunch, breakfast Sunday morning, and lunch on the way home Sunday, provided that all except the man steering the boat do not fall asleep. At these Saturday night dances all manner of social and business announcements are made. Following the presentation of an engaged couple, a newly wedded pair will be compelled to dance alone; then a boat sale or trade will be made, a dog will be swapped for a shotgun, a man will be employed to take the place of one lost while shrimping or oyster-tonging, for the great marsh is not without its tragedies as well as it pleasures, and a proud father and mother will be congratulated on the arrival of the first child. Thus all sorts of contracts and agreements are made publicly, and though few of them are ever reduced to writing, except in the case of the marriages, none are broken. Honor of the spoken word runs high in the great marsh, and hospitality is as wide and free as it ever was on the banks of Teche or the Bayou Barataria.

This is a land of trading, swapping, direct merchandising, and the man who sends a boatload of shrimp to market puts in with it orders for enough coffee, cornmeal, calico, denim, powder and shot, as well as fishing equipment, to eat up all he receives for the product of his labor.

Yet these people of the marsh are contented, care-free, happy exponents of the idea that 'man wants but little here below, nor wants that little long.'

Cruiser making its way along a shallow bayou through vast flats of wild rice, the trembling prairies of the great marsh.

Ourselves Across the Pacific

(*Continued from page 13*)

It was as if one man were there. There was not the batting of an eyelash.

Down in San Fernando the Filipino patriots were erecting on the public square a statue of General Hisan. It was a great occasion. Natives for miles around gathered until the little town was crowded as on fiesta days.

General Hisan had been an *insurrecto* leader against the United States not a quarter of a century previously. It was necessary for the United States to deport him because he refused absolutely to take the oath of allegiance as the other rebel leaders had done.

In spite of that, however, this benevolent nation that we are proud to call ours permitted the erection of this statue to a rebel. No nation on the earth but America would have tolerated it.

I wondered whether the natives appreciated the magnanimous attitude of America in allowing them to erect a statue to one of the stoutest rebels with which America had to deal. I wondered whether they would realize what it meant. I was gratified to hear the leading orator of the day express the very thing that had been present in our hearts.

THE governor of this province, which was Pampanga, in the course of his dedicatory remarks, said:

'We are under a flag which permits us to dedicate to one of our own heroes a man who refused to take the oath of allegiance and to yield after his arrest to the sovereignty of the United States. He would not take an oath to support the Constitution of the United States. But in spite of that we are permitted here on this day to dedicate this monument to his memory. I don't believe that any other nation on earth would do it.'

Nor can one forget the romance of the American soldiers who have married native Filipino women and Spanish girls and settled down for life on these islands. It is a story full of romance, mixed bloods, wealth, beauty, color. I confess that it has a fascination for me that holds me enthralled. I have seen children spring from such a union that were nothing short of the sons of genius. My heart goes out to them. Something in their veins calls to something in my veins—American blood!

On the beautiful Mindanao to the southeast is Davao Gulf. Some say that there is no more beautiful spot in the Islands; it is more tropical, more junglelike, more fertile than any other. Today the bay is owned from tip to peak by American soldiers who, marrying native women at the end of their enlistments, have taken up land and settled down.

The gulf towns are full of little mestizos, half-American and half-native. Schools and colleges have been established for them. One would think that he was in America at commencement time when visiting one of these colleges, hearing the college yells, and catching the spirit of these half-Americans. The best of the two bloods seems to dominate in their characters and a fine product is the result.

English-Americans in Revolution

By LEWIS WORTHINGTON SMITH

THE attitude of Englishmen toward transplanted Englishmen on this side the Atlantic when the American Revolution was in progress was one of greater friendliness than has been commonly supposed. History has largely been written as a record of the doings of government. More properly, it should be a record of the changing opinions and modes of living of men. It is certainly the record of the English Government that it waged war upon the American Colonies. It is also true that the Colonies were fighting the battles of Englishmen the world over, and that they had the sympathy of large numbers of intelligent Englishmen at home.

This is not to be gleaned, of course, from the records of the government of the Hanoverian, George Third. To know what Englishmen thought, to realize what Englishmen were, it is necessary to go outside the activities of government to see what were the ideas of Englishmen as Englishmen, the ideas of the ruled, rather than of the rulers, of men who were factors in the evolution of English life, rather than of those who were trying to hold it back.

At a critical period in the history of England, there was one great mind burningly concerned with the problem of human freedom and of the forms of government within which it could exist, the mind of John Milton. About forty years after the landing of the Pilgrim Fathers upon Plymouth Rock, the dreams of religious and political liberty that had brought them to the New World were on the way to temporary eclipse among countrymen at home. The strong hand of Oliver Cromwell, felt throughout Europe as a safeguard to the rights of man while he directed the Commonwealth of England, had been superseded by the weak hand of his son, Richard.

CHARLES II, the most dissolute and irresponsible of English monarchs, was soon to come to the throne of his father and restore the autocratic personal rule of the Stuarts. All that Milton had fought for was to be overthrown. The deepest convictions of his life were to be submerged in a riot of royal license. The progress that Englishmen had made in the assertion of their liberties was to be lost for a quarter of a century.

Some of those who had done the most for the larger interests of man were to die under the axe of the executioner for the death of Charles I. Others were to find refuge among men of their own kind in America. Back of one of the churches facing the Green in New Haven, there is a lonely grave where one of the regicides lies buried, a symbol of that community of interest between the free spirits of Englishmen here and in the little island across the water.

Although Milton must have known what was impending and although the danger was great, he wrote a pamphlet in support of those conceptions of government that were being put into active operation by Englishmen in America, separated by three thousand miles of water from the immediate exercise of royal authority. The marks of Milton's disturbance, of the turmoil of his mind before the coming disaster, of the rush of tumultuous passions carrying him on, are unmistakable in the pages. The surety and majesty of word and thought that make much of Milton's prose forever memorable are not, perhaps, to be found in *A Free Commonwealth*, but it is the word of a great man on the great issues of a great day. More than a century before the Declaration of Independence, it foreshadows much of the spirit in which the founders of our Government wrote the Constitution of the United States. This that follows is Milton speaking:

> 'Now is the opportunity, now the very season, wherein we may obtain a free commonwealth, and establish it forever in the land, without difficulty or much delay. Writs are sent out for elections, and, which is worth observing, in the name not of any king, but of the keepers of our liberty, to summon a free Parliament, which then only will indeed be free, and deserve the honor of that supreme title, if they preserve us a free people.
>
> . . . .
>
> 'For the ground and basis of every just and free government (since men have smarted so oft for committing all to one person), is a general council of ablest men, chosen by the people to consult of public affairs from time to time for the common good. In this Grand Council must the sovereignty, not transferred, but delegated only, reside.
>
> . . . .
>
> 'This liberty of conscience, which above all things ought to be to all men dearest and most precious, no government more inclinable not to favor only, but to protect, than a free commonwealth, as being most magnanimous, most fearless, and confident of its own fair proceedings. Whereas kingship, though looking big, yet indeed most pusillanimous, full of fears, full of jealousies, startled at every umbrage, as it hath been observed of old to have ever suspected most and mistrusted them who were in most esteem for virtue and generosity of mind, so it is now known to have most in doubt and suspicion them who are most reputed to be religious.'

One of the keenest minds of the 18th Century was that of David Hume, philosopher, political theorist, historian. In 1741 and 1742 he published his *Essays, Moral, Political, and Literary*. It was an age when men were questioning everything that had before been believed, and Hume was one of the most inquiring spirits of his day. His temper was much colder than Milton's, much more dispassionate and self-contained. Analytic, wide-ranging, penetrative, he contributed greatly to the discussion of many subjects.

Capable of a fine detachment, as he was, he observed the world about him with a lively interest, the manners of men, the movements of society, the thoughts and opinions that marked the day in which he lived. He believed in monarchy as a form of government, a constitutional monarchy with a House of Commons representing the people, but he recognized the possible advantages of a republican form of government, and in these essays he brings those advantages forward with judicial calmness.

Debating 'Whether the British Government Inclines More to Absolute Monarchy than to a Republic,' he says:

> 'Now, there has been a sudden and sensible change in the opinions of men within these last fifty years, by the progress of learning and of liberty. Most people in this Island have divested themselves of all superstitious reverence to names and authority; the clergy have much lost their credit; their pretentions and doctrines have been ridiculed; and even religion can hardly support itself in the world. The mere name of *king* commands little respect; and to talk of a king as God's vicegerent on earth, or to give him any of those magnificent titles, which formerly dazzled mankind, would but excite laughter in every one.'

This is emphasis upon the weakening power of arbitrary authority of every sort in England, and it might almost be the voice of Milton himself uttering afresh the Puritan protest against the tyranny of overlords in church and state. The difference between Milton and Hume is that between reason wrought up to a passion, because of wrongs endured, and reason pursuing her course calmly, because undisturbed. Hume was a great influence in his day and the influence persists. These essays antedated the declaration of American independence by a third of a century, and they are part of the evidence indicating the trend of English thought toward the writing of that document.

HOW Englishmen felt toward the Colonies while the struggle was coming on and while it was in progress is a matter of closer moment. One of the most acute analysts of the political conditions of the period was the unknown author of the *Letters of Junius*. The century and a half that has passed since his day has not made us certain who he was, but, whatever his place in society or in the world of public affairs, he had a mind of the keenest, and the incisive directness with which he wrote gave his opinions a wide currency and influence. Probably his sympathy with the Colonies was not great. Quite possibly, indeed, he held that they were in the wrong, but more certainly he condemned the course of the English Government.

'A series of inconsistent measures,' he says in one of his letters, 'had alienated the Colonies from their duty as subjects, and from their natural affection to their common country.'

Again in a later letter he speaks more positively, and his phrase, 'the king's servants,' is worth bearing in mind as lodging the responsibility on the shoulders of the autocrat rather than on the representatives of the English people.

'The conduct of the King's servants in relation to America, since the alteration in 1765, never had a reasonable argument to defend it, and the chapter of accidents, which they implicitly relied on, has not produced a single casualty in their favor. At a crisis like this, Sir, I shall not be very solicitous about those idle forms of respect, which men think due to their character and station; neither will I descend to a language beneath the importance of the subject I write on. When the fate of Great Britain is thrown upon the hazard of a die, by a weak, distracted, worthless ministry, an honest man will always express the indignation he feels. This is not a moment for preserving forms, and the ministry must know that the language of reproach and contempt is now the universal language of the nation.'

His feeling for the venality and incompetence of the court party is again a biting sword when he comments on the appointment of a governor for Virginia and on the motives actuating the minds of those responsible for the appointment. 'It was not Virginia that wanted a governor, but a court favourite that wanted a salary.'

IN HIS *Thoughts on Present Discontents*, published in 1770 and so far popular that four editions of it were brought out within the year, Edmund Burke attacked the administrative policy of the government by which the king and the court party isolated the administrative from the general spirit and attitude of the country at large, and made them instruments for the exercise of the personal will of the sovereign. Men were chosen for places under government, he declared, not for their known and tried capacity, but for their relative insignificance. Such importance in the affairs of the kingdom as they could claim came wholly from the king, and they were consequently ready to do his bidding, ready to appoint 'a court favourite that wanted a salary.'

'A plan of Favouritism for our executory government,' Burke wrote, 'is essentially at variance with the plan of our legislature.'

He saw many evils to flow from such a plan for subjecting the country to the will of the king, and among not the least was the inevitable straining of relations between the Colonies and the mother country.

'Nor is it possible that this scheme should have a better effect upon the government of our dependencies, the first, the dearest, and the most delicate objects of the interior policy of this empire. The Colonies know that Administration is separated from the Court, divided within itself, and detested by the nation. The *Double Cabinet* has, in both parts of it, shown the most malignant dispositions towards them, without being able to do them the smallest mischief.

'They are convinced by sufficient experience, that the plan, either of lenity or rigour, can be pursued with uniformity and perseverance. Therefore they turn their eyes entirely from Great Britain, where they have neither dependence on friendship nor apprehension from enmity. They look to themselves and their own arrangements. They grow every day into alienation from this country; and whilst they are becoming discontented with our Government, we have not the consolation to find that they are even friendly in their new independence. Nothing can equal the futility, the weakness, the rashness, the timidity, the perpetual contradiction, in the management of our affairs in that part of the world.'

This is strong language from one of the foremost of English statesmen. Moreover he is not speaking as an isolated Briton taking a position in opposition to government as a matter of private opinion. He had represented the people in Parliament. He had been indirectly part of the government itself as private secretary to the Marquis of Rockingham, when the latter was Prime Minister of Great Britain, and he had seen his friend go out of office because he entertained opinions too liberal for the party of the court and the king. That the English people were not fully alive to what the government of the king was doing with the Colonies in America Burke knew very well, and he was deeply concerned with the problem of rousing them to the actualities and the needs of the situation. Quite as uncompromising is his attitude in the following passage from his great speech on *Conciliation with the Colonies*, delivered in the House of Commons in 1774.

'I propose, by removing the ground of difference and by restoring the *former unsuspecting confidence of the Colonies in the mother country*, to give permanent satisfaction to your people, and (far from a scheme of ruling by discord) to reconcile them to each other in the same act, and by the bond of the very same interest which reconciles them to the British Government . . .

'The Colonies complain that they have not the characteristic mark and seal of British freedom. They complain that they are taxed in a parliament in which they are not represented. If you mean to satisfy them at all, you must satisfy them with regard to this complaint . . .

'I wish you to recognize, for the theory, the ancient constitutional policy of this kingdom with regard to representation as that policy has been declared in Acts of Parliament, and, as to practice, to return to that mode . . . in which you walked . . . until the year 1763.

'My resolutions therefore mean to establish the equity and justice of taxation of America, by *grant*, and not by *imposition*.'

No less unmistakable was the attitude of Burke's great contemporary, William Pitt. Speaking in the House of Lords on May 27, 1774, he said:

'This, My Lords, though no new doctrine, has always been my received and unalterable opinion, though no new doctrine, and I will carry it to my grave, *that this country had no right under heaven to tax America*. It is contrary to all the principles of Justice and civil polity, which neither the exigencies of the State, nor even acquiescence in the taxes, could justify upon any occasion whatever.'

A note from Benjamin Franklin and Arthur Lee, American agents in London, dated there February 5, 1775, and made a part of the *Journals of Congress*, shows that this attitude of these leaders of public opinion in the United Kingdom was not without a substantial following among such of the generality of men as gave attention to public affairs.

'We think it proper to inform you that your cause was well defended by a considerable number of good and wise men in both houses of parliament, though far from being a majority; and that many of the commercial and manufacturing parts of the nation, concerned in the American trade, have presented, or, as we understand, are preparing to present, petitions to parliament, declaring their great concern for the present unhappy controversies in America, and praying expressly, or in effect, for healing measures, as the proper means of preserving their commerce, now greatly suffering and in danger.'

The author of the *Letters of Junius*, Burke, and Pitt were all public men absorbed in the political struggles of that day. What were the feelings of some other representative Englishmen whom we may not so much think of as influenced by the passions of party? Many Englishmen were of the opinion that the Colonies were thoroughly in the wrong, but there is abundant evidence that among the finer minds of England there was a deep feeling of distress over the estrangement, a passionate regret that the government had not so managed affairs as to prevent the conflict. The colonists were brother Englishmen maintaining firmly in the New World the principles and purposes that many of them were trying to establish on a more solid basis in their own life at home. They could but give their sympathies in some measure to those who were carrying forward the realization of much that was in their own spirits, on this side of the Atlantic.

A MAN of an altogether different temper and a different range of experiences was the poet, William Cowper. He was not involved in politics, either actively in his own interest or as a partisan adherent. He saw that things had gone badly, that Englishmen had been separated from Englishmen, that there had been wrong and misjudgment and folly somewhere. He was ready to blame anybody and everybody, but to his mind the Americans were Englishmen still. They were not objects of enmity, men to be vituperated and abused, but objects of regret, that there should have arisen so disastrous a difference of opinion between the two branches of the family.

'I consider the loss of America as the ruin of England,' Cowper wrote to Joseph Hill in a letter dated December 9, 1781. On the last day of that year, he wrote to Joseph Newton:

'I consider England and America as one country. They were so in respect of interest, intercourse, and affinity. A great earthquake has made a partition, and now the Atlantic Ocean flows between them . . . This dispensation is evidently a scourge to England, but is it a blessing to America? Time may prove it one, but at present it does not seem to wear an aspect favourable to their privileges, either civil or religious.'

This is not the word of an enemy, but of a man who can still feel himself a friend of those with whom his country has just been at war.

In one of Cowper's letters there is a tribute to Franklin that has a very pleasant flavor. It is dated in 1782, at a time when it might be supposed that an Englishman would have been ready to undervalue anything American. He quotes a letter just at hand from Franklin, in which Franklin has praised a volume of poems of Cowper's that a friend of the poet had given him, and he is so much pleased with the American's approval that he says:

'We may now treat the critics as the Archbishop of Toledo treated Gil Blas, when he found fault with one of his sermons. His grace gave him a kick, and said: "Begone for a jackanapes, and furnish yourself with a better taste, if you know where to find one." '

The colonists who carried forward the Revolution thought as free Englishmen, fought as courageously as ever Englishmen fought, and when it was over, established a government that was the outworking of ideas developed on these shores from English foundations.

Where the Thrill Comes In

(Continued from page 2)

White Sands, between the Sacramento and San Andreas Mountains, with 'Old Baldy' in the distance.

citizens joined forces with thirteen Texas rangers, and sallied forth against the Indian Chief Victorio and his band; riding like the old Scottish borderers, they carried a little sack of meal at the side of their saddles; the rangers were every bit as simple. In the battle eighty-seven Indian warriors fell, one of whom was Victorio. The Apache spirit was broken forever.

From Ysleta you should head into the desert proper, resisting the temptation to go to Juarez, opposite El Paso, and there mail picture postals to your friends by way of leading them to believe you are traveling in foreign countries. For Juarez is only a show place like Greenwich Village, a trading place for American merchants with an eye to a bargain and to the cupidity of tourists of the common variety.

But you will be in a new land if you get to the place where the San Andreas Mountains are on your left hand and the Sacramentos on your right. And you will be seeing the land in its true character if you have chosen the dry season. There are times when the desert blooms, after exceptional rains; but in that case the desert would be no more like the real thing than a motion picture star cavorting about among lath-and-plaster houses in Hollywood while dressed in a Stetson hat and Mexican spurs and a bandana handkerchief is like a Judith Basin cowboy.

So every sensible autoist with a grain of adventure in him should see the desert at its best, in its sterile solitude, with its saline beds and its dried-up lakes, its ranges of sand hills like sea waves, and its tracts when the only vegetation is composed of a few scattered thorn bushes, greasewood in stunted clumps, dwarfed mesquite, sagebrush, and cactus; and its darting lizards of metallic green and blue.

You may see, too, fragmentary skeletons of cattle and horses—sometimes of men. Some of these are modern but others are relics of bygone days when those who made the overland journey to California hit the southern trail; for there were fearful happenings in those days in the alkali lands, as many an old and forgotten diary testifies. Mark this, for example, which I copy from a record made by an overlander named Abbey: 'I counted in a distance of fifteen miles 350 dead horses, 280 oxen, and 120 mules, an average of a dead animal for every 108 feet of the road.' If you are extremely lucky you may find what were called 'prairie letters.' For overlanders often wrote messages on shoulder blades, much as Mohammed was used to do, for the information of others who might pass that way. 'We frequently find a buffalo head stuck up with a notice that there is a spring in such & such a place,' writes one of the old-timers.

BUT a wonder you would be more likely to see is a desert mirage, perhaps the vision of a tree-lined lake, not looking at all unreal or ghostly, but showing up magnificently on the horizon of a barren country. And what you would certainly see is the White Sands, as desert a tract as exists in the wide world, utterly void of vegetable or animal life and looking like nothing so much as a field of snow under a burning sun. There is peril in the crossing of that waste, though men have done it just as men have attempted and done everything in the world, both good and bad.

On skirting the White Sands you should get out of the machine and climb one of the dunes, if you have shaped your course with the white waste on your port side. From the summit, looking eastward, you will see trees with such strange distinctness that they seem to be only a couple of miles away. It is no mirage. They are cottonwoods, lofty and widespreading and shade-giving, edging that mile-long oasis in the desert called 'Alamogordo'—a man-made oasis, twenty-five years or so old.

Two little rivers were led to the place where the town stands: one, of alkali water, served for irrigation; the other, which burst out of the hills seven miles away, was good drinking water. With the water the hard and dry soil blossomed wonderfully, and the land is now tilled to the foot of the mountains. In the town are electric lights and motion picture palaces, and taxicabs, a railroad depot, Sunday newspapers, filling stations, dance halls, and people afraid of being out of a job and real estate speculators and money lenders and ice cream parlors—and all other strangely stirring things belonging to civilization.

So your journey into the wilds is at an end unless you care to venture north into the land of the Pueblo Indians. They are a queer folk who, like the conies, live in the rocks. That is, their villages are built in cliff walls hollowed out and then rewalled, very much like the troglodyte dwellings in Cappadocia, which, if you have no senseless prejudice against the Bible, you may find referred to by a writer named Obadiah.

But should you, like a wise traveler, decide to return by a way altogether new, here is one. Go to La Luz, an old-time Mexican town, where Billy the Kid once operated and where Pat Garrett was killed by a sheepherder. (In passing I should say that Pat Garrett's daughter, Miss Elizabeth, had a splendid contralto voice, and we gave a concert or two together.) Climb the Sacramento Mountains next. The road is a winding one of ten miles or so, taking you from an altitude of four thousand feet to nine thousand at Cloudcroft, which is four miles in an air line from Alamogordo. Next head boldly eastward, down the Penasco River, across the Mescalero Apache Reservation, until you hit the road that leads to Amarillo. You should be able easily to manage it with automobile, thermos bottle, blankets, and all the comforts and conveniences of today. Though I doubt that you will have a better time than I did, traveling afoot, for the appetizing sauce of difficulty went with the doing.

Discovers Apocryphal Gospel

By LOUIS C. KARPINSKI

DR. M. R. JAMES, provost of Eton, has discovered in the Cathedral library at Hereford, a manuscript of one of the lost apocryphal gospels. This gospel of Saint Peter has long been known through small fragments, but this manuscript brings a new story of the birth of Jesus. Dr. James found two other versions of this story of the birth of Christ, one in the British Museum and the other in an Irish manuscript which omits the unorthodox passages. The Greek version of the gospel of Saint Peter was brought to England in the Fourth Century by Anglo-Saxon pilgrims. The translation, author unknown, was made in the 13th Century, when the real revival of learning in Europe began most actively, particularly with translations from the Arabic.

The main narrative is given by Jacques, son of Joseph the carpenter; Jacques is reputed to have been an eyewitness of the recorded events. While Jacques plays no rôle, a new character Simeon is introduced, son of Joseph by a former marriage.

Hiking in the Mountains

(*Continued from page 4*)

in his chosen patch. But a different surprise was in store. Turning between two clumps of trees and crossing a low reef of rocks which just broke through the surface of the grass, we found ourselves suddenly on the shore of another lake, not marked on the map—a small lake, but undoubtedly a permanent one. As we stood there a sudden drumming of hoofs struck our ears. We were just in time to see a noble elk sweep by into the thicket, its widespreading antlers threading the boughs as by magic. At the outlet of the big lake we halted and looked up to the great cliff of Mount Reynolds. In the old days it took its name from a hunter whose prowess and stamina as a hiker were recorded in his Indian nickname, 'Death on the Trail.' An early demise was supposed to be the fate of any who attempted to stay with him when on the move. There seemed an appropriateness in this name's being assigned to a mountain of such formidable aspect.

With difficulty we tore ourselves away, to stroll up the easy slopes to the north, cross the saddle which hides the lake from the world, and drop down to the pass. A series of blasts was in progress and so, after some talk with the workmen, we went along the Garden Wall trail to Granite Park chalets. The whole valley below was full of signs of the great road that was being built. It had reached that stage in which a well-engineered road is one of the finest symbols of man's command over nature.

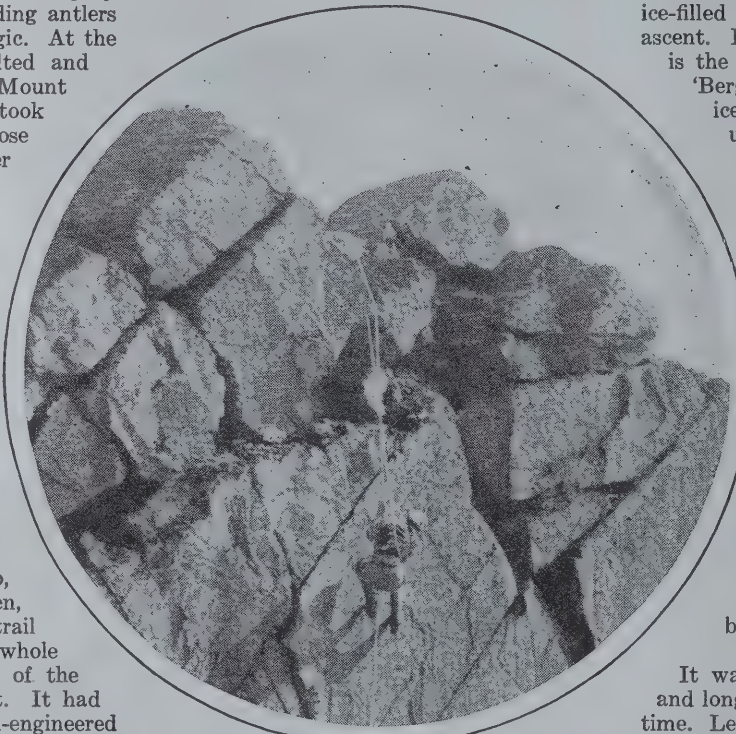
FROM Granite Park we made, as by accident, an expedition which will serve as the third method of enjoyable mountain travel—genuine climbing.

We set out late on a cloudy morning, intending only to visit the crest of Garden Wall before descending to Lake McDonald. We followed the good trail that takes one quickly up to the first notch in the sky line, and looked down on Grinnell Glacier, Lakes Grinnell and Josephine and on the Many Glacier region. While clouds interfered with most of this prospect, on Grinnell Glacier itself we were surprised to spy a wandering pair of human beings. After watching them a while we decided to go down to the glacier.

The descent offered no difficulty. A wide funnel-shaped hollow dropped away from where we stood to the level of the glacier. This was lined for the most part with moderately steep snow, thinning out in the upper hundred feet to bare rock, littered with the usual mountain rubbish of stones, broken fragments and dust. We zigzagged down these rocks, following the line of least resistance.

The snow, when we reached it, presented a minor problem. It was snow which lends itself to what is called 'glissading.' In this maneuver you place your feet with the toes well pointed downward, lean a little forward and go down with a rush, balancing, if the slope is uneven, by holding ice axe or staff behind you. This also acts as a brake if you wish to stop; or you may stop by turning the foot sideways to the slope; you steer much as in skiing. This form of glissade is to be preferred to the sitting variety usually indulged in by beginners.

The great objection to glissading is the possibility of running unexpectedly upon ice. More lives are lost in the Alps through this cause than through any other.



—*Ray-Bell Films.*

Genuine climbing. One of the members of the author's party in Glacier National Park.

We happened to have axes with us. As the presence of ice patches was not an impossibility, the temptation to glissade had to be resisted. We resorted to the comparatively tedious process of kicking down the slope. The secret of this is to stand up well and to use no half measures in the forcing in of the heel.

In this discreet manner we gained the lower reaches, where running was permissible; and so we came quickly to the glacier. There we met a numerous party who were enjoying their first contact with crevasses and the rest of ice phenomena.

The glacier here lies on two levels separated by a belt of rocks. The upper shelf of ice breaks off from time to time, leaving great pale-blue scars where the fallen fragments have separated from the main mass. If this upper glacier should advance, the pass would cease to be possible; at present a wide corridor or balcony is left at the crest of the rock belt. Ice avalanches are too infrequent to be a serious consideration.

A direct attack upon these ice cliffs would be a long job, though amusing to the man who wants practice with his ice axe. To take a single step in ice takes at least a half-dozen blows and may take as many as sixty, even in the most powerful hands. In snow, on the other hand, a couple of chips or scrapes will be sufficient. Having no axes we took what will usually be the route followed and outflanked this hundred-foot obstacle on the right, walked round it on the more level part of the glacier and so came to the upper stretch of cliffs which lead to the ridge of the Garden Wall. The crest of the rocks which bound a small ice-filled gully gives the obvious line of ascent. But between them and the glacier is the pit (known in Alpine parlance as 'Bergschrund' or 'rimaie') where the ice has split away from the rocks under the pull of the glacier. It is a grim pit giving one a glimpse of that dark and horrid underworld of the glacier where its terrible weight grinding on its bed reduces everything to a noisome gray powder. Once across this moat the Garden Wall was soon ours. After half a dozen amusing little 'pitches' (the space of rock dividing a ledge or standing ground from the next point at which a climber may fix himself securely to 'take in' the rope, is called a pitch) the angle eased off, a few steps of walking and the western mountains, with Heaven's Peak resplendent amid them, rose up before us.

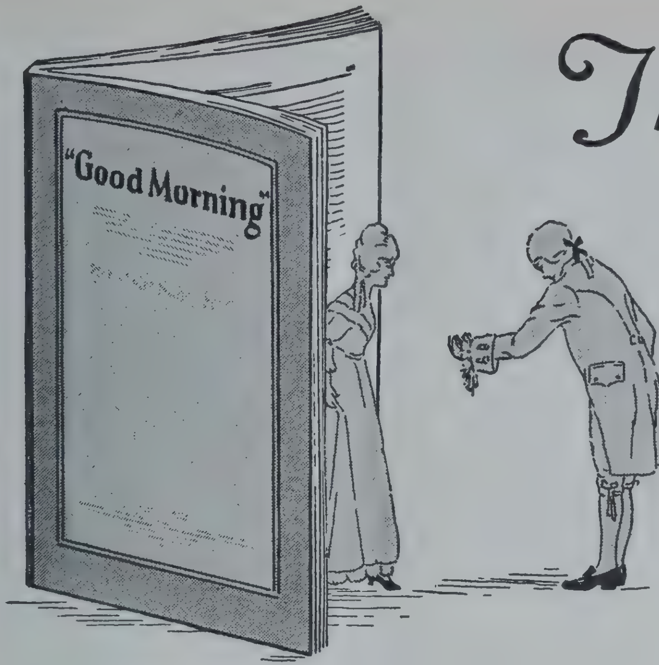
* * *

It was 5 p. m. Gossip on the glacier and long lingering had swallowed up our time. Less than an hour away was Granite Park Chalet, from which we had set out. On the other hand, our original intention to go down to McDonald Lake was still strong in us. We felt perfectly fresh; pleasant climbing has this extraordinary effect: while the exhilaration lasts, fatigue is imperceptible. Disregarding the fact that twenty-two miles would have to be added to what was already a moderate day's travel, we thoughtlessly set out on the valley road.

By the time we realized the folly of our proceedings, night had fallen, mitigating to some degree the monotony of road walking. Never walk a surfaced road. The only foot that can stand it is one which has never trod mountain or forest trail.

The tourist who tramps through mountains on the road has no conception of what he is missing. The road is for the automobile and for those who cannot make a nearer approach. On the trail a greater intimacy with the hills is possible. More confidential still is the knowledge to be gained by the deeper entrance into fastnesses where no trail exists and where the traveler must rely upon himself. Best of all is the reward to be won by the climber to whom not even innermost recesses, the uttermost sanctuaries of the mountains, are barred.

The chances, changes and rival delights of the various forms of mountain sport cannot be enjoyed by holding to a single branch of mountaineering. A mixed bag of expeditions, in which the hybrid type of hike is frequently present, is best of all.



The RETURN of the DANCE

Everyone enjoys the old-time dances. They are easy to learn. They are being taken up enthusiastically by schools, clubs and community groups.

Piano Music for twenty popular old American dances is available. Price 50c the set.

Orchestrations of 13 parts each, including saxophone, for 20 dances. Specially priced $2 the complete set.
Single Orchestrations 15c each.

Edison, Columbia *and* Victor have recorded Old American Dance Music as played by the Henry Ford Orchestra. Your local music dealer handles these records.

THE methods of the world-famed Ford School of Dancing at Dearborn are now made available to everyone in the specially prepared manual entitled

'GOOD MORNING'

Compiled by Mr. and Mrs. Henry Ford

This 169-page manual contains complete information with instructions on each of the dances. Calls, music and pictures visualizing the various steps are given. There is also detailed information on how to arrange and conduct a successful dance.

The origin and etiquette of dancing, style and deportment are also fully described. This feature makes *Good Morning* a valuable reference book, especially in connection with the training of children.

Send for this book today. 50c a copy, postpaid.

The Dearborn Publishing Co.,
Dearborn, Mich.

Please send me the items checked below for which I enclose remittance of
$...............

...............copies of *Good Morning* @ 50c a copy ....
...............sets of Piano copies @ 50c a set ....
...............sets of Orchestrations (13 parts) @ 15c per orchestration....................

Name..
Street or R. F. D...
City.. *State*..

Table of Contents
'GOOD MORNING'

- The Return of the Dance
- Style in Dancing
- Deportment in Dancing
- Arranging for a Party
- Positions of the Feet in Dancing
- Dictionary of Dance Terms
- Floor Manager
- Prompting
- Quadrilles
- The Lancers
- Novelty Quadrilles
- Contra Dances
- Minuet
- Exercising the Knee Joints
- The Waltz and Other Round Dances

Wall Street's National Daily

(Continued from page 15)

last, inaugurated five years ago, was profitable from the start.

Thus there are four primary utilizations of news, by the Barron organization. Each meets, in most part, a demand that is distinct. While in general the same material is drawn on by all, the news is worked over and supplemented for each agency of distribution.

The Wall Street Journal is singular among daily newspapers in that virtually all of the material appearing therein is original. It uses practically no press association copy and no features of the syndicated kind. It is probably the only important newspaper that might live on what it receives from subscribers. This puts its advertisers securely in a position secondary to that of its readers.

THE personnel of the Barron organization must be made up of specialists. Many of its members are experts. For instance, the man who handles the railroad department has been specializing in his field for more than twenty years. Other experts look after other big fields, such as those of steel, oil, crops, and of varying classes of mines and manufactures.

A more literal theory of news than that followed by the run of newspapers and press services has to be adhered to by them. The basis of this is Mr. Barron's motto, 'The truth in its proper use.' Accuracy must be pursued with scientific care; for a misstatement, even a statistical error, may cause immense losses before it can be corrected.

The Wall Street Journal is probably the most trusted newspaper in America because its statements of fact are guides to actions involving money in greatest measure. This newspaper is the fullest single expression of what in the practical sense is symbolized by 'Wall Street,' of which it is as integral a part as the New York Stock Exchange or the house of Morgan.

However, it is much else. For example, there is its editorial page, one of the last whereon are exercised the pointed thrusts of a single vivid individuality. It is that of William P. Hamilton, its editor. Though he has been a journalist on four continents, Mr. Hamilton's association with *The Wall Street Journal* antedates the purchase by its present owners, who never interfere with him.

'I wrote seven hundred editorials before one was published,' says the man whom many followers of journalism rank at the head of American editorial writers.

Whatever its advocacies—and they are not usually of the kind that please the radically minded—there are no equivocations on the editorial page of *The Wall Street Journal.*

Vigorously 'regular' on economic and political principles, *The Wall Street Journal* probably attacks more often than it defends practices in the realm of finance for which it is popularly regarded as a spokesman.

One of the paper's former editors was appointed a member of the Interstate Commerce Commission not long ago by President Coolidge. Confirmation of the appointment was opposed in the Senate, on the ground, among others, that the appointee had 'written' about railroads for *The Wall Street Journal.* This was true, but the bulk of his writing on the subject at the time was displeasing to most of the railway officials of the country. He condemned many practices then prevailing and urged reforms, notably in matters of accounting, that have since been made.

When Mr. Barron opened *The Wall Street Journal* to dramatic criticism he did it without permitting solicitation of any advertising from the theaters. He engaged James Metcalfe, then probably the ablest dramatic critic in the country—the man who, on the staff of the magazine *Life,* sounded the first compelling outcry against the purveyors of filth upon the New York stage. *The Wall Street Journal* gave Metcalfe a free hand to state the truth without animosity. Mr. Barron's idea was that the people of wealth and position who read *The Wall Street Journal* were entitled to know the absolute truth concerning the stage, and understand thoroughly the plays to which they might take their families. Mr. Metcalfe has passed off the stage of this world, but the above principles remain.

Most newspapers, like nearly all mundane enterprises, reflect the souls of single individuals. In the case of *The Wall Street Journal* and its associated mediums of news distribution that individual is Clarence W. Barron, who exults in being classed as only a reporter. He rarely visits his offices; but sometimes his suggestions in messages in letters, notes, telegrams and telephone number well above 50 as counted in a single day at the New York office. He treats all the world as his 'news beat'; yet his is the predominant spirit of the establishment.

He rambles through Europe every year or two, stumbles afoot over real estate subdivisions in Florida, studies petroleum and revolution in Mexico, saunters among cane mills in Cuba and manufacturing plants everywhere and writes always as a reporter of the facts.

NEXT to reporting, his passion is for people, all kinds of people. He is probably on intimate footing with more leaders and more kinds of men throughout the world than any other American.

His creed transcends the fact note which dominates his publications. It is:

'I believe in service and I believe in happiness. The laws of service are the laws of happiness and the laws of happiness are the laws of service. I know no other happiness. There are no other laws.'

He is an adherent of the Swedenborgian faith, and has written much about it. He is also a farmer, cultivating much land in the vicinity of Cohasset, Massachusetts, where he operates a dairy for supplying certified milk to insure the lives of children. He is the country's largest importer of Guernsey cattle. In his Boston home, there are eighteen telephones, with a private exchange, which is always busy when Mr. Barron is there.

He has had most to do with formulating the theory of news which is adhered to by the Barron organization.

'News is a creation out of facts,' he says. 'Hence its proper presentation calls for skill, honesty, devotion to the spirit of service, and for firm adherence to truth in its proper use. No newspaper can publish everything that happens, nor, usually, all details having to do with what happens. Hence there must be selection. The newspaper that aims chiefly at pleasing or entertaining its readers cannot always publish the truth no matter how it may adhere to facts. To exaggerate or to set forth only those facts which you think will please or entertain your reader is to misstate.

'In presenting financial news we let the facts tell all. We have never indulged in prophecy. You can never say positively what is going to happen in any specific instance, for too many unseen forces enter into the shaping of even the slightest occurrence.'

Mr. Barron adhered to the rule of 'facts only' even in warring on gigantic evils of speculation, as when he arrayed himself against the Lawson-Rogers operations in Amalgamated Copper a quarter of a century ago. When the stock was being whipped up to unjustified heights he merely published what his investigations showed to be its real worth.

HE WAS then a comparatively poor man. They tried to stop him.

'The only way in which you can keep me from presenting facts,' he said, 'is to put me out of business. But I can still earn eighteen dollars a week as a stenographer.' Facts won out.

'I object particularly to pessimistic prophecies,' he says, 'for predictions tend to confirm themselves. Suppose the president of the United States should say that a bear market is coming. It would come just because of the prediction in so powerful a quarter.

'The pessimist has not the same right of expression as the optimist. No one has the right to damage another's property or to retard another's progress by damning it with pessimistic prophecy.

'Every business man is building for the future and one who follows bearish predictions had better stop. Remember that the sun is always shining somewhere. In my fifty years' study of finance I have never known a time when prosperity didn't exist in the United States, in some kinds of business or industry or among some concerns. We control too many of the world's basic products for the outlook to be other than good for this country. Here are some of the figures: Petroleum, 73 per cent; cotton, 58 per cent; zinc, 43 per cent; copper, 58 per cent; steel, 52 per cent; iron, 51 per cent. The full list is a long one.

'If there is one thing that the schools and the public need it is knowledge of the A B C's of finance. There is not a problem of finance which does not affect everyone's pocketbook. And none is difficult to understand; for each is mainly a question of debits and credits or of present assets and future demands.

'The craziest of ideas is that of individual monopoly, particularly of ideas or facts. The more a man knows and thinks he gains by keeping his knowledge to himself the more he loses. The more he expresses his knowledge, the more he knows whether it is sound and the more he adds to it through exchanges.

'A possibly more foolish notion is that wealth postulates poverty, that you can grow rich only by making or keeping someone else poor. Wealth is nothing but the accumulation of wages, and the better the wage the greater, naturally, the accumulation. Suppose the wages of Orientals equaled those of Americans. What this would mean in terms of consumption of goods we produce is almost unimaginable. Such would mean still better wages and more accumulation of wealth in this country.

'Another foolish notion is that power derives from material things. True power comes from within, not from something outside us. It is inward determination. Happiness does not come from selfish accumulation. It comes from service.

'And service and happiness are found just as truly in the everyday affairs of the world and its material blessings as in big affairs or in the business of giving or of service without compensation.'

Such, briefly, is the country's almost only national newspaper, the organization of which it is a part, and the man whose spirit dominates both. At more than threescore and ten, he is an inveterate optimist, though he has rubbed for half a century against the rough as well as the smooth sides of American finance. His career has been immersed in statistics and bounded in the main by the solid facts of business. Yet his philosophy of life far transcends mere figures on paper and his interests have only a foothold in things purely material.

The Creation, According *to the* Fans

By HENRI GALLAND

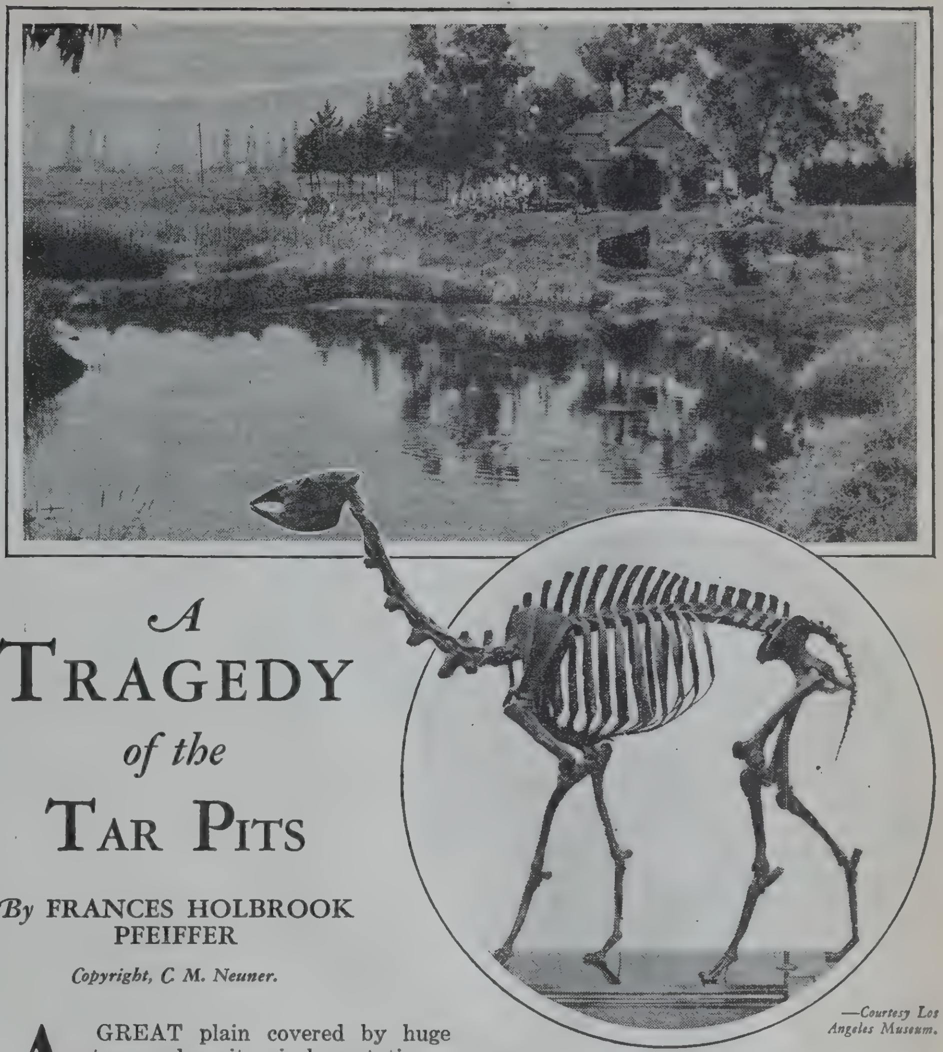
GOD created man with clay. First He gave him the shape of a lizard and, after five days, He put that lizard in a large basin. The five days over, He filled the basin with water and left the lizard there for seven more days. On the eighth day God went to see it and called out to it: "Get Out." It got out. It was a man. Man asked God: "Who created Thee?" And God replied: "I have neither beginning nor end; I am eternal." Then God ordered Man to clear the forest and to sow its ground; some time after, man noticed trees had sprung there. And God said to man: "Which do you prefer as a companion, a man or woman?" Man answered: "Whichever Thou wilt give me." Then God ordered him to lie down. He plunged him into a sound sleep and while he was asleep, He tore his big toe off. He then woke up man, took an earthen pot, poured water into it and dipped man's toe into that water. When he saw that, man wept; but God sent him to the garden and when he came back to the village of God, he caught sight of a woman. God said: "Here is your mate." '

Such is—besides a few details which I leave out—the account of the creation of the world among the Fans of Gaboon. There are other different accounts, according to tribes; from all of them, however divergent they may be, one conclusion is to be drawn: among the most primitive peoples, the pygmies for instance, there is to be found a belief in a supreme being.

A TRAGEDY *of the* TAR PITS

By FRANCES HOLBROOK PFEIFFER

Copyright, C M. Neuner.



—*Courtesy Los Angeles Museum.*

Circle—*Prehistoric camel from Rancho La Brea.* Above—*This excavation, now filled with water, in the asphalt pit region, contained some of the first fossils discovered in California.*

A GREAT plain covered by huge trees and semitropical vegetation—giant ferns and big-leaved plants—marshy places in the deep shade lighted by the gleam of many pools; monstrous creatures feeding upon the herbage and they, in turn, hunted by terrible carnivorous animals; giant birds flying overhead. That was southern California, the region west of the mountains, where Los Angeles now stands, and reaching to the sea—in the Glacial Period.

The history of this awful age is written in the asphalt pools of Rancho La Brea, lying a few miles west of Los Angeles. These tar pools, craterlike pits formed by gas 'blowouts' from oil deposits beneath, became the death traps of innumerable animals over many hundreds of centuries!

Owing to the preserving qualities of the tar-soaked sand Rancho La Brea has yielded the largest collection of Pleistocene material in the world—bones of 25,000 individual animals: those of the long extinct mastodon, and the Imperial elephant; great numbers of the fierce saber-toothed tiger; giant sloths, peacocks unknown elsewhere; the largest flying bird, the giant *Teretornis*—'Terrible Bird'; the prehistoric camel and the horse (the latter two probably originating here); strange vegetation no longer existing in this locality; a well-preserved cypress tree standing upright, with roots and bark—a tree native to northern California; stone-age human implements, and, most sensational of all and most tragic, the discovery of the bones and skull of a human being thought to be those of a medium-sized woman!

Where the first man came from—the first Californian—we do not know. A poetic theory, and a plausible one, is that he was storm-blown from Asia. That he was here at an early time is the practical conclusion from discoveries of human bones at great depths together with those of the saber-toothed tiger, and also by finding the human skull and bones in the tar pools of Rancho La Brea, near Los Angeles.

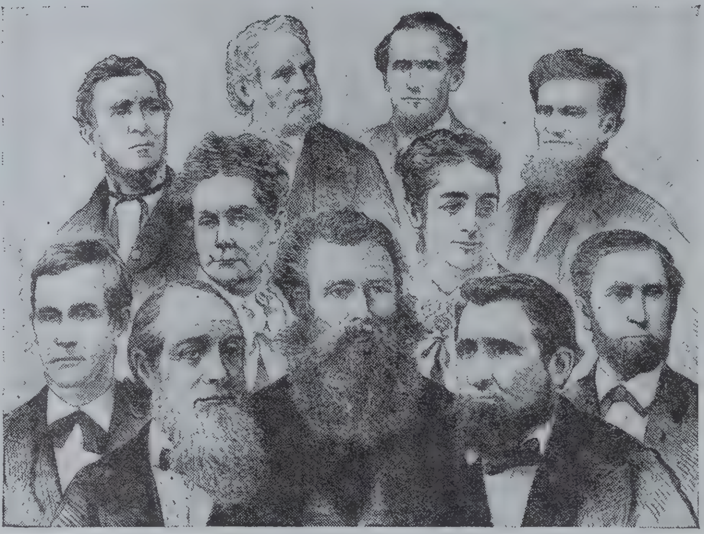
The woman who met her tragic fate in that death trap of the ages left a record of stupendous import. It is interesting to conjecture why the remains of only *one* human being were found among bones of innumerable animals—seventeen elephants, for instance, in one pit—this fact indicating the intelligence of those who, although they were helpless to rescue her, were warned by her fate and passed it on as a tradition.

Or, was she brought over the mountains in the talons of the 'Terrible Bird' which let her fall and dropped after her? We can only surmise. The bones of that great, long extinct bird were found in the same pit above those of the woman, which leads to the conclusion that, because they were found together, this ancient tragedy took place about ten thousand years ago.

Although primitive man continued to exist amidst such ferocity, he was not developing as man was elsewhere on the globe. When the first white man stepped upon California soil in 1542, he found a dense population not far advanced beyond the stone age.

The National Grange *and the* Awakening *of the* Farmer

By
J. V. NASH



Some of the founders and officers of the National Grange in 1873.
Front, left—*William Saunders, First Master*; right—*O. H. Kelley, Secretary.* Second row, left—*John Weir, First Master, Indiana*; center—*D. W. Adams, Master*; right—*C. D. Beeman, General National Deputy.* Third row—*Mrs. J. C. Abbott, 'Flora,'* and *Mrs. D. W. Adams, 'Ceres.'* Fourth row, left—*T. R. Allen, Master, Missouri; John Cochrane, Master, Wisconsin; S. H. Ellis, Master, Ohio; F. H. Dumbauld, Master, Kansas.*

IN THE development of the American farmer since 1865, the work of the National Grange, otherwise known as the order of the Patrons of Husbandry, has received too little attention from historians and hence from the public at large. And yet, through its work during the past half-century, it has achieved results of importance, both to farming communities and to the nation.

It was the National Grange that developed the idea of a Department of Agriculture with its secretary a cabinet officer. It secured the establishment of agricultural colleges and experiment stations in many states.

From the very beginning of its existence, the Grange advocated prohibition, and as far back as 1875 it formally indorsed woman suffrage, having proved its sincerity by applying the principle to its own organization, in which women were accepted on a perfect equality with men.

As early as 1886 the Grange declared for the direct election of United States senators by the people. It worked for pure food laws and meat inspection, and exerted its influence to procure humane treatment of livestock in transit.

LIKE most movements which have exercised a powerful and lasting influence upon our history, the National Grange began in a small way. The movement had its inception in the mind of a Boston boy who migrated to northern Minnesota. His name was Oliver Hudson Kelley. In October, 1865, Kelley was summoned to Washington by the agricultural commissioner, Isaac Newton, and after a conference with President Johnson was appointed a special agent of the bureau of agriculture.

On January 13, 1866, he set out for a tour of the Southern States, and, while in his travels, conducted 'a lively correspondence' with friends in the North. In a letter to his niece, Miss C. A. Hall of Boston, he first broached the idea of a society of farmers for the purpose of restoring good feeling among the people of North and South in those postwar days.

According to Kelley's plan, the order was to embrace persons directly interested in the cultivation of the soil, and was to consist of various degrees, the lectures in each degree to be practical, pertaining to agricultural work, but at the same time conveying a moral lesson. Both sexes were to be admitted to equal membership, with separate degrees for the women, but both men and women meeting in common. The national organization was to be tied up with local granges in the various counties through state granges.

THE name *Patrons of Husbandry* was finally selected, but the alternative form, the *Grange* has always been popular. On November 15, 1867, the first formal meeting was held in Washington, at which plans of organization were perfected. By December 4, 1868, the National Grange was organized, with the following officers:

Master	Wm. Saunders
Secretary	O. H. Kelley
Treasurer	Wm. M. Ireland
Overseer	A. Bartlett
Lecturer	J. R. Thompson
Steward	Wm. Muir
Asst. Steward	A. S. Moss

Soon thereafter subordinate granges began to be organized in the various states.

The various degrees established were as follows:

Subordinate Granges

First degree: Laborer (man), maid (woman).
Second degree: Cultivator (man), shepherdess (woman). Third degree: Harvester (man), gleaner (woman). Fourth degree: Husbandman (man), matron (woman).

State Grange

Fifth degree: Pomona (Hope).
Composed of masters of subordinate granges, and their wives, who are matrons.

National Grange

Sixth degree: Flora (Charity).
Composed of masters of state granges, and their wives, who have taken degree of Pomona.
Seventh degree: Ceres (Faith).
Members of the National Grange who have served one year therein may become members of this degree upon application and election.

The dues were made so small as to bring membership within the means of all.

Mr. Kelley resigned from the Government service, and devoted all his time to the interests of the new society, aiding in the establishment of local granges in the various states. They were soon flourishing in New York, Pennsylvania, Ohio, Illinois, Iowa, North and South Carolina and Georgia. In a few years several thousand local granges had sprung up. On April 1, 1874, the total membership was said to be 1,500,000.

The prime object of the order was the promotion of the social, educational, and economic interests of the farmers. As soon as a local grange was formed, one of the first steps taken was to devise some plan of coöperative buying and selling. Often an agency would be established, supplied with a certain amount of capital by the Grange or by a stock company of members. In other instances, the granges of a county or other district would join together in a county council or Pomona Grange, and form a county or district agency to aid the members in their buying and selling. Later on, state agencies were established. In December, 1874, twenty-six state granges were operating some sort of agency system. In the Middle West a considerable number of patrons' coöperative stores were established during 1874-5.

GRANGE fire insurance companies were organized in several places, small fees being paid for membership and proportional assessments made upon members whenever there was a loss. While some of these companies were not successful, others—especially in the East—continued to flourish and are reported as still in existence.

The value of the social and educational activities of the grange can never be estimated; this alone would have more than justified the existence of the organization. In the early seventies there were no telephones, automobiles or rural free delivery service—in fact, nothing to bring the farmer into touch with the great outside world. Farm life, consequently, was lonely and monotonous. The grange, by means of regular monthly, semimonthly, or weekly meetings, provided a meeting place for the farmers, their wives, their sons and their daughters. At the meetings there was an interesting and pleasing ritual, a literary and musical program, games, and conversation. Sometimes the meetings were held in country schoolhouses, village halls, or private homes, but where feasible the granges built grange halls with suitable conveniences.

In traveling about the country today, one still finds these grange halls dotting the landscape. Besides the regular meetings, there were informal 'get-togethers' of all kinds—festivals, picnics, and outdoor gatherings where special speakers made addresses on timely topics.

In every grange there was a lecturer, who prepared a program for each meeting. Questions of general interest were proposed for discussion. Some of the granges established libraries—there were practically no public libraries at that time—and each grange generally subscribed to a number of agricultural papers which were passed round among the members.

CHATS WITH OFFICE CALLERS

'How does it feel to be a feminine attorney,' said the ***Woman Lawyer,*** repeating a query. 'Well—that depends! I grew up in the atmosphere of the law, as my father who was a lawyer was my pal and chum. I had helped in his office, been interested in his cases and copied his briefs. I did not go into an alien atmosphere. The lawyer's point of view, legal terms, and the habit of looking at things from the legal angle were among my earliest acquisitions.

'In those days the idea of a woman really practising law was supposed to be quite funny. I had a dear old uncle who was very fond of me, and one day I proudly confided to him that I was going to be a lawyer. I can still hear the chuckle and the humorous drawl with which he answered: "Oh, you'd better get a mop and a broom."

'One woman in a law school seemed to be very embarrassing to the men. They did not know just what was expected of them. On graduation night, the faculty placed their one woman graduate in the back row of the stage where she could be hidden out of sight and so not attract too much notice. But I was told that a representative delegation of the class went to the dean and protested against this arrangement. Anyway, after being assigned to a place in the back row, I was requested to go down and take a place in the front row.

'I remember soon after I entered the law college some one from one of the other classes brought a little mouse up to the floor where my class was reciting, and released it in the crack of the door just in front of where I sat.

'Fortunately for me on this occasion, mice have never been among my pet aversions, and so nothing in particular happened, except that the mouse ran away.'

* * *

'Gassing is by no means limited to war,' said the ***Visiting Surgeon.*** 'Many persons who do not suspect it are being slowly gassed day by day in their homes. The gassing is caused by carbon monoxide, which under certain conditions is formed when fuel burns in cookstoves, in heating stoves, in furnaces, and in gas or gasoline engines.

'The Ohio State Department of Health reported 81 cases of carbon monoxide poisoning with 34 deaths, during the first ten weeks of one winter. Injuries and fatalities from this cause rise rapidly as the weather gets colder, owing to the increased tendency to neglect ventilation. Carbon monoxide poisoning always means bad ventilation.

'This may suggest to housewives why they are drowsy in the daytime and sleepless at night. If they are accustomed to use a gas cookstove or a gas heating stove, especially in winter, with imperfect ventilation, they may make a very shrewd guess as to the cause of their trouble, and may be able to prevent further damage. Kitchens should be better ventilated.

'Where possible, heaters should be installed in the fireplace, so that the products of combustion may go up the chimney. Under no circumstances should gasoline motors be run in a closed room.

'In closing the chimney damper of a stove, there is always the danger that partly burned gases will be forced out into the room. This damper should be closed cautiously if at all, especially when the chimney draft is not good; and the room should be well ventilated.'

* * *

'Jazz,' said the ***Dancing Instructor,*** 'had to play itself out. This having been about accomplished, the better element in the nation is wondering what will take its place. It is not like Americans to divest themselves entirely of novelties. Women are said to be more responsible for these extreme fads than men. This is not true. Men adopted jazz to a greater extent than women, and it has been more difficult to eradicate from the minds of men the idea that jazz dancing after all is not real artistry than it has been to teach the women so.

'The Dancing Masters of America some time ago prescribed nine "Don'ts" for dancers and dancing academies. They will bear repeating once in a while.

'1. Don't permit vulgar jazz music to be played;

'2. Don't permit young men to hold their partners tightly;

'3. Don't permit partners to dance with cheeks close or touching;

'4. Don't permit "neck holds";

'5. Don't permit so-called "shimmy" or "toddle dancing";

'6. Don't permit dancers to take exceptionally long or exceptionally short steps;

'7. Don't dance from the waist up; dance from the waist down;

'8. Don't permit suggestive movements;

'9. Don't permit dancers to copy the extremes that are now used on the stage.

—Kuhn, *Indianapolis News.*

AFTER THE FIRST WEEK OR SO.

These "nine points" constitute what the Dancing Masters of America may very properly proclaim a way of escape from the "jazz" age.'

* * *

'For a combination of beauty and usefulness, I think there is nothing to equal a rice field when it is young and green or when it is golden-ripe unto the harvest,' said the ***Returning Missionary.***

'A green rice field in the early tropical morning with its dewy blades sparkling under the first warm sunlight is a thing to remember long.

'Often have I driven through a province at rice harvest time to watch the harvesters, working with a straw roof over them. The carabaos tread out the grain, eight abreast; walking, walking, walking; now turned about to keep from getting dizzy. Beautiful brown-skinned women stand with trays of rice; holding the grains high above their heads, they let them fall that the chaff may be blown away in the wind—which reminds one of the "chaff which the wind driveth away" and the "ox that treadeth out the corn." A guitar player is part of the scene; he plays as the others work. The chanting of the harvesters, the smell of grain in the warm tropical afternoon, the yellow straw stacks and the stubbled fields combine to make a memorable setting.'

* * *

'The Great Lakes provide a route for the largest and most economical movement of freight in the world,' said the ***Commercial Man.*** 'The commerce of the Detroit River, the "Main Street" of lake shipping, is double that of any port of the Seven Seas. The combined traffic of such other narrows as the Panama and the Suez canals, the straits of Gibraltar, Constantinople and Singapore, fails to equal that of the Detroit River, although it is closed by ice during one-third of the year.

'The distribution of manufactured products is cheapened by the Great Lakes as every manufacturer with a national market knows full well; and here again the ultimate consumer shares in the saving.

'But the outstanding element in the navigation of the Great Lakes is that America would not have been able to attain her present world supremacy in steel production if these lakes were not available to carry the iron ore of the Lake Superior country down to the southern lake ports, Gary, Detroit, Lorain, Cleveland, Ashtabula and Buffalo. Either at these points or nearby, the ores are brought into contact with the coking coal of the middle Appalachian Mountains and converted into iron and steel on a cost basis that enables American industry to dominate the world market. Utah has iron ore deposits of immense proportions but there is no waterway there to carry this ore to coking coal districts; and Utah ore lies dormant just as the Superior ore would if the lakes were not utilized.'

CAN YOU TELL ME?

Question. Is an autopsy performed on a body after electrocution and if so, why?

Answer. The statutes of the State of New York provide that an autopsy must be performed on the body after a condemned prisoner has been electrocuted. The provision for autopsy promotes the possibility of scientific research of the different problems included in studies resulting from deaths in this particular class. For statutes relative to this matter in other states write to the Secretary of State, at the capital of the state regarding which the information is desired.

* * *

Q. What is the name of the King of Holland?

A. The prince-consort of Queen Wilhelmina of Holland is Henry Frederick, Duke of Mecklenburg-Schwerin, to whom she was married in February, 1901.

* * *

Q. What day of the week do the Mohammedans observe as the Sabbath day?

A. Mohammed adopted a new sacred day in lieu of the Jewish Saturday and the Christian Sunday, on the week day in which he had safely reached Kuba—Friday; but the sanctity was reduced to the actual time occupied in public worship.

* * *

Q. What was the first iron battleship to engage in a fight and where was it built?

A. The first important use of armor plate was made in the operations against Gibraltar in 1782. The Chevalier d'Arçon had caused to be constructed 10 floating batteries of 600 to 1,200 tons, armed with 10 to 20 guns each. The hulls were of wood, protected with bars of iron laid on at short intervals, with an outer covering of cork. Sand was placed in the spaces between the bars and it was to be kept wet to avoid danger of fire from red-hot shot. In the attack on Gibraltar on September 13, 1782, one of the vessels took fire, and as they were moored very close together, the conflagration spread to the others and all were destroyed. In September, 1854, the French Government began the construction of several armored floating batteries fitted with weak auxiliary power for which designs had been prepared some years before. Three of them took part in the attack on the Russian batteries at Kinburn, October 17, 1855. While practically uninjured themselves, they were able to lie so close to the enemy's works, that they dismounted nearly half his guns and compelled him to surrender after four hours' fighting, though these batteries had held at bay the combined wooden fleets of France and England for months. Their success demonstrated the value of armor plate. England at once followed with others of the same kind; then came the French *La Gloire*, the British *Warrior*, and the ironclads and monitors of the American Civil War. The *Gloire* was the first seagoing armorclad. While the European ships were, for the most part, modifications of existing types, the American ships were constructed from new designs, or railway iron and the like was attached to existing vessels. The *Monitor* was the first successful ironclad in the United States Navy. The battle of the *Monitor* and the *Merrimac* (a Confederate ironclad) occurred on March 9, 1862.

* * *

Q. Is the Parcel Post Department separate from the Post Office Department?

A. No, parcel post is the name usually applied to what is known as fourth-class matter under postal regulations.

* * *

Q. I should like to get some information on the long-range guns used by the Germans to bombard Paris during the World War.

A. In the spring of 1918, beginning on March 23, the Germans bombarded Paris from a distance of seventy-six miles with specially built long-range guns throwing 265-pound shells. They obtained this long range by using a velocity of 5,000 feet a second and by firing at an elevation of 55 degrees so that the shell passed through the layer of dense air nearest the earth and reached comparatively thin air at a height of ten miles, which opposed little resistance to its flight. In this case the greatest height of the trajectory was twenty-four miles. Guns of this type cannot fire more than thirty rounds before becoming worn out. Owing to uncertain weather conditions, the accuracy is slight; while the gun is new the shells may be expected to fall within a space of two miles by three-quarters of a mile, but as the gun becomes worn these limits are soon exceeded.

* * *

Q. Please tell me something about precanceled stamps. Is a license required for their use?

A. Precanceled postage stamps may be used only by the persons or concerns who have been given a permit to use them. Such stamps are good for the payment of postage on matter of the third and fourth classes and on second-class matter mailed at the transient rate or at the rate applicable to copies mailed for local delivery by letter carriers at city delivery offices, and, when specially authorized in each case, on first-class matter presented at the office where precanceled. For information in regard to the obtaining of such permit and the conditions governing the use of precanceled postage stamps, address the Third Assistant Postmaster General, Division of Classification, Washington, D. C.

* * *

Q. What are the races of the world and to which one do the Eskimos belong?

A. There is no classification by races which has been accepted generally as conclusive. According to Linnaeus, *Homo Sapiens* comprises four varieties or primary races: The European, Asiatic, African and American. Blumenbach distinguished five: Caucasic, Mongolic, Ethiopic, American and Malay; while Huxley recognized four principal types of mankind—the Australioid, the Negroid, Mongoloid, and Xanthochroic ('fair whites'), adding a fifth variety, the Melanochroic or 'dark whites.' The modern tendency is to base the classification by races on anatomical characteristics; such as leiotrichous, ulotrichous, and cymotrichous, (straight-haired, woolly-haired and curly-haired, respectively); and dolichocephalic, brachycephalic, mesocephalic, or the long-headed, short-headed and intermediate groups. Ethnologists are not agreed as to the origin and racial affinities of Eskimos, although their Asiatic connections seem definitely proved and Huxley numbers them among the yellow (mongoloid) division of mankind.

* * *

Q. Did Mrs. Abraham Lincoln have any half brothers or brothers-in-law who fought for the Confederacy?

A. Mrs. Lincoln had three half brothers who fought and died in the Confederate army. She also had a brother-in-law, the husband of her youngest half sister, who fought for the Confederacy and who was killed at Chickamauga.

REMARKS BY OUR READERS

Philadelphia, Pa.

In an article in your September 10 issue Louis C. Karpinski depicted French workers as poorly paid, but did not explain how they manage to thrive on the so-called 'low wage.' Two years ago I lived in Marseilles. Workers then averaged about two hundred francs a week. They paid for room and board one hundred francs a week, and so had money left for theaters or other recreation.

Every Saturday afternoon and Sunday many of the workers would go picnicking, bathing or swimming *a la mer.* Nearly every one used a bicycle or rode in the train. Eight cents (about two U. S. cents) would take the worker to the Madraga or to Miramar where after bathing he could have supper. Coffee was six cents a cup. That is not quite two American cents.

A worker can get a furnished room for forty francs a month, a good meal including one pint of wine for three francs, fifty centimes (about fifteen cents in U. S. money). Meat averaged from four to five francs for roastbeef; for a kilo of steak (about two pounds four ounces), seventeen to twenty cents in U. S. money. Bread was then twenty-six cents a kilo, a little over five cents U. S. money for more than two pounds. Butter was twenty francs for over two pounds.

Saturday all workers quit at noon. In the afternoon all the restaurants around Marseilles are full of workers; at night and Sunday the inns are full of workers enjoying themselves. When I say workers I mean women, girls, boys and men. Where men go, so go the women, girls and boys. They are permitted to play together in any public place.

ANDRE BOISELLES.

Boston, Mass.

I should like to say a few words with regard to the article in your issue of September 3, 1927, entitled 'Great Figures in Fiction—Bazarov and Colonel Sellers'—by Lewis Worthington Smith.

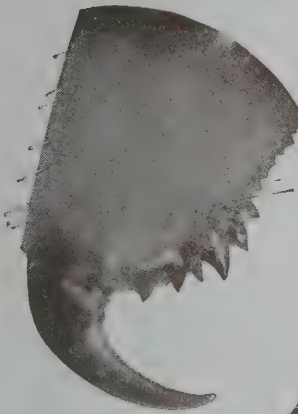
The author has a wrong understanding of Russian novels when he remarks that 'in the main Russian novels are revolutionary.' The greatest of our writers, Dostoyevsky and Tolstoy, have shown in their novels the struggle in human souls of the eternal ideas of God, life, love, crime, passion, and the growth of spiritual element.

More than that, Dostoyevsky in one of his best novels, *Devils,* in a wonderfully strong and dramatic way condemned revolutionary ideals, and with true prophetic pathos pictured the present bolshevist Russia.

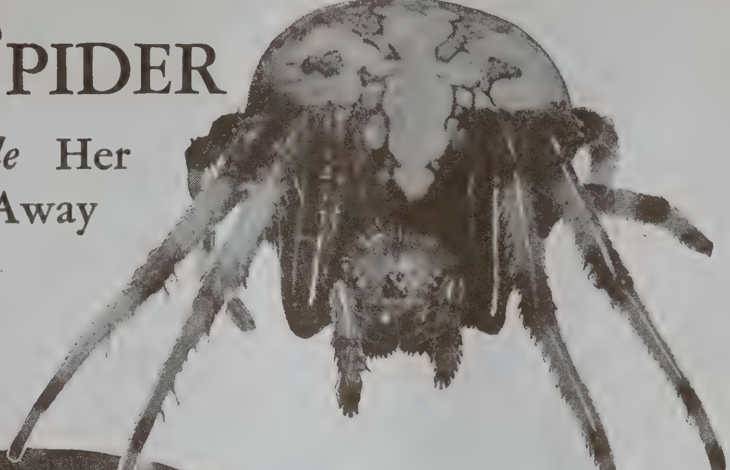
As to Turgenev, whenever he writes about 'nihilists' he shows very little sympathy, if any, for them or their cause. WALTER KONSHTLOW.

Miss Moffet's SPIDER

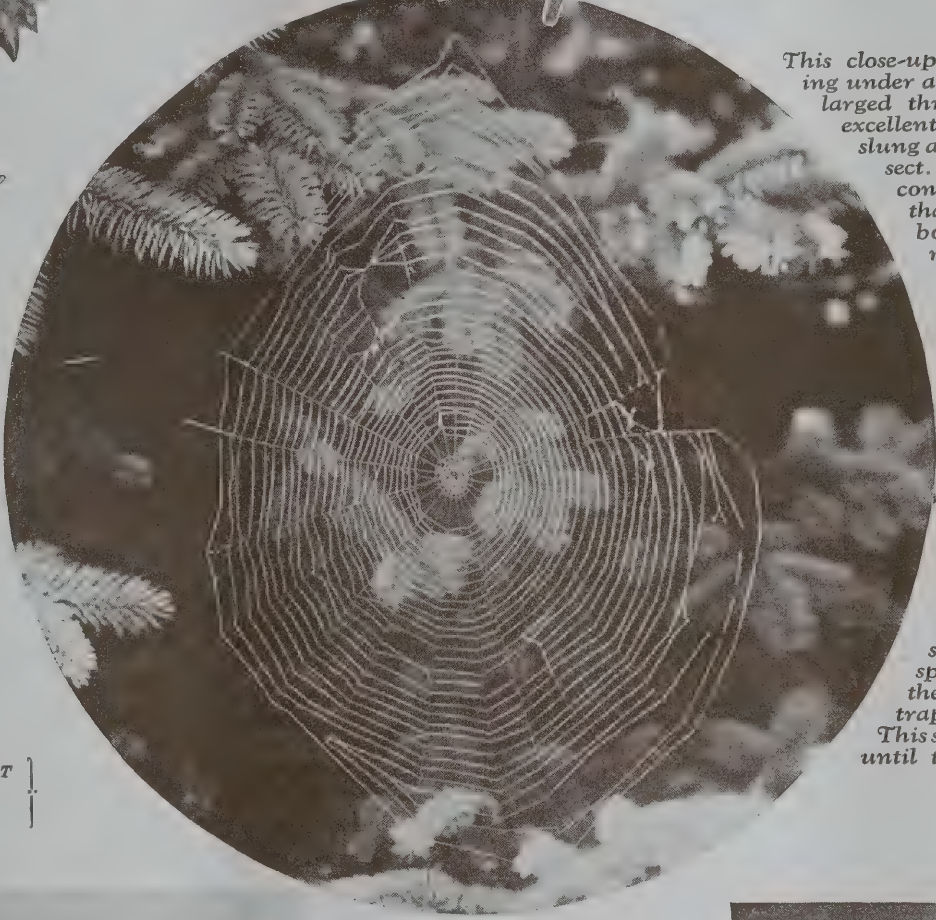
When We Sit Down *Beside* Her *and* Are Not Frightened Away

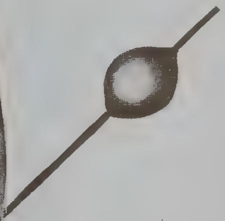


The spider's fang, above which is the poison sac used to kill his prey, a poison not dangerous to humans. The teeth are not for chewing, but for grasping his prey, as the spider takes only liquid food.



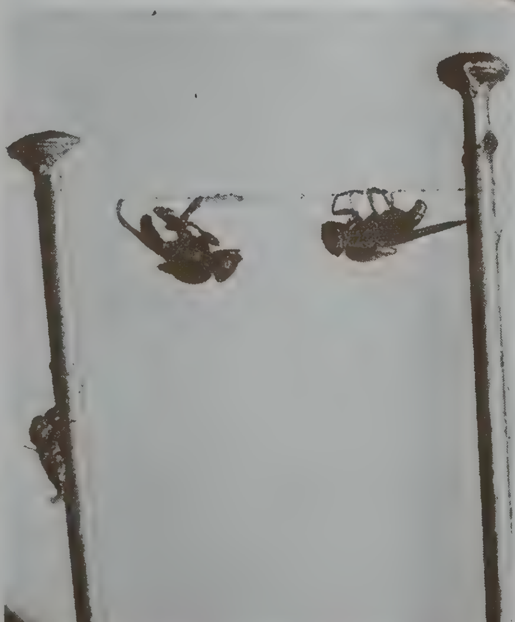
This close-up of a spider, posing under a microscope and enlarged three times, gives an excellent idea of the underslung appearance of the insect. His knee joints are considerably higher than his head. The body looks like a marble made to fit.





For a fly to get into this ointment is fatal. It is a globule, magnified, of the viscid substance that the spider spreads over the strands of his web trap to catch insects. This substance holds them until the spider's return.

I—HERBERT PHOTOS, INC.



Granted that the poet was right when he said that 'a thing of beauty is a joy forever,' then the spiderweb ranks among those joys. Few things in Nature are more exquisitely beautiful than this web of the orb-web spider. It has served as the motif for many man-made works of art. These webs are generally pictured in the early dawn when they are dew-laden.

Left—These upside-down insects are apparently in a rope-walking act, but it is not what it seems. The stunt is very serious to these insects, which are gnats caught fast in the sticky strands of a spiderweb silk stretched between two upright pins, all, of course, greatly magnified. The wary spider is seen on the pin at the left mounting to the kill.

How many angels can dance on the point of a needle is a question unsettled by medieval scholars, but this picture illustrates that the head of a common pin is a spacious site for a single spider egg.

HARVEST

The LURE of AUTUMN TRAILS

Days *of* Real Sport *For the* Hunter *Have* Arrived

The joys of a well-earned rest. The long portage is over. Camp is made and the evening meal of fish and bacon has been eaten. As the lengthening shadows of tall cedars touch the far side of the beaver pond the smoke of the modern Peace Pipe mingles with that of the campfire.

You can't keep a good man down. And the opening day of the season finds the footsore hunter ready for business equipped with improvised moccasins.

[—H. Armstrong Roberts Photo.]

Even the dogs sense the difficulties before them and resign themselves to their fate. The hunter smiles, for he knows of a free woodland just over the ridge where fox squirrels frolic amid the autumn leaves. If the game is too elusive the mackinaw pockets are spacious and the shellbark hickory at his side yields a bountiful harvest. He will return with provender of some kind, for Nature rewards those who seek her fruits.

The guide outlines the plan of campaign. Tomorrow there will be moose steaks for dinner. But it means hard work.

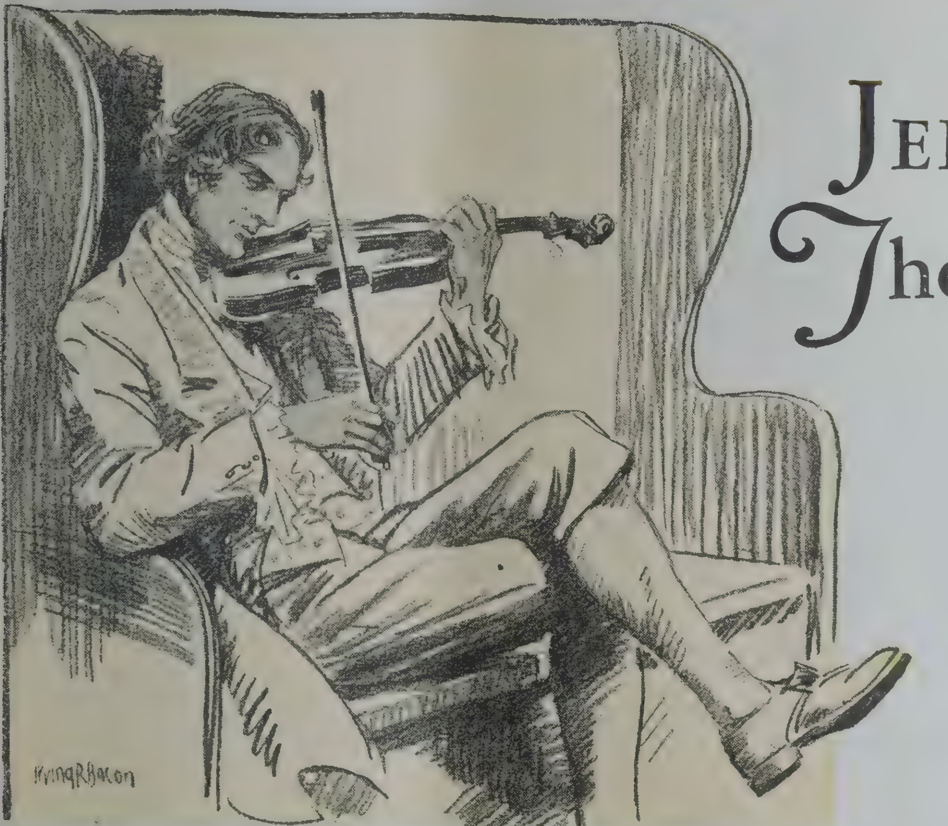
THOMAS JEFFERSON'S Thousand Years

By VACHEL LINDSAY

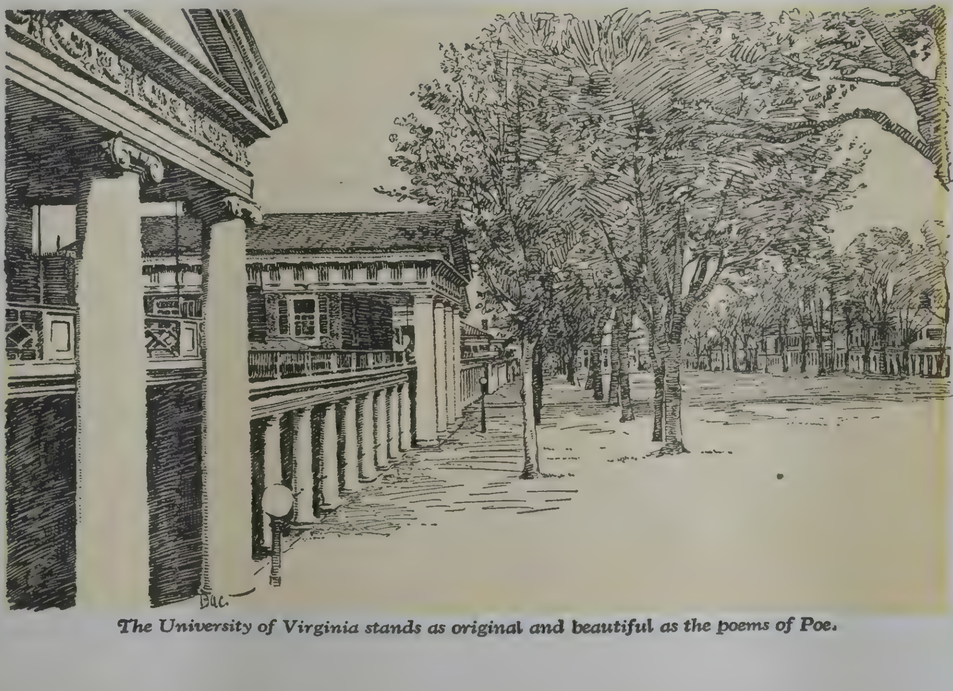


I like to think of Jefferson at Raleigh Tavern playing his violin alone by the fire.

THOMAS JEFFERSON has taken a thousand-year lease on American thought, and then perhaps he will come into full possession.

The first thing noticed in any election campaign is the number of quotations from Jefferson used by the leaders of both parties, to fortify whatever position they may take. It is my conviction that the worth-while leadership in any political party quotes Jefferson with all sincerity.

As George Washington grew old, there hardened around him the Federalist Party under the leadership of John Adams and Alexander Hamilton, claiming more of Washington's support than I believe was actually theirs. This party was destroyed by Jefferson's eight years of Presidency. When Jackson came into power, he represented an effort to overthrow those who were doing merely a lip-service to Jefferson, but who did not understand his ideals. When Lincoln built up toward the Presidency with speech and debate in the years immediately preceding the Civil War, he based much of his argument on Jefferson's 'Notes on Virginia.'



The University of Virginia stands as original and beautiful as the poems of Poe.

Both old parties, and all new parties, are, or will be, committed to the Jeffersonian propositions; and the question will always be whether they mean what they say. To take the most exact opposite: India, as far as man has remembered, has been committed to the caste system, and almost any Hindu man or woman will die to maintain it. I am now through with what some people would call a political speech. By Thomas Jefferson's thousand years, I mean that we cannot get rid of his ideas for a thousand years; and we will be fighting over them for better or worse, for that time, and giving them every kind of artistic, literary, religious, and political expression. The nearer we are to the precise Jefferson, the nearer we are to exactitude in Americanism.

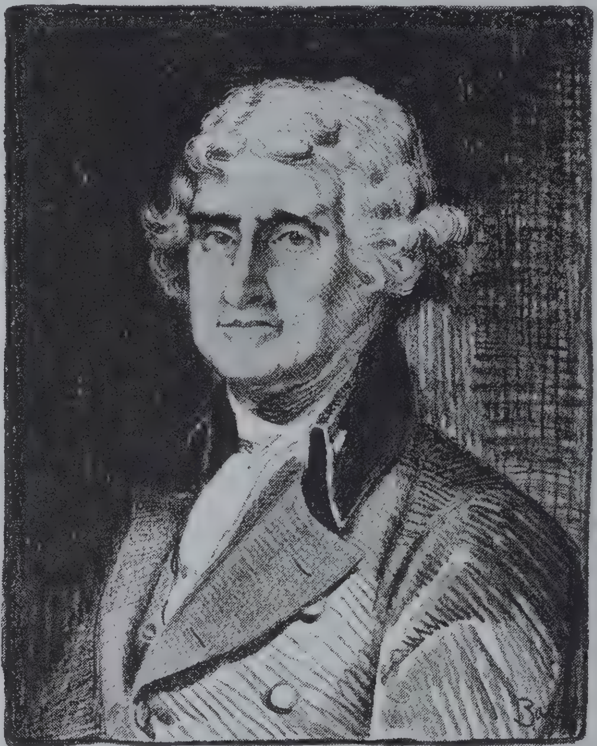
We want some pictures of the real past; we do not want the magnificent generalities only. The first picture is of Thomas Jefferson's father, a man of the Daniel Boone type, dressed in the same fashion, way out on the Virginia frontier surveying lands for the Randolph family, doing it well, winning their respect and allegiance, and incidentally picking up a deal of land for himself, in a real estate career almost parallel to that of young George Washington who later surveyed lands for the Fairfax family. To be a surveyor was to be a natural chieftain among the backwoodsmen, however democratic the conditions; and land was almost as free as water, if one could draw a line around it.

The difference between Jefferson's father and some other adventurous young Virginians on this frontier was a tremendous love for the life; a deeper conviction that the type of equality which frontier life enforced between white man and white man was the natural life of a man. And Jefferson's father had something that was probably not a conviction, but a deep instinct: the disposition to make a red Indian of himself. This has often taken hold of young white men on the frontier, and has left its eternal mark on the American nervous system.

George Washington was rewarded for his career as Indian fighter and surveyor by good will from the tremendous Fairfaxes of the tidewater; and Jefferson's father was rewarded by being presented with one of the Randolph young ladies for a wife. Thus has come about that perpetual paradox in the chronicle of Jefferson. People who have the lavender-and-old-lace state of mind discuss him as the red-headed son of a Randolph, with a few peculiar French notions which he outgrew when he made the Louisiana Purchase and became imperial. People who see him as the son of the self-made Peter Jefferson look upon him as from the beginning, the perfect natural democrat. But let us be fair, and thank both the Randolphs and the Jeffersons for Thomas Jefferson.

JEFFERSON as a student at William and Mary is an interesting creature, all hands and feet, as George Washington was at the same age; but as much interested in professors and their books as Washington was in horses, foxes, and farms. I like to imagine Thomas Jefferson at the old Raleigh Tavern in Williamsburg when there are not enough guests to be worried by him; when his books are not on his mind, actually finding time to play his violin alone by the fire. Now there you have Thomas. Some passionate Jeffersonians have conceded that he could not play very well. But it does me a lot of good to realize that he was red-headed and that he played anyway. I like the kind of man who is not ashamed of his musical instrument. He certainly had self-knowledge, for one does not hear of great occasions which he ruined with this violin. But the spiritual brother of Daniel Boone playing a violin by a lone tavern fire is one real picture of young Thomas Jefferson.

They say Jefferson was a wary lover. He got along with the girls at the start better than did Washington, and did not have to fight Indians to get over his terrible setbacks. But he loved his dear Belinda, and maybe she loved him in the same cool way; and this coolness and this ability to get by at a ball without being a nervous wreck he probably owed to the consciousness that, after all, his mamma was a Randolph, if he did have big feet and red hair.



Thomas Jefferson has taken a thousand-year lease on American thought.

Pardon me if I suggest that heroes are not always beautiful. Jefferson was a gawk at first. Isn't it true that men who have made perfectly elegant presidents at middle age were often clodhopper youths, even at twenty-five? They grow slowly, these giants, and sometimes their magnificent personal style is the last thing they acquire. In our early days we see Jefferson, Franklin, and Adams doing what they could for us in Europe, as Fathers of the Republic; and we see Jefferson a French Revolutionary, when the Revolution had the Lafayette flavor. The way he fitted into the Lafayette mood of the early fathers of the French Revolution was probably owing as much to the good manners of his Randolph mamma as to the courage, brains, and practical democracy of his Jefferson papa.

Surely if he had not been a Randolph, it would not have been so easy to have made him Secretary of State in George Washington's first administration. And in his eternal duel with Hamilton, then begun, which will go on for a thousand years, his father furnishes the strength and the brains; his mother, the limberness.

For the next Jeffersonian picture, look at his tombstone. On it, at his own request, he is praised for three things only: The statue for religious freedom for Virginia, the Declaration of Independence, and the founding of the University of Virginia. The most romantic thing in the biography of Edgar Poe is his attending this university founded by Jefferson. It had an influence upon the imagination of Poe, seldom celebrated by the Russians or the French or the Polynesians who praise Poe with such passion.

BECAUSE Thomas Jefferson was a Jefferson, he was an artist; because he was a Randolph, he was a versatile artist; and the list of the contrasting things he did superbly well would shame a Florentine of the Renaissance. We can kid his violining, but that is about all. Surely it was a symbol of his meditative, sage-like, creative mind.

He was a better architect than violinist. With the help of his daughter, he drew the plans for the buildings of the University of Virginia, and there they stand today, as original and beautiful as the poems of Poe, reminding one of Poe's serenest lines. Since they came first, it is proper to assume that Jefferson's architectural genius became a part of Poe's visualizing power. Just as Poe mixed the classic and the wildly unknown and original, to achieve a new order, so did Jefferson in the drawing of these buildings and in this landscape gardening.

When I was about thirty-five years old, I was called from the West to speak at the University of Virginia. I found myself altogether astonished at the parallel I then discovered between Poe and Jefferson in the serener moods of both. This is a deeper matter than I can dwell upon in a general article; but it is indeed fitting that the bust of Poe by Zolnay should be in the rotunda of the library of the University of Virginia. The wandering walls that inclose the yards of the school, lost in extraordinary shrubberies, have the effect of a Poe incantation; and the high porches of the buildings are as classic as Poe's bust of Pallas, and the oldest statues and columns of the university speak of 'the glory that was Greece and the grandeur that was Rome.'

One of the most interesting things about the place is that while it seems still in some wilder-

WHISTLER—*the* Decadent

By L. R. MASSEY

PERHAPS the most strange personality in American art is that of the picturesque James McNeill Whistler, who as a painter has been declared a genius, and as an etcher, the equal of Rembrandt himself.

Whistler was born in Lowell, Massachusetts, in July, 1834; and it was one of his peculiarities that he sought at every turn to puzzle those who were curious concerning such details of his birth. One of his models once asked him where he was born. 'I never was born, my child,' he answered, 'I came from on high.'

This reply did not in the least disconcert the model, who quickly said: 'Now that shows how easily we deceive ourselves in this world. I should say you came from below!' This reference to the diabolical no doubt pleased Whistler, but his biographers have been undeterred in their search for facts concerning his life.

While very young, Whistler was taken to Russia; and it was here that the lad, then only nine years of age, was placed as student in the Imperial Academy of Fine Arts. A few years later his family was compelled to return to the United States, owing to the death of Whistler's father. After additional years in school, several of which were spent in the U. S. Military Academy at West Point, and after a short period during which he was employed in the Coast and Geodetic Survey office in Washington, Whistler left for Paris.

Upon arriving, he immediately entered the studio of Charles Gabriel Gleyre. Friendships were readily formed among the other students, and, as he progressed in life, with men of affairs. Yet there were enemies, too, made chiefly because of Whistler's intense individualism, which in later years won for him the ridicule of critics, and jeers from the public.

Whistler worked steadily—painting, etching, studying—buoyed up always by the love of beauty which was the essence of his life. Poverty did not dismay him. His smile was ready, and a *bon mot* was on his tongue. In many ways, it was fortunate that Whistler was so constituted; for adverse criticism rained upon him. By turn he was called poseur, eccentric and esthete. His 'symphonies' were called capricious, bizarre and rank impostures. Ruskin, who was then a popular idol and a favorite critic, remarked that 'he never expected to hear a coxcomb ask two hundred guineas for flinging a pot of paint in the public's face.'

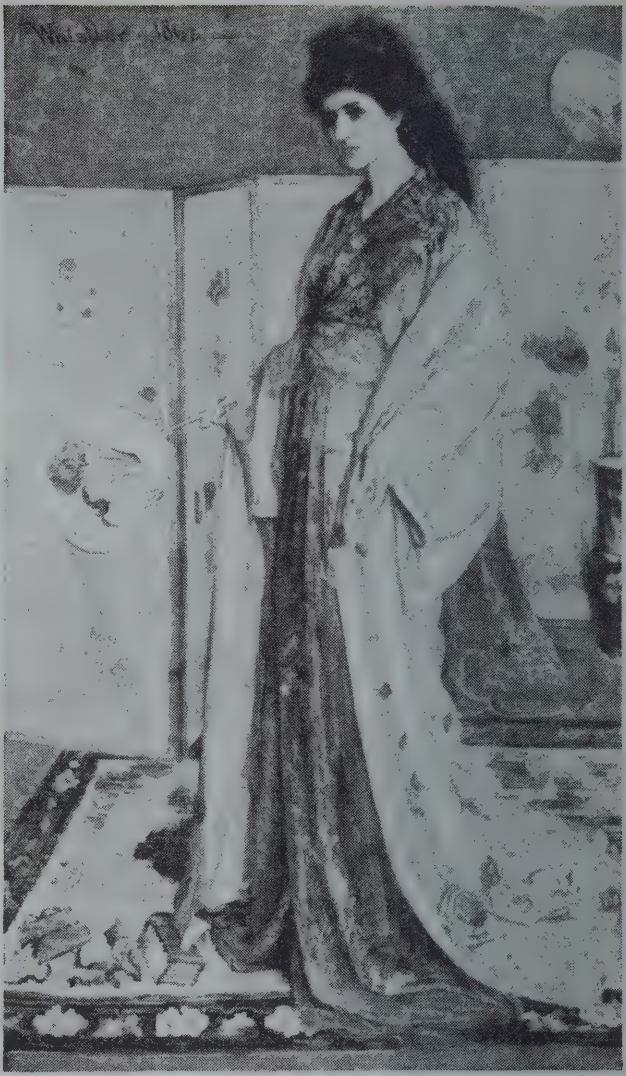
As a result of this remark, Ruskin was sued by Whistler, who secured damages to the extent of one farthing.

The attendant notoriety pleased Whistler, who was fond of having himself talked about, whether for good or evil. He liked to mystify his public, and seemed always involved in some controversy which kept his name constantly alive.

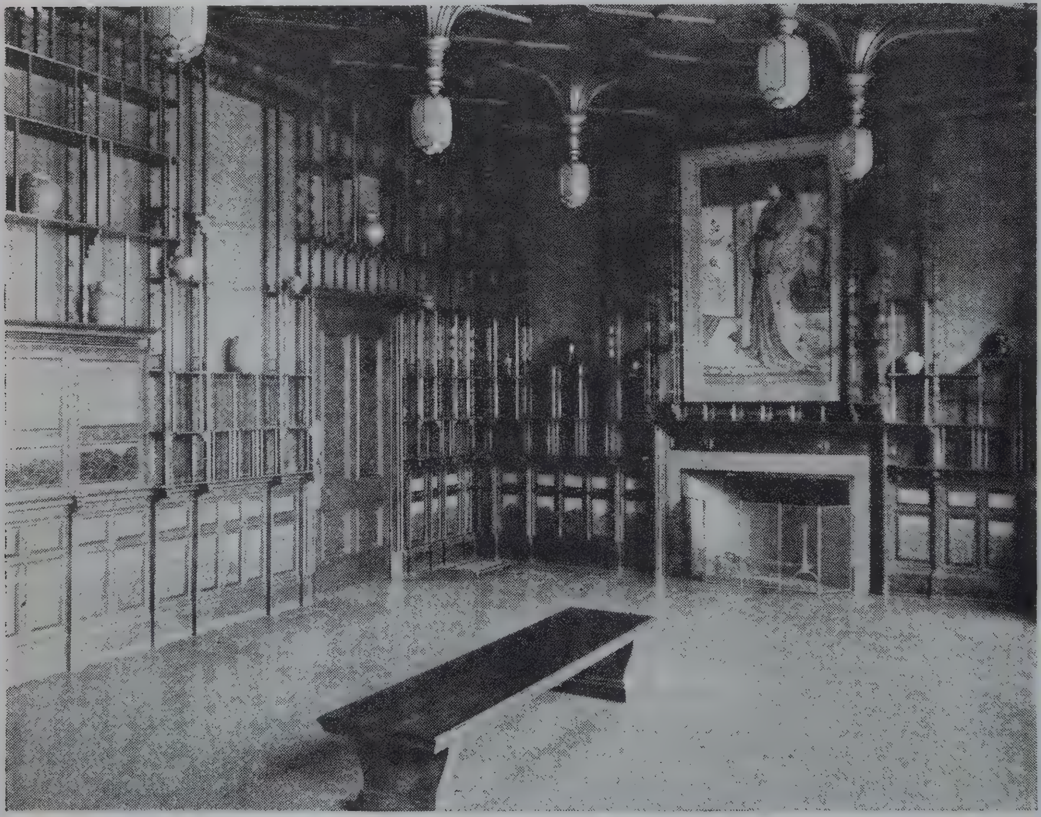
Whistler was his own god, and his own prophet. Above all, he was the exponent of that attitude toward art which impelled him to the interpretation of his sense of fact, rather than the fact itself: an attitude, according to Pater, that should always distinguish the true artist from the mere good workman. In art, perhaps he belongs properly in the school of the decadents, because of his love of unexpected detail; his iconoclasm, and his very personal ideas regarding beauty. Whistler had a fine disregard of conventions, and he had a lashing contempt for proprieties, not only in art, but in life as well.

One of his earlier works, 'The Music Room: Harmony in Green and Rose,' well illustrates his individuality. The walls are ivory-white; the curtains sprigged with roses. A child, dressed in white, is seated slightly behind a woman who stands expectantly, and who is garbed in a black riding habit. It was a difficult technical problem to keep the figure of the woman in a dominating position in relation to the child and to the light color values of the picture. This problem Whistler solved admirably.

Above all, Whistler was concerned with light and color, and their exact values. His delicate color sense finds best expression, perhaps, in his favorite, 'The Princess From the Land of Porcelain.' This portrait involved Whistler in one of those frequent imbroglios which kept his name prominently before the public. The daughter of the Greek consul general in London had posed for the picture especially to please Whistler; but as a likeness it was evidently not satisfactory, for Whistler had difficulty in disposing of it. Dante Gabriel Rossetti, the poet, was one of Whistler's warm friends who was greatly interested in 'The Princess' and who tried to assist the painter in finding a purchaser.



'The Princess From the Land of Porcelain.'



'The Princess' over the mantel in the 'Peacock Room.'

It is said that one collector was anxious to buy the portrait, but stipulated as a condition that Whistler's signature should be altered so as to be somewhat less offending. This Whistler refused to do.

Eventually 'The Princess' came into the hands of a wealthy shipbuilder, F. R. Leyland, who placed the picture in his dining room. It was, however, not in harmony with the room, and when Whistler observed this, he offered to redecorate the walls if Leyland would remove a distasteful red border on the rug. Eventually, it was necessary for Whistler to undertake extensive alterations in the original decorations of the dining (Continued on page 28)

ELLERY and His Kin

By JULIAN HAWTHORNE

THE American Channings seem to have begun in Newport, Rhode Island, and were distinguished from the start. Edward Tyrrel Channing and his brother William Ellery Channing were born here not more than a decade or so after the close of the Revolution. Both must have been agreeable young men of the kind that New England produced in those days: well educated, refined, courteous; the first reaction from the primitive Calvinist of the prime; not yet too pragmatic and sceptical, but 'broad' and conversational. Their hearts were apt to be cool, as we see Emerson's; but their brains were warm and benevolent, and somewhat prone to philanthropy, that last infirmity of amiable minds or of plethoric pockets.

None of the Channings ever had gold, except of the kind that is not subject to rot, robbery, or moths. With wealth of the spirit they were well endowed, and William Henry Channing spent his share generously. He was held to be the father of American Unitarianism, and was the first to expound that doctrine from a Boston pulpit.

I am on my way to 'Ellery,' but must first speak of another Channing, a minister of the faith, an earnest and sincere one, whom I knew in Liverpool in the 1850's. His name was William Henry Channing, after the great original; he was cousin or nephew of the first of that name. He was married to a woman who had been a beauty, and was not far from being one still at forty years.

I sat under the pulpiteering of Mr. Channing in Liverpool for the better part of a year. My parents—my father at any rate—were not churchgoers, less perhaps from lack of religious convictions than from excess of them. But they thought, I suppose, that I might as well have the experience. So I sat in the pew and listened, and learned my way through the church service and the hymn book; but I was prone to attend to the agreeable modulations of the minister's voice more than to the purport of what he was saying: I had always believed in God, but had postponed convictions as to the nature and function of Christ; and it was not until a good while afterward that this perplexity was resolved. To put it gently, I matured very slowly.

Now, as to Ellery (William Ellery Channing, the second: born in 1819, died in 1891; a nephew of the first), he was held to be an enigma. His friends agreed upon calling him 'Ellery,' to mark, I suppose, his divergence from the predominant traits of the Channing stock, most salient of which, in that still pious age, was his unconcealed discontent with religious dogmas in general.

Tristram Shandy said that the British army swore terribly in Flanders. Ellery made a point of doing the same in Massachusetts; but he did it in a histrionic way, when other people were there to hear him; I doubt whether he was at the pains to swear to himself in solitude. The sensibilities of the softer sex did not deter him—their appalled murmurs may have even given him a 'kick,' as we say now. In other words, I fancy he was not so much an infidel as a doubter, indulging in profanity by way of discouraging religious conversation in advance. He was possessed of obstinacy and weakness, a combination which sometimes makes an interesting character; and interesting he was, if sometimes tiresome in his wilful perversities. He turned for succor to art and poetry, saying that all in Christianity that was really sane and worth while was derived from paganism.

He was a man of moods, emotional and variable, one man today and another tomorrow or the next hour; but he became increasingly gloomy and reserved as he grew older. He indulged in passionate likings or lovings of certain persons, but would abuse the same persons savagely if they crossed his humor. One felt the existence in him of a warm and tender heart, which frightened him, and against whose impulses and solicitations he was on his guard. He assumed to ignore and despise society, but was really of very social tendencies, though he covered timidity with roughness. His powers of self-control were limited; he delighted in making himself incomprehensible, and was angry because nobody understood him.

His love of art was strong. He went to Europe and cultivated his taste by reading and by the study of works of art, though poetry was the only art he cultivated personally. His poetry was deeply thought out and felt, and once in a while it proved to be fine work; but he was resentful because his readers didn't pronounce him the equal or superior of Byron, Wordsworth, Shelley or Shakespeare; indeed, he studied to render his verse obscure, so that his readers might be discouraged. But once in a while a great line broke through his clouds:

If my bark sink, 'tis to another sea!

was one such; and others as poignant and profound might be quoted.

But his composition was scanty and difficult; he sought always to be 'original,' and was almost angry with language for having been so much used by poets who came before him. The one art that he carried to the highest pitch was that of making himself miserable. Like a spoiled child, he went out of his way to appear fantastic, foolish and injured.

He married rather early in life, his wife being a sister of Margaret Fuller. She was clever and attractive, but wearisomely selfish. She and Ellery made a tortuous and jolty life of it; he was passionately in love with her at intervals, and fought her fiercely at other times. Soon after their marriage Margaret Fuller wrote to my mother suggesting that Ellery and his wife, who were casting about for a habitation, should lodge and board with the Hawthornes in the Old Manse in Concord, which the latter were occupying in their honeymoon years.

THE indelicacy of such a proposition would have been obvious to anybody but Margaret and her sister. Hawthorne replied in a letter which is quoted in *The Biography of Hawthorne and his Wife*, and is a masterpiece of its kind: courteous, kindly, but explicit; studious in avoiding injury to the sensibilities of the persons concerned; lightened with humor here and there, and enriched with imaginative touches. Margaret and her sister never forgave it. Ellery himself saw the point and was silent; though years afterward, in a whimsical mood, he allowed himself to say silly things about Hawthorne.

He felt people rather than saw them objectively, and when he tried to describe them, he would produce a likeness of his fantasies rather than of the reality. In his saner moods, he admired and respected Hawthorne above other men, and was angry when he married, because he thought it would alienate Hawthorne from himself. My mother also, however, was reverenced by Ellery, and it used to be said that 'Sophia's was the only influence that could tame Ellery.' She herself never imagined such a relation; but the purity and gentle strength of her nature impressed him, and his coarser sallies would die upon his lips. In her presence he felt ashamed of his own worse self and when they met he would put his best foot foremost.

HE dramatized himself: he pictured characters in his imagination and attempted to act them out. Abnormal sensitiveness is at the bottom of such avoidances of truth; they aim to protect one from the danger of actual contact with his fellows, and yet cause resentment because the true man is not discerned through the disguise. But Ellery was, upon the whole, much better understood by his associates than he imagined. They accepted his good, passed over his bad, and were amused at his evasions and misleadings. He was too exacting, however, for the patience of most people; and when after his wife's death he sought seclusion, few cared to penetrate it. He became a more solitary hermit even than Thoreau, and seemed to shrink more from comradeship, having little of the Walden man's love of nature.

He had collected a number of art things in Europe, and his chief pleasure in life came to be in them. Yet he could not be content unless others shared his pleasure: he would not invite anyone to examine them: what was to be done? He met the difficulty by selecting some drawing or engraving from his store, wrapping it in paper, and carrying it to a chosen person. He would knock at the door and when it was opened would hold out his treasure—'Take this!' and would then turn and walk away. Occasionally the recipient of such a favor would assume that Ellery meant it as a gift. But no: after a time, days or it might be months, Ellery would appear again, and curtly demand back what he had given.

It was not invariably 'Indian giving,' however. He was much devoted, in his queer way, to my sister Una, then a girl of sixteen or seventeen with a great flood of Titian auburn hair; his face would soften when he looked at her, and his voice rumble with a rough tenderness. One afternoon, she answered an orphic knock at the door: Ellery—with arm outstretched—in his hand a flat paper package. 'For you!' and he plodded away. It turned out to be a rarity of inestimable value, a pen-and-ink sketch by Correggio, done hurriedly on a piece of stout studio paper, the ink faded to a soft brown, but every stroke distinct and masterly.

To preserve it from accident, my mother mounted it with loving skill in such a way as to leave the paper untouched on a piece of cardboard. It was put in a simple wooden frame, and glazed. It stood on the library table, the most conspicuous object in the little room; and when, as happened three or four times in as many years, Ellery came for a short call, 'Here is your Correggio, Ellery,' he would be told, 'when you want it.' He would grunt and shake his head embarrassedly. He never claimed it, and we kept it. It is above my desk today as I write. When I went to Europe several years afterward, I saw a number of similar pen-and-ink sketches by old masters—Correggio among others, but never one which I would have exchanged for this. Ellery has no doubt often watched Correggio at work in his studio in Paradise since then, and has not regretted his royal gift.

Ellery would sometimes speak of Concord in disparaging terms but seemed to prefer it to any other place. He dwelt there continuously for more than thirty years, until his death in 1891; the latter ten years were passed as a denizen of the house of Frank B. Sanborn, my old schoolmaster, who himself died twenty years later at the age of more than fourscore, the last survivor of Concord's golden age. The fact of his retaining Ellery's companionship so long is remarkable. He was the only friend of Ellery's, except my father and Emerson, with whom Ellery had not quarreled at one time or another; he had never been a housemate, however, of either of these last two gentlemen.

Ellery happened to be the last, if not the most distinguished, of this glorious company, and though his sins had been as scarlet, they would be washed white as snow by reason of that connection. Ellery, on his side, needed only to be worshiped intelligently to be good-humored. Nevertheless, this friendship between him and Sanborn is one of the signal ones of history. In my last interview with my old schoolmaster, in 1915, he told me of Ellery, much of the narrative coming with delightful touches of humor; for Sanborn was as quick as anybody to see the humorous side of things. But his humor evaporated in print; so that the several autobiographical volumes which he published are very gritty reading, and his portraits of persons are perhaps the very worst that anybody ever drew.

Ellery's peaceable coexistence with Sanborn is the more extraordinary because Sanborn himself had all his life been prone to quarrels, from the time he went to bloody Kansas in the John Brown raids, to his last year or two before departing for a better world.

Ellery was a better-looking man than his great contemporary, Thoreau, whose strange visage would have been almost repulsive but for the spirit that glimmered through the features. But Ellery was no beauty; rugged and forbidding, yet at the same time gentle and appealing. At a first glance you were repelled, at a second you were arrested by—something!—you knew not what: hidden here was a soul of feminine delicacy, incongruously lodged. You felt that there were moral and intellectual treasures in this person, if one could but find the open-sesame to unbar the doors. And once in a while, at long and uncertain intervals, they would loosen of themselves, and you would get a glimpse of pure gold and jewels. Ellery's bells were jangled out of tune and harshly except at these moments, when music came which was worth waiting for. One can speak of these things figuratively only; they are nothing or everything.

He was of medium height, thick-shouldered, sturdy, passing on his way unobtrusively, face downcast, gait plodding. There was space beneath the brows, clear gray eyes, a finely moulded nose. He wore sidewhiskers, but his upper lip and chin were smooth-shaven. He smiled seldom, and as it were awkwardly, like sunlight appearing grudgingly through clouds. He was as a man gifted with lovely aptitudes for fine and noble human intercourse, but wandering through the desert, finding scarcely ever a sympathetic and understanding glance. It was a pity, but it was his own fault—and yet not his either, since the elements were so mixed in him at birth. So we turn, rather doubtfully, to Browning with his oft-quoted verse:

All I could never be,
All men denied in me,
That was I worth to God, whose wheel
the pitcher shaped.

In the silence of his own old-age self-communings, Ellery may have solved his riddle, and found peace.

Long Live HALLOWEEN!

By JANE L. HICKS

HALLOWEEN is fast following in the wake of Santa Claus. It is coming to be a mere memory, its rites and ceremonies familiar only to those who have origins in the British Isles, and moreover who treasure a store of tales handed down from other days.

For all that, it is a venerable day, handed down through the ages, modifying as it rolled from year to year, and acquiring the characteristics of the ages through which it passed. Rooted as it is in antiquity, it should not fail to hold the interest of this antique-loving generation, incredulous and enlightened though it be.

To rescue it from oblivion, it is not amiss to recall its traditions, as it were, before the blaze of an October fire.

Halloween, or Allhallows' Eve, is the name given the vigil of Hallowmass, or All Saints' Day. It is now generally known as the eve of a Christian festival, but its formerly attendant ceremonies long antedate Christianity. Clearly, it is a relic, and an interesting one, of pagan times, for nothing in the church observance of All Saints' Day could serve as the origin of the extraordinary notions or remarkable practices.

The day was generally marked by the lighting of bonfires, and by the belief that it was the night of all nights when devils, witches, and other mischief-making beings were abroad on baneful midnight errands, and particularly when aerial folk, such as fairies, were said to hold a grand anniversary. Hence it was a time of divination, when the gift asserted by Glendower of calling spirits 'from the vasty deep' became available to all who took advantage of the privileges of the occasion.

The druids, on November first or thereabout, held their autumn festival, and lighted fires in honor of their sun god in thankfulness for the harvest. They believed that on the eve of this festival, Saman, lord of death, called together the wicked souls that within the past twelvemonth had been condemned to inhabit the bodies of animals.

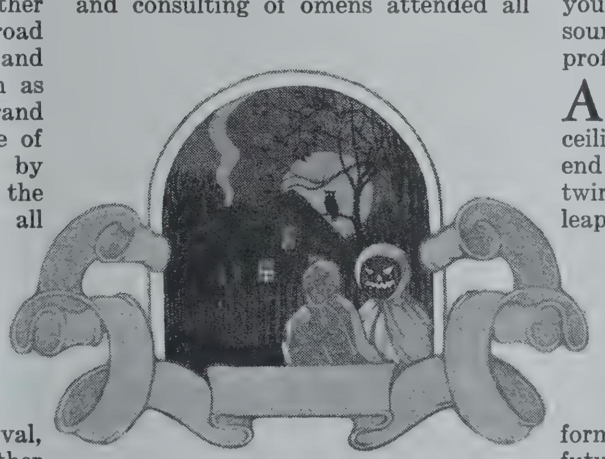
That the main celebration is purely druidical is further proved by the fact that in parts of Ireland the thirty-first of October is still called *Oidhche Shamhna*, Vigil of Saman.

On these druid ceremonies were grafted some characteristics of the Roman festival in honor of Pomona, which occurred about November first, in which nuts and apples, representing the winter store of fruits, figured prominently.

In the Calendar of the Church of Rome, under November 1, occurs this notation: 'Feast of All Fools is removed to this day.' Hallow Even is the vigil of All Saints' Day (November 1).

Goldsmith, in the *Vicar of Wakefield*, when describing the customs of rustics which were still preserved, observed that they 'religiously cracked nuts on All-Hallows Eve.' Indeed, nuts and apples are the *sine qua non* of many festivities of this night and it is from the custom of flinging nuts into the fire, of cracking and eating them, and of using them as a means of discovering the course love affairs will take that the night came to get its vulgar name, 'Nutcrack Night.' It was alluded to under that name in *Poor Robin* in 1735, and is still so known in parts of the north of England.

Hutchinson, in his *Northumberland*, Vol. 2, p. 18, observes: 'The 1st of November seems to retain the celebration of a festival to Pomona, when it is supposed the summer stores are opened on the approach of winter. Divinations and consulting of omens attended all these ceremonies in the practice of the heathen. Hence, in the rural sacrifice of nuts, propitious omens are sought touching matrimony: if the nuts lie still and burn together, it prognosticates a happy marriage or a hopeful love; if, on the contrary, they bounce and fly asunder, the sign is unpropitious. I do not doubt but the Scotch fires kindled on this day anciently burnt for this rural sacrifice.'



Gay, in his *Spell*, beautifully describes it:

'Two hazel nuts I threw into the flame,
And to each nut I gave a sweetheart's name:
This with the loudest bounce me sore amaz'd,
That in a flame of brightest colour glaz'd;
As blaz'd the nut so may thy passion grow,
For 'twas thy nut that did so brightly glow!'

The same custom is found mingled with sage philosophy in a poem of Charles Braydon, *On Nuts Burning, Allhallows Eve*, published in 1801:

'These glowing nuts are emblems true
Of what in human life we view;
The ill-match'd couple fret and fume,
And thus in strife themselves consume;
Or from each other wildly start,
And with a noise for ever part.
But see the happy, happy pair,
Of genuine love and truth sincere;
With mutual fondness, while they burn,
Still to each other kindly turn;
And as the vital sparks decay,
Together gently sink away:
Till life's fierce ordeal being past,
Their mingled ashes rest at last.'

Apples are featured in many customs. The most familiar is that of ducking for apples in a tub of water. This is particularly popular among the youngsters, the most fearless and resourceful of whom often become very proficient in these Halloween aquatics.

AGAIN, a stick is hung from the ceiling, with a lighted candle in one end and an apple in the other. This is twirled rapidly and the merrymakers leap up in succession and attempt to snatch the apple with their teeth. Often the candle scorches the face or anoints it with grease, to the immense enjoyment of the onlookers.

Apple parings are also thrown over the shoulder, and should form the letter of the name of the future husband or wife. This custom is described by Gay:

'I pare this pippin round and round again
My shepherd's name to flourish on the plain;
I fling th' unbroken paring o'er my head,
Upon the grass a perfect L is read.'

The apple seed, or kernel, is also used as a means of divination, again related by Gay:

BROMO, *and the* SAND SEA

By WILLIAM L. STIDGER

ONCE upon a time God flung a string of island beads, pearls, opals, sapphires, diamonds, across the beautiful neck of the South China Sea.

They run from the mainland of Asia in a beautiful curve, a necklace consisting of the separate jewels of Sumatra, Java, Borneo, the Celebes, the Philippines, and Formosa. Geographers call this string of beads the Malay Archipelago.

Java, most beautiful of all, is a Dutch possession four times as large as Holland itself—with close to forty millions of population and 110 volcanoes—a fair proportion of volcanoes to the population, one must admit. About fifteen of these volcanoes are continuously active.

Java is in the earthquake and volcanic belt. The earthquake belt runs through the string of islands their entire length, and into Japan. It then leaps the Pacific Ocean to Hawaii, thence to Alaska, down the Pacific Coast through California into Mexico, and then into South America.

I had always wanted to visit Java because I wanted to see as many earthquakes and volcanoes in a short time as it was possible to see. Java was the most promising part of the earth for that purpose. They do not dare to run the railways at night in Java, because they have an average of five hundred earthquakes a year; and these convulsions reach up gigantic brawny hands, clutch a railway trestle and twist it until it looks like an old piece of baling wire. Consequently the Dutch Government has stopped running trains by night.

The history of volcanic action in Java reads like romance.

When the famous Klut erupted in 1901 it belched out 70,000,000 cubic feet of solid material. In 1894 the Galung-gung vomited from its restless 'innards' 770,000,000 cubic feet of rock and lava, and old Krakatua, when it last made a display of spleen—after two and a half centuries of comparative quiet—shot out 635,000,000 cubic feet of débris.

More than seventy thousand people perished in the earthquake and the tidal wave when the island of Krakatua blew up and disappeared. This tidal wave swept great steamers far up on the hills of Sumatra.

The eruption was felt all along the string of islands from Sumatra to the Philippines. Steam and smoke arose to a height of forty thousand feet. Volcanic ash spread itself all over the earth and after sunset a red glow was plainly seen in Africa, Europe and our own land, all due to this dust from Krakatua.

The natives of Java believe that there is a great turtle under their beautiful island and that he raises his huge back now and then when earthquakes come. They fear that after the huge turtle has raised his back to destroy all humanity he will drop back into the sea—and then they will drown. So they keep shouting: *'Hidoop! Hidoop! Hidoop!* (We are alive! We are alive! We are alive!)' so that he will know that many human beings still survive; then he will not sink and drown them all.

Old Bromo is located on the eastern tip of Java. One has to travel from Batavia on one end of the long narrow island to the other end to see Bromo. The trip takes a week, because, as I have said, one cannot travel by night.

Bromo is well named. At first I suspected that he must have been named for one of our favorite American medicinal drinks—Bromo Seltzer. He is certainly effervescent!

But I learned that he was actually named from Brahma.

Bromo is one of four mountains located in the famous extinct volcanic crater called the 'Sand Sea,' the other three peaks being Widodaren, Segrowedi, and Batok.

These famous volcanic mountains have for untold centuries worked in shifts. When one mountain takes up the task the others quiet down; but as far back as memory prevails one of these four has been in eruption.

We spent the first night at Jokjajakarta. This strangely spelled city is in central Java. The next day at dawn we took train for Surabaya, at the eastern tip of Java. From there it was necessary to take automobiles to Tosari, a little mountain sanatorium at an altitude close to six thousand feet. From this mountain town we took Javanese ponies at three o'clock one misty morning to ride to smoking Bromo.

From Tosari it is still eight miles to Bromo, and all of this must be traveled on the backs of tiny ponies led by Javanese guides.

Three memories of that ride up the narrow trail of the mountain sides are abiding ones. The first is of beautiful white lilies blooming along the trail, as abundant as the thousands on Burbank's farms in California; 'moonbeam lilies' the Javanese call them. A second thing is the odor of sulphur from active Bromo. This swept down upon us from the rumbling volcano, and mingled with the scent of the lilies, rich and overpowering.

The third thing was the crowing of wild chickens in the tree tops in the gray dawn. These are the wild fowl from which our domesticated variety originated; their crow has a hoarseness in it that suggests the difference between a wild and a domesticated animal.

The thunder of Bromo we heard all night from Tosari far away. Flashes of weird light which looked like heat lightning shot at frequent intervals from the fiery crater, lighting up the white moonbeam lilies along the mystic way.

Strange superstitions still linger among the natives about invading the holy precincts of these volcanic mountains. For centuries they have offered human sacrifices to propitiate the angry mountain gods. At a certain time of the year they bring secretly the most beautiful girl in the tribes, along with the most beautiful boy, and cast them into the old volcano's crater as a human sacrifice.

'The Dutch Government has tried to stop the horrible performance, but it still goes on secretly,' my host told me.

Then he continued: 'I climbed Semeru, which you will be able to see when we get to the top of this trail. It is an active volcano twelve thousand feet high—the highest on the island. We had some native boys as guides. As we entered the jungle trail leading to the mountain, these boys stopped for an hour to pray. We could not budge them until they had made their peace with the mountain god.

'They begged us to be respectful while on the mountain. "Please don't talk harshly about the mountain! If it is hot or uncomfortable don't let on you notice it. If it is cold do not complain. Say that everything is fine and that you are happy and comfortable, or the Volcano will be angry and we shall all be killed." '

Before I knew it, we were standing upon the edge of what looked like a 'Grand Canyon' filled with white fog. It was a hot tropical morning and I felt as if I should like to plunge into such a sea of cool mist.

We ate our breakfast in the lookout cabin, and peered down into the great crater of the Tengger, as it is called. We could see nothing but white cloud.

But we could hear the old Bromo's roar none the less.

Then the sun shot up over the eastern mountains and suddenly, as if a magic wand had been waved, the mists began to burn away. A black cone began to appear, belching black smoke. It was as if some great machinery of nature had been set in motion to lift the black volcanic cone upward as the mists burned away under the morning sun. Then suddenly, foot by foot, Bromo rose, as by some strange mechanism, until it stood forth in beauty and grandeur, throwing out a trail of black smoke along the horizon.

A native method of delivering retail lumber in Java. Circle—How certain Chinese truck gardeners in Java carry produce as far as 30 miles to market. —Ewing Galloway Photos.

Soon we saw the great Tengger crater—sublime manifestation! It was six miles long and five miles wide at the top; five and a half long and four miles wide at the bottom.

The mist, white and cool, was replaced by smooth, silvery sand, like an oriental rug spread over the crater floor. It is this which gives it the name, the 'Sand Sea.'

Set down like a black jewel of gigantic size in the six-mile crater was ancient, smoking Arjuno over to the northwest, with its five tops, every one a belching fissure. To the south was twin-topped Semeru, the highest and at times the most ferocious crater on the island.

The Leaders Are Here

NO BANKRUPTCY that a country can face is so dangerous as bankruptcy in men. All other kinds of scarcity can be met and mastered, but scarcity of the human qualities of vision, wisdom, and courage is fatal. Perhaps more people are conscious of this today than ever before, and the various conclusions they draw are the most effective influences active today upon the people's outlook of the future.

What is it that is driving the people to entertain the thought that perhaps the nation is bankrupt of men? There is no doubt that it is nothing other than the apparent scarcity of high-class material in those regions where, for the last hundred years, we have looked for guidance. Our people, our nation, has always looked into the regions of finance and politics for leadership. The man of oratory and the man of money were thought by the possession of these powers to be the natural leaders. It was very fine while it lasted and doubtless it served the nation during the period when those things were most significant.

> *THE severest poverty a nation can have is to be poor in men. Other scarcities can be met; but scarcity of the human qualities of vision, wisdom and courage is fatal. This, perhaps, explains why so many people are alarmed at the apparent lack of leadership in this country. They sense the dangers which a bankruptcy in men will bring. But their alarms are based on false premises. The leaders are here—but they are devoting their energies to new fields. Formerly finance and politics claimed them; now they turn their hands and minds to industry and commerce and agriculture. Those who say the nation is leaderless are only looking in the wrong direction.*

But, being established as the leading classes, finance and politics attracted men whose ambitions were greater than their abilities and whose shrewdness was greater than their desire to serve. And so their personnel began to weaken in power and impressiveness. It was like a business which because of its success attracts all manner of people who are much more interested in the profits than in the welfare of the business, and so the business gets a bad name and begins to run down. We have so many men who can make speeches today and so many men who can make money that these accomplishments have ceased to be distinctive. That is, what were formerly the upper reaches of leadership are now somewhat shabbier and much less powerful than they were; the power has gone out of them.

Seeing this, the people jump to the conclusion that all the qualities of leadership in the country are going to seed and that there is no reserve left; and a country which gets itself into that state of mind is not in good national health.

It is time to look at the matter in what is probably a truer light. If there is one thing the history of our race, the history of our great ideas of religious freedom and political liberty, should have taught us, it is this: peoples dedicated to justice and service are never bankrupt of men. The national reserve is always greater than we believe.

It is doubtless true that in official circles we are witnessing a great decline in vision and ability, or what seems to be that. (It may only seem to be that.) It is not improbable, however, that there is another element which we overlook. If things were still being done in the same old way, these men might not seem to us so helpless as they appear now. If they had the same conditions to deal with as obtained fifty years ago, or if conditions themselves were as susceptible of control as they were then, these men might appear quite as able as their predecessors.

But we are approaching the end of a system of things, and all the tactics, all the skill, all the determination productive of results fifty years ago, are powerless as a child's arm against the immovable decree which has sounded the end of a certain chain of experience. The new time is pushing up under the old and the old personnel has not the knowledge of how to help it. New things are to be done in new ways and our official circles belong, mostly, to the old. It may be this fact, therefore, which gives them the air of being more inefficient than they really are.

Now, if the nation were obliged to stand or fall by the ability of official circles to become proficient in the new order of things, the future would be very doubtful. But that is not the alternative. As the growth of the new leaf pushes the old one off the stem, so does the pressure of a new order of public servants gradually urge the old order into retirement.

The thing to bear in mind is that our official circles do not comprise the nation's wealth in able men. The nation's ablest men have been doing their work in other fields. Our country has been built up not so much by the government as by the people at work, under the leadership which various fields of service have developed.

The men are here. That is the fact upon which the mind of the people may rest in utmost assurance—the men are here. They are here in sufficient number to carry on all the public processes. They are here in sufficient wisdom, honesty and courage to meet all our problems.

But the men who are able to do what the country wants done will not play the old political game for the chance of doing it. They have too much wisdom to hope that anything can be accomplished by the old methods. They do not crave any honor which is bought at the price of wilful inefficiency in office. And while they will fight for the welfare of their country they will not fight for the tinsel of a public title. But when the hour arrives for free untrammeled public service, these men will move quite naturally to their places in the public service. The great thing to know is—the men are here.

Movie Won'ts

HERE are a few of the things the movies *won't* do in the future, according to an offer made before a Federal Trade Commission conference by Louis B. Mayer, representing the picture producers:

They will not disseminate profanity.

They will not portray nudity.

They will not ridicule the clergy.

They will not show traffic in drugs.

They will not give offense to any nation, race or creed.

They will not picture seduction.

They will not show arson, the use of firearms or methods of smuggling.

They will not demonstrate the technique of murder.

Nor is this all. Such things as theft, robbery, safe-cracking, and dynamiting of trains, mines and buildings will be portrayed with special care.

With a program such as this few people can quibble. And it would be, probably, ungracious to suggest that the pledge carries with it tacit admission that the 'won'ts' of the future have been common practice in the past. The important fact is that the movie people are realizing that bad taste does not pay. They are beginning to clean house from within. Which is much better than cleaning house from without.

Then and Now

FILLING the family woodbox was a regular chore for the boy of twenty-five years ago who lived in the small country town or on the farm. After the first snowfall his troubles began. The snow had to be shaken off each stick and the wood piled neatly in the box. Not only the kitchen woodbox but the big round forerunner of the base-burner in the 'parlor' had to be kept supplied with a prodigious amount of fuel. The housewife of that early day cooked and worked about a hot kitchen stove and then rushed out into the open to hang up clothes. Sudden changes of temperature brought on colds and suffering. The oven required constant watching. There was little time for social visits.

Things are different now. Power comes into the home on wires or through pipes. By a press of a button a genie is released who washes, dries and presses clothing, sweeps the floor, cooks food, heats and lights the home and does a score of other things. The temperature of the home is more constant and even, making for healthfulness. But we wonder if, with all the modern improvements, the new housewife can make mince pies with that golden, crispy crust and delicious filling that was possible with the old cook stove. Yes, ours is no doubt the better age. But many things of the past are worth remembering.

Showing Off Criminals

CHICAGO is trying a new kind of publicity—publicity not of crime but *against* crime. Each week a round-up of known and suspected criminals is made. Then on Sunday morning they are put through a veritable 'fashion show.' In the court room of one of the large police stations powerful lights are thrown upon the 'stage,' and the criminals are forced to march back and forth under the pitiless glare. Meanwhile the main body of the room is kept in semidarkness, and there sit victims of robberies, assaults and other crimes, ready to spot their assailants should they pass under the light. Already several notorious criminals have been identified in this manner, criminals wanted for crimes not only in Chicago but elsewhere.

The plan has still further ramifications. A newsreel film concern takes motion pictures of the 'show,' and the films are taken to all local theaters, where additional thousands have an opportunity to pick out criminals. So successful has been the venture that the films are now being sent to all principal cities to aid police and victims in identifying fugitive criminals. Small wonder then that the round-up is proving highly unpopular with the underworld, and that criminals make strenuous efforts to avoid being included.

The Riddle of the Ring

OCCASIONALLY, surprises come to vary the monotony of life. One such came to a gentleman in St. Louis the other day, when he pleaded guilty to interstate transportation of the Tunney-Dempsey fight films in violation of Federal law. A few weeks previous the same gentleman had pleaded guilty to transporting the Dempsey-Sharkey fight films illegally, had smilingly paid a fine of $600, and had then proceeded to reap pleasing profits through renting the films to exhibitors. There is no law against *exhibiting* fight pictures. But this time the smile vanished. 'One thousand dollars' fine,' said the judge in effect, '*and three months in jail.*'

All of which brings up interesting questions. If it is illegal to transport the films, why should it not be illegal to show them, once they have been brought into a state unlawfully? Why should the fights themselves be not only legal but pseudo-civic enterprises, staged in municipal stadiums under the benevolent supervision of municipal authorities? Surely it is no more degrading to look upon a celluloid reproduction of a brutal fight than it is to look upon the spectacle itself? And if it is illegal to transport celluloid pictures of the battle by train or airplane, why should it not also be illegal to broadcast word pictures by radio? It is all very puzzling.

MIRRORS

By MARY HARROD NORTHEND

A MAN'S first thought on entering a room is, 'Where is there a place to sit down?' while a woman's is, 'Where is there a mirror?' It is only since the beginning of the 16th Century that mirrors have been used as articles of household furniture and decoration, and there are few women of the present day who do not realize and make use of their artistic value in adorning the home.

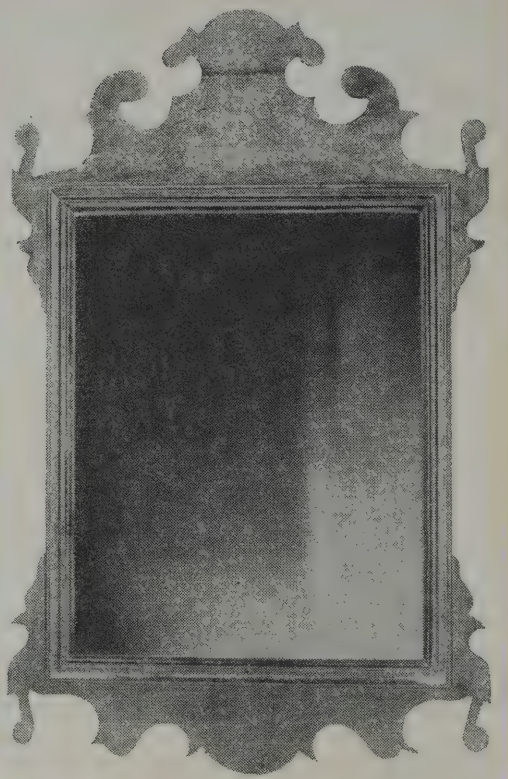
One cannot overestimate the possibilities of mirrors in house decoration, for they create an impression of spaciousness; they reflect choice and unexpected bits of color, and they actually light up a dark interior. They are more fascinating than pictures, and are usually more decorative. Place a mirror over a table and on the table set a vase holding a spray of apple blossoms, or a single flower, so that they will be reflected on its surface. Do you not see what a charming Japanesque effect you have? If you change your angle of vision and glance at the mirror from the other side of the room, instead of viewing the flower effect, you may see a splashy length of cretonne curtain reflected in its depths and supplying color to the wall where color was absent a moment before.

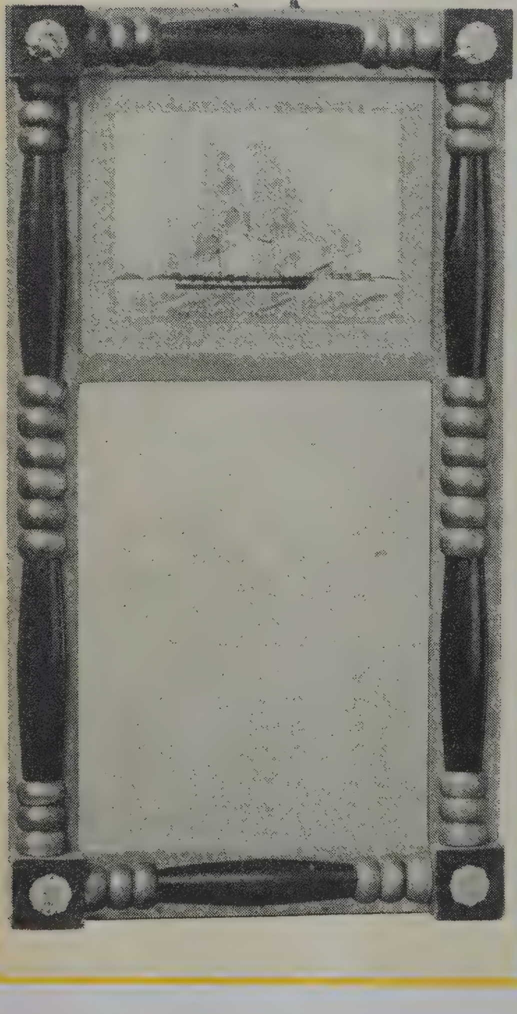
From another angle you see a window arrangement. These distinctive changes never become tiresome.

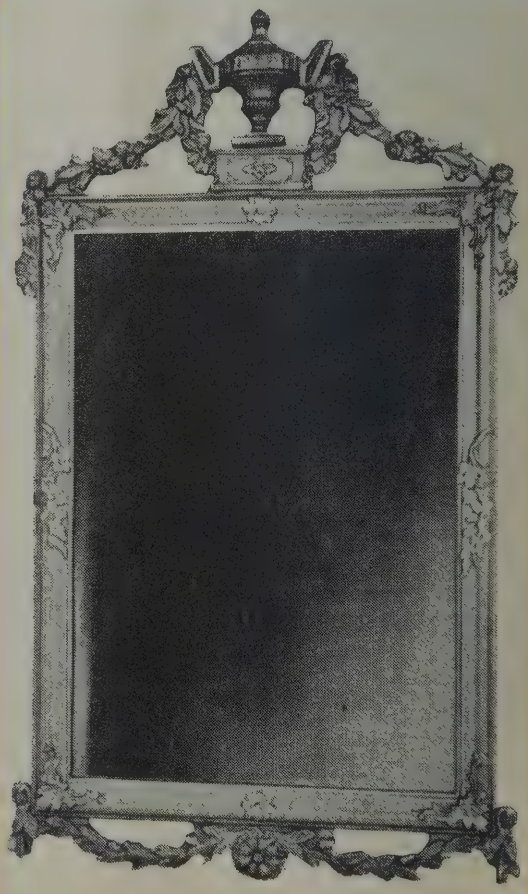
Color is the keynote of successful interior decoration, and it can be effectively brought out in the right use of the mirror, not only on the walls of the drawing-room, but in every part of the house. Mirrors are not chosen as in old Colonial days to reflect a pretty face or the good taste of the purchaser, but rather to lend character and charm. Many pieces of furniture formerly regarded as novelties have emerged to essentials in the well-appointed household, and among these we can include the mirrors, which serve for both utility and ornamentation. They are not unimportant accessories, for their judicious use produces attractive effects, the more so because of the many different types from which to choose.

The antiques naturally have the highest value, and especially interesting are those of the Chinese origin owing to their exquisite craftsmanship, which brings into relief realistic flowers and natural designs, such as the rose, the daisy, grapevines and quaint figures like the sea horse, all of which originated under the influence of the Sassanid art of Persia.

The first mirrors were introduced into our country from







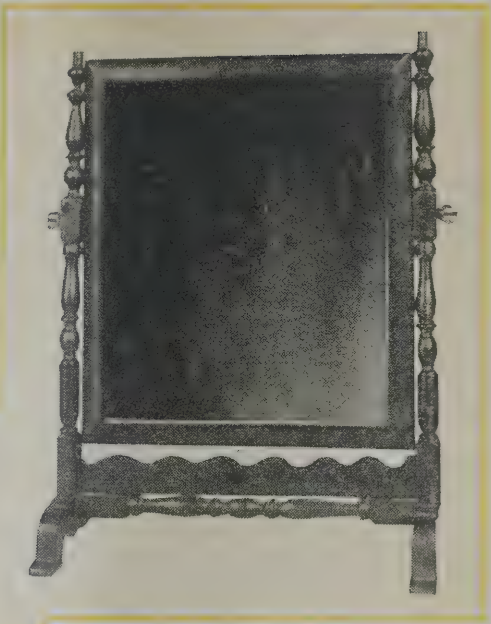
Mirror in walnut frame making decided use of curves, dating from about the first quarter of the 18th Century.
Left—Looking-glass, dating about 1810. The upper panel is decorated with a painting on the glass.
Right—Very rare walnut frame with elaborately carved fruit and leaf ornaments, whose making was the province of special crafts men in 1789.

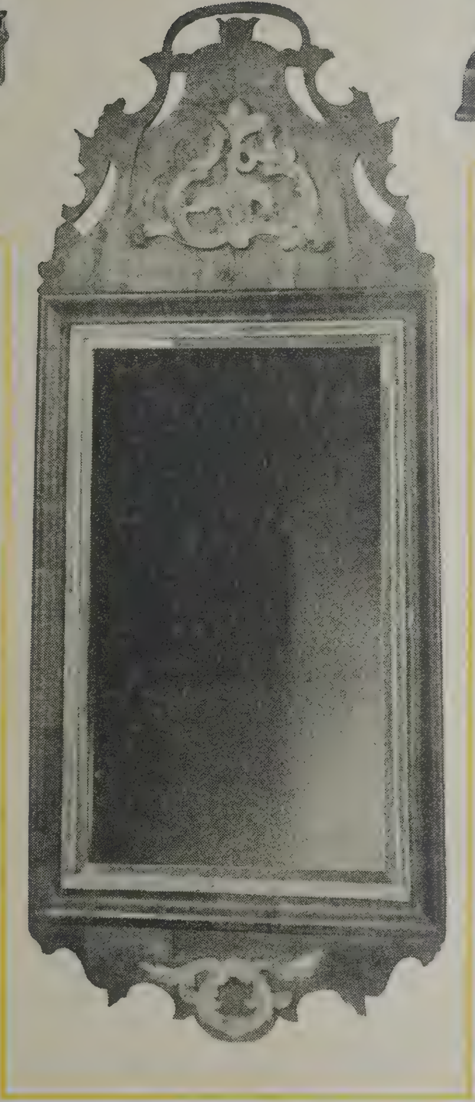
Left—*Girandole in the Henry Wadsworth Longfellow house at Cambridge.*

Right—*Cheval glass in walnut frame and standard, a rare specimen.*

Center, below—*Vertical wall mirror with thick, beveled glass in walnut frame, displaying the cabinetmakers' art of 1785.*

Lower, right—*A fine specimen of old walnut frame.*





England, having been brought from Venice. Until about 1673 Venice had held practically sole control of their manufacture. The earliest ones termed as looking-glasses were simple and were finished with a wooden frame divided into two parts to save expense. One of the most interesting of this type is in the collection of Dwight M. Prouty of Boston. It is very valuable, for not only has it retained the original glass but it is larger in size and shows a gilt ornamentation on the hood, a feature that was rarely found at that period.

Trained designers are taking advantage of the wonderful pieces of forgotten periods and are bringing into vogue interesting subjects, reproducing them with surpassing charm and quaint originality. Those copied from the designs of centuries ago are linking the present with the past. The mirrors of antiquity were of highly polished bronze but those of today show a great diversity in finish, thus making them to harmonize with any kind of interior decoration or period furnishing.

Nothing gives milady more pleasure than to place an attractive mirror in her drawing-room, but should it chance to be a girandole everything shown is distorted. One of the most interesting of this type hangs over the fireplace in the old Craigie House, Longfellow's home at Cambridge, Massachusetts, and is a notable specimen of Chippendale's best work. Mirrors ornamented with filigree were fashionable about 1775, and in the Prouty collection is a most interesting one representing a gilt urn festooned on each side. The best type came into existence during the popularity of the Adams brothers, and were designed with such graceful *motifs* that they stand today as the most desirable pieces for interior settings. What is more tasteful for a hall treatment than one of these mirrors above a console of the same period?

Like everything else of the olden times love is linked with this particular feature, for betrothal or courting mirrors, now so rarely seen, were formerly considered among the choicest kinds. There are three types. The first is the 'Constitution,' so popular during the Reconstruction period, when the eagle as the favorite emblem was used for decorative purposes. Surrounding the medallion and introduced into the frame are stars, representing each state in the Union, while underneath are the clasped hands from which its name originated. The second is commemorative of our appreciation of General

FREE CITIES of the DECAPOLIS

By JOSEPH WARREN

DURING the Middle Ages, when all Europe was a mosaic of principalities, counties, dukedoms, bishoprics, free cities, republics, seigniories and various other feudal subdivisions, Alsace was regarded as part of the Holy Roman Empire under the Hapsburgs.

This empire was loosely held together, fighting between the various nobles and sections being continuous. Alsace, always endowed with a feeling of independence, was evolving prosperous cities here and there, under the domination of petty nobles who used the accumulated wealth to their own advantage.

These cities one by one appealed to the Emperor, and purchased their independence from outside influence, until they were given a sort of standing, owing allegiance only to the empire and having a representative in the imperial diet. However, as they were constantly subject to attack and pillage, it was natural that a league between them should come into being.

This league, known as the Decapolis, served the double purpose of defense against marauding nobility, and the ensuring of better commercial relations.

It was founded in 1353, being composed of the cities of Hagenau, Kolmar, Schlestadt, Oberehnheim, Rosheim, Mülhausen, Kaysersberg, Türkheim, Münster and Weissenburg. In 1511 it was enlarged to include Landau, but in 1523 Mülhausen left to become part of the Swiss Confederation, and it was ten cities again. These cities continued independent until after the Treaty of Nimwegen in 1679, when they recognized the authority of Louis XIV and were incorporated into France without further privileges.

DURING the course of the three centuries in which their league flourished, these Alsatian cities became rich and important. All of them, fortified to withstand attack, maintained military establishments. They were rebuilt and embellished in the best style of the times under the supervision of both Alsatian and French architects, and became centers of culture. During the same period, the great city of Strasbourg was also independent, but, being so much larger, was not incorporated with the others and had nothing in common with them.

Because of this independence and ability to withstand attacks, these cities today offer much of interest to the traveler, much that is genuinely old and replete with medieval charm.

Consider first Weissenburg, a small city of seven thousand people on the northern frontier of Alsace. It is best known now as the place where one must get out of the train and have his baggage searched on the way into Germany, so far has it fallen from its ancient glories. Originally, it grew up around a powerful abbey of the Seventh Century, and was sufficiently important to become a free city of the empire in 1255.

Of the abbey there remains now only the 13th Century church of early Gothic, with a fine tower and some cloisters. However, on the side streets many old houses are still standing, some dating from the 16th Century. A few of them must have been built as palaces, others as homes of wealthy merchants.

MANY examples exist of that particularly Alsatian type of house with exterior galleries of dark carved beams, and spiral stone staircases sheltered by graceful turrets. Practically every house has the date of its erection carved somewhere on it, so that it is not difficult to determine its period.

An air of decay remains about Weissenburg however—the quiet of past power. It seems to feel the decline of its destinies, and reflects a certain sadness. Nothing disturbs the quiet of the streets, and even the customs officers are most unusually polite and apologetic.

Weissenburg was the scene of one of the tragedies of the war of 1870 when MacMahon's French army was defeated by the Prussians. Since the German occupation, the old fortifications have been razed, and nothing stands but some vine-covered walls of no military value.

A few miles over the German border is Landau, formerly a French city, and for one hundred and fifty years a member of the Alsatian Decapolis. It was taken from France by Germany in 1815 and still remains a part of Germany, in the Rhine provinces. The old fortifications have been demolished and little remains to show the antiquity of the place. On the whole it is an uninteresting town, with nothing to see, and it is quite Germanized.

Twenty miles south of Weissenburg is Hagenau, another city of the league. Of all the Alsatian cities, perhaps none suffered the rigors of war more than Hagenau. It has been taken, burned, dismantled, and then rebuilt and refortified, only to suffer new disasters throughout its history. Originally it was fortified in 1164, but little remains of the ramparts.

Hagenau is a prosperous city now, and wealthy. Although the two churches of St. George and of St. Nicolas date from the 10th and 13th centuries respectively, there is not much to remind one of the Middle Ages.

The many ruinous wars and the subsequent prosperity have caused much of the city to be rebuilt; the buildings are modern French. In fact, it is one of the most French-appearing cities in Alsace. There are, or course, some buildings that date back to the reign of Louis XV and these are very elegant with their façades of the 18th Century. However, the city is not over-interesting, in view of the fact that in 1354 it was leader of the Decapolis.

Still farther to the south are the two little cities of Oberehnheim and Rosheim. Neither has many more than three thousand people, and both are quaint and very old. These tiny cities are both important members of the league and, although they have suffered from war and fire, they retain remarkably well the atmosphere of centuries ago.

Both boast of well-preserved walls and ramparts, and picturesque gates and towers. In Rosheim, an ancient gateway has a high-peaked roof and a clock, surrounding which are rows of quaintly gabled houses with wooden balconies belonging to remote periods.

Many of the houses in both of these towns have no doors facing on the street, but one must go through a gate into a garden to gain admittance. This is undoubtedly a survival of the days of marauders and street fighting. It gives a bleak aspect to the streets, relieved, however, by vines and roses which clamber all over the walls and houses. In both places are unusual public wells, with carved stone copings and very beautiful stone baldachins covering them. They are used today quite the same as they must have been six or seven hundred years ago.

OF OLD buildings there are plenty. Whole streets remain much as they were centuries ago, and there is an atmosphere about them seldom felt elsewhere. It is all so untouched and genuine that it is difficult to render adequate appreciation at first. In Rosheim is a remarkable Romanesque church rich in sculptures, dating from the 12th Century. This church was not destroyed when part of the city was burned in 1622 by a hostile army. A legend relates that as the soldiers ran through the streets setting fire to buildings with their torches a cordon of angels was seen encircling the church with torches also. The marauders, thinking them part of their own forces bent on setting fire to the building, passed by. Thus it was not harmed.

Citizens of Rosheim point out a dilapidated ruin which they credit with having been, over a thousand years ago, one of the hunting boxes of Charlemagne. Perhaps it was, for nobody can deny it.

In Oberahnheim is an amazingly beautiful Hotel de Ville dating from 1523, heavily ornamented with sculptures, but retaining an element of lightness. Here also the whole town is old and does not seem to have changed much as the centuries have passed.

Still to the south, the next Free City is Schlestadt. It may also be spelled Selestat or Schlettstadt. Owing to the French, German and Alsatian languages which intermingle everywhere, it is often difficult to know which spelling is proper. The other cities in the group also have the same variety in the spellings of their names. Schlestadt has the antique air of the smaller towns of Obernai and Rosheim, although a touch of the modern is found in the name of the street leading to the center of town—'Rue du President Wilson.'

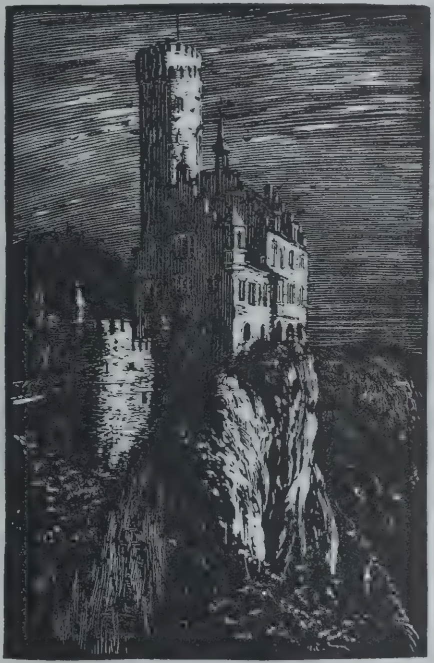
Schlestadt reached the pinnacle of its importance in the 14th Century, and offers some interesting old buildings as relics of that time. Among them is a charming old clock tower, massive and ancient, dating from the 13th Century, and two unusual churches. St. Foy, one of the finest Romanesque buildings in Alsace, was begun in 1094, and St. George's Cathedral is admirable Gothic of the 13th Century.

FROM Schlestadt it is not far to Kolmar, one of the more important cities of Alsace. Here is a modern town, very different from the other cities of the Decapolis. However, the original town is undisturbed, for the modern part has been built around the old part; Kolmar thus has treasures of art and architecture of which it is very proud. The Church of St. Martin was built in the 13th Century, and is a fine Gothic structure dominating much of the city. Nearby are to be seen many excellent examples of ancient buildings, with much carving and with timbered balconies. All through the old town are houses with emblazoned inscriptions on the fronts in Latin, generally giving good advice to pedestrians.

Among the famous citizens of Kolmar was Bartholdi, who designed our own Statue of Liberty; his home is pointed out to all Americans. Near the railway station is another 'Rue Wilson,' showing the feeling of these people since the war. Kolmar was the center of French feeling in Alsace all during the German occupation, and was a thorn in the flesh for Germany.

As a crowning monument to the conquerors, a railway station was erected. It was an unfortunate monument—being architecturally atrocious looking, and thoroughly out of place amid its surroundings. Alsace is studded with these examples of Teutonic architecture, and they are without exception more useful than ornamental.

Near Kolmar are the two smallest members of the Decapolis, Türkheim and Kaysersberg, neither of which has more than 2,500 inhabitants. Türkheim is most famous as being the place where Turenne gained a decisive victory over the Germans in 1675, expelling them from Alsace. The town itself is a sleepy little place partly surrounded by its old walls and boasting several towers. One of the old gateways, the Porte Basse, is remarkable, with a creamy old stone tower, four corbel towers on the corners, and a red-tiled roof rising to a point. To lend an additional touch to it, the storks have built a nest on the very top.



As one wanders through the narrow streets, one comes upon many choice relics of past centuries in carved and sculptured doorways, ancient fountains, and rambling walls. The town is literally a tangle of narrow alleys and lanes.

Kaysersberg is just as picturesque, but in an entirely different way. Old-fashioned gables, timber-framed houses with the quaintest of carvings, statuary, and all the ornamentation of hundreds of years ago, give character to the streets. On the hillside overlooking the town is the great ruined feudal keep of the Kaiserburg, dominating every view. An unusual fortified bridge accents the charm of the little river Weiss which also helps to make Kaysersberg beautiful and fascinating.

Up the valley of the Fecht from Kolmar lies the little city of Münster, a Free City since the 13th Century. When one sees it, one realizes better what some of these Alsatian cities have been through during the past centuries. Münster was fought over during the last war, and is sadly damaged by shell fire. There are remains of the Hotel de Ville of 1550, but that is about all that is left of the ancient buildings. Many workmen were about—which gave promise of restoration of the dwellings soon; but the old and antique things of Münster have passed away—as they have in other places of France.

THE last city of the Decapolis is Mülhausen, the second city of Alsace and the center of the manufacturing industries. It was a Free City in the beginning, but joined the Swiss Confederation in 1523. In 1798, it voluntarily rejoined France and is very French at heart. At the beginning of the war it was liberated by the French for a few days, but they had to retire later; from that time on, it was ruled by the Germans as enemy territory. Here again are American touches in a Rue Wilson and a Rue Franklin.

With all the bustle of a large industrial center, Mülhausen has lost practically every historical vestige. The beautiful Hotel de Ville of 1552 is the one notable exception; it is indeed a charming example of the former importance of Mülhausen, being a blend of Gothic and Renaissance at their best.

However, in a secluded portion of the city is a most unusual tower known as the *Bolwerk*. It rises from two sections of the old wall, slender and most satisfying as an example of a medieval tower. The upper part is white, and below this is an excellent decoration of a knight on horseback cap-a-pie, all in orange, blue, gold and crimson. It is surmounted by a gayly flèched, steep pent roof, and must be very, very old.

Mülhausen is the last of the Decapolis, and one leaves there feeling one has gained a fresh insight into Alsatian history. The cities all possess an individual charm, although naturally some are more interesting than others. Moreover, they represent Alsace, and contribute much toward making that little land one of the choice spots for the traveler who appreciates the ancient and beautiful.

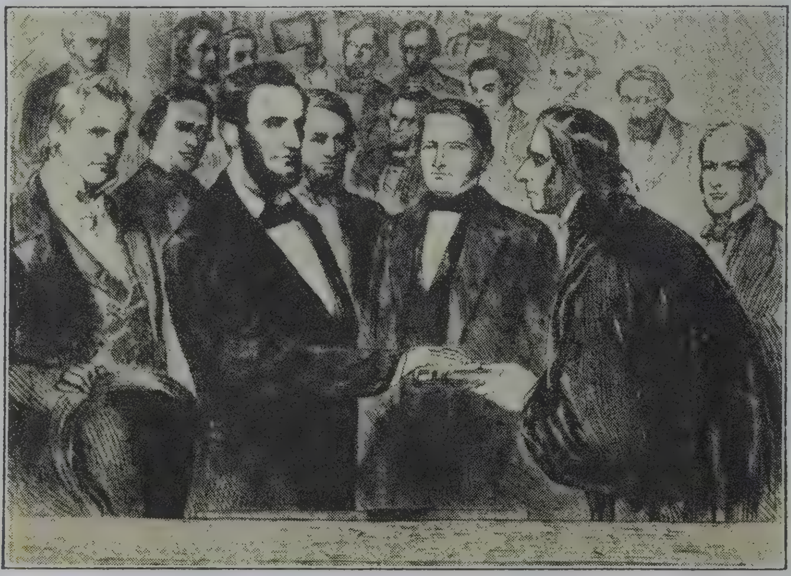
Mrs. LINCOLN in the White House

By WILLIAM E. BARTON

TWO women constitute important sources of information concerning Mary Todd Lincoln's life in the White House. One was her cousin, Mrs. Lizzie Todd Grimsley, who remained with her the first six months in the White House. She left an interesting account of the visits of Southern politicians, who, before their departure from the Capital to take up arms against the Government, called to say 'good-by.' One of them was John C. Breckenridge, a relative, who pleasantly said, 'Cousin Lizzie, I should not like you to be disappointed in your expected stay in the White House. Remain here as a guest after the Confederates take possession.'

Mrs. Lincoln responded that Cousin Lizzie was quite welcome to stay that length of time, and in that event would be there a good while.

Mrs. Lincoln needed all of her practical wisdom and more. Washington was full of Confederate spies. There were many highborn women of Southern sympathy who were eager to hire out to her as chambermaids for the privilege of listening at keyholes. At least one woman got in the White House in some such fashion. One other such narrowly headed off from securing lodging there with intent to create a scandal. The newspapers had their representatives secretly employed. If Mrs. Lincoln made mistakes now and then, it was no wonder. No wife of any President ever met such a situation or was so little prepared for it.



—Keystone View.

An old print depicting part of the ceremony at the second inauguration of Lincoln, 1865.

The other woman was Elizabeth Keckley, a mulatto. For thirty years she was a slave, but secured her freedom and became one of the best-known dressmakers in Washington. Mrs. Lincoln had spoken of needing a dressmaker and several of her friends sent her candidates. They came at a given hour, and when she catechized them she learned that Mrs. Keckley had been dressmaker to the wife of Senator Jefferson Davis, the new President of the Confederacy. That seemed to settle the matter for Mrs. Lincoln.

She told Mrs. Keckley, however, that as she and Mr. Lincoln had just come from a small town in the West, and were still poor, she could not afford to pay high prices. She hoped Mrs. Keckley's rates would be reasonable, and assured her that she would have abundant compensation in the fact that other women would be glad to employ her when they knew that she worked for the wife of the President.

It was even so. Mrs. Keckley had occasion to employ a large corps of assistants and her business prospered; she, however, became an increasingly intimate and influential person in the White House, and was a confidential friend of Mrs. Lincoln for many years afterward. She told her story in a volume which ought never to have been published, but which is so thoroughly documented and supported by Mrs. Lincoln's own letters, and by the newspaper accounts of the time, that we cannot question the essential truth of her narrative of those days.

She made Mrs. Lincoln's dress for the first White House reception; it was a bright rose-colored moire antique, and she had to work hard to get it finished. Indeed she was a little late on the evening of the reception and Mrs. Lincoln had worried herself into a highly nervous state for fear it would not arrive. When Mrs. Keckley got there with the dress, Mrs. Lincoln was scolding over the delay and declaring she would not go down at all.

When Mr. Lincoln came in and saw his wife so brilliantly attired, he looked at her in unfeigned admiration, and began to recite, one after another, poems about beautiful women, each of them applying to his own wife. 'You are very poetical tonight, Mr. Lincoln,' she said to him. 'These are poetical times, Mother,' he replied, and quoted another poem.

Fifteen or sixteen dresses Mrs. Keckley made for Mrs. Lincoln that spring and summer, and she grew to know the White House family quite intimately. She saw Mrs. Lincoln in all of her moods, which were many, and the two women were drawn together by closer ties than those of business relationship. Mrs. Lincoln had an attractive neck and rounded, well-proportioned bosom; her arms were plump. These charms she liked to display, but what her dress lacked at the top, it more than made up in the length of her train. The first time Lincoln saw her in a dress of this extreme character, he drew a low whistle, and said, 'Whew, what a long tail our cat has!'

When she questioned him as to whether he did not like her dress after all, he gave a qualified approval, saying that he thought it would look quite as well if the head and tail of it were a little closer together.

One White House custom Mrs. Lincoln found and for a time observed, but soon rebelled against it. Traditionally the President offered his arm to some other lady, the wife of the Secretary of State or some one else whom he wished to honor, leaving Mrs. Lincoln to be escorted by some notable man. This caused her to go behind another woman, and she could not tolerate it.

Once she compromised by having her husband lead Lizzie Grimsley down to a reception, but even this did not put the President's wife in the first rank. She declared that she herself, as 'Mrs. President' should go on the President's arm, and no other woman should ever precede Mrs. Abraham Lincoln, the wife of the President of the United States.

Not only this, but she kept a close eye on her husband at every public function, and any woman who succeeded in engaging him in five minutes' personal conversation suffered a black mark in Mrs. Lincoln's mind. She did not fail to admonish her husband before each reception not to act like a beardless schoolboy and conduct flirtations with silly women. He teased her a little by naming a list of women with whom he might possibly talk, choosing the names of those whom he knew to be least acceptable to his wife.

She denounced them one by one as 'hateful,' 'horrid,' and all the rest, and then he would ask, 'Well, Mother, who shall I talk to?' He should have said 'whom,' but he did say 'who,' and Mrs. Lincoln never succeeded in making out a list of the women she really wanted to see her husband talk with. Few women in the history of the world have had less occasion for jealousy than Mrs. Lincoln, and she knew that, but such matters with her were not wholly affairs of reason.

The White House was not wholly a cheerful place in those days. Hardly had the Lincolns moved into it when they were constrained to drape it in mourning for Colonel Elmer Ellsworth, a member of their own household. Nor was it long until they draped it in mourning again, and this time for Stephen A. Douglas, a most magnanimous act on Lincoln's part. The little boys contracted measles visiting the camps, as it was supposed. Mrs. Lincoln had no natural aptitude for nursing; she was an oversolicitous mother, and one who lacked steadiness of nerve. She was a Christian woman, and her faith was a comfort; but her temperament had in it nothing that helped her to bear the strain of anxiety, or the calamity of grief. These crushed her.

After the death of Willie Mrs. Lincoln was almost frantic; she never again entered the room where he died or where his body lay awaiting the funeral. At one time she expressed her grief in such passionate terms that her husband led her to the window, and pointing out, said, 'Mother, do you see that large, white building yonder? Unless you control your grief I am afraid we shall have to send you there.'

Lincoln himself was almost prostrated with grief over little Willie's death, but he was a man of self-control, and self-control was something Mrs. Lincoln never learned.

More than once, as just after the Battle of Bull Run, the family of the President was advised to leave Washington. Mrs. Lincoln was by nature a woman of great timidity, but she refused to go, and her presence was an encouragement to her husband.

His wife contrived to invite old friends to meals at the White House, especially to breakfast. She laughed and joked with them as they talked of old days in Illinois; she even shared the fun at the expense of herself and her sisters, all but one of whom, like herself, married lean men, when an old friend made free to tell a story, familiar in the family, that Major Wallace had been the only man who had been able to put on flesh while tyrannized over by a Todd. The story was almost exasperating, but Mrs. Lincoln let it pass for the sake of the fun it gave her husband, who, like all tall men married to short women, complained of his helpless subjugation.

Mrs. Lincoln assumed a benevolent despotism over her husband, and compelled him to drive with her every afternoon, a blessed relief, and one he would not have taken had her sway over him been less absolute. Her attempts to lift the cloud of gloom that hung over the White House were not wholly successful. If she gave a reception, she was criticized for displaying joy at a time when the nation was suffering defeat upon the battlefield and sorrow in its homes; if she did not give a reception, she was criticized for not doing so. Her social errors were noted, exaggerated, and made the subject of unbecoming mirth. The American people have treated with shocking rudeness every woman who has occupied the White House, from sedate Martha Washington and gay Dolly Madison down to Mrs. Warren G. Harding and Mrs. Calvin Coolidge, but among them all no one has been so shamefully stripped and pilloried as has Mrs. Abraham Lincoln.

Lincoln, head lowered in thoughtful mood, an aspect he often presented during his tenancy of the White House. From the statue by Daniel French.

I believe this to be a
case entitled to
executive clemency

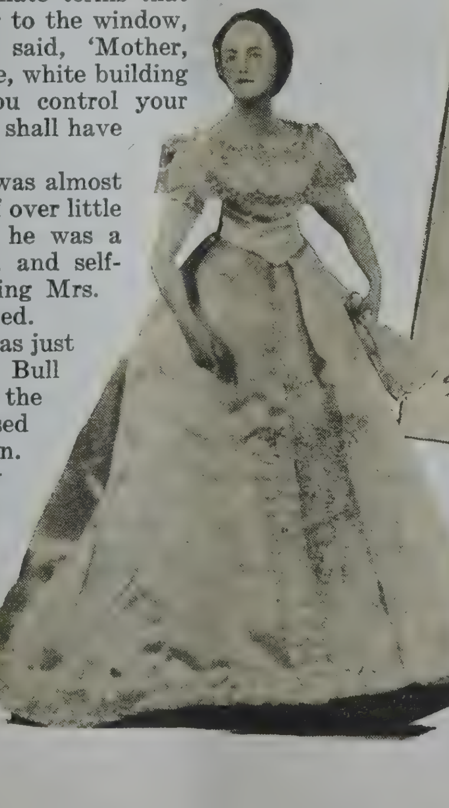
Wm L. Avery

Let this man be released
on taking the oath of
Dec 8. 1863.

A. Lincoln

April 12. 1865

The President approves a recommendation for the release of a prisoner: 'Let this man be released on taking the oath of Dec. 8, 1863. A. Lincoln. April 12, 1865.'



Left—Figurine of Mrs. Lincoln, with replica of gown she wore to the Inaugural Ball. In Chicago Historical Museum.

Mrs. Lincoln, in her interview with Herndon September 4, 1866, said of her husband: 'Mr. Lincoln was mild in his manners, but a terribly firm man when he set his foot down. None of us, neither man nor woman, could rule him after he had once fully made up his mind. I could always tell when, in deciding anything, he had reached his ultimatum. At first he was very cheerful; then he lapsed into thoughtfulness, bringing his lips together in a firm compression. When these symptoms developed, I fashioned myself accordingly, and so did all others have to do sooner or later. When we first went to Washington many thought Mr. Lincoln was weak, but he rose grandly with the circumstances. I told him once of the assertion I had heard coming from the friends of Seward, that the latter was the power behind the throne; that he could rule him. He replied, "I may not rule myself, but certainly Seward shall not. The only ruler I have is my conscience—following God in it—and these men will have to learn that yet." '

Mary Todd had not received a sufficient preparation for the task before her, nor had any of the American women of the time. The mistress of the White House at that juncture would have needed to be superwoman to have met the distressing and complicated situation. Mrs. Lincoln had not the patience, the tact, the self-control, essential to her position. But she was loyal to Mr. Lincoln and to the Government of the United States.

It was Mrs. Lincoln's fate from the first to be pilloried by all the viler elements of society, as the wife of the first Republican President; and it was her misfortune that she was not fitted by nature to bear herself sublimely in the pillory. She refused to be a martyr and insisted on enjoying herself in her own way all she could. When it was urged upon her that she must give at least one ball at the White House to enliven the black gloom that had settled over Washington, she consented. After the date was fixed, the disappointed birds of prey who hovered around her were enraptured because, between the announcement and the night of the ball, a fatal battle intervened. She was covered with scorn and contumely because, though an interval had elapsed, she still allowed the original program to be carried out. Beyond all question it would have been better for Mrs. Lincoln to have refused to yield to the pressure brought to bear upon her, and not to have given any ball, as the instance has always been used entirely to her discredit. She gave her ball, and such other social events as were deemed necessary, chiefly the formal weekly reception.

SHE dressed in gowns very scant as to the top, and with enough material in the skirt to have clothed Fifth Avenue or Michigan Boulevard; and she wore upon her head enormous bunches of flowers. She bought dresses lavishly, more than Mr. Lincoln knew about or could afford. The story of her extravagance and her eccentricities is pathetic in much that can make the thoughtless laugh or the judicious grave.

Moreover, Mrs. Lincoln sometimes displayed an ungovernable temper, and a jealousy as intense as it was silly. The latter can only be accounted for by assuming that even in that period there was in her some element of mental aberration. Foolish she certainly was, but she was loyal, and she loved her husband with a passionate devotion.

Peace came at last, and there was mercifully granted to Abraham and Mary Lincoln a brief interval in which they were permitted to build castles in the air. Up to the time of the second election, they had always assumed that when they left the White House they would return to Springfield to live. Now there opened before them longer vistas. They would see the second term of office through and the wounds of the country healed; there would be a policy of forbearance and forgiveness and good will. Their period of office which had begun under the cloud of war would end in the sunlight of peace. Then they would travel; they would take the boys and go to Europe; they would visit the Holy Land; when they returned they would go to California, and see men digging out the gold that was to pay the national debt.

They were no longer sure that they would return to Springfield; if their hearts pulled them back to their old home, well and good; but if otherwise, they would find a home where it might seem best. In the meantime there was peace, and the work of rebuilding the desolate places and healing the wounds which the strife had caused. And under the Stars and Stripes there was not a single slave.

THESE were the things they talked about on their daily drive, even to the last afternoon before Lincoln died. (There was no memory that she dwelt on more fondly than that of the conversation of their last ride together.) These were the castles they built in the air. So far as we know the story of those last days, no cloud came between Abraham and Mary Lincoln. At evening time there was light. Then came the assassin's bullet and the dark.

Mrs. Lincoln returned to Chicago with her sons, Robert and Tad. Robert was grown and engaged to be married, but for a time he was with his mother. They were not always happy together; in some respects their dispositions were too much alike for them to be congenial. They took rooms for a week at the Tremont House, where she had once attended a great reception with her husband in November, 1860. She remembered when Mr. Lincoln stood on one side of her and Hannibal Hamlin on the other, and hundreds of Chicago people passed by and greeted her as they had greeted no other woman in all the history of that city.

Summer was coming on and the family moved to Hyde Park, where the university now stands but what then called itself a summer resort. In time they moved back to the city and took rooms at the Clifton House on Wabash Avenue and Madison Street. While there Tad attended school at what was called the Chicago Academy, only a block away. He had grown to be a very tall rawboned boy, in stature almost like his father, but still in some respects, he was almost feminine. He was far behind in his studies, and did not learn readily, though his mind was not defective. Robert came and went and sought to be patient with his mother's moods, but at times he lost his temper.

A distressing condition now arose out of Mrs. Lincoln's bills: unknown to her husband she had contracted debts for dress goods, furs, laces, diamonds and shawls, to an amount of almost seventy thousand dollars. The merchants had not been swift to demand their payment, but intimations came with increasing frequency and emphasis that money should be forthcoming.

She made a desperate effort to get some friends to secure Mr. Lincoln's full salary for the four years; his salary was paid for the remainder of the year 1865, and after that a small pension was given her. At this she complained bitterly, and she talked of some scheme whereby the Republican politicians might be compelled to advance the money to save the shame of the poverty of the President's widow.

When matters came to their worst she permitted interviews and other statements of her poverty to appear in the papers of New York and other cities. Robert was furious about this and he and his mother quarreled violently. The newspapers of the country took up the matter, some affirming and others denying that Mrs. Lincoln was a poor woman.

She now called to her aid Lizzie Keckley and the two met in New York. There it was arranged that the dresses and other goods of Mrs. Lincoln should be put on exhibition, but that before that step was taken the merchants should let the Republican politicians know what they proposed to do. This may have seemed rather a close approach to blackmail, but it was not effective. She authorized the printing of a circular with a plea for the raising of a fund on her behalf; she even went to the length of appealing to the Reverend H. H. Garnet, a colored minister in New York, and then to Fred Douglas to appeal for money to the colored people and she offered to leave to Lizzie Keckley five thousand dollars at her death, if the colored people should raise fifty thousand dollars or even twenty-five thousand dollars.

The reports that Mrs. Lincoln was insane now grew widely current. Just about this time Judge David Davis presented to the court of Sangamon County a statement of Mrs. Lincoln's assets, showing that her husband had left a fortune of about $110,000.

Washington Street, Chicago, was extending westward; she secured a house on the north side of that thoroughfare, between Elizabeth and Ann. The First Congregational Church was almost across the street. Tad joined its Sunday school and she frequently attended its services. She shrank, however, from any approach to intimacy and lived there almost in solitude. Robert married and had a home of his own; Tad died July 15, 1871. There was very little left for Mrs. Abraham Lincoln. Her conduct grew more and more erratic; her friends, and especially Robert, suffered on account of her behavior.

At length Robert felt compelled to apply to the County Court of Chicago to have his mother declared insane. No little care was taken to hide the records, and when the present writer instituted a search for them, the oldest clerks in the office declared that such papers did not exist; subsequent investigation, however, revealed them, and the writer supposes himself to be the first person who has seen these papers since they were carefully hidden away.

SO FAR as the records show, the sad thing was done as decently and with as much dignity as possible. The complaining witness was, of necessity, her son Robert. The jury was composed of twelve as prominent men as Chicago had at that time. It would appear that everything was done that legally could be done to carry out what was deemed necessary with as little publicity and with as much regard for propriety as possible. No docket number appears to have been given to the case, and the loose papers were conveniently lost or mislaid; but the court record is there, with the names of judge and jurors; and they are of such character as to forbid the suspicion that they acted hastily or through prejudice.

Mary Lincoln was found insane and a fit subject for confinement in one of the state hospitals for the insane in the State of

Illinois. She was not taken to a state hospital, but to a private asylum at Batavia. After a little more than a year she was declared cured; another jury found her restored to reason. The date of her first trial was May 19, 1875, the second June 15, 1876. That she was indeed insane would seem past dispute; that she was restored to reason is less certain.

Mary Lincoln went abroad. During at least a portion of her stay abroad she and Robert were not in correspondence and he did not know her address. Part of the time she was in Pau, France, and part in Frankfort, Germany. In the former place in December, 1879, she suffered a serious injury. She was living economically and without a servant, and she mounted a stepladder to adjust a picture hanging over the mantelpiece when the stepladder broke with her. She was confined to her bed for some time, afflicted with inflammation of the spinal cord and partial loss of power in the use of her legs.

When she thought she was able to travel she got as far as Nice, and there again was prostrated. At length she got on board ship, and being somewhat improved in health, she sailed for the homeland. How she was received in America is related in the New York *Sun*, which tells this story of the home-coming, in October, 1880, of a woman who had been almost a queen:

'When the *Amerique* reached New York a throng was assembled on the dock and a greater throng was in the street outside the gates. During the tedious process of working the ship into her dock, there was a great crush in that part of the vessel where the gangplank was to be swung.

'Among the passengers who were here gathered was an aged lady; she was dressed plainly; her face was furrowed and her hair was streaked with white; this was the widow of Abraham Lincoln.

'She was almost unnoticed. She came alone across the ocean, but a nephew met her at quarantine. She had spent the last four years in the South of France. When the gangplank was swung aboard, Mme. Bernhardt and her companions, including Mme. Columbier, of the troupe, were the first to descend. The fellow voyagers of the actress pressed about her to bid her adieu, and a cheer was raised, which turned her head and provoked an astonished smile as she stepped upon the wharf.

'The gates were besieged, and there was some difficulty in bringing the carriage, which was to convey the actress to the hotel. She temporarily waited in the freight office at the entrance to the wharf. Mrs. Lincoln, leaning upon the arm of her nephew, walked toward the gate. A policeman touched the aged lady on the shoulder and bade her stand back.

'She retreated with her nephew into the line of spectators, while Manager Abbey's carriage was slowly brought in. Mme. Bernhardt was handed in and the carriage made its way out through a mass of struggling longshoremen and idlers who pressed about it and stared into the open window. After it, went out the others, who had been passengers on the *Amerique*, Mrs. Lincoln with the rest.'

Mrs. Lincoln tarried for a time in New York for medical treatment. Dr. Lewis A. Sayre, to whom she confided her troubles, gained the impression that she was still exceedingly poor. When she died, as she did only a little later, she had six thousand dollars in cash and seventy-five thousand dollars in Government bonds in the top drawer of her bureau, and had innumerable boxes of silks and shawls, which she had never opened, and was destined never to wear.

Mrs. Lincoln returned to Springfield, and to the home of her sister, Mrs. Edwards. It was the home in which she had first met Abraham Lincoln, the home in which they were married. These days were mercifully shortened; she died of paralysis on July 16, 1882. The attending physician made a postmortem examination, and issued a statement that for years she had been the victim of a cerebral disease. This ought to be deemed a sufficient explanation of all that needed to be explained for her violence of temper and her unfortunate words and doings.

The story of Mary Todd is a sad story, the story of a woman misunderstood and cruelly persecuted. But this much deserves to be remembered to her everlasting credit:

In the day when her heart was torn asunder, and most of her relatives were on the opposing side, she was unflinchingly loyal to the Government of the United States. While she sometimes made her husband unhappy, and he not infrequently vexed her, she was an affectionate wife and mother, loving her husband with a passionate devotion and never failing in her faith in his character, his ability and his success.

And he loved her; she was the only woman to whom he gave a ring, and in that ring were the words, *'Love is eternal.'*

Sangamon River at New Salem, Illinois. While rowing a skiff near this point Abraham Lincoln met his sweetheart, Ann Rutledge.

A CIVIC DUTY

By WILLIAM LEE CALNON

LEGISLATORS are proposing to draw all future jury lists from the ranks of nonvoters and thus compel everyone who wishes to avoid jury service to make sure of it by voting regularly. One has offered a bill to reward voters by apportioning the seats in the legislature on a basis of the vote cast in all districts and not on a basis of population.

The scheme to limit jury calls to nonvoters is unsound. If such a law were in effect and resulted in bringing out the vote to the extent that Chicago voted in its last election, jury lists would be confined to hospital patients, chronic invalids, registered voters dying or dead on election day, and people absent from the city. Apportioning legislative seats on a basis of the vote cast would be an invitation to small districts to cast a 100 per cent vote and gain an advantage over larger communities where anything approximating a 100 per cent vote is impossible at any given time.

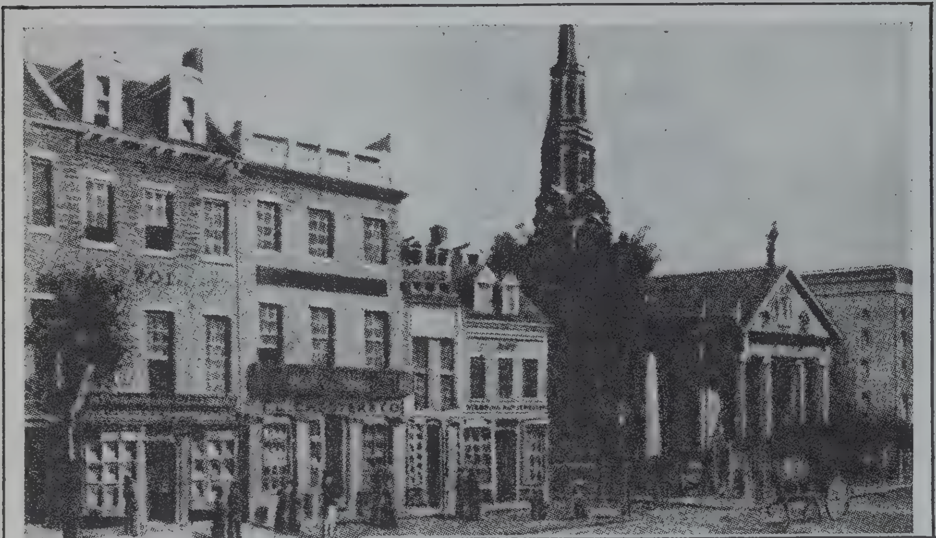
It is easier to 'get out the vote' to nearly complete figures in a local referendum on permitting 'movies' to operate on Sunday, or some other such issue of a comparatively minor nature that hits home directly to those in the community affected.

The problem has its root in the primary election system, which has increased the number of elections and lessened party responsibility to a considerable degree. Added to the primary has been the nonpartisan city method of choosing certain officials, now widely in use. It is becoming a frequent experience to have a light vote cast where only mediocre candidates are engaged in a contest for minor offices, the problem of getting out the vote being up to the interest the candidates can arouse.

Pre-primary conventions, sponsoring candidates with party endorsement, form one constructive suggestion as to a means of getting away from various primary troubles. A real trying out of this plan would be needed to show if it will do what is claimed for it, and incidentally brace up party responsibility and permit party leaders to make more effective appeals to the voters to vote. Unless this, or some other alteration in the present system, is given a trial, it is likely that the Chicago plan of machine guns, dynamite, bullet-proof vests, et cetera, will remain the one effective lure.

The WALL STREET of Yesterday

By JAMES R. DANIELS



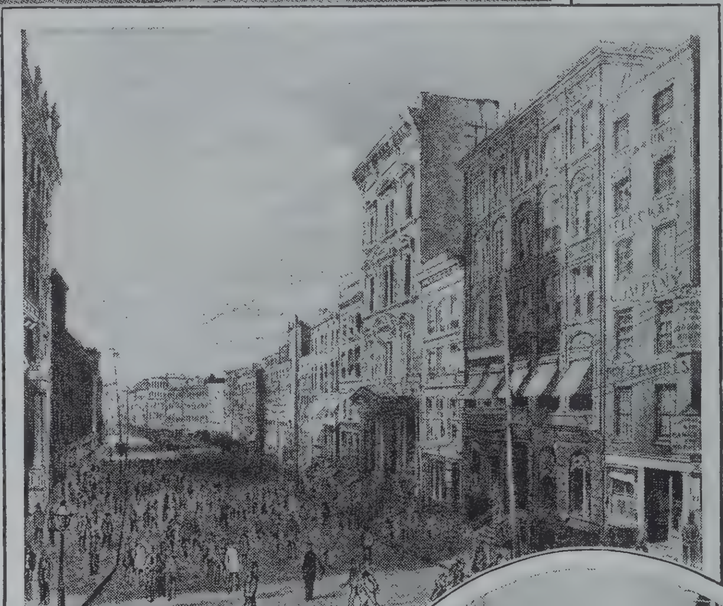
Broadway in 1845, from a rare old print. The two-story houses stand on part of the ground now covered by the American Telephone and Telegraph Company building.

TO THE average farmer Wall Street is anathema. To the sucker it is a place where fortunes are made for the trusting by philanthropic 'bulls' and 'bears.' To the well-informed it is the seat of government of a large portion of the globe, and to the casual onlooker the street is a narrow canyon thronged with hurrying crowds. It is all these things and something more.

'Wall Street' has a sinister sound to many people. It is credited with power to bring prosperity or ruin, inflation or depression, to this United States. In politics, the Street has been the target for denunciation and criticism in every campaign for the last fifty years.

Wall Street, the financial district, and the synonym for money power, is an undefined territory situated at the southern end of Manhattan Island. It is of comparatively recent growth. Wall Street, the thoroughfare, is a narrow street running from Broadway to the East River, crowded with history. It is of comparatively ancient origin. In many ways the development and evolution of Wall Street is the story of America. No single street is more entitled to fame, and it is one of the most famous in the world.

The history of the Street begins in 1653. In that year war was declared between Great Britain and The Netherlands. The little settlement of New Amsterdam was filled with consternation. Peter Stuyvesant, the doughty old governor, knowing well that the colony could not withstand an attack from the English settlers of New England and Virginia, sent messages to them assuring them of his peaceable disposition. But at the same time he began making all the preparations for defense that lay in his power. On the thirteenth of March at a general meeting of the Council of the New Netherlands it was decreed that the city should be a walled city and have a wall street. Work on this palisade was at once begun and was completed by the first of May, 1653, at a cost of 3,166 guilders, or about $1,300. This included a sloping ditch, a breastwork and a parade ground. The wall ran straight across the island and along the East River shore.



Broad Street from Wall Street in 1873.

—International Newsreel.
Wall Street in the gas lamp days. Trinity Church is in the distance.

The Dutch are a thrifty people, and when the war scare waned, the burgomasters politely declined to pay for the wall. They stoutly declared that the West India Company was bound to defend its own property without expense to the citizens, and from this position they would not recede until Stuyvesant abandoned the excise duties imposed upon the inhabitants and surrendered to the civic treasury the revenues derived from that source. This masterly display of financial acumen was undoubtedly Wall Street's first 'killing.'

Then followed years of alternate decay and feverish repair at the hint of war for the wall. The English took the city, despite everything Stuyvesant could do. The Dutch recaptured it and in 1674 ceded it to Great Britain in return for Dutch Guiana. Possibly the lord proprietors of the West India Company were glad to be rid of a colony where the citizens sheared the company in Wall Street. At any rate, they considered the tropical colony a good exchange for Manhattan.

In 1685 the land immediately north of the wall became the subject of a scandalous speculation. His Excellency, Thomas Dongan, was the royal governor at that time, and he spied possibilities of a real estate development project which only needed a little judicious promoting to yield a golden harvest. The governor, through a 'dummy' purchaser, acquired a strip of land a thousand feet long and eighty feet deep, fronting upon the wall, together with the right, title and interest which the sellers had in the parade ground behind the wall which they and everyone else supposed would become the public highway. Next day, one Leonard Beckwith, at His Excellency's orders, surveyed the wall and laid out the new street. Instead of being a hundred feet wide it was only thirty-six. Dongan's eighty-foot lots immediately became a hundred and twenty-four. Thus was illustrated the value of an inside tip. Being 'in the know' and having the power to lay out the street as he chose, the governor realized a handsome profit for his sagacity. The results are visible today in the narrow chasm that is Wall Street.

By a queer chain of circumstances one of Governor Dongan's lots came into the possession of a very famous gentleman. To quote history:

'This parcel of land (part of which is now No. 56 Wall Street) lies opposite the head of the present Hanover Street, and a Mr. Browne was the purchaser. Browne transferred his bargain to a well-known citizen named William Cox, whose wife, Sarah (née Bradley), was destined to greater fame than he. Shortly after acquiring this plot Cox is said to have built a house upon it, and if this be so, the building was the first erected on the north side of Wall Street. In 1689, however, he succumbed to what has since proved fatal to many dwellers on that avenue, for the report of his demise says that he "took too much water in," and his widow, to whom he left his property, consoled herself by marrying John Cort. This gentleman fell a victim to her charms so speedily that she took out letters of administration on his estate May 15, 1691. Within twenty-four hours the indefatigable Sarah was wedded to no less a person than Captain William Kidd, the future pirate, who thus became one of the earliest Wall Street proprietors.'

Kidd would have much to learn from some of the present operators in that famous thoroughfare. He was hanged for killing a sailor with a bucket. Today, of course, he would employ a bucket shop and would make his killings financially.

Despite the uselessness and actual encumbrance of the palisade, it survived. It was not until 1699 that a committee of citizens petitioned His Excellency, through the common council, to remove it as an obstructing nuisance and use the stones of its bastions for the new city hall. Then the end came, and New York ceased to be a walled city.

The locating of the city hall on Wall Street, where the Subtreasury now stands, contributed greatly to the dignity and importance of the thoroughfare. Not only was it the seat of government, but the street soon became the center of fashion. The presence of Trinity Church at the head with the Presbyterian Church along the northern side of Wall Street imparted an added prestige. With these attractions it was no wonder that the most aristocratic townspeople had their houses on Wall Street, close to the heart of things.

The first floor of the city hall was taken up with a large corridor, quarters for the fire department (which got its water from two nearby wells), and a dungeon for all prisoners except debtors. The debtors had special quarters in the garret. On the second floor were the court, the jury, and the common council rooms.

During the series of events which led to the actual outbreak of the Revolutionary War, Wall Street was the center for popular demonstrations. Loyalists were stripped and ridden on rails through the street. The Declaration of Independence was read from the city hall July 18, 1776. Washington and the Provincial Committee deliberated there.

—Ewing Galloway.

Corner of Broad Street and Wall Street today.

When the British army occupied the city, Wall Street underwent many changes. Scarcely were the royal troops established when the great fire of September 21, 1776, destroyed more than one-eighth the city. The fire was wrongfully attributed to rebel sympathizers. Harsh measures were taken in retaliation. Many American residents fled and their Wall Street mansions served to house British and Hessian generals.

The city hall was made the headquarters and guardhouse by the Army of Occupation. The soldiers destroyed and maltreated the houses in which they were billeted. The trees which had added so much to the attractiveness of Wall Street were used for fuel during the bitter winter of 1779-80. Piles of rubbish accumulated in the roadway and the city presented a shabby appearance at the end of the war.

—Ewing Galloway.

Intersection of Broad Street and Wall Street in 1868. The former Morgan bank stands on the far corner.

And what a joyous occasion it was when the English forces left the Battery, as General Knox at the head of the American Army entered from the Bowery! The General then marched back to the Bull's Head Tavern where Washington and Governor Clinton were waiting, and escorted them down Queen Street (now Pearl) to Cape's Tavern at what is now 115 Broadway.

Slowly the city recovered from the damage wrought by the occupation and by February, 1784, the first American mayor, James Duane, was installed in office. The ceremony was held in John Simmon's tavern at the corner of Wall and Nassau streets. This corpulent Boniface was a familiar sight at this corner for many years. When he died part of the tavern had to be torn down to remove his ponderous body.

With peace restored, trade commenced again. The leading men of the nation came to the city. The chamber of commerce was incorporated by the legislature and began systematic work for a revival of commerce.

One field of activity, however, needed no stimulation—litigation. The seizures, restorations and confiscations, together with the confusion of state, national, and colonial laws, made the practice of law a lucrative one. Added to this, all the Tory advocates had been disbarred and for once in New York the business exceeded the supply of lawyers.

Among the first shingles hung out on Wall Street was that of Alexander Hamilton, at No. 33. Aaron Burr had offices around the corner, and John Jay was close by at 8 Broad Street. New York's most famous lawyers received their preliminary training at the Mayor's Court, on the southwest corner of Broad and Wall streets.

When Congress decided to make New York its headquarters, the city authorities offered their best. The municipal government was moved to the Mayor's Court across the street, and the renovated city hall was surrendered to the national assembly. Thus in 1785 national, municipal and state authority was concentrated in Wall Street. Here such men as John Hancock, Rufus King, Charles Pickney, James Madison and others of nation-wide reputation congregated daily.

Naturally, the presence of the Continental Congress and the influx of visitors increased the city's prosperity.

Although the Congress of the Confederacy was utterly impotent, it did pass, in 1787, while sitting in the city hall, the Northwest Ordinance. This law dedicated the Northwest Territory to freedom.

Into the conflict over the formation of a permanent national government, Hamilton poured his efforts unsparingly. Sixty-three of the eighty-five 'Federalist Papers' were written in his office.

With the Constitution ratified and New York designated the national capital, a building for the first United States Congress became necessary. Major Pierre Charles L'Enfant, a French engineer, who later planned the city of Washington, was commissioned to transform, add to, and remodel the old city hall.

In his state barge, manned by thirteen pilots and accompanied by many dignitaries, Washington was rowed across from Elizabethtown Point, New Jersey. The barge turning up the East River swung alongside the Wall Street wharf. The first president, upon whom all eyes focused, mounted the carpeted stairs amid the firing of cannon, the ringing of bells and the thundering of cheers. On foot through the wildly applauding crowd, Washington passed up Wall Street to Pearl (whose sidewalks were so marvelously wide that 'three persons could walk abreast') to his house at No. 3 Cherry Street.

Washington, attended by Chancellor Livingston and the senators' and representatives' committee, appeared upon the balcony of Federal Hall, and was greeted with universal shouts of joy and welcome.

Then says an eyewitness:

'After a few moments Washington came forward. Chancellor Livingston read the prescribed oath of office, and Washington repeated it, resting his hand upon the Bible. Mr. Otis, the Secretary of the Senate, then took the Bible to raise it to the lips of Washington, who stooped and kissed the book. At this moment a signal was given, by raising a flag upon the cupola of the Hall, for a general discharge of the artillery of the Battery.'

Brilliant as was this epoch, it continued only a year and a half. During that time several important events occurred. The State Treasury and War departments were created, and the machinery of government put in motion. Federal Hall, at Wall and Nassau streets, was also the scene of the birth of the Supreme Court. Here, too, was presented the first bill for the abolition of slavery. In the discussion which followed were muttered threats of secession.

But at that time neither secession nor slavery was the issue. The fight was over Hamilton's policy for Federal assumption of state debts. In order to carry his point, Hamilton was forced to make large concessions. One feature of his compromise eliminated New York as the permanent national capital.

That is why Wall Street today does not contain a House and Senate Chamber. But if the White House and the Capitol are in Washington, the power has not left Wall Street. The machinery of government may be hundreds of miles away, but the force, the power of tremendous world finance, still resides in and about the historic street—named after a wall.

Calcio and Football

By ZETA ROTHSCHILD

FOOTBALL has an international past and a family tree with branches in many countries. The earliest football was a popular sport in Italy where, under the name of *calcio*, it became an exclusive game played by the nobles and the military on special fête days.

The customs that surrounded the game, the number and the line-up of players, are suggestive of modern football. The players entered the square in a procession, preceded by eight trumpeters and two drummers. Then came thirty players in double file, two standard bearers, and then more players, drummers, and musicians.

The line-up of players can be seen from the accompanying illustration. There were twenty-seven players on each side, fifteen *innanzi* (forwards), five on each wing and five in the center; five *soonciatori* (half backs); four *datori innanzi* (three-quarter backs), and three *datori addietro* (full backs).

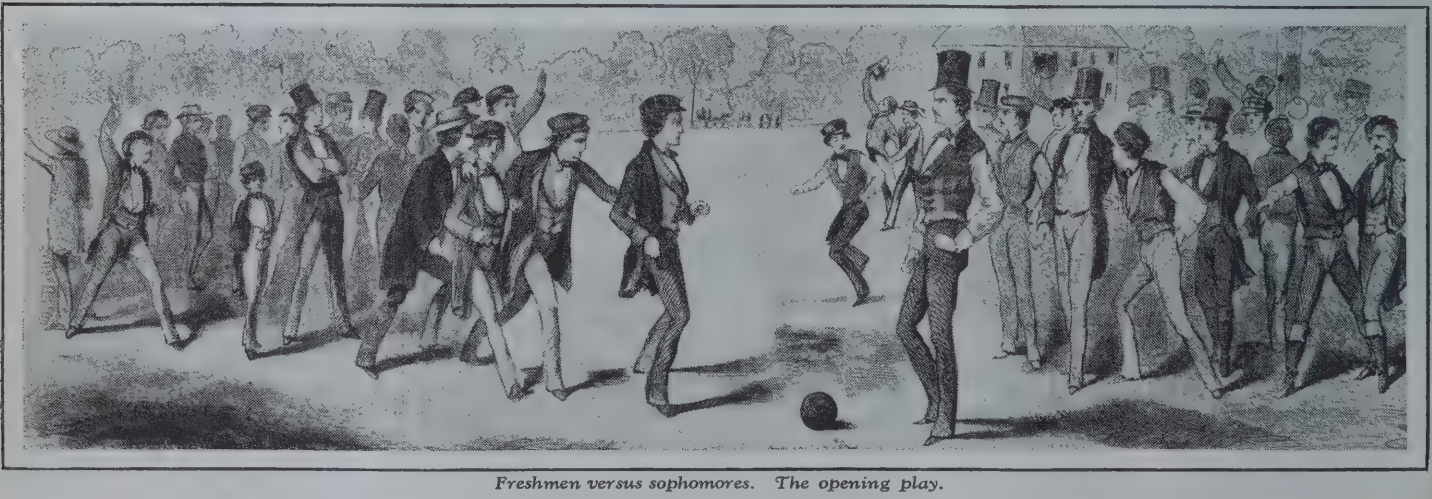
The players scored a goal by propelling the ball behind the barricade of the other side, which stretched across the field. Though the ball might be kicked or struck with the hand, if thrown higher than a man's height a penalty goal was forfeited. Two penalty goals made one real goal, and after every goal scored, the sides changed positions.

When football migrated to England, it lost all its aristocratic background. Played without rule or regulation, it deserved its reputation of being 'the most obstreperous and disreputable member of the family of English sports.'

The players in the English game lined up on two sides. There was no limit to the number of players and whole villages turned out for a country game. The goals, usually miles from the spot where the ball was dropped, were often located in a churchyard or a graveyard. The players strove to kick the ball into the enemy's territory and, with no time limit, the game lasted until the players succeeded or were too exhausted to continue. And when, to the dismay of the townsfolk, the young men and boys started to play football in the city streets, the merchants closed their shops and barred the windows.

It is said that Harvard imported football to this country, while others give the credit to Yale. To support the Yale claim is the account of the old games played between freshman and sophomore classes of that college about 1840. Challenge and acceptance were posted in a prominent place upon the door of the old chapel and, judged from the one illustration that has survived those days, football of that period was first cousin to the rough English sport.

A football game in '59 was presumably of this type. There were no goal posts. Despite their high hats, players were always ready for a hard fight. Later accounts of college football show that football, modeled more after the Italian *calcio*, began around the early seventies, though the first game between Harvard and Yale did not take place until 1875. Harvard won—to the delight of the seventy-five students who accompanied the team to New Haven.



Freshmen versus sophomores. The opening play.

MODERNS *and* ULTRA-MODERNS—*A Strange Theory*

By
CHARLES J. FINGER

TAKE psychoanalysis from one angle, a popular one, which is an insistence upon the immense significance of dreams. If the objection is made that such discussion is trivial, I reply that it is exactly that aspect which attracts so many persons. Further, many so-called works on psychoanalysis and psychiatry are crowded with the names of those dealing with dreams and the dream state. Great or small, there is usually agreement that the nightmare is a symbol. As one writer declares, 'he who can read the indications of his own dreams has at his disposal an instrument of great precision (!)' and that 'oneiromancy (or dream interpretation) is the algebra which enables us to perform rapidly complicated calculations in the mathematics of psychology.' Scratch these moderns and you discover one who believes the whole world of men to be neurotics, save himself.

While the old-time adepts who called themselves oneiromanticists (they used the same term as the moderns) followed the one simple rule that dreams were to be interpreted by opposites, that is, a dream of gold or of silver betokened loss, a dream of meeting friends meant that persecution by enemies was at hand, and so on, the moderns almost invariably find corrupted instincts, perversions and swinish things. It is their theory that men, women, and children are possessed of a kind of devil dwelling in the unconscious mind which is kept in repression by the conscious. In each and every man are dark demoniac powers that work subtle fascinations of evil.

THOSE dark powers in the dream life reveal the true man by means of symbols, and as those symbols may seem to be anything but significant of danger to the uninstructed, but extremely significant to the adept, the most ordinary daily act when dreamed of may come to have outrageous meaning. When a man dreams that he is putting on a heavy overcoat, a perverted notion is at the bottom of things! If a young girl dreams of being startled at the sight of a twig lying across her path, she is the victim of crude sensuality. I do not exaggerate in either of these instances, but quote from a book by a recent writer. So also to dream of losing a tooth, of rocking, swinging, or flying is symbolical of evil; there are significant symbols in the commonest things, in dreams of hats, cloaks, pencils, boxes, trunks, apples, gardens, ships, sticks, umbrellas. I take all that from one writer who holds that dream study has been lifted to the plane of an 'accurate science.'

My contention is that the ultra-modern sees filth everywhere because he looks at his world through the medium of a filth-bespattered veil of his own design and manufacture. So in his interpretations he unavoidably befouls the simplest things. That which you and I and the rest of us take for innocent play in the very young, he views as something much like extreme duplicity. The fancy of the poet, in his eyes, is an unconscious craving for something very like obscenity. Using the test applied to dreamers (that is, interpreting as conduct the written and the spoken word as well as the act), then the expert also has the appearance of one suffering from a delusion.

IF THE applying to conduct of the written and spoken word is objected to, I reply that it is to be charged to the adepts themselves, who set immense store by a dream, a reaction word, a shrug, a smile, a yawn, an accidental interlacing of the fingers.

More than that. Even the absence of movement, the very failure on the part of a patient to speak a word when undergoing examination, may tell the tale of guilty suppression. At least, so some moderns claim.

Mark well what all this comes to, when we consider the influence of the theory applied to literature. For, according to these moderns, all literature has a meaning that would escape the eye were it not for the unlocking of the door with the key held by the adept. I quote from one: '. . . there is no form or species of literature that may not be interpreted by psychoanalytic methods. Be the author never so subjective, no matter how much he has sought to make his personality intangible and elusive, there are means, with the aid of clues, of opening up the barred gates of his soul.'

So, having covered his eyes with his psychoanalytic veil, the author gets to work with sleuthlike activity. His is the *ipse dixit.* He is Sir Oracle, and all things are carefully tagged and ticketed. Almost he becomes like a conjurer who takes a thing, asks you what it is, then, presto! before your eyes it is something else. You find yourself to be in topsy-turvy land. What you took to be an eagle he declares is a hyena. Where you imagined that you sat silent and listening in the company of the gods, he shows you that you did but rout with swine. What you took to be glorious and high-hearted, he reveals as having been gloomy and evil and malign. You listen to him to discover that instead of consorting with spirits finely touched to fine issues, you had been breathing a withering atmosphere, had been poisoned by a moral malaria.

Does Poe write his 'Gold Bug,' does Kipling give us the glorious tale '.007,' does Jack London delight a world with his virile fighting story *The Game,* then down comes the modern, hot-footed, to pronounce his opinion that the one was the result of an evil desire, the other signified repression, the third the result of a neurotic impulse.

Where you or I or any normal person may find evidence of love of the picturesque in Longfellow's poem 'The Bridge,' this psychoanalyst sees that the poet 'is thinking of the time when he had no love and longed for it.' That there is mention neither of love nor of sex in the poem does not deter the theorist. 'We may discern,' he says, 'the unconscious love sentiment in poems where no mention is made of them.' Again, you may find Shelley's 'To a Skylark' to be a poem of purely lyrical character, but a modern discovers in it 'unconscious sexual manifestations.' Also when Keats, full of the spirit of poetry, sings of

'The coming musk-rose full of dewy wine,
The murmurous haunt of flies on summer
eves,'

in his 'Ode to a Nightingale,' the blinking malignity of the modern sees 'sex symbolism.' So he considers Wordsworth, quite oblivious of that half-mystical veneration of nature which is the poet's peculiar note, entirely blind to that most happy combination of thought and phrase that marks the poet on the heights, and when Wordsworth, all a-quiver with the glory of sunlit sky and moveless space, bursts out with

'Up with me! up into the clouds!
For thy song, Lark, is strong:'

we are warned that 'the sexual interpretation is unmistakable.'

SO IN one way and another the Freudian follower spreads his trail of slime everywhere. In Browning's splendid 'How They Brought the Good News from Aix to Ghent,' a poem loved by every clean-minded, healthy lad, and by every man with a boy's sense of adventure because of its fire and vigor, one sees 'sexual significance in the rhythmic swing.'

As for fairy tales, in them is hidden abomination: 'folktales telling of dragons . . . are symbolic of the lustful side of man.' As for those wild romances dealing with giant cannon and flying ships and submarines and marvelous mechanisms, the glorious mind-creations of Wells and Stockton and Jules Verne and Kipling, a grave sexual weakness lies at their beginnings!

To Aid Animals

By E. I. FARRINGTON

FIVE years ago Jack London clubs existed only in the mind of one man, Dr. Francis H. Rowley of Boston. Today there are Jack London clubs all over the United States and in many parts of Europe, with hundreds of thousands of members. There are Jack London clubs even in South Africa, in Japan, in Siam, and in India. There are no dues and no officers. The purpose of these clubs is to stop the exhibition of trained animals.

Not long before he died, Jack London wrote a book called *Michael, Brother of Jerry.* Now Jack London had never been considered a namby-pamby in any sense. In fact, in some quarters his name was anathema because of his red-blooded novels and his graphic word pictures of fistic battles. Nevertheless this book was written as a protest against the training of trick animals which he had witnessed behind the scenes in the theaters. In his preface the novelist says:

'No normal, healthy human would tolerate such performances did he or she know the terrible cruelty which lies behind them and makes them possible.'

People who frequent theaters and circuses like to persuade themselves that the animals they see doing absurd or difficult acts are enjoying the performance as much as the audience. The manager tries to foster this belief, but the animal trainers themselves and the investigations of impartial observers indicate that in many cases the animals are in a state of absolute fear as long as they remain on the stage.

Much has been printed about the humane methods employed by certain animal trainers, the impression being given that only kindness is used. It has been stated, however, that some of the most popular acts, like the turning of backward somersaults, cannot be taught without torture to the animal.

It is sometimes argued that a wild animal is better off in captivity than in roaming the jungles, getting its food without danger or effort, and living a life of calm serenity. The Jack London club has been investigating this side of the question and as a result presents some of the facts written by Charles Mayer, an animal hunter of wide renown, in his book, *Trapping Wild Animals in Malay Jungles.* It is stated in this book that tigers and leopards are captured by the use of birdlime, which is spread where the animals are wont to pass. They step into the sticky stuff, which clings to their feet. They become excited and enraged. They try to bite and rub off the pitch, and in doing so plaster it over their eyes. Finally when they are thoroughly covered they are so helpless that with little danger they can be put into cages, there to spend weeks removing pitch from their fur.

Birds and small monkeys are also captured with birdlime, which is smeared on the limbs of trees. They stick to it until someone releases them.

After capture, wild elephants are kept in an inclosure for a long time and given no food. They are half-starved before the 'breaking' commences. In this weakened condition there is very little danger in handling them. The 'tuskers' are killed solely for their ivory.

Jefferson's Thousand Years

(*Continued from page 2*)

ness which Jefferson's father explored, it is surrounded by more good bronzes and marbles in various gaps in the shrubbery than any other school I have ever seen, or than any other single spot of outdoors on American soil that I know about. Here again you have the Randolph and the Jefferson happily married, a thing to meditate upon.

As we have declared, Jefferson's violin was a symbol of his meditative, creative mind. Poe said that:

> Israfeli's fire
> Was owing to that lyre,
> By which he sits and sings,
> The trembling living wire
> Of those unusual strings.

Now Brother Poe did not think himself a leveler or a democrat, though he owes one of his greatest debts to Thomas Jefferson's violin. As far as Poe had any thoughts about his dramatic status in this world, he probably saw himself as a raging, dashing southern fire-eating cavalier with gauntlet, bonnet and plume. Very recently I heard him denounced as a charlatan by a high Massachusetts authority; and I suppose that this is what was meant. But the mind of Poe in the arts is as world-pervasive as the mind of Jefferson in politics, and affects the same people. There is the Jefferson in Poe's clarity and the Randolph in his style.

A new school has sprung up of quite lively historians of the Fathers of our Republic, a school which is most useful and edifying. They are as valuable as the President of the Sewing Society when she gets the low-down on the preacher, and tells the congregation one at a time for their own good; of course, wishing the preacher well. They are as edifying as the deacon, who having been labored with by his wife, ultimately makes the Sewing Society conclusions official. Yes, gentlemen, we want the truth about all the Fathers of the Republic. But when you attempt a fatherly attitude toward the father of your country, or the father of the Democratic Party, you are attempting the impossible. You are not dealing with short-legged Massachusetts men afoot, but with long-legged Virginians on horseback. You may rage and roar; but you cannot destroy the gauntlet, the bonnet, and the plume. These are part of Thomas Jefferson's thousand years.

It is to be freely admitted that when Thomas Jefferson went into power, he attempted what was then called 'republican austerity.' He left off a few ostrich plumes. But if the sonorous passages of the Declaration of Independence and the magnificent decorative style of the University of Virginia architecture mark republican austerity, they are also Virginian of the Old School.

There are two styles: the petty and the grand. The petty style has nothing to do with aristocracy or democracy, or with mere size. A hog may have it, a gnat may have it, a hippopotamus may have it, a monkey may have it, a gorilla may have it. The grand style has nothing to do with aristocracy or democracy, or with mere size. A sea gull may have it, a dragon fly may have it, a flying fish may have it, a bison may have it, a sunrise may have it. We are approaching the American sunrise of the grand style.

Splendor is not synonymous with tyranny. Decoration may appear on the gipsy's bonnet or on the pheasant's wing. At present, the flapper is the only everyday citizen on American soil who has the privilege of dressing the part. But the flapper rebellion so lately achieved may yet break out in costumes for men; and before the end of Thomas Jefferson's thousand years men may have the privilege of the splendors of the old red chieftains, or of Washington, Jefferson, and Hamilton, on horseback.

(*To be concluded in an early issue.*)

Bromo and the Sand Sea

(*Continued from page 9*)

In the immediate foreground was Batok, now quiescent, and just back of it Bromo belching out a pall of black volcanic smoke and ash.

Then we started down into the crater from the rim. All the way I was fascinated by the clearly discernible strata of ash that formed the entire wall of the pit. Through untold ages the crater had been in action and had formed walls a thousand feet high—each successive eruption showing as plainly as if it had been penciled. The descent was so steep we could not ride. Even the sure-footed ponies had trouble in making the downward trail and had to slide on their haunches most of the time.

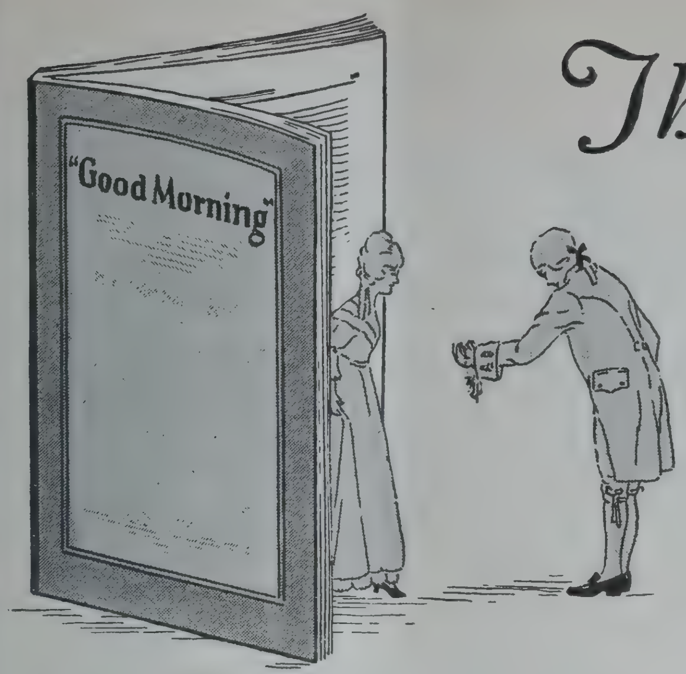
It took an hour for our ponies to cross the Sand Sea after we reached the bottom of the crater. We arrived at last at the foot of Bromo.

All the way up the side of this volcano, set down as it was in the larger crater, we had to climb over formations of hot lava that had been thrown out of its mouth. A stone ladder had been built by the Dutch Government so that the Crown Prince could climb up without difficulty or hardship on a visit that he had made a few years before.

On the top I lay down and looked over into the mouth of Hell. Great open fissures stained with iron and sulphur shot forth fire and ashes. Now and then the old giant would draw its breath deep into subterranean lungs for an extra loud blast and then would shoot great stones as large as a car to the very rim of the crater where we lay holding on like grim death, while smaller stones showered about like hail, and stinging dust and sand made us black as coal miners.

Imposing, awe-inspiring, tremendous, terrifying—these words describe a half hour's look into Bromo, one of many in this great bowl which in its heyday was a valley of ten thousand fires.

There is no region on earth so thick with active volcanoes as Java. I had now traveled from one end of the island to the other—a week's trip—to look for a half-hour into the mouth of Java's most active volcano. Having heard of the famous Sand Sea, I had now seen it. I had seen smoking Arjuno in the distance, and belching Semeru, Java's highest fire mountain. I had seen the beautiful cone of extinct Batok; and back of Batok, thundering Bromo. They are all a part of the world's most gigantic crater.



The RETURN *of the* DANCE

Everyone enjoys the old-time dances. They are easy to learn. They are being taken up enthusiastically by schools, clubs and community groups.

Piano Music for twenty popular old American dances is available. Price 50c the set.

Orchestrations of 13 parts each, including saxophone, for 20 dances. Specially priced $2 the complete set. *Single Orchestrations 15c each.*

Edison, Columbia *and* Victor have recorded Old American Dance Music as played by the Henry Ford Orchestra. Your local music dealer handles these records.

THE methods of the world-famed Ford School of Dancing at Dearborn are now made available to everyone in the specially prepared manual entitled

'GOOD MORNING'

Compiled by Mr. and Mrs. Henry Ford

This 169-page manual contains complete information with instructions on each of the dances. Calls, music and pictures visualizing the various steps are given. There is also detailed information on how to arrange and conduct a successful dance.

The origin and etiquette of dancing, style and deportment are also fully described. This feature makes *Good Morning* a valuable reference book, especially in connection with the training of children.

Send for this book today. 50c a copy, postpaid.

The Dearborn Publishing Co.,
Dearborn, Mich.

Please send me the items checked below for which I enclose remittance of
$..............

Long Live Halloween!

(*Continued from page 7*)

'This pippin shall another trial make;
See from the core two kernels brown I take:
This on my cheek for Lubberkin is worn,
And Booby Clod on t'other side is borne:
But Booby Clod soon drops upon the ground,
A certain token that his love's unsound;
While Lubberkin sticks firmly to the last;
Oh! were his lips to mine but join'd so fast!'

It was also said that if a maiden ate an apple before a mirror, brushing her hair the while, her future husband would peep over her shoulder.

The old chapbooks, too, abound with curious customs for telling the future, especially effective on this occasion.

In Scotland was observed the ceremony of pulling kale stocks, or stalks of colewort. Young people were led hand in hand, blindfolded, into the kaleyard, or garden, and each pulled the first stalk he met with; they then returned to the fireside to inspect their prizes. As the stalk was big or little, straight or crooked, so should be the future wife or husband; the quantity or yird (earth) clinging to the root indicated the tocher (wealth), or dowry; the taste of the pith or custock indicated the temper. Then the runts, or stalks, were placed over the door, and the Christian names of the first to enter thereafter were those of the individuals whom the respective parties were to marry.

'Luggies' was another quaint practice of Scotland. Three luggies, or dishes, were prepared. In one was clean water; in another, foul water; and the third was empty. These luggies were arranged on the hearth, and one after another the parties advanced, blindfolded, and dipped the finger into one of them. If it was into the clean water, he would marry a maiden; if into the foul, a widow, and if into the empty dish, he would be a bachelor. The luggies were, of course, rearranged each time.

Another custom was to wet a shirt sleeve and hang it by the fire to dry, while the owner lay in bed and watched till midnight, when the apparition of the future partner for life would come and turn the sleeve.

HEMPSEED was also sown, and the winnowing of three wechts; this was repeated three times. The action exposing the corn to the wind was said to have the effect of making the future husband or wife appear.

A detailed account is found in Vallancey's *Collectanea de Rebus Hibernicis*, Vol. III, on Allhallows' Eve: 'On the *Oidhche Shamhna*, or Vigil of Saman, the peasants in Ireland assemble with sticks and clubs (the emblems of laceration), going from house to house, collecting money, bread, cake, butter, cheese, eggs, etc., for the feast, repeating verses in honour of the solemnity, demanding preparations for the festival in the name of St. Column Kill, desiring them to lay aside the *fatted calf*, and to bring forth *the black sheep*. The good women are employed in making the griddle cake and candles; these last are sent from house to house in the vicinity, and are lighted up on the (Saman) next day, before which they pray, or are supposed to pray for the departed soul of the donor. Every house abounds in the best viands they can afford; apples and nuts are devoured in abundance; the nut-shells are burnt, and from the ashes many strange things are foretold; cabbages are torn up by the root; hemp-seed is sown by the maidens and they believe that if they look back they will see the apparition of the man intended for their future spouse; they hang a smock before the fire on the close of the feast, and sit up all night, concealed in a corner of the room, convinced that his apparition will come down the chimney and turn the smock; they throw a ball of yarn out of the window and wind it on the reel within, convinced that if they repeat the *Pater Noster* backwards, and look at the ball of yarn without, they will then also see his sith or apparition; they dig for apples in a tub of water, and endeavor to bring one up in the mouth; they suspend a cord with a cross stick, with apples at one point, and candles lighted at the other, and endeavor to catch the apple, while it is in a circular motion, in the mouth. These, and many other superstitious ceremonies, the remains of druidism, are observed on this holiday.

IN VARIOUS parts of England it was customary to bake cakes for the festival of All Saints. At St. Kilda it was 'a large cake in the form of a triangle, furrowed round, which was to be all eaten at night.' At Ripon, in Yorkshire, on the eve of All Saints, the women made a cake for every one in the family, and so it was generally called Cake Night. In *Gentlemen's Magazine* for August, 1790, this reference is found: 'My servant, B. Jelkes, who is from Warwickshire, informs me that there is a custom in that county to have *seed cake at All-Hallows*, at the end of wheat seedtime.' Also Mr. Pennant observes: 'They have a custom (in North Wales) of distributing *soul-cakes* on All Souls' Day, at the receiving of which the poor people pray to God to bless the next crop of wheat.'

Another unusual custom is graphically described in Sinclair's *Statistical Account of Scotland*, 1793: 'On the evening of the 31st of October, O. S., among many others, one remarkable ceremony is observed. Heath, broom, and dressings of flax are tied upon a pole. This faggot is then kindled. One takes it upon his shoulders, and, running, bears it round the village. A crowd attend. When the first faggot is burnt out, a second is bound to the pole and kindled in the same manner as before. Numbers of these blazing faggots are often carried about together, and when the night happens to be dark they form a splendid illumination. This is Hallowe'en, and is a night of great festivity.'

The Halloween fire is well described in Sir R. Hoar's *Itinerary of Archbishop Baldwin Through Wales*, Vol. II, p. 315: 'The autumnal fire is still kindled in North Wales, being on the eve of the 1st day of November, and is attended by many ceremonies; such as running through the fire and smoke, each casting a stone into the fire, and all running off at the conclusion to escape from the black short-tailed sow; then supping upon parsnips, nuts, and apples; catching at an apple suspended by a string, with the mouth alone, and the same by an apple in a tub of water; each throwing a nut into the fire; and those that burn bright betoken prosperity to the owners through the following year, but those that burn black and crackle denote misfortune. On the following morning the stones are searched for in the fire, and if any be missing, they betide ill to those who threw them in.'

So it is that the legacy of outgrown superstitions for Halloween, a blending of the beliefs of various periods, comes to us largely in the form of old wives' tales or of bits of folklore snatched from oblivion by some student of folk literature and history. Nevertheless, even today we have vestiges of these old customs in our midst, and Halloween, the season of harvest, of gorgeous autumn colors, and of the dance of leaves with blustering wind, is a favorite time for pranks and merrymaking, for the urge of the season is irresistible, even to enlightened moderns.

Mirrors

(*Continued from page 13*)

Lafayette's help during the Revolutionary War, and it consists of a small square looking-glass with hooded top which contains a painting of the general inserted as a central feature.

Bilbao glasses were imported into Marblehead, brought across the seas from Spain, and are to be found today principally in this historic seaport town.

Dressing tables with triple mirrors are more suitable for the feminine members of the family, for the mirrors swing on hinges to meet any desirable angle. These are reproductions of the mantel mirrors which were designed for fireplace use by some economical cabinetmaker who wished to avoid the expense of one large plate, and so divided it into three separate parts, framing them either in wood ornamentally carved and showing a gilt decoration, or with lovely curves and delicate mouldings. Surely he struck a popular note, for they were favorably received, and are used extensively today in the 20th Century homes. One of the most interesting of the old-time mantel mirrors is still in existence in the Pierce-Nichols house, at Salem, Massachusetts. This was designed in 1783, to please the fancy of a young bride, and shows the white and gold coloring with exquisitely wrought garlands and festoons, harmonizing, as does all of Samuel McIntire's work, with the hand-tooling of the fireplace and mantel.

As a note of decorative interest, a well-framed mirror is appropriate. For a small room, where it is necessary to work out odd ideas, it can be made most attractive. For instance, a lowboy with a looking-glass of the same period placed above it can be transformed into a charming dressing table, or a small curtained shelf with a large mirror hung over it can be utilized to serve the same purpose. If more decorative effects are desired, sconces placed on each side of the mirror will give a helpful touch to the interior setting.

Much care should be taken in regard to the placing of period mirrors, for the Empire pier table in the hall demands a massive girandole or a convex mirror; if Chippendale is used the setting of the room lacks harmony. Bear in mind that a single piece well chosen is better than a dozen pieces where no special thought as to type has been given.

When the COWS Came Home

By FRANK M. CHASE

Main Street, Fort Scott, Kansas.

WHENEVER some of his subscribers see George W. Marble, publisher of the *Tribune-Monitor* at Fort Scott, Kansas, they think of a cow. Marble brought cows to Bourbon County after everything else had failed to revive the exhausted agricultural industry; through dairying he enabled his home town to find prosperity; and in the natural course of events he found prosperity himself. His name is in *Who's Who;* he is past president of the National Editorial Association, and has served two terms as regent of the state university.

'While I was working on the paper as an apprentice, my pay came irregularly, and I knew it was because of lack of business due to depressed agricultural conditions around Fort Scott,' says Mr. Marble. 'After I had acquired the paper at a very low figure, my first thought was to undertake to make the farmer prosperous so that the merchant in Fort Scott could be prosperous and the paper increase its revenue. The town had attempted to become an industrial center. Several giant smokestacks and old factory buildings stood empty about town, monuments to misdirected energy. It was my idea to build along the line of natural cleavage—agriculture. One day, to arouse interest, I ran a four-line editorial: "Fort Scott is sick. What medicine would a doctor prescribe should we call him on the case?"

George W. Marble.

'Then the newspaper called a "doctor." On the theory that the only opportunity lay in the possibilities of farming, it undertook to discover just what these were, always conscious that a misstep would only leave the situation more hopeless. Soil analysis, thorough research, and consultation with the highest authorities, together with a close technical study of local conditions and prospects, led to a decision that dairying was the one best remedy.

'This decision reached, I went to dairy sections to study the industry, more interested in detecting some reason why dairying could not be followed in the Fort Scott vicinity, than in discovering favorable reasons. Investigation and comparison covered feed crops, climatic conditions, markets, care of stock, and economies of operation.

'A daily descriptive news letter to the *Tribune-Monitor*, accompanied by occasional pictures of small cheese factories and coöperative creameries, and some striking illustrations borrowed from the University of Wisconsin bulletins, aroused great interest. Farmers began to get cows and business men began to promote the idea. We secured a whole market for retail milk distribution in Kansas and cream stations began to prosper. Subsequent trips to dairy districts, further studies and more local publicity followed. One of the unique methods of interesting farmers was to publish the amounts of milk checks or cream checks of individual farmers, with a statement of how many cows they milked, and so forth. Usually their neighbors who had had no experience would be reluctant to accept these figures.

'An inexhaustible whole-milk market seemed indispensable to permanent and satisfactory development. We found it difficult to interest any of the larger manufacturers of dairy products in establishing a plant at Fort Scott. In the meantime we went to a dairy farm and brought in Harry Russell, graduate of the University of Wisconsin. Through his constructive genius and with the pledge of newspaper support in guaranteeing an ample milk supply, a condensery was located in Fort Scott. The newspaper thereupon set about to clinch the benefits possible to the community, which, it had learned, would come only in proportion as the farmers could be induced to change their methods and their plans to conform to dâiry production. Diversified farming, of which dairying is the backbone, is the desired end. It would be unjust and not in accordance with truth to claim for the newspaper the credit for such progress as has been made. Mr. Russell is an outstanding figure in the accomplishment. Without him it could not have been done.'

One of the unique facts discovered by Mr. Marble in his study of dairy development is that in no community in the United States where the farmers had turned to dairying was there not a precipitate rise in the value of real estate both in town and on the farm as a result. This has been one of the conspicuous consequences of the development of dairying around Fort Scott. A comparison with similar communities furnishes a striking illustration of what has been done for Fort Scott and its agricultural environs.

Incident to the revolutionizing of business conditions in and around Fort Scott was the development of country-road paving. Early in the movement it was realized that 365-day roads are essential to dairy development because milk must be de-

Paved road through farm lands near Fort Scott.

livered every day. What was accomplished against great obstacles may be illustrated by the simple statement that five years ago more than 75 per cent of the paved roads in the State of Kansas radiated from Fort Scott; today it has an almost completed county system extending to every corner, with more than 150 miles of pavement. In this work Mr. Marble and his newspaper and Mr. Russell, the educated dairyman, took the lead, not to provide the motorist with fine drives, but from economic necessity to build up the farmer and the merchant.

Incidental to the campaign was the necessity that farmers build silos. In this, through the newspaper, Mr. Marble has scored a striking achievement. More silos were built in Bourbon County in a year than were erected that year in the entire state outside Bourbon County.

Mr. Marble's registered Guernsey, grand champion at the Kansas Dairy Show.

Mr. Marble, in the meantime, developed a hobby that has widely interested his newspaper friends. It is cows. He has invested largely in pure-bred dairy stock and has made a technical study of feed-mixing, of care and treatment looking toward maximum production. Even today he milks his own cow morning and evening and mixes her feed. He insists on experiencing every unpleasant chore in the task of dairying that he has asked the farmers to face, and at the same time he has learned much to enable him to assist the farmers in securing maximum production under all conditions.

His technical judgment of cows is shown by the fact that he spent several hundred dollars traveling around looking for a heifer, going as far east as New England. He finally bought one in Wisconsin for four hundred dollars and paid sixty-five dollars express to get her home. Since she has developed she has taken the sweepstakes in her breed in every show in which she has been entered.

At the time Marble asked what a doctor would prescribe if called to tend Fort Scott, the town had three daily newspapers. It was a strong Republican community, whereas his paper is independently Democratic. The other two papers have long since been discontinued or absorbed by Marble's. On the very day before he left for Wisconsin to study the possibilities of dairying, a company of politicians announced a reorganization of one of the dailies, with a strong force and ample means, to take the field away from him. The Wisconsin trip and its consequences won the fight for him.

In the last five years there has been three million dollars' worth of new buildings erected in Fort Scott. That is more than were built in the past twenty-five years.

The Right Temperature

By GEORGE H. HEALD, M. D.

If it is a typical American home, the chances are that in winter it is overheated, and as dry as the Sahara Desert. A little investigation may reveal in this fact the source of many of your winter troubles.

JONAS NETTLEBY, well clad but chilly, on seeing an Indian attired in a breach clout and a feather, but evidently enjoying the snappy air, asked the latter why he did not suffer from the cold.

'White man's face cold?' asked the Indian, after a pause while he looked Nettleby over.

'Why, no,' admitted Nettleby, somewhat surprised at the question.

'Injun all face,' was the sententious comment of the Indian.

Our sense of warmth or cold is to a large extent dependent on the temperature to which we have been accustomed. Stated by an example: Tap water usually feels cold to the hand; but if the hand is first held for a while in ice water, the tap water will feel quite warm. Again: The water in summer seems chilly when we enter it for a swim, but after we have been in for a while, it may feel so comfortable that we may remain in for hours without inconvenience.

A person has it in his power to accustom himself to a cooler temperature, so that the cold does not make him feel uncomfortable.

Few people keep their houses so warm in winter as do most Americans. Possibly we proudly regard our superheated apartments as evidence of a better standard of comfort—or luxury—permitted by our increased prosperity. The truth is that such abnormal conditions of heat are not more comfortable, except to those who have trained themselves to enjoy such temperature.

Americans visiting Europe in winter find the hotels and homes comfortless, chilly, lacking in the 'cozy warmth' that characterizes the American home or hotel. Our boys in France are said to have felt the cold much more keenly than the soldiers of the other allies. On the other hand, people from Europe often complain of our overheated rooms.

WHY should Americans prefer a tropical climate in winter? It was not so in the early days of our country. A hundred years ago, the temperature of the American home was much lower than the present average. For homes, it was about 55°. Hospitals aimed to keep the temperature between 50° and 60°. What has changed the American taste to prefer a temperature averaging 70° or more? In other words, what has caused the comfort temperature to change from below 60° to 70° or more?

It would seem that the comfort temperature changed after the change from the radiant heat of the fireplace to hot-air heat. Stoves, base-burners, latrobes, hot-air furnaces, and hot water or steam radiators all heat the air of the rooms. Fireplaces, on the other hand, maintain the comfort of the people by direct radiation without very perceptibly warming the air. Rooms heated by a fireplace, though comfortable for those seated around the hearth, have a much lower temperature than rooms heated by modern methods.

We Americans, by changing from the direct radiation of the fireplace to warm-air heating, have been compelled, on account of the dryness of heated air, to have the air heated still warmer in order to get the required comfort. The warmer we make the air, the drier we make it, and so the process goes on until sometimes we have our houses at ridiculous temperatures, such as would cause us to use a fan in summer.

The effect of living habitually in such an atmosphere is cumulative, and those who are accustomed to such a life cannot be content with cooler rooms, even though they are more moist.

Especially in offices where girls are arrayed in summer attire in midwinter, and where those who are most scantily attired usually dominate the temperature standard, and where it is very difficult to provide sufficient moisture, the problem of having a more reasonable temperature is far from satisfactory.

Those who are interested in conserving health and fuel in the home may accomplish something, even with the present heating system. Thermometers should be provided, and it is also desirable to have some device for registering the humidity, the wet-and-dry-bulb thermometer being much more accurate than some of the others, but more troublesome, and hence less likely to be used regularly.

Whistler

(Continued from page 4)

room, so that 'The Princess' might have an appropriate setting. Thus came into being the famous 'Peacock Room,' every inch of whose walls are covered with blue and gold, with the peacock as the *motif*.

Unfortunately, no price for this work had been agreed upon; and a tempest raged between artist and shipbuilder which the public relished, and which brought added notoriety to the name of Whistler.

A little later, the volatile Whistler painted what is perhaps his most popular, and certainly his best-known picture, the 'Portrait of My Mother.'

Prior to 1880, Whistler had suffered poverty, braved the laughter of critics, and the indifference of the public to his art.

From the early eighties, however, he experienced a more and more sympathetic recognition, and he had many friends and admirers. His paintings began to be appreciated from their points of sheer merit. His etchings were looked upon as masterpieces.

As Whistler grew older, he considered visiting the land of his birth, but for various reasons he failed to do so. His heart was becoming less strong, and a vigorous climb left him in a state of near collapse. The tired body had fought too long, and soon he died, as he no doubt would have preferred to die, brush in hand, in his workshop.

CHATS WITH OFFICE CALLERS

'Did you ever eat a pot of baked soya beans?' asked the ***Chef.*** 'My first pot of baked soya beans was just about as tasty as whale oil. I learned that it is necessary to give the soya bean special treatment before it becomes suitable for human food.

'In China, Manchuria, and Japan, the soya bean is an indispensable food of the people. Meat does not enter into the dietary of the common people any more than terrapin enters into the dietary of the common people of this country, and they must therefore depend on vegetable protein. The soya bean is the king of all vegetable protein foods. Some contain more than 40 per cent of protein, and from 18 to 20 per cent of fat. It may be considered vegetable meat.

'As a matter of fact, the Chinese actually make all kinds of dairy products from the soya bean, such as those derived from the cow—milk, curds, cheese, cream, butter.

'Not only is this bean a delicious thing to eat by itself, either hot or cold, but it may be used as a great improver of nearly all other foods, rendering them richer in flavor and nutrition. I am looking forward to the time when the soya bean will become one of the chief crops of this country. In the South, the soya bean can be raised and can thus supply a suitable food which in the end will largely replace meat. The time may come when there will be a great shortage of meat, and there is no better vegetable substitute than the soya bean.'

* * *

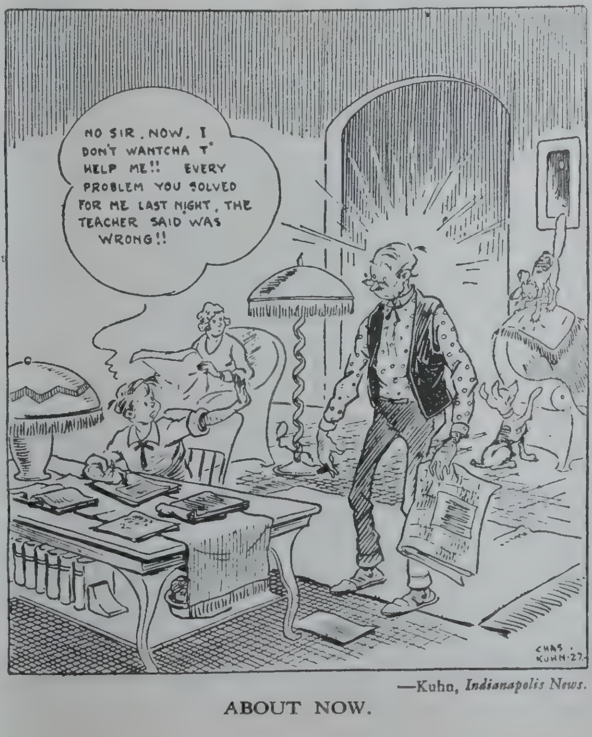
'Before science had solved the mysteries of diphtheria, it was a veritable scourge to mankind,' said the ***Family Doctor.*** 'Even now, it carries off altogether too many of our children. In Chicago during the last fifteen years prior to the introduction of antitoxin, the death rate was 144 in a thousand. In the first fifteen years succeeding its introduction, the death rate dropped to 38 in a thousand. This death rate continues to diminish as time goes on.

'Diphtheria usually starts in the throat or the nose. The causative agent is a microörganism, a small rod-shaped body about 1/2000 of a millimeter in diameter and about 1/400 of a millimeter in length.

'These bacilli are living bodies consisting of the lowest form of life, a single cell. They have no power of motion, and when deposited on the healthy mucous membrane of a susceptible person, have the power of sustaining their life and reproducing their kind.

'They live by simply absorbing food from the surrounding tissues and fluids of their host. So far, they are harmless. However, in the process of their metabolism they throw off waste products, as do the higher forms of animal and plant life, and these waste metabolic products, called toxins, are deadly poisons to man.

'The reason for this malignant property is that a person who has them in his throat readily absorbs them into his system, where they act just as would any other poison.'



NO SIR, NOW, I DON'T WANTCHA T' HELP ME!! EVERY PROBLEM YOU SOLVED FOR ME LAST NIGHT, THE TEACHER SAID WAS WRONG!!
CHAS. KUHN-27

—Kuhn, *Indianapolis News.*

ABOUT NOW.

'This,' said the ***Poet,*** 'is the legend of the Bamboo:

'The Master once planted a beautiful grove of Bamboos. The trees were tall and graceful, one more beautiful than all the others. One evening the Master came to it and said: "I want you for a great purpose. Are you willing? It will hurt. It will take you from your friends. Are you willing—even to die?"

'The Bamboo was willing to serve the Master. So he took a sharp instrument and ran it through the heart of the beautiful tree. Then he cut off each beautiful branch. The Master laid one end of the hollow Bamboo in the cool waters of the stream. Across a little valley was a parched hillside. Trees and flowers and grass were dying for want of water. They could not send their roots so far as the stream. Suddenly the Bamboo felt cool water running through its hollow stem over to the dry hillside. Soon the hillside began to blossom as the rose. Green grass sprang up and trees reached out into the sky with green arms lifted in prayer for the water that had come to save them.

'One evening the prostrate Bamboo which had lost its beauty in service heard a strange music on the hillside. It seemed to come from grasses, flowers, and trees that had grown luxuriant because it had been willing to die.

'It listened as the water gurgled, and it heard the winds singing. It was a hymn of praise—to the Master. That was reward enough. Through its willingness to suffer, and die, the Master had been exalted.'

* * *

'When Lloyd George visited America, he expressed a desire to eat a real American dinner,' said the ***Man From Boston.*** 'I have often wondered what would be a proper menu for such a meal.

'To please some of the real first families of America, jerked meat should be included. Of course that division of the people has now lost its influence. We had better instead have chop suey and also some bird's nest soup, lest our Oriental fellow citizens feel hurt. Do not forget *chili con carne* and *frijoles,* for these dishes appeal strongly to the residents of our Southwest.

'By a similar token, we should not overlook "possum an taters," which dish has for generations been considered a delicacy by some. Spaghetti? Sure!

'Hash might solve the problem as typically American. Thanksgiving seems to be the one day on which we come closest to a real old-time American menu. And who can say whether the old-time menu is better for us than the food we eat today—or as well balanced?'

* * *

'Perhaps you have never heard,' said the ***Artist,*** 'of the origin of the now famous "Artists and Models Revue" of Manhattan. This show was originally staged by the Society of American Illustrators and was taken over by well-known showmen after it had been shown privately to the members.

'In the hands of the showmen, it became one of the greatest of money makers. Its lack of clothes brought the attention of the police, the attacks of editors, and enormous patronage. Some of the illustrators who had contributed material to the society's show, which was a family affair, writhed under the notoriety that followed its presentation.

'The next year, when the illustrators gave their annual performance, it contained a sensation not on the program. Between the acts James Montgomery Flagg hopped on the stage and announced that he had a little number he would like to introduce. Mr. Flagg being one of our best-known illustrators, the audience waited eagerly. Whereupon in a clear and ringing voice he chanted two verses devoted to a satirical reference to the showmen.

'Flagg's act caused a riot which completely submerged the second half of the program. Flagg announced that the showmen had made $400,000 out of "Artists and Models" and that the illustrators got only one per cent of that sum. Next day the entertainment committee of the illustrators' organization explained that Mr. Flagg was familiar with the terms of the contract between the society and the showmen whereby the latter were permitted to select certain numbers from the society's annual show and incorporate them into musical comedies of their own manufacture.

'Furthermore, the showmen were the fairy godmothers of the illustrators' show, as they guaranteed the society against loss and helped with the staging of the production. Mr. Flagg did not reply. But no more "artists and models revues" have been fostered by the illustrators. Nowadays—it isn't necessary.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. What was the last February that had five Sundays besides the one in 1924?

Answer. February, 1924, did not have five Sundays inasmuch as February first of that year fell on Friday. February, 1920, however, had five Sundays. The previous February to that having five Sundays was in 1880.

Q. Through whom must 'reëntry permits' for noncitizen residents of the United States be applied for? What are the requirements and charges for such a permit?

A. Applications for permits to reënter the United States must be made to the Bureau of Immigration on forms provided by it for that purpose. A fee of three dollars is charged for each permit issued, and for each extension. Permits may be issued to any alien who has been legally admitted to the United States. They may not be issued to those who are here illegally.

* * *

Q. Please give me the dates of the deaths of the following generals: Nelson A. Miles, Edward O. C. Ord, Grenville M. Dodge, and Alfred Howe Terry.

A. Lieutenant General Nelson A. Miles died May 15, 1925; Major General Ord on July 22, 1883; Major General Dodge on January 3, 1916; and Major General Terry on December 16, 1890. Grenville M. Dodge at the close of the Civil War was major general of volunteers; the others held their commissions in the Regular Army.

* * *

Q. During the Civil War what states seceded and fought against the Union?

A. By a proclamation of the President of the United States on August 16, 1861, the inhabitants of the states of Georgia, South Carolina, Virginia, North Carolina, Tennessee, Alabama, Louisiana, Texas, Arkansas, Mississippi, and Florida (except inhabitants of the State of Virginia lying west of the Allegheny Mountains) were declared to be in a state of insurrection against the United States.

* * *

Q. Who was General Gonzalez Salas? Was he ever president of Mexico?

A. General Gonzalez Salas was a cousin of Francisco I. Madero (President of Mexico 1911-1913). General Salas was at one time minister of war of Mexico. In 1912 he was one of the commanders in charge of the Federal troops in their operations against the insurrectionists who were headed by General Orozco. He committed suicide on March 24, 1912, in a fit of despair on finding himself cut off from his army by the troops of Orozco.

* * *

Q. In the case of the death of a president of the United States, is his successor, while completing his unexpired term of office, president in the full sense of the term or merely 'acting president'?

A. Article II, Section 1 of the Constitution reads: 'In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of said office, *the same shall devolve* on the Vice-President, and the Congress may by law provide . . . ' The language of the Constitution is clear, and it is no longer controverted that upon the death of the president, the vice-president becomes in name as in fact—president.

* * *

Q. Who was the founder of the Red Cross?

A. The introduction and development of the Red Cross movement in the United States were chiefly due to Miss Clara Barton, the founder of the American branch. The American National Red Cross Society was first incorporated in 1881. However, an international conference of Red Cross societies had been held in Geneva in 1863 which was followed by another the next year at the same place at which the International Treaty of Geneva was accepted and signed by a number of different nations. According to this all hospitals and hospital officials and all in any way engaged in attending the sick and wounded in war are treated as neutral parties. The first war to bring the Red Cross into active service was that of 1866 in Germany, Austria and Italy.

YEAH, HOLD HIM!

* * *

Q. Has the State of Montana paid any bonus to soldiers serving in the World War?

A. No, the State of Montana is not paying any bonus along this line.

* * *

Q. I should like to get some information regarding Millard Fillmore.

A. Millard Fillmore, thirteenth President of the United States, was born in Cayuga County, New York, February 7, 1800. After a youth of industry, with little opportunity for education, he undertook the study of law and was admitted to the bar in 1823. His practice of his profession, chiefly at Buffalo, continued actively for twenty-four years. His political life began in 1828 with his election as an Antimason to the state legislature where he served for three terms. In 1832 he was elected to Congress as a Whig and retained his seat with one intermission (1835-1837) until 1843. During this period he was prominent as a debater on the Whig side, served as chairman of the Committee on Ways and Means in the 27th Congress, and reported the Tariff Act of 1842, of which he was virtually the author. He became Comptroller of New York State in 1847. In 1848 he was elected Vice-President on the Whig ticket with Zachary Taylor.

Upon the death of President Taylor in July, 1850, Fillmore succeeded him and the change in administration was marked by the early passage of the Compromise Measures. Fillmore's support of those measures and especially his signing of the Fugitive Slave Law alienated many of the extreme northern members of his party. Aside from the development of the slavery problem, his administration was marked by the establishment of diplomatic relations with Japan. In 1852 he was a prominent presidential candidate before the national convention of the Whig party and in 1856 he was a candidate for the Presidency on the ticket of the Know-Nothing party, but received the electoral vote of only one state. He took no active part in the Civil War and spent the remaining years of his life at Buffalo where he died March 8, 1874. Fillmore was twice married; in 1826 to Abigail Powers and in 1858 to Caroline C. McIntosh.

ONE CAMPHOR TREE WILL produce solid camphor, while another, although similar in appearance, will produce only camphor oil, which is far less valuable. Japanese botanists, who alone know the reason for this, guard the secret carefully inasmuch as its discovery would lead to Japan's losing her present monopoly on camphor.

NOTES & COMMENTS & CRITICISMS

MR. FORD'S Page discusses this week the value of natural leaders.

* * *

On his tombstone, Jefferson is praised for but three things: the statute of religious freedom for Virginia, the Declaration of Independence, and the founding of the University of Virginia. Jefferson selected them himself. Vachel Lindsay, western poet, interprets the achievements of our great third president in the light of parentage, friends, and surroundings. George Washington's influence, as well as that of Hamilton, explains some of Jefferson's activities. Lindsay holds that the great sage has taken a thousand-year lease on American thought. (p. 1)

* * *

John Ruskin once remarked that he never expected to hear a coxcomb ask two hundred guineas for flinging a pot of paint in the public's face. He referred to Whistler, who thereupon sued the famous critic and secured judgment amounting to one farthing. Whistler has been called a genius; he had a fine disregard for the conventions and a lashing contempt for proprieties. Intensely individualistic, he belongs to the school of decadents. (p. 3)

* * *

Ellery Channing was the last, if not the most distinguished, of that glorious company which forgathered in Concord in the days of Hawthorne, Emerson and Thoreau. Although Ellery came of a line of religious leaders and noted divines, he was at least a doubter, if not an infidel, and indulged in profanity in the presence of the softer sex of Concord in order to discourage religious conversation. Even their appalled murmurs at his derelictions did not deter him. Julian Hawthorne's reminiscences reveal the human side of this divergent member of the Channing family. (p. 5)

* * *

On November 1 or thereabout the druids held an autumn festival and lighted fires in honor of the sun god in thankfulness for the harvest. The Romans had their festival in honor of Pomona, wherein nuts and apples figured prominently. Although today's Halloween is the name given the vigil of All Saints' Day, the superstitions we now know, from the jack-o'-lantern to the divining of future loves, come to us from pagan times rather than from the Church. Jane L. Hicks describes the origin of many such customs. (p. 7)

* * *

The great Tengger crater is six miles long and five miles across at the top. Set down in its 'Sand Sea' are four volcanoes, one of which has been in eruption for untold centuries. These are only a few of many volcanoes which are active in Java. On that island railways cannot be operated at night, because of the large number of earthquakes—an average of five hundred a year. The natives believe a great turtle is under the island and that he raises his huge back occasionally. Hence the shocks. (p. 8)

* * *

When a woman enters a room she instinctively seeks a mirror. At one time Venice had a monopoly on the manufacture of looking-glasses and as late as 1673 was furnishing them to this country through England. The possibilities of this article of furniture as an artistic adornment to the home have only recently been studied. (p. 12)

* * *

In Alsace are ten cities which from the days of the Hapsburg rule had been free. Known as the Decapolis, they continued independent until late in the 17th Century, when they joined with France. Joseph Warren has visited all ten of the cities and has found something attractive in each. 'Because of their independence and ability to withstand attacks,' he points out, 'they offer today much that is genuinely old and replete with medieval charm.' (p. 14)

* * *

Within Mary Todd Lincoln's wedding ring were engraved the words —placed there by her husband— *Love is eternal.* Her days in the White House were saddened not only by the great war between the states but also by personal loss. Yet she contributed her part; the drives she forced Lincoln to take with her daily probably did much to ease the load he was carrying. Doctor Barton's researches into Mrs. Lincoln's history have brought to light several new points concerning that lovable woman. (p. 16)

* * *

When Peter Stuyvesant began a wall to defend New Amsterdam against British invaders, 'Wall Street' got its name. The palisade which it marked was built at a cost of $1,300. One of the earliest proprietors of the estate containing the wall was Captain Kidd, the pirate. Among the first shingles hung out on Wall Street was that of Alexander Hamilton at No. 33. Aaron Burr had offices around the corner, and nearby was John Jay. (p. 20)

* * *

Just how much significance may be attached to dreams? So asks Charles J. Finger, who has contributed a brief outline of his own views of the Freudian theory. Mr. Finger flays the belief that the works of genius, the great poems of the masters, were due to sex impulses or to repression. 'Scratch these moderns,' says Finger, 'and you discover one who believes the whole world of men to be neurotics, save himself.' (p. 23)

REMARKS BY OUR READERS

Los Angeles, Cal.

Your editorial on the job of thinking pleased me more than I can say. I have referred many of my students to the article, and to others that have appeared on Mr. Ford's Page. I do not believe we can stress too much the importance of right thinking. As Shakespeare says, 'There is nothing good or bad but thinking makes it so.'

MARION E. HUTCHINSON.

Asheville, N. C.

I am led to write to you through reading an article by Charles D. Cameron in the October 3 issue on 'King Solomon Discusses Us.' I may have been especially attracted because I have been reading the *Book of Proverbs* during the past year and have been much impressed by its modernity. All truth is modern and is never behind the time. The fact is, that it is always abreast of the present time and is usually ahead of the times.

The Scriptures as a whole are most neglected today, both Old and New Testaments. People seek in every direction for the truth but often fail to recognize the eternal truth of the Scriptures and the Christ of the Scriptures. As we read in *Proverbs*, 'There are many devices in a man's heart, nevertheless the counsel of the Lord, *that* shall stand.'

I enjoy your paper very much.

R. H. SPIRO.

Denver, Colo.

I noted in a recent issue of your paper some reference to Sunshine Valley in New Mexico. The writer of the letter which you published seemed to feel that, as an irrigation or settlers' project, this valley offers more than the usual number of drawbacks.

The conditions in the valley are similar to those in the entire West. The records in the office of the state engineer of New Mexico disclose what the settlers have accomplished in the valley. Every dollar that they have paid has been put back into the building of one of the finest irrigation projects in the country.

Recently they petitioned for the formation of a conservancy district. More than one hundred contract holders and owners signed the petition to the District Court. We hope to see the big main canal to the Red River completed; also the construction of a storage reservoir for late irrigation.

VOLNEY T. HOGGATT.

THE pioneers seem bigger than those who follow them, because they stand alone. They go out from a growing race, the first tendrils of conquest, but those who follow are of the same stock. In a multitude, however, the average is high enough to bring even the pioneer to the level of his fellow men. Pioneers in statecraft, science, invention, ethics, win reputation because out there in the new field they stand alone, and appear like giants. But as new fields are occupied by the crowds that swarm behind, distinction tends to vanish in a high average. Ordinary men are doing daily now what would have won them lasting fame in days when the average was lower. If sometimes we seem to live in a time of little men, it may be only because there are so many big men that greatness does not seem unusual.

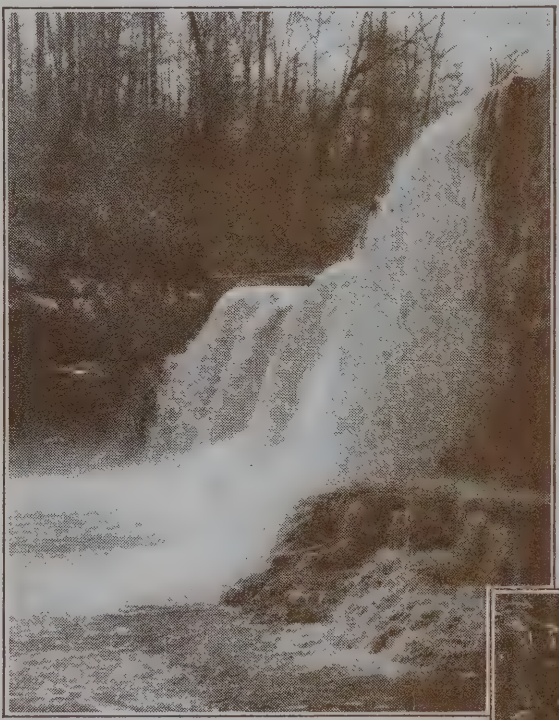
HUNTING THE BUFFALO

When WATER Falls O'er Rocky Walls

Nature's Charms Unfold In Leaping Cataracts

—Asahel Curtis.

Picturesque Snoqualmie Falls, in Washington, is the source of part of the electric power produced in Seattle. The water plunges over the cliff in awesome beauty, and the charm of the ever-changing clouds of water, with the mist below and the churning waters beyond, are all graphically caught in this picture. The thunder and roar of the water, the fleeciness of the fall, the formidable, unyielding cliff, by way of contrast, and the play of sunlight on the seething waters below are all apparent to the person who has once experienced the spell of such beauty.



—J. C Allen.

In sylvan setting the sparkling waters leap in foaming beauty over huge boulders, with miniature falls by way of contrast, in Lower Cataract Falls in Eel River, Owen County, Indiana.

—Stephenson Studio, Asheville, N. C.

Through leafy glades near Asheville, North Carolina, this mountain stream comes tumbling with prodigal abandon, as it breaks over the rocky slabs that are its bed into the bottomless pool below.

—S. R. Winters, Washington, D. C.

Along the Appalachian Trail, that stretch along which Nature has so lavishly spread forth her loveliest scenic gifts of mountain, wood and stream, the traveler comes upon such compelling beauty as this sparkling waterfall aptly named Crystal Cascade, in Pinkham Notch, White Mountain National Park, New Hampshire. It is indeed of a crystal beauty as it spreads like spun glass over the piles of rock, transforming the scene to one of transcending loveliness.

—Publishers' Photo Service.

Howick Falls, in Natal, South Africa, are a surprise in African scenes. They are 365 feet high, and plunge from comparatively level country over a precipitous cliff in a foaming, ribbonlike waterfall of surpassing beauty, ending in a film of spray. The suddenness of the cavern into which this water leaps is staggering.

The beginnings of Monterey.

The DISCOVERY of ALTA CALIFORNIA

By
FRANCES HOLBROOK PFEIFFER

Copyright, C. M. Neuner.

IN 1542—fifty years after Columbus' discovery of this continent—Juan Roderiguez Cabrillo, a brave Portuguese navigator in the service of Spain, sailed from the west coast of Mexico in search of the fabled 'Straits of Anian,' said to be the short route to India.

He entered San Diego Bay in October, the first European to set foot upon California soil. (The Indians were friendly and mistook the white men for gods until they saw them shooting birds. The Creator of Life, they argued soundly, would not so wantonly destroy life!)

Indian runners preceded Cabrillo's ship up the coast, setting signal fires all along the way—a mighty incense to the new gods—and so, after he had repaired his ships in Avalon Bay, Catalina Island, and had crossed to what is now San Pedro, Cabrillo found the land under a heavy veil of smoke and named it 'The Land of Smokes.'

At San Pedro he found a large Indian village, and others at Buenaventura and Santa Barbara, with all the Indians friendly. In fact, the white man was not wholly unknown to them. Coronado, in his unsuccessful search for those mystical 'seven cities of Cibola,' had traveled over a large part of the southwest on the eastern side of the mountains and, returning to Mexico 'very sad, very weary . . . and shamefaced,' had made such an impression upon the natives of the region that those of far-off California had heard of him. All along the coast they made known to Cabrillo that they knew of white men 'with beards' beyond the mountains.

Cabrillo sailed north as far as San Francisco but did not discover the bay! Driven back by storms to the Santa Barbara Channel, he passed away in January, 1543, on that lonely windward island, San Miguel, and lies buried in an unmarked grave in its sands.

Ferrelo, second in command, continued the voyage, at Cabrillo's dying request, and sailed as far north as the Oregon line; but he, too, missed the entrance to San Francisco Bay. Driven back by storms, he returned to Mexico with a report of which he could not even suspect the great importance.

Old Indians had passed away to the happy hunting grounds, and young Indians, who had seen the white gods' steps upon the shores, had grown old before another sail gleamed on the sea.

Once more the watch was set and the signal fires lighted; but a lone, unfriendly ship passed by far out, and disappeared in a low-lying bank of fog: Sir Francis Drake in the *Golden Hind*, 1579, loaded with plunder from the Spanish Main, was trying to escape capture by slipping through those mythical 'Straits of Anian' to India and home to England around the globe!

Like Cabrillo and Ferrelo, Drake, too, missed the Golden Gate, and when driven back by stormy weather, he anchored in a bay, now known as Drake's Bay, north of San Francisco. Here he took possession in the name of Queen Elizabeth, set up a post, nailed upon it a brass plate with the name of his sovereign and his own, that of his crew, and the date of discovery, and turned back to England.

It may have been Drake's visit to the Pacific that caused Philip II of Spain to try to tighten his hold upon California.

In 1596 Sebastian Vizcaino, with three ships, sailed up the coast, practically repeating Cabrillo's voyage. He explored the Bay of Monterey and was impressed by its beautiful hills and trees. Many of the names he gave along the coast still remain.

Geological authorities are beginning to believe that the reason Drake, whose men spent many weeks exploring up and down the California coast, did not discover San Francisco Bay, and why Cabrillo, Ferrelo and Vizcaino passed by the Golden Gate, was because the bay existed then as a great dry valley!

THERE is, also, an Indian tradition that a great cataclysm occurred, breaking through the Golden Gate, flooding the beautiful valley and changing it into a beautiful bay. This titanic change must have taken place between 1596, the year of Vizcaino's voyage, and 1769, when Portola discovered San Francisco Bay.

Vizcaino's report of his voyage to the viceroy was most enthusiastic. He prepared to fit an expedition and return with permanent settlers—this in 1596!—but passed away before his plans were completed. Then—a long silence of one hundred and sixty years!

The white gods and their great winged birds had become only a tradition among the Indians; Spain had declined, and her western possessions were stagnating. On the Atlantic Coast the Anglo-Saxons had established a church and firmly planted their Thirteen Colonies, and were already chafing under the yoke of the Mother Country, before another ship appeared off the coast of California.

A new and energetic king came to the throne of Spain and the most important decree of his reign was that of ordering his *visitador* of Mexico to colonize California that it might be protected from the menace of Russian invasion and from other foreigners.

The conquest of Alta California was delegated to the Franciscan Order and placed in charge of that great and zealous padre, Junipero Serra, a man who must be linked forever reverently with the history of California.

Gasper de Portola was appointed military and civil governor—the first governor of California. The stupendous preparation was under the general direction of José de Glavez, who, although he never beheld his golden land, deserves an important place in her history.

Four expeditions set out from Mexico with cattle, horses, fruit trees, plants and priceless seeds—two by land and two by sea. Captains Juan Perez and Vincueto Villa were given command of the ships *San Antonio* and *San Carlos;* Captain Rivera y Moncado was in charge of one of the land divisions, and Governor Portola with Father Junipero of the other.

The terrible hardship and suffering of that pioneer expedition, in our day, cannot be realized. Many perished on the way, but one hundred and twenty-six gathered to celebrate their safe arrival in this strange land, when the four divisions were united in San Diego July 1, 1769, and the town was founded.

Two weeks later, Governor Portola, with sixty men, started north to find the Bay of Monterey discovered one hundred and sixty years before by Vizcaino. They were the first white men in what is now Los Angeles. The record states that they crossed the Los Angeles River August 2, 1769, naming it *Porciuncula* for a stream in Italy dear to their patron saint, St. Francis. A crowd of Indians from their village, Yang-na (located at the present site of Alameda and Commercial streets), met the Spaniards near the plaza. They had been on the lookout for the strangers, warned by runners from San Diego who were wildly excited to carry the great news that the almost lost traditions of their forefathers had been verified—that there were white men who came up out of the sea in huge canoes!

We know that Portola crossed the hills of Elysian Park and journeyed north. He could not find a trace of Monterey Bay, possibly owing to heavy fog. His report reads:

'At Point Pinos there is no port, nor have we seen in all our journey a country more desolate than this, a people more rude, Sebastian Vizcaino to the contrary notwithstanding.'

Continuing north a detachment of the party under the command of Lieutenant Ortego, an ancestor of the Santa Barbara family of that name, looked off from a hilltop upon that wonderful body of water passed by the ships of four navigators—San Francisco Bay.

Failing to be reached by the

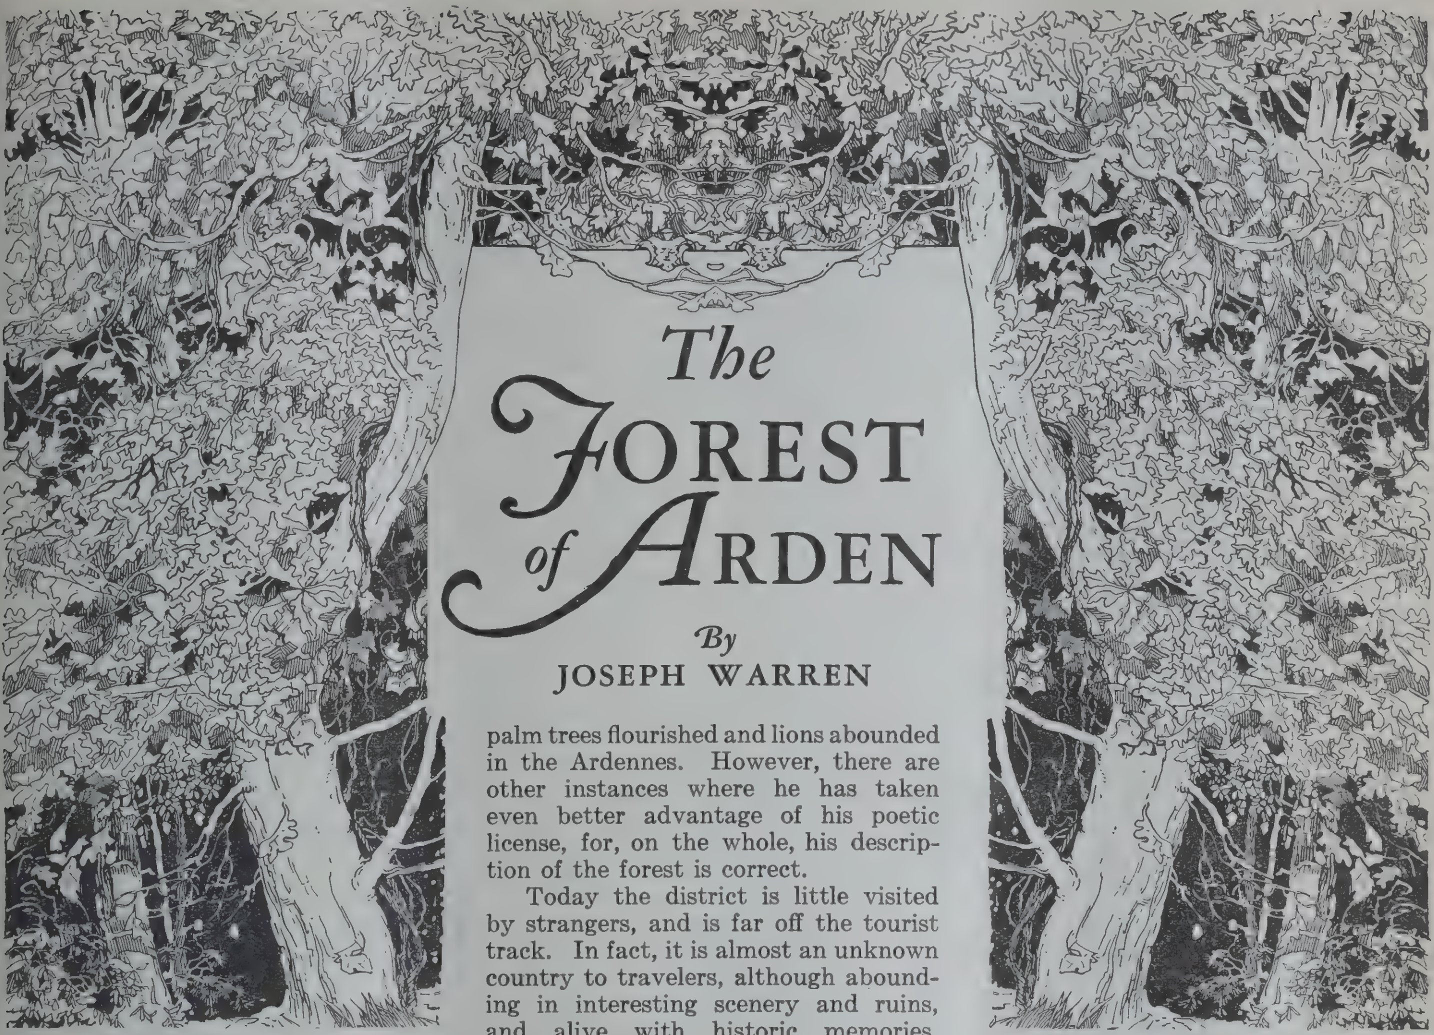
Along the Pacific Coast of California. Inset—Drake's vessel at Drake's Bay, 1579.



The FOREST of ARDEN

By JOSEPH WARREN

CERTAINLY there is no lover of Shakespeare but has been fascinated at some time by the thought of the Forest of Arden. Peopling it with some of our favorite characters, the Immortal Bard has given us a picture of a silvan retreat which seems to be the haven of many of our dreams. That it is not a mythical forest at all but actually exists today much as it was during Shakespeare's time may be a surprise.

The Forest of Arden, called *Ardennes* in the French, covers a considerable part of Belgium, Luxemburg, and one department of France. It is the largest forest in Central Europe, and always has been a wild and inaccessible place, heavily wooded and sparsely settled. Shakespeare here located *As You Like It*, and it has been known to the English-speaking world ever since. Because he took serious liberties with geography many have believed that Arden was entirely imaginative, for Shakespeare knew better than that palm trees flourished and lions abounded in the Ardennes. However, there are other instances where he has taken even better advantage of his poetic license, for, on the whole, his description of the forest is correct.

Today the district is little visited by strangers, and is far off the tourist track. In fact, it is almost an unknown country to travelers, although abounding in interesting scenery and ruins, and alive with historic memories. This is because of the scant hotel accommodations offered to visitors, and the meager means of transportation. It is almost necessary to plan a walking tour if one is actually to relive the scenes with Rosalind and Audrey, the Duke of Burgundy and the melancholy Jacques. But it is worth a walk to catch a fleeting glimpse of those silvan glades where one can imagine a figure in ancient doublet and hose philosophizing, 'All the world's a stage.'

Although the Ardennes is unknown to tourists, it must be said that it has not been entirely neglected by Americans. Some few took the time in those arduous and exciting days of October, 1918, to realize that about a million Americans were battling their victorious way into the Ardennes of Shakespeare. It seemed a long way from the dreamy stage of the 17th Century to the turmoil of the Meuse-Argonne offensive.

We did not realize that those soul-stirring names of Grand Pré, and Buzancy, and Sedan meant that American troops were doing all in their power to throw the German armies back into that forest, where the dense woods and difficult terrain would disrupt their communications and give us the victory. At any rate, we did not then have time to think of such things. That the Americans did not penetrate entirely into the heart of this Forest of Arden was only because the Armistice had been signed.

The Ardennes covers a territory of considerable extent, roughly about one hundred miles square. Naturally, this area is not solidly wooded now, but is crossed by pleasant river valleys, and dotted with villages. It is sufficiently forested to be a country apart, with many customs peculiar to its inhabitants. It is the country of the Walloons, who are quite different from their Flemish neighbors in the remainder of Belgium. Their language is called *Walloon*, and is said to be the ancient French language. The name itself may be like Wales—Gales—a corruption of *Gallois*.

In many ways they are like the French, being a good-looking race, lively and joyous. They are quite unlike the stolid, easy-going Flemish, and evidently have no German blood in their veins. Caesar writes of the forest and the fierce tribes that inhabited it, and tells us that it was possible for these tribes to muster more than three hundred thousand fighting men in those days.

The history of the forest extends from the time of the Romans as related by Caesar and Tacitus, down through the quarrels and wars of the Middle Ages to the present, when the

---

EDITOR'S NOTE: *As You Like It* was first printed in the folio of 1623. Shakespeare took the fantasy from a tale called *Rosalind*, written by Thomas Lodge, and published in 1590. The period of action is quite indefinable. The scene seems French; and in Lodge's novel the father of Rosader (the Orlando of the comedy) is Sir John of Bordeaux. But, notwithstanding this, and although there was an Ardennes in France and an Arden in England, the Forest of Arden is neither in France nor in England, but wherever the reader may like to fancy it.—Richard Grant White Edition *Complete Works of William Shakespeare.*

Germans came swarming through the defiles of Ardennes and fell upon Liége, Namur and Dinant. There is scarcely a spot that has not had some happening about it—and the tales are many.

On the hilltops along the river valleys are found many ruined castles of the feudal times, their towers and battlements still rising above the trees, and commanding wide views of the surrounding country. Old chapels and quaint little shrines are here in abundance, with wayside calvaries at almost every crossroad. There are no towns, but villages are to be found every ten miles or so, nestling in some valley and offering a welcome to the traveler who stops for a meal or for the night.

ALTHOUGH the Walloons are deeply religious and are devout Catholics, they have the weirdest collection of legends and tales to be heard in all Europe. The element of witchcraft is paramount, and there is an absence of poetry and mysticism; the ideas are coarse and more material. One does not find sprites and fairies here, with jolly elves and helpful spirits.

The big favorite is the 'Evil One,' and he recurs in all the stories of the countryside until one wonders if his Satanic Majesty had time to be elsewhere. He is always appearing as the tormentor of saints or the tempter of sinners. Sometimes he impersonates a wolf or some other animal, but he is always present to work woe. Most of the legends are terrible tragedies, and yet the people are a happy lot in spite of the tales they tell you. As usual in other places, every castle has some particularly famous story in connection with it, and history is interwoven with legend everywhere.

The French portion of the Ardennes is now a great battlefield, with memories of 1870 and 1918, to the exclusion of the dim history of the vanished centuries and storied legend. All the mysteries and seclusion that may have once lingered there vanished before the withering blasts of war, and it is impossible to visit that section with a mind of peace. It is necessary to cross the Meuse at Sedan and penetrate to the north into Belgium, before one comes into the country that is untouched and still charming.

The Ardennes is so unknown that it is difficult to plan just where to go first, but we decided to visit the very heart of the country, where we knew there was a special extent of unbroken forest, known as '*La Chasse de Saint Hubert.*' This is reputed to be the veritable forest of *As You Like It* and is also the site of the shrine of Saint Hubert, who is the most important saint in the country.

Saint Hubert seems to have been a rich noble, so greatly addicted to hunting that he neglected all else besides. It happened that he was hunting in the forest once, regardless of the fact that it was Good Friday, when all at once he saw a fine stag bearing between its horns a golden crucifix. For an instant Hubert paused, struck with wonder at the strange vision; then, believing it to be some delusion, he urged his horse toward the stag. Instead of running from him, the animal stood still, and a voice sounded in the huntsman's ears, 'Hubert, Hubert, how long will this idle passion for the chase tempt you to forget your salvation?'

Hubert dismounted, conscience-stricken, fell on his face, and became converted. Later, his good works were such that he became Bishop of Tongres, and at his consecration it is said that an angel descended and placed on his shoulders the famous stole, which is reported still to have healing powers. A monastery was built on the spot, and Saint Hubert was buried there, so that now it is a favorite place of pilgrimage.

There is nothing much to see in the village of Saint Hubert, except the many souvenirs offered for sale, all representing stags and horns and crosses. Within easy walking distance, the forest stretches in all directions, and there is no better place from which to see it. It is safer to drive in a carriage, for this part of the forest is still wild and has not only deer but also wolves and many wild boars.

It is not difficult to procure a rather dilapidated carriage in which to enjoy the several rides through the forest. The roads are beautiful, and one seldom meets anyone except in the villages.

At the time of our visit, we often drove for miles through beeches, their gray satiny trunks giving an unusual light in the forest, with here and there dreamy green glades breaking between the trees. We crossed many little brooks, and wondered which was the one where Jacques had reposed, watching the stag 'augmenting it with tears.'

AWAY from the roads the forest is thick and tangled; it is difficult to penetrate, and there are few glades large enough to hold the silvan banquet of the Duke and his friends, so roughly broken in upon by Orlando. It was dark and mysterious under the great trees, and we could not wander very far away from our carriage without thinking of the stories of wild boars that we had heard. We had no 'boar-spear in our hand' as had Rosalind, and we generally retraced our steps before we had gone far. It would have been a simple matter to become completely lost, and we had no craving to become 'babes in the woods' and wear a leafy coverlet for long.

Those deep forests have a charm that was not lost upon us, and we were always unwilling to return to civilization after a ramble under the beeches and oaks.

Decoration by
GERALD VAN DER HEYDEN

From Saint Hubert we went through the forest to La Roche, a little town on the banks of the Ourthe, above which rises the highest pinnacle of the Ardennes topped by the towers of the old castle of La Roche. About this ancient ruin is told a story, with many embellishments, which recounts why the castle has fallen into disuse and ruin.

Many centuries ago the barons of the castle were noted far and wide for their exploits on the field of battle. The father of the last baron, Henry, had been killed in battle, and when the warriors returned, they expected Henry to lead them to revenge. However, Henry was a student and peace-loving, and all warfare was alien to his nature. He and his beloved sister were alone in the world, and although he loved her more than anything else he seemed incapable of understanding that he should lead his men into battle even when she wished it. Gradually, he became despised by all, and he was in the depths of despair, for he could hardly ride a war horse, and knew nothing of fighting.

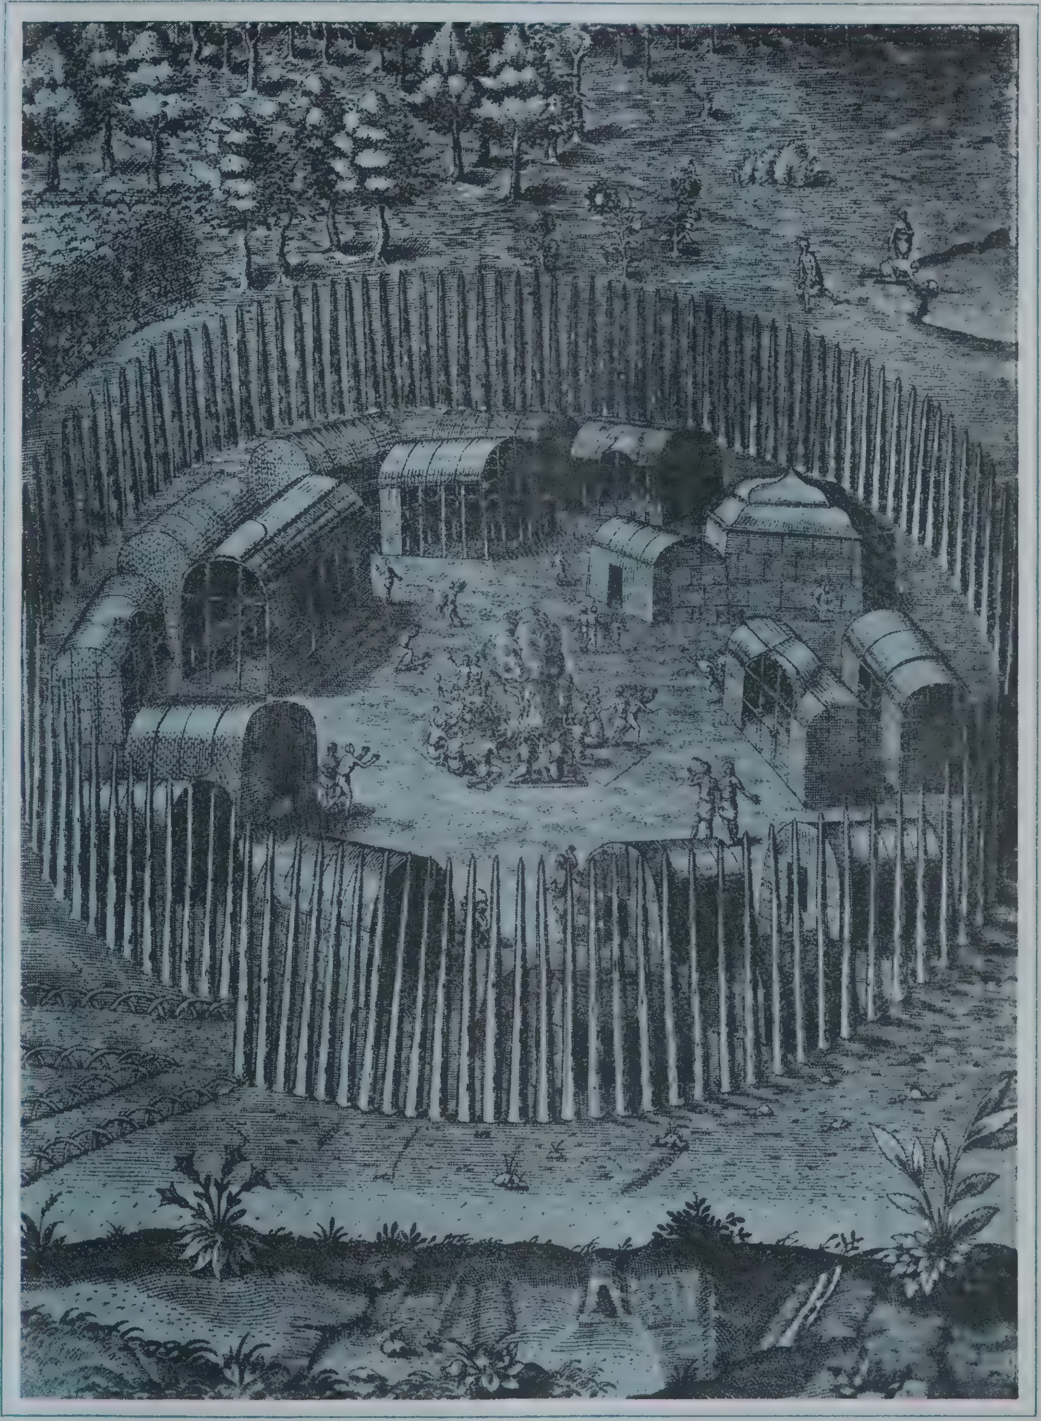
One night, almost frantic with his thoughts, he left

(*Continued on page 22*)

The LOST COLONY of Roanoke

By J. G. DE ROULHAC HAMILTON

A Romance of American History



—Illustrations from the John White pictures in the British Museum.

Hatteras Indians around fire in center of their stockaded village of 1587.

[1587]

THE 18th, Eleanor, daughter to the governor and wife to Ananias Dare, one of the assistants, was delivered of a daughter in Roanoke, and the same was christened there the Sunday following and because this child was the first Christian born in Virginia, she was named Virginia.

* * *

'The governor being constrained to return unto England . . . departed from Roanoke the seven and twentieth of August in the morning, and the same day about midnight came aboard the Fly-boat who had already weighed anchor, and rode without the bar, the Admiral riding by them, who but the same morning was newly come thither again. The same day both ships weighed anchor and set sail for England.'

[1591]

'The 20th of March, the three ships, the *Hopewell*, the *John Evangelist*, and the *Little John*, put to sea from Plymouth with two small shallops.

* * *

'The 15th of August toward evening we came to an anchor at Hatorask, in 36 degrees and one-third, in five fathoms of water, three leagues from the shore. At our first coming to anchor on this shore, we saw a great smoke rise in the Isle Roanoke, near the place where I left our colony in the year 1587, which smoke put us in good hope that some of the colony were there expecting my return out of England.'

* * *

'The next morning, being the 17th of August, our boats and company were prepared again to go up to Roanoke, but Captain Spicer had then sent his boat ashore for fresh water, by means whereof it was ten of the clock aforenoon before we put from our ships which were then come to an anchor within two miles of the shore . . . But in the end by the commandment and persuasion of me and Captain Cook, they prepared the boats, and seeing the captain and me so resolute, they seemed much more willing. Our boats and all things fitted again, we put off from Hatorask, being the number of nineteen persons in both boats; but before we could get to the place where our planters were left, it was so exceeding dark that we overshot the place a quarter of a mile; there we espied towards the north end of the island the light of a great fire through the woods, to the which we presently rowed; when we came right over against it, we let fall our grapnel near the shore and sounded with a trumpet a call, and afterwards many familiar English tunes of songs, and called to them friendly; but we had no answer, we therefore landed at daybreak, and coming to the fire we found the grass and sundry rotten trees burning about the place. From hence we went through the woods to that part of the island directly over against Dasamonquepeuc, and from thence we returned by the water side round about the north point of the island, until we came to the place where I left our colony in the year 1586 [1587]. In all this way we saw in the sand the print of the savages' feet or two or three sorts trodden in the night; and as we entered up the sandy bank, upon a tree, in the very brow thereof were curiously carved these fair Roman letters, C R O; which letters presently we knew to signify the place where I should find the planters seated, according to a secret token agreed upon between them and me at my last departure from them; which was, that in any ways they should not fail to write or carve on the trees or posts of the doors the name of the place where they should be seated; for at my coming away they were prepared to remove from Roanoke fifty miles into the main. Therefore at my departure from them in An. 1587, I willed them, that if they should happen to be distressed in any of those places, that then they should carve over the letters or name a cross + in this form; but we found no such sign of distress. And having well considered of this, we passed toward the place where they were left in sundry houses, but we found the houses taken down, and the place very strongly enclosed with a high palisado of great trees, with curtains and flankers, very fortlike; and one of the chief trees or posts at the right side of the entrance had the bark taken off, and five foot from the ground, in fair capital letters, was graven CROATOAN, without any cross or sign of distress; this done, we entered into the palisado, where we found many bars of iron, two pigs of lead, four iron-fowlers, iron locker shot, and such like heavy things, thrown here and there, almost overgrown with grass and weeds. From thence we went along by the water side toward the point of the creek, to see if we could find any of their boats or pinnace, but we could perceive no sign of them, nor any of the last falcons or small ordinance which were left with them at my departure from them. At our return from the creek, some of our sailors meeting us, told us that they had found where divers chests had been hidden, and long since digged up again and broken up, and much of the goods in them spoiled and scattered about, but nothing left of such things as the savages knew any use of, undefaced. Presently Captain Cook and I went to the place, which was in the end of an old trench, made two years past by Captain Amadas, where we found five chests that had been carefully hidden of the planters, and of the same chests three were my own, and about the place many of my things spoiled and broken, and my books torn from the covers, the frames of some of my pictures and maps rotten and spoiled with rain, and my armor almost eaten through with rust; this could be no other but the deed of the savages, our enemies at Dasamonquepeuc, who had watched the departure of our men to Croatoan, and as soon as they were departed, digged by every place where they suspected anything to be buried; but although it much grieved me to see such spoil of my goods, yet on the other side I greatly joyed that I had safely found a certain token of their safe being at Croatoan, which is the place where Manteo was born, and the savages of the island our friends.'

These two brief accounts record all that is positively known of the first person of English blood born in America. Virginia Dare's recorded history spans only the first nine days of her life and includes only her birth, her baptism, and her disappearance from view. And yet she is quite a personage in history and has a more perfect score of mention in American histories than any other infant, male or female, in the annals of the United States. In fact, it compares favorably with such names as Christopher Columbus, Sir Walter Raleigh, Captain John Smith, and even Washington, Jefferson, and Lincoln.

HER relative prominence in American history is due not only to her primacy among the native born. She typifies to most people the whole group of one hundred and twenty persons who figure in history as the Lost Colony of Roanoke. Her name is the only one that is remembered by the thousands who have known of the tragic disappearance of the colony and have wondered what was the probable fate of its members.

Most who have considered the matter in the years which have followed upon their disappearance have accepted the obvious solution that

they were destroyed by hostile Indians. But there were always those who refused to believe that they had perished. Some of these believed that the lost were later found and that, once found, they ceased to excite any particular interest in the public mind, and so no record of their return was made. Others believed that they survived in the New World, either preserving their racial integrity or intermarrying with the Indians. Some forgot their existence.

The first of these theories is easily disposed of. Interest in the fate of the colony lived a long time. After White's failure to locate any of them, Raleigh sent out several expeditions with no better success. No real search was made, however, that might have led to their discovery. After the settlement of Jamestown in 1607, constant inquiries were made and explorers generally continued to seek them for many years. And there is abundant proof that they found traces of them, here and there; traces which were later to help solve the puzzle of their fate.

It was not until after the Civil War, however, that any adequate explanation was found. But this when advanced was so convincing that one wonders why it was not discovered long before.

IT IS clear that the colonists before the departure of White had determined to remove to Croatan and there is the clear proof that they left Roanoke with that intention. Where was Croatan? It was that region of the banks inclosing the North Carolina sounds to the south and southeast of Roanoke, where dwelt the friendly Hatteras Indians. But they also laid claim to the peninsula of Dasamonguepeuc across Croatan Sound to the west of Roanoke Island and this, as early maps show, was also called Croatan. Here they probably went when they left Roanoke.

In 1669 John Lederer, a German who explored a part of eastern North Carolina, heard of a nation of bearded men 'two and one-half days' march to the southwest,' whom he erroneously supposed were Spaniards since Indians did not wear beards. In 1704 the Reverend John Blair who visited the Albemarle settlements of North Carolina wrote of a powerful tribe of Indians living to the south of Albemarle Sound, 'many of which live among the English and are as I can understand, a very civilized people.'

John Lawson, the first historian of North Carolina, personally explored a large part of eastern North Carolina and was anxious to find traces of the lost colony. Speaking in 1709 of the Roanoke settlement, he says, 'A farther confirmation of this we have from Hatteras Indians who lived on Roanoack island or much frequented it. These tell us that several of their ancestors were white people and could talk in a book as we do; the truth of which is confirmed by gray eyes being frequently found among these Indians and no others. They value themselves extremely for their affinity to the English and are ready to do them all friendly offices.' Lawson makes it fairly clear that he believes them the descendants of the Lost Colony.

A Croatan girl of modern times.

This sums up the early evidence of the survival of the colonists. It is good evidence, if scant in amount. Later, however, still more interesting and much more convincing proof was discovered.

In the period between 1700 and 1730 the upper valley of the Cape Fear River began to be settled by the Scots and the French Huguenots. These found on the banks of the Lumbee or Lumber River, in what is now Robeson County, a considerable tribe of Indians who owned slaves, lived in houses, spoke good English, cultivated the soil, and had good roads connecting their centers of settlement. Many of them had gray or blue eyes and they had English names. When the white people first came these Indians held their land in common, but they soon began to take up individual holdings. As early as 1732 grants were made by King George II to Henry Berry and James Lowrie, two of the important members of the tribe. Others obtained grants later. Many, however, never sought grants but by securing individual tracts they perfected their titles by occupation.

IN THE Tuscarora war which occurred in 1711 these Indians declined to join the Tuscaroras but instead under the title of 'Hattoras Indians' aided the whites under Colonel Barnwell, whose name transformed into 'Bonnul' still runs through their warlike traditions. Little is known of their part in the Revolution beyond the fact that a number fought on the patriot side, but a large number enlisted in the War of 1812. They furnished men to the Confederate army, and more than two hundred from Robeson County alone were soldiers in the World War.

In the late seventies or early eighties Hamilton McMillan of Robeson County became much

Frutigen, photographed from an elevation on a nearby foothill.

Pleasant Valley, SWITZERLAND

By JUDSON GRENNELL

FRUTIGEN is like no other locality in the world—outside the Swiss republic. And even Switzerland cannot exactly duplicate Frutigen. Each Swiss valley is individual in customs, in dress, and even in language. These differences are to be found in the industrial activities as well as in the languages spoken. In one valley German is spoken, in another French, and in still another Italian. There are populous communities such as Bern, Lucerne and Zurich where the German, French and Italian languages intermingle. Switzerland has no language of its own. Its business, its social intercourse, and its official pronouncements are not confined to any one of the three tongues.

The Frutigen valley is half a mile wide at the bottom, and some ten miles long. Through it runs a noisy river. Snow-topped mountains are on every side, rising first in gentle slopes and then more and more abruptly to the timber line. The mountain cliffs are precipitous, culminating in snow-covered rocky peaks.

Pasture lands reach to the timber line, chiefly fir; in places they penetrate the timber, making little oases of grass-covered meadows producing, it is locally claimed, the sweetest cream and the richest cheese. Here have been erected shelters for the cows and goats—protection from swift summer snowstorms that depart as quickly as they come.

The village of Frutigen is more than a hamlet, being credited with a population of two thousand. Its special industries are nowhere duplicated in any other Swiss valley. Frutigen employs a few men and many women to make matches and watch jewels. Here are four match and two watch-jewel factories. In addition there are a creamery and several machine shops. The valley in great measure owes its prosperity to the owner of one of these machine shops. Not only has he made many of the machines in his shop, but he has invented the special machinery used in the local factories, so that his reputation extends beyond the Swiss border.

What Joseph Brugger has done for Frutigen is worth recording. Not very long ago most of the matches sold in Switzerland came from Sweden and Germany. Today nine-tenths of the matches used in our own republic are the product of machines invented by Mr. Brugger, and these machines operate only in Frutigen. A single machine will produce 250,000 matches an hour, and two of them are in operation. Three other match factories in the village make the old-fashioned sulphur match, for which there is still a modest demand.

Brugger inventiveness has not stopped at the making of matches. It has been equally successful in making a machine for turning out watch jewels so exactly and economically that they can now be used in the cheapest watches. Success in this direction has been so great that one Frutigen watch jewel manufacturer has added unit after unit to his plant, until five are now in operation, making a formidable array of factory buildings for a Swiss village.

The Brugger inventions not being patented, the entrances to the match and jewel factories are jealously guarded. Wages are low, compared with American standards, averaging about a dollar a day. These factories, however, by absorbing the surplus population not needed for farm purposes, have made Frutigen more prosperous than localities not so fortunate in possessing an inventor who reserves his skill for his neighbors.

Frutigen's singing societies and the government church are the social centers. If one cannot pray, then one must sing. Some do both—the minister for example, who preaches no sermons when a singing festival is on the program. It is a great occasion. From villages in the neighboring valleys, the members troop in, each dressed for the occasion in ancient holiday costume. Rooms in the hotels are reserved weeks ahead. The day before the festival commences great loads of beer come in by train and truck. The singing contests are held in the freight shed which has been cleared of all débris and made spotlessly clean; the songsters in interludes of singing test their beer capacity.

The singing societies parade; prize cattle, each one belled, are brought out to join the procession, and gayly decorated floats add to the joyousness of the occasion.

Scattered through the level of the valley and on the sloping mountainsides is a farm population equaling that of the village itself. As a rule there is but one building to each farm. The same roof shelters the cows, the goats, the pigs, the poultry and the family. The lower floor is given over to the beasts; the farmers live overhead. Much space is reserved for hayloft and woodpile.

These Swiss farmers are a sturdy race, of Alpine stock, living a simple life. Happily their wants are few, or the little plots of land they call their own would not support them. It is practically all in pasture. Vegetable gardens are the exception. The season of frost and snow lasts seven months in the year. Seldom before May can the mountain pasture lands be utilized, and as early as September the cattle must be removed from the higher reaches. The valley itself is a thousand feet above sea level, with the mountainside pasture land reaching several thousand feet higher.

The food of the average Swiss farmer and his family consists of coffee and bread and cheese for breakfast; the same menu is served for dinner. At night soup or macaroni is added. On Sunday the family indulges in meat, which is generally smoked or salt pork. They seldom eat the eggs their hens lay, or have a 'chicken dinner,' these luxuries being sold in the valley to those who cater to the tourist trade.

On Sunday, dressed in their best—the same suit or dress doing service for many years, and sometimes for several generations—these outwardly unemotional men and women wend their way down the mountainsides to the government-supported church, where the pastor baptizes their babies, admits them as church members, exhorts them to live pure and honest lives, and preaches the funeral sermon over their dead, who are buried in the churchyard.

IN Frutigen, as in the rest of Switzerland, every child can read and write. Here the language taught in the lower grades is German, but French, Italian and English are included in the higher grades. Students who wish to perfect themselves in a foreign tongue go to London for their English, to Paris for their French, and to Rome, Milan, or Florence for their Italian. Thus they fit themselves to hold positions of trust in most of the cities of Central Europe, or to serve their own country. It is necessary to have an intimate knowledge of French, German and Italian, if one wishes to represent his community in the Swiss legislature, for a representative is privileged to rise and address the chair in any one of the three languages.

In this farm-grazing community, as in agricultural districts in Amer-

OF THE DEARBORN INDEPENDENT

Definition of a Working Man

WHAT is a working man? Is he not a man who works? And if he is a man who works is it not equally true that he is a working man whether he works with his hands or with his brains, or both? Yet the phrase, 'working man,' is almost always used to mean a man living by some mechanical or manual occupation.

In the ordinary course of things, hand and brain must work together to accomplish any results; to divorce one from the other would be like depriving a ship of its navigator and allowing it to run wheresoever it listed. The result would be disaster.

This combination of hand and brain is essential to success. The farmer prepares the soil and sows the seed, but even with the most propitious weather conditions the cultivation of the land and the planting of the seed would lead to poor results were it not for judicious selection and proper fertilization.

It is the same in the work of the engineer and builder. A steel girder may be a perfect piece of workmanship, but it takes the guiding hand of the engineer to place it where it belongs; a pier or buttress may be a marvel of strength, but it is the architect who decides its position so that it may give strength where most required. Both engineer and architect have made a study of these things and their judgment is relied upon.

Give a man a spade and tell him to dig a hole and plant a tree. He may dig the hole and plant the tree, but it requires expert knowledge to tell him just what sort of hole to dig and what kind of tree to plant. He must dig the hole where the soil is suitable for the variety of tree he intends to plant, and if the tree is to be of any commercial value when it comes to maturity, it must be of a species which furnishes good timber.

There is also the danger of using the wrong tools. In addition to his spade the man might be given an axe, and in addition to his planting activities he might be told to cut down some of the mature trees for timber purposes. If it were not for the intelligence with which he is endowed and which directs him in his actions, there is a likelihood of his applying the tools in the wrong way.

It is related that a gang of coolies in an Eastern country were once supplied with wheelbarrows to take away the dirt from an excavation. Now, it so happened that previously the dirt was put into baskets and carried away on their shoulders. The advent of the wheelbarrows completely puzzled them. They had never seen such things before, and to the coolies they were only so many containers in which to put the dirt; but the barrow was too heavy to carry on their shoulders in the usual way; one man took hold of the shafts and another seized the wheel, and between them they lifted it bodily from the ground, with its load, and dumped it just as they had the baskets.

Obviously this was a case of misdirected energy, an illustration of the hand working without the brain. However, instances of this kind are every day brought to notice in the unskilful use of tools even when applied to their legitimate use. The partnership of brain and brawn cannot be dissolved without inviting disaster.

Therefore, the man who uses his brains as well as his hands in the performance of a given task, or the man whose intelligence fits him for the guidance and direction of others in the carrying out of his work, is as much a working man as any. He is just as truly a man who works.

And so it is in any profession, whether that of law, medicine, or the ministry: all who perform their duty faithfully are working men in as true a sense as the toiler in the woods, the fields, or the factory. All who are engaged in legitimate labor, be it with the hands or with the brains, are working men; all who are not idle have the right to be included in this designation.

Much of the trouble and turmoil that have upset the world from time to time might have been saved if the proper relation of the intellect to the hand, of the director of a task to its performer, had been fully recognized. There would have been less talk about 'capital' and 'labor,' about the 'bosses' and the 'workers,' about employer and employe. For that matter men who work are all capitalists, all bosses, all employers, if they only fully understood it: all are equally essential to the general welfare.

The man who possesses health, strength and skill is a capitalist; if he can use this health, strength and skill to the best advantage he becomes their master and is therefore a 'boss,' and if he uses them as a means toward the betterment of his personal welfare and in promoting the happiness of those who depend upon him, he is an employer conscientiously fulfilling his destiny. He is assuming the functions to which he is legitimately entitled; he is taking his proper place in the order of things; he is the captain of his soul, not its slave.

> *BRAINS and brawn are inseparable and make up the world's motive power. The hand, no matter how dexterous, would be a useless piece of machinery were it not guided by the intellect. The partnership of mind and matter is one which has existed since the beginning of time and cannot be dissolved. If this dissolution took place we should have labor without utility, and intelligence divorced from toil. The result would be economic chaos. There must be harmony of intention in order to reach the common objective of accomplishment. The buyer of the product of this partnership, himself a worker, is also an essential unit in the scheme, and the disintegration of this trinity would bring disaster.*

OF THE DEARBORN INDEPENDENT

As Maine Goes

THE decisive manner in which Maine voted to retain her direct primary law is indicative of the sentiment throughout the country. Concerted efforts have been made in recent years to bring back the old boss-ridden convention system. Inspired articles have appeared in the daily press from Pennsylvania to Oregon, from the Lakes to the Gulf. Propagandists have spoken from platforms and from broadcasting studios. Politicians have extolled the virtues of the old system and magnified the defects of the new. Yet in spite of the most strenuous attacks, the direct primary law still remains. Almost every attempt at repeal has met with defeat at the hands of the people. The voters seem somehow to sense that, defective as the direct primary is, it is a vast improvement over the antiquated and corruptible convention system.

The direct primary is far from perfect. It permits the nomination of a Vare in Pennsylvania and a Smith in Illinois. It allows, in some instances, the expenditure of enormous sums of money. But this very fact of money can be turned into an argument in its favor. Gang politicians can still control a state, but it costs them far more than it did in the good old days. And their control is more fitful and uncertain. A Vare can still be nominated and elected in Pennsylvania, but his grip on the state is infantile compared with that of Matt Quay or Boies Penrose under the convention system. Blocks of votes can still be delivered by city politicians, but whole states cannot be delivered—not in the old way, at least. The chief fault of the primary system is the same fault as applies to all elective processes in America: the apathy of the voters. Opponents say that because of this apathy the voters should return nominative power to the politicians, to those who manipulate conventions. But would this prove a remedy? If it is a choice of lesser evils, does not the direct primary stand in far more favorable light?

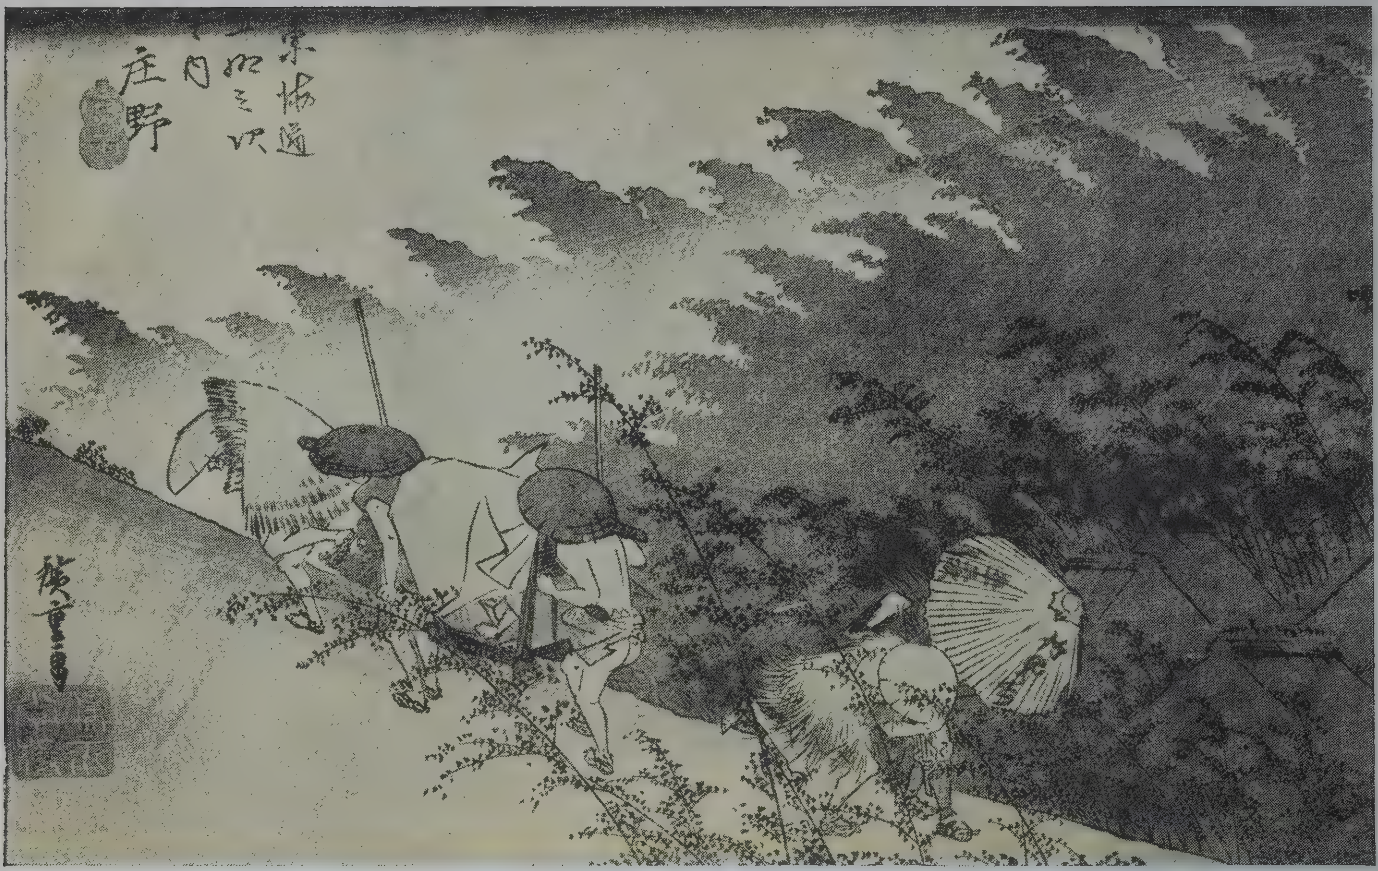
The Silent Places

THIS is the time of year to enjoy long walks in silent woodlands and sunny fields. To those who dwell in cities and bustling towns, the word *country* brings to mind visions of peace. The country may be quiet even to dullness, tranquil to sleepiness, or calm to heaviness. Because of this, city dwellers follow Nature's paths and seek her temples where holiness and reverence may still be found in high hills and lowly valleys, in deep woods and rippling waters. From the main traveled road the beckoning trail leads on into mysterious vistas, a challenge to step from the beaten way, a hope of escape from the ruts of usage. Turn from the beaten path and walk across country. You will be amazed at the things you will see: things that you thought did not exist in this present day and age. Your trail will twist and turn, up hill and down dale, here through woods, there through fields, with once in a long while a farmhouse, boarded up and deserted, and once in a while a pasture with a cow or two feeding. It will cross a brook by a plank bridge and will be bordered part of the way by snake fences, stump fences, wire fences, or by tumble-down walls of field stone. There are little cataracts in a woodland brook; bits of jagged rock on hillsides, that look oddly like mountain peaks; a ditch in a field, with red clay walls and clear water. Country silences are soothing to worn nerves. You will find that nothing works a more complete mental detachment from the perplexing things that wrap about us an atmosphere of anxiety and worry than turning from the crowded city streets into the roadways of the woods about you.

Growing Bureaucracy

PRESIDENT COOLIDGE in recent speeches has given timely warning of the growing efforts to transfer from the states to the nation those functions and prerogatives which were specifically reserved to the states at the time of the formation of the Union. The Colonies which joined a century and a half ago to form the United States of America were independent in thought and action. Victorious in a common cause, they deemed it necessary to make permanent their alliance for mutual interests; but they nevertheless retained to themselves all powers necessary to be independent in government. To Congress, as representative of the people as a whole, they gave the control of legislation in matters of common interest; but internal matters were retained largely in their own hands. Such legislation as that affecting qualifications for the franchise, direct assessment taxation, what are known as excise laws, and the control of public education had originally no place in the authority of Congress or in the Federal scheme of things.

Gradually these things have been taken over by the Federal Government in greater or lesser degree. 'States' rights' has become almost an empty phrase. Each new function the Federal Government assumes removes that function from the realm of state sovereignty. To this end, ceaseless efforts are made to amend the Constitution. *From the years 1889 to 1926 alone, 1,314 proposed amendments to the Constitution were introduced into Congress.* And this total does not take into consideration those additional thousands which were proposed but for which no sponsors could be found in the Federal legislative body.



On Collecting Japanese Color Prints

By HERBERT ASBURY

Illustrated with prints from author's collection.

JAPANESE color prints are properly wood engravings, printed by hand from blocks of wood, usually cherry, on which the design was engraved after the artist had drawn it in black outline on thin paper. A separate block was engraved for each color, some prints requiring as many as twenty-five to thirty impressions.

The wood of the cherry tree, *sakura*, has a grain of peculiar evenness and hardness. It is worked plankwise to a surface parallel with the grain and not across it. Surfaces are gradually rounded off, where necessary, to obtain in printing a soft and graduated mass of color that does not terminate too abruptly.

Although the origins of color printing are obscure, it is known to have been practised in China and Korea to some extent. Apparently it is one of the few indigenous arts of Japan. However, as refutation it must be borne in mind that it was at this time that the so-called chiaroscuro engraving was at its height in Italy, and also that that was the time that embassies from the Christians in Japan visited Rome. That the originals of these European prints are never found, if this theory is correct, is accounted for by the fact that they were doubtless religious subjects and as such were destroyed in the extermination of Christianity by Hideyoshi in the beginning of the 17th Century.

The technique as originally developed is still employed in Japan, but the modern print is also prepared by various photographic processes, and is generally printed with aniline dyes, which fade within a few years and even at their best do not have the luster and beauty of the old vegetable colors. It is the old prints that collectors strive for, the modern output being worthless except for the work of a few artists such as Hasui, Gokkei and Goya.

If the design of the print proved popular and the work of the artist was in demand, thousands of copies were printed from the blocks, so that there may have been an interval of several years between two impressions of the same print. The first copy may have been drawn as soon as the blocks had been cut; the second may not have been printed until the blocks had become worn with fuzzy, sprawling lines. I once owned two copies of a Kuniyoshi print in which the difference was so marked that at least five years must have elapsed between the two printings.

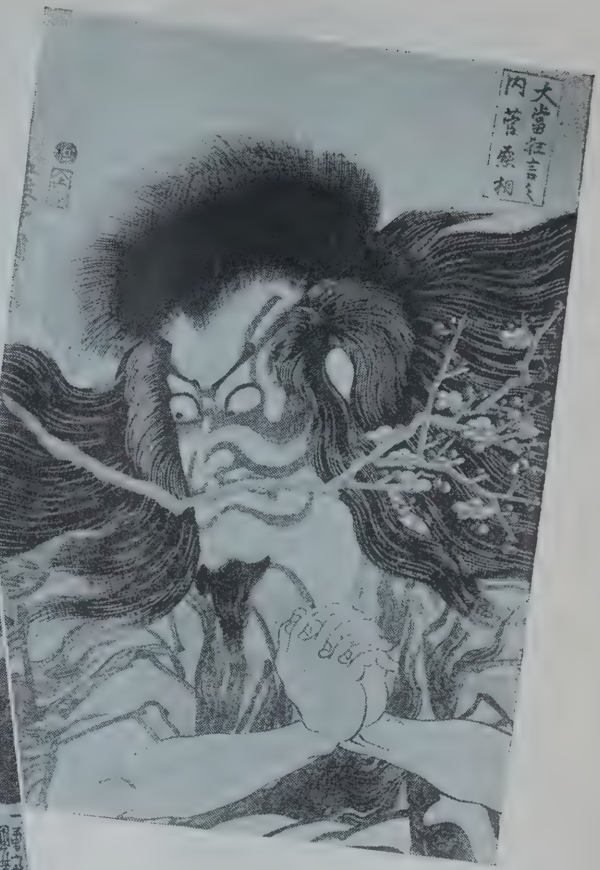
Copies of the same print may also differ in color arrangement, as many of the artists took advantage of the opportunity to experiment. A good example of this is found among the prints of Hokusai's 'Thirty-six Views of Fuji,' generally recognized as the best work of this master. For these reasons prints from the same blocks may vary in price from one to several hundred dollars, and the difference in esthetic value may be as wide as eternity.

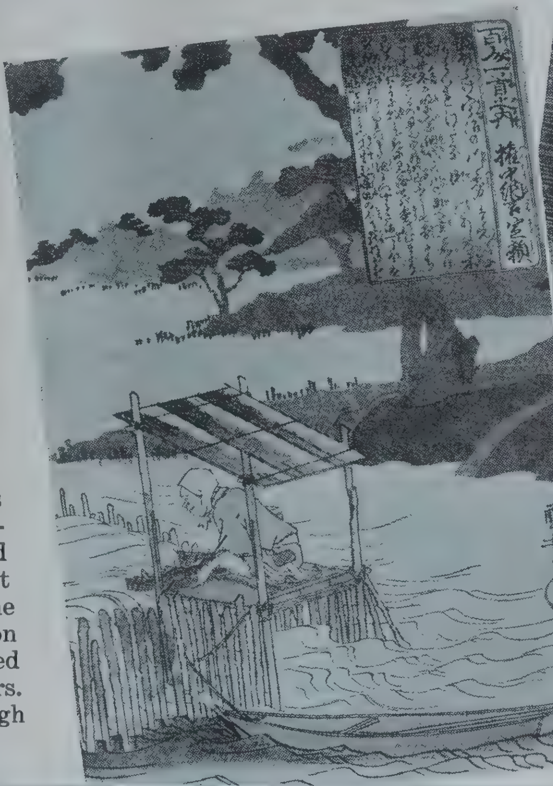
While large sums have been paid for Japanese prints in recent years, it is a mistake to assume that the poor man is barred from acquiring them. It was essentially a poor man's art during the two hundred years between its birth with Torii Kiyonobu in 1664 and its death with Kunisada in 1864; it remains so to a large extent.

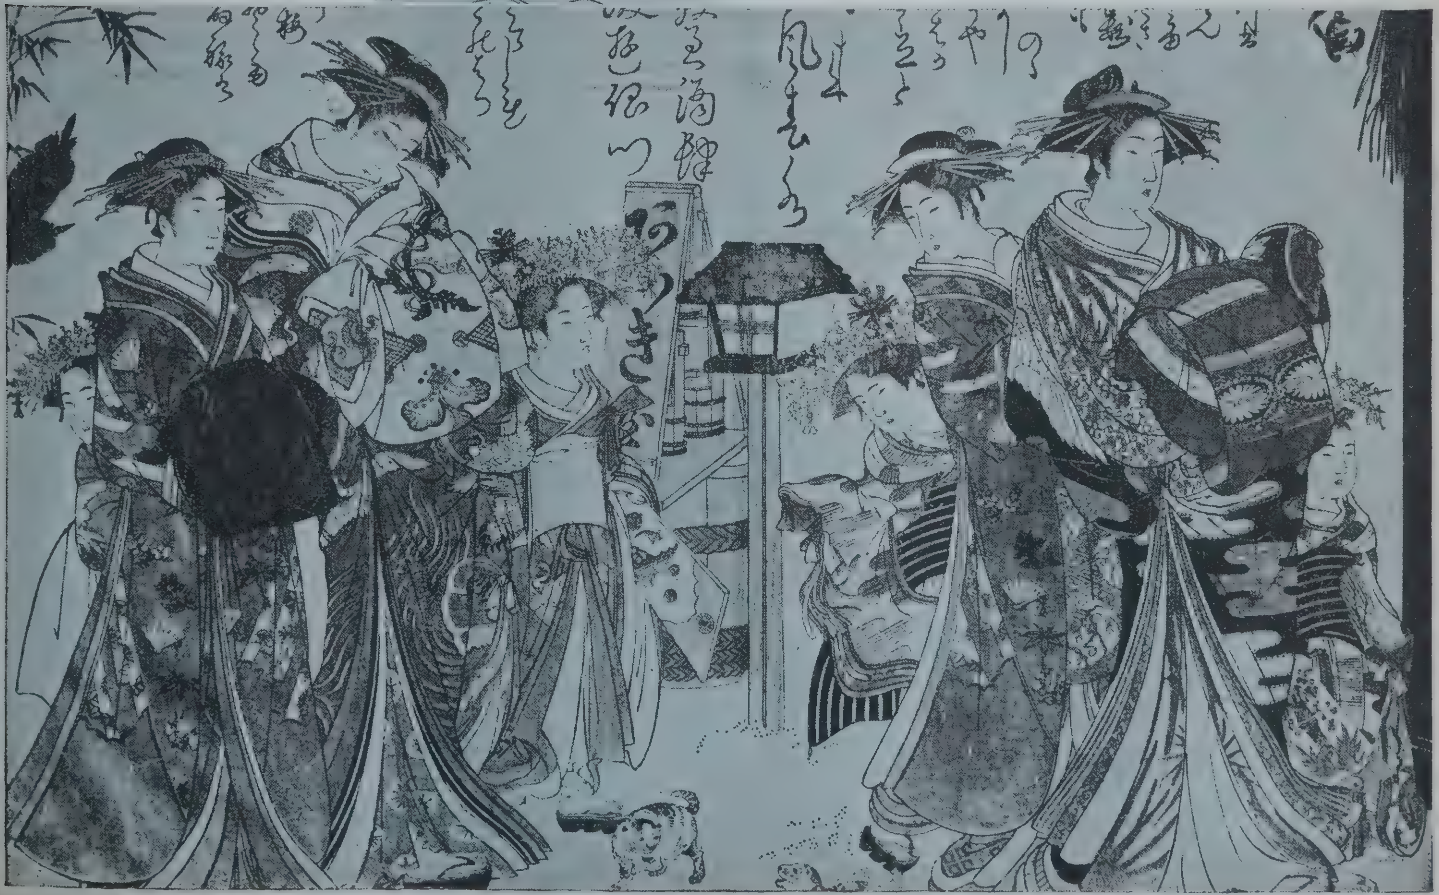
With few exceptions the artists themselves were poor men, of the lower classes, with no cultural background and no classical training. They became known as the school of Ukiyoye, variously translated as 'pictures of the floating world' and 'mirror of the passing world and times.' The aristocrats of the Kano and Tosa schools, who labored solely for the approbation of the nobility, considered their work vulgar and degrading, because it portrayed the daily activities of the people and the life of the theater, then in great disrepute.

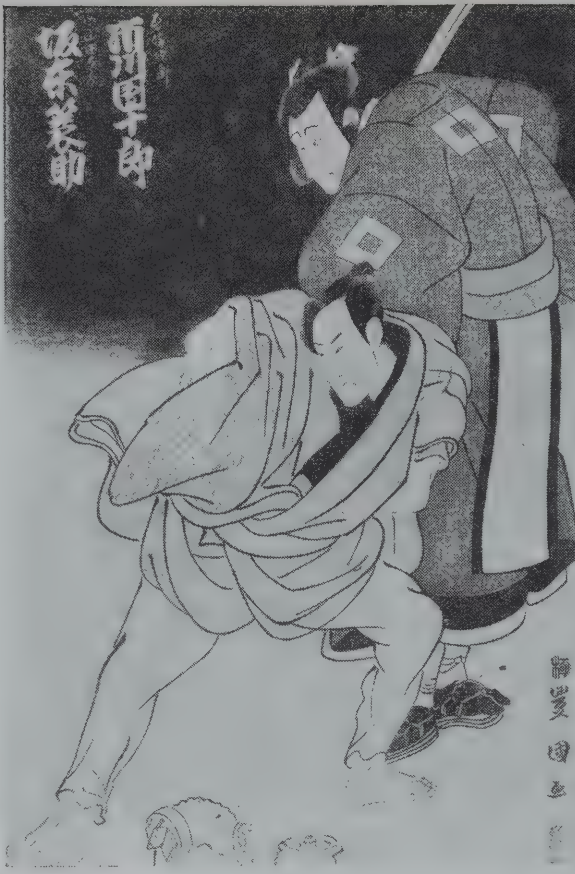
Japan did not really begin to appreciate her own color prints until they had been discovered by the Western world. The first prints to come under Occidental scrutiny reached Europe as wrappings for tea boxes about 1800, and fell into the hands of an artist of Amsterdam. But it was many years after that before they were recognized as perhaps the most distinctive art that any country has ever produced; they were regarded as the curious product of a savage and benighted race.

As late as forty years ago prints by the greatest Ukiyoye artists could be bought for less than a dollar. In many American collections are prints which cost their owners only a few cents, but which are now worth hundreds of dollars. I know one man who has a copy of Hokusai's 'Wave at Kanagawa,' for which he paid sixty cents; it is now worth perhaps four hundred dollars. Another collector paid twelve dollars for a print by Sharaku, and when he dispersed his collection sold it for nine hundred and ninety-five dollars. Such prints bring high prices, but there are still thousands that can be obtained for very little money. For a few hundred dollars, by careful buying and the exercise of patience and taste, a collection may be formed which will be a source of continual pleasure, and which is bound to increase in value with the years, because the art is dead so far as concerns the production of prints equal to those of the old masters. Modern prints tend to mere prettiness; the Japanese artist has gone to school too often to the Occident, and the es-









sentially Japanese character of his conception is gone.

Twenty-five years ago only a few Americans were interested in Japanese prints, and those largely because of the fine missionary work of La Farge and Fenollosa, and the Ukiyoye influence on Whistler. But now it seems that almost everybody owns them, and many small collections are coming to light and are being sold in the auction rooms of the art galleries, where the finest prints and the greatest bargains are to be found.

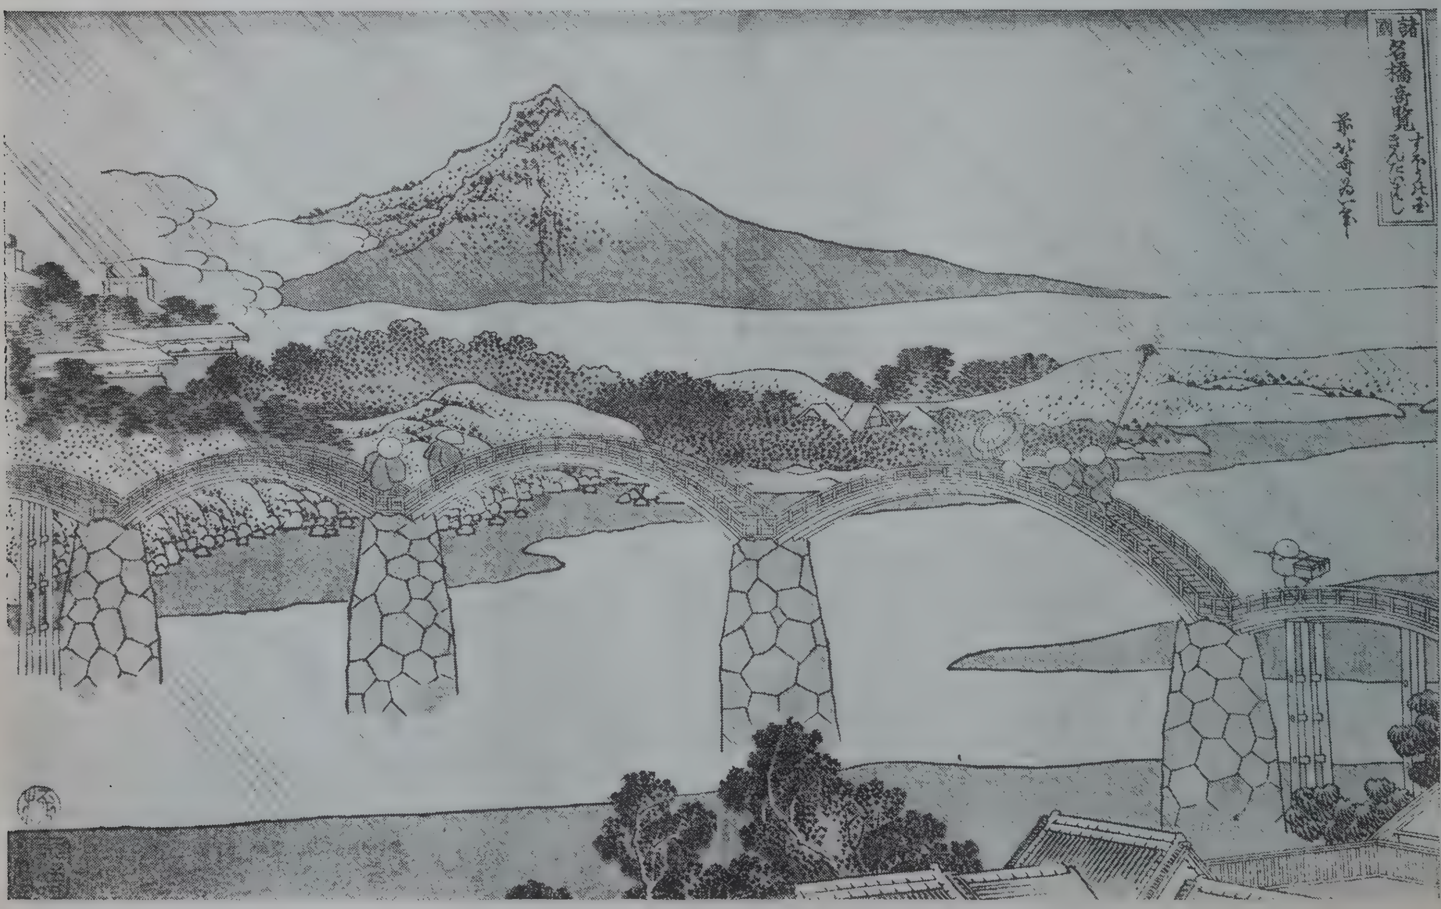
The growth in the number of print collectors has been amazing. And every person who owns a Japanese print, especially if it is wrinkled and torn and dirty, with wormholes in it, is apparently under the impression that he has a fortune. Once in a great while he has, in a small way, but generally the opposite is true, for the high prices are not paid for such prints. After all, there is nothing so easy to imitate as age. A print can be soaked in tea, and wormholes punched with a pin, and in half an hour can be made to look as ancient as desired. Also it will be absolutely worthless.

The amateur in collecting is apt to make his first mistake as soon as he buys his first print, for his early enthusiasm is so great that he is prone to buy every impression that strikes his fancy. But he learns by expensive experience, and eventually he goes through his collection and casts out the poor impressions and the prints by minor and inconsequential artists. Occasionally, having done this, he has nothing left.

In my own collection there is not one print that I bought during the first year I had the collecting fever. Before a beginner buys prints he should read books on them from cover to cover, learning their history and meaning and their relation to Japanese life; he should examine whatever collections he can get access to, and learn to know the texture of the paper with which the old printers worked, and the colors that distinguish certain artists, such as Hokusai's green, Kuniyoshi's brick red and Harunobu's blue, and the orange found in many of Koriusai's prints.

I prefer to avoid the output of all artists who worked after 1850, with the exception of Hiroshige's and some of the prints of Kuniyoshi and Kyosai and Kunisada, notably Kuniyoshi's 'Nichiren' series and his 'Hundred Poems.'

A collection should be formed primarily for the enjoyment of its owner and his friends, and the collector who acquires things because he loves them will seldom buy a print just because it is important historically or because it is rare. He will buy the one from which, vulgarly speaking, 'he gets a kick.' Which is as it should be.



The Senate of the Fiftieth Congress

By BARNES COOLEY

OF THE seventy-six senators in the Senate of the Fiftieth Congress, thirty-nine were Republicans, thirty-seven Democrats. The Democratic senators were described in a preceding article. This deals with the Republican membership.

Nearly three-fourths of the Democratic senators had seen military service with the Confederacy, in the Civil War, but only one-fourth of the Republican senators had worn the blue. In the Senate of 1887-89 were ten Republican senators who had served in the Union Army: Bowen of Colorado, Hawley of Connecticut, Ingalls and Plumb of Kansas, Davis of Minnesota, Manderson of Nebraska, Blair of New Hampshire, Quay of Pennsylvania, Aldrich of Rhode Island, and Spooner of Wisconsin.

Thomas M. Bowen served from June '61 to July '65, first as captain and finally as brigadier general. He settled in Arkansas after the war, but it took him fifteen years to learn that Arkansas was no place for a Republican who wanted to practise his politics; in January, 1875, he removed to Colorado Territory.

Joseph R. Hawley of Connecticut won distinction in the Union service. He left his editorial desk in Hartford, where he had recruited the first company of volunteers raised in Connecticut, and, entering the war as a second lieutenant at the age of twenty-four, came out a brigadier general.

He was an original Republican, for he had been a delegate to the Free Soil convention in 1852. After the war Connecticut was glad to give him whatever he asked—he was her greatly honored son.

KANSAS chose as its representatives two men who had worn the blue, John J. Ingalls and Preston B. Plumb. Ingalls was an officer in the Kansas Volunteers, 1863-65. Sarcastic, intellectual, a builder of phrases—as witnessed by his 'purity in politics is an iridescent dream'—a zealous partisan, Ingalls won distinction in the Senate. Plumb, a blunt, forceful man, a perfect type of the western 'go-getter' of that day, was in emphatic contrast to his colleague. Entering the Union service in August, 1862, as second lieutenant he became lieutenant colonel of his regiment. Though blessed with a superb constitution, he died suddenly in the very vigor of health.

Minnesota's Union veteran in the Senate was Cushman K. Davis. He was first lieutenant in the Twenty-Eighth Wisconsin Infantry, 1862-64. He was elected to the Senate in 1887 and served continuously until his death on November 27, 1901. He died as a result of blood poisoning. Davis was bald, and drooping lids gave his eyes a peculiar expression, but his wonderfully fine mental machinery moved with smooth precision.

General Charles F. Manderson, Republican senator from Nebraska, entered the army as first lieutenant of the Nineteenth Ohio in April, 1861, and rose to become its colonel. He left the service because of severe wounds in April, 1865, as brigadier general. Manderson was a kindly gentleman, a capable president pro tem. of the Senate, an excellent lawyer, and a useful senator.

NEW HAMPSHIRE'S Union veteran in the Senate was Henry W. Blair. He served in the Union Army as lieutenant colonel of the Fifteenth New Hampshire Volunteers and was twice wounded. He was in the Senate from 1879 until 1891. Because of his advocacy of Chinese exclusion, the Chinese Government refused to receive him as minister from the United States after his nomination had been confirmed.

Matthew Stanley Quay was senator from Pennsylvania. Had he shown the resourcefulness as a soldier which he displayed as a politician, Lee would have been brought a year earlier to surrender. Quay was twenty-seven when the war broke out and, after serving as lieutenant of the Tenth Pennsylvania Reserves, was colonel of the 124th Pennsylvania Volunteers and saw active service at bloody Fredericksburg. From 1870 until his death on May 28, 1904, he was not only a leader but *the* leader of the Republican Party of Pennsylvania. He controlled its offices and its delegations to Republican national conventions. As chairman of the Republican national committee in 1888 he managed the campaign that resulted in Harrison's election to the Presidency, and with the philosophy of a practical politician endured thereafter what he regarded as rank presidential ingratitude. He felt toward Harrison much as Gorman felt toward Cleveland. It is probably true that, but for Quay, Harrison would not have been elected in 1888. Quay's motto was: 'If you play, you must pay.' He died on May 28, 1904, and the country now remembers him chiefly as an intensely practical politician. He was a many-sided man. Possessing a remarkable library, he knew the contents of his books, no less than their covers.

Nelson W. Aldrich of Rhode Island never boasted of his military service, but it is a fact that in 1862 he did garrison duty in Washington for nine months. Long engaged 'in commercial pursuits,' as he was wont to put it, Aldrich ever looked like a misplaced business man; but never was business man placed where he could transact more important business. Aldrich had received early training, for he had worked as clerk in a store from his twelfth to his sixteenth year. Afterward he made money, studied finance, drifted into politics and became Burnside's successor in the Senate in December, 1881.

Burnside had been a gallant and wholly competent corps commander in the war, but was incapable of commanding an entire army. It is fate's irony that Burnside is most widely known because his side whiskers gave such new words to the English language as 'burnsides' and 'sideburns.' There could not have been a sharper contrast than that between the tall stately general and the keen-eyed, shrewd Providence merchant—never more the merchant than when he was senator. Aldrich went to the Senate in 1881 after four years' experience in the House, and was kept there by successive reëlections. He specialized in tariff and finance, held the Republicans to the service of special privilege, and by his cunning and real strength again and again defeated, if he could not always silence, opposition.

JOHN C. SPOONER, the tenth of the Senate's Union veterans, served as a private and then became captain of a Wisconsin regiment. Smooth-shaven, he looked younger than his forty-five years. A capable lawyer, he readily gained recognition in the Senate, from which he voluntarily withdrew because he felt the need of earning money and of making provision for his old age. The salary of a senator was then but five thousand dollars a year and, while it is twice that now, five thousand dollars would buy considerably more in 1887 than what ten thousand can buy in 1927. A congressman with a family wholly dependent upon his pay could not easily save an honest nickel.

The Republican portion of the Senate in the Fiftieth Congress was notable in other aspects. There were some exceedingly rich senators.

Leland Stanford of California was one. He was a delegate to the convention that nominated Lincoln and was governor of Cali-

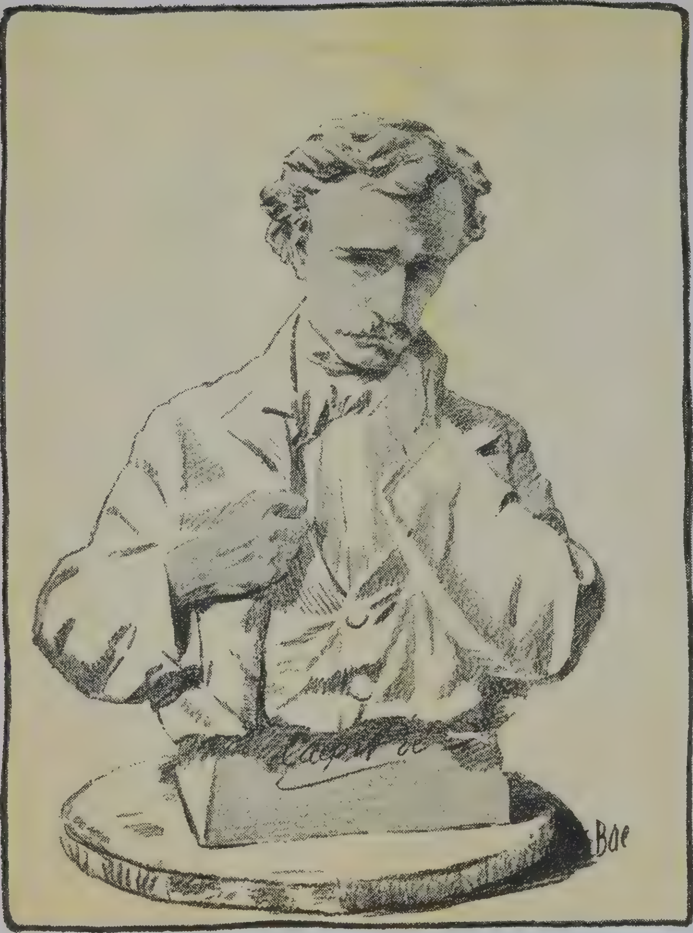
THOMAS JEFFERSON'S

By VACHEL LINDSAY



It is indeed fitting that the bust of Edgar Allan Poe by Zolnay should be in the rotunda of the university founded by Jefferson.

THERE was a sharp difference of opinion between Jefferson and Washington as to party government. Jefferson believed in the two-party system which we have had ever since. Washington believed that the nation should be governed as our best commission cities have lately been governed, by a nonpartisan commission. This is not a political article, and I do not think that I am smart enough to write one. But the rivalry of Washington and Jefferson is a rivalry which both dramatized better than they knew.

Washington was wisdom itself in keeping Jefferson in his Cabinet as long as possible. Jefferson was right in seeing that the Constitution demanded perpetual George Washingtons in the chair; and since there never was but one, and there never will be but one, I hold that Jefferson was a statesman in thrusting party government upon this country again, at the end of Washington's eight years. It was a return to the old Anglo-Saxon precedent, and not necessarily a barn-burning idea. There is no doubt that Jeffersonians made what seems now an unnecessary clatter about the Virginia pomps of Washington; especially those of Martha Washington. He seemed to accuse them of hinting at a kingdom in all but name. This bonnet-and-plume idea can run away with people sometimes; though there is not the remotest sign that it has ever disturbed the American people since the great General was laid in his tomb.

He was our first and last king, and let us face that. But he was king more like an Indian chief than a European king. Jefferson was more like a free young Indian, than like a European, though he never knew it. He may have piled up all sorts of essays about liberty and equality, in the French manner; but the real liberty and equality that was in his blood and bones was that of his father sitting cross-legged at some Indian chief's camp fire, with his surveyor's instruments piled beside him, and the chief offering the feast of brotherhood there in the roaring woods. It is from such interviews as these that we have a birthright to the Jeffersonian equality and to the Virginia bonnet and plume.

The book of *Field Service Regulations of the U. S. Army* is based on Indian warfare. The Civil War, north and south, was fought with Red Indian tactics. These things are fairly clear to any man in haste. But we shall not begin to understand the Fathers of our Republic until we admit that they were as much influenced by the Indian in peace as in war. And if Washington was educated by the Indian scalping knife and tomahawk on the frontier, Jefferson was educated by the peace pipe. Both men piled up words in the European manner to disguise their education.

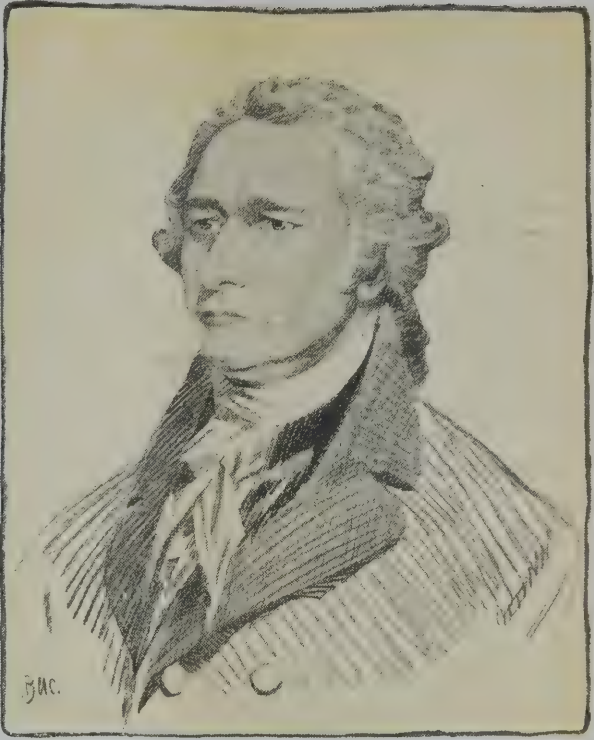
There is another Jeffersonian picture: the 'Sage of Monticello' at home, and a great host. We will set aside the word 'Sage,' and let someone else explain it. It was a mannerism of the time. But look at the man Jefferson, never busy and never idle, and as ingenious as Thomas Edison. His ingenuities are social rather than scientific. That is, he draws architectural plans; he invents a desk; he works out a curious dumb-waiter system; he evolves our coinage, which is all right now, of course, because we have it, though he proposed a thousand other ingenious schemes which are not all right because we don't have them yet, but they are, nevertheless, as matter-of-fact as our coinage. When he is in Europe, he collects like a botanist, a zoölogist, and a geologist; when he is President, through his influence, Lewis and Clark do the same in our Far West. It was his own private library, the most distinguished in America, which had enough old maps of all sorts and kinds to determine what the Louisiana Purchase was. And if it had not been for those maps and Jefferson's scholarly compilation of the same, we might not know what his Louisiana Purchase was, even yet. Aside from being a very big man, he was the busiest little bee not to buzz that can possibly be imagined. It ought to be an enormous satisfaction, a common bond with most of the readers of this article, to know that neither he nor George Washington could make a speech. Washington retired into a magnificent Gilbert Stuart silence; and Jefferson took his pen in hand. The general dexterity of which I have spoken, which is really the theme of this paragraph, was probably owing to the Randolph blood. It worked out, with the dignity and intricacy of a Japanese museum rather than with the tricks of the patent office. One side of Jefferson's doctrines might be:

'All men are ingenious when they have a chance, because I am.'

'All men are magnificently versatile when they have a chance, because I am.'

If we get tired of 'life, liberty, and the pursuit of happiness,' we might translate a tiny aspect of this phrase into Jeffersonian versatility. America has just begun to live up to this versatility. Once we almost invented ourselves into fits. But that was in the blacksmith's shop and patent office. Now every sport shop has a new trick way of doing something or other. So has every filling station and every John Dewey school. We are now applying to skyscrapers, landscape gardening, coast-to-coast highways, and things more and more bordering on the social rather than on the scientific life, the genius of Jefferson, and not that of Edison. We are just beginning to

Thousand Years



Hamilton's military genius was far beyond even his unquestioned financial genius.

graduate into the former's mellow type of Virginia versatility. We are becoming Randolphs.

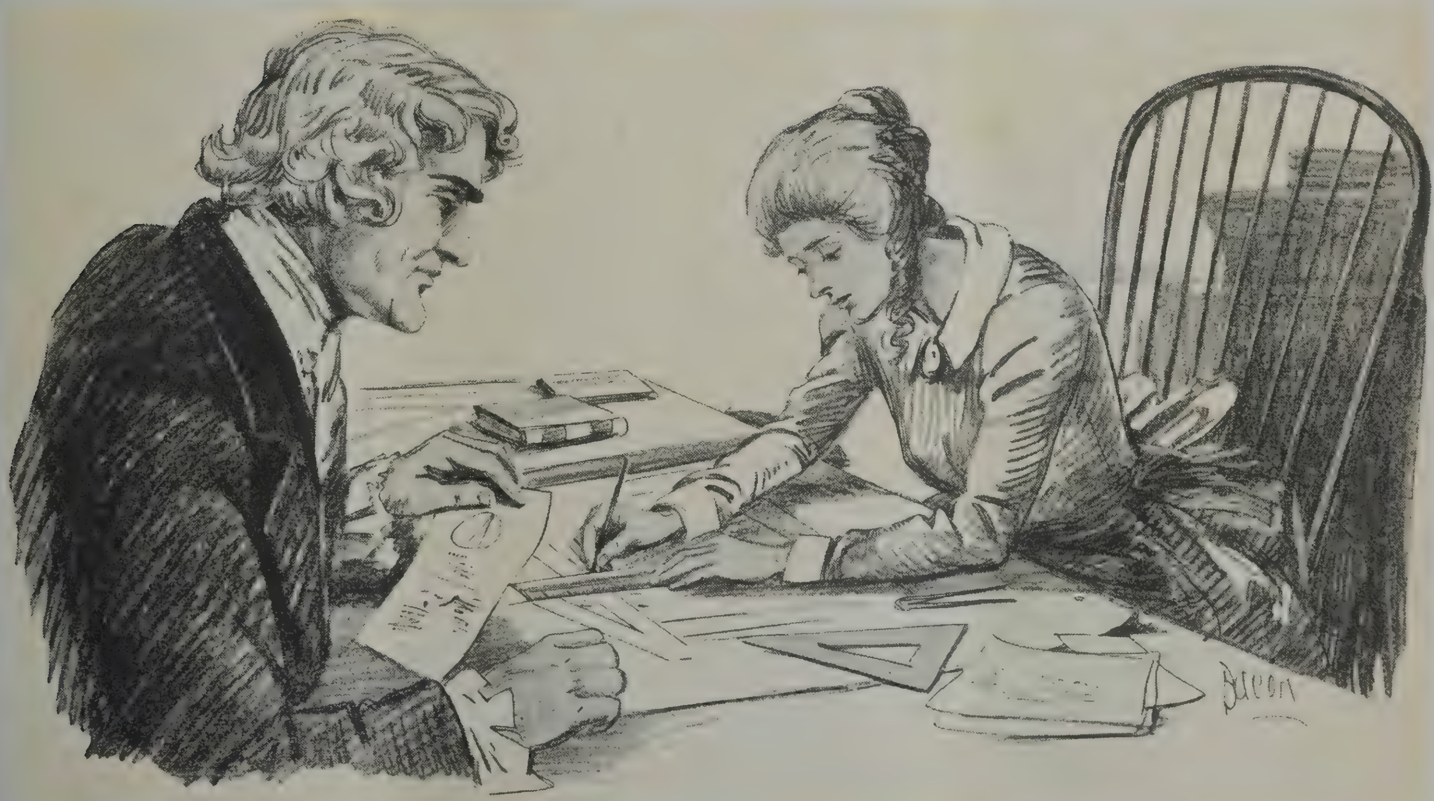
The knowledge that he had all these powers in himself had a great deal to do with Jefferson's buoyant faith in the powers of all men.

As a host at Monticello, every known variety of human experience was welcome, and was a source of courage to this eternal fighter for democracy. He is described over and over again as the perfect host. When he was flattered into ordering a bust of himself, he ordered one in the same fashion of his greatest political enemy, Alexander Hamilton; and they faced each other in the great room at Monticello. Moreover, Jefferson always spoke in terms of the greatest personal admiration for his most implacable political foe. He could be thus self-possessed because the issues of Jeffersonism are not political and are not settled on election day. They are social, and are settled on all other days.

Another picture of Thomas Jefferson is as an old man of eighty-three, lonely in Monticello, his work all behind him or a thousand years ahead, writing to his ancient Federalist foe, John Adams, ninety-one, his work also all done, or a thousand years ahead. Jefferson is the only man who has founded an intellectual dynasty in America; Adams, the only man who has founded a family.

Jefferson opens the correspondence with none of these thoughts in mind; Adams responds with equal innocence and with the most ardent friendship after lifetime battle; and it is about as salty a correspondence as one would wish to dip into. Here is this John Adams who was so vain, who was so chagrined over Jefferson's beating him in the presidential election, that he rode out of town without waiting for the inaugural ceremony, now writing to one who still represents an utterly alien mind. Both of them realize by this time how much the wind and tides, the sun, the stars, the air, and the four seasons count in human life, and both are willing to let old age speak to old age. Adams is ardent, voluble, writes many letters to Jefferson's one. Jefferson is still the amazing tactician, and avoids all points of controversy in conversation. His style is a miracle of violin music in its slightest note.

And so to the end of the drama. The two old men die on the same day, the Fourth of July; and are later eulogized by the famous Daniel Webster in his 'Adams and Jefferson Oration,' given in the presence of Continental soldiers as old as the G. A. R. soldiers of today.



With the help of his daughter Jefferson drew the plans for the buildings of the University of Virginia.

The dramatic quality of this correspondence at a time when Massachusetts and Virginia were as far apart as Tibet and Brazil are now cannot even be hinted at. It is worth a hundred plays and a hundred novels. Reading the correspondence converted me to testy, petulant, puffy old John Adams. And that is, in itself, a small miracle. The word 'Adams' always did make me nervous.

For our final scene, let us picture a Cabinet meeting at the height of Washington's first administration: The General is in the chair; and he sits in the chair not as though it were a throne but as though it were a magnificent white horse, the horse of a great general. Various members of the Cabinet are scattered about in appropriate steel-engraving attitudes. But at one end of the table stands Alexander Hamilton, and at the other stands Thomas Jefferson. Hamilton is Secretary of the Treasury; Jefferson, Secretary of State. Whatever one man says brings the other to his feet. The General, who could hold the British at bay, can scarcely keep these two men from an argument, though he looks his Gilbert Stuart best.

Now, my friends, you can think about this picture all you want to. If you are a Hamiltonian, you can say that Hamilton dominates the scene and furnishes the ideas. If you are a Jeffersonian, you can say that Jefferson dominates the scene and furnishes the ideas. I am not so much for ideas as some people I know; and I cannot avoid the impression that George Washington is in the chair. In a hundred years, men will attribute Jefferson's ideas to Washington, if they are Jeffersonians; and they will attribute Hamilton's ideas to Washington, if they are Hamiltonians. But the Capital of the Nation will be Washington, D. C., not Jefferson, D. C., nor Hamilton, D. C. It will take Thomas Jefferson a thousand years to get Hamilton out of that Cabinet; it will take Hamilton a thousand years to get Jefferson out of that Cabinet. Solve this puzzle your own way.

I was very much interested when a young English poet, Robert Nichols, in three successive years on American soil, tried to talk politics with me. I was amused to discover that every time I had answered him, 'Well, your position on that question depends on whether you are Hamiltonian or Jeffersonian,' his indignation knew no bounds. The idea of a free country being a slave to a conflict raised by two men, dead so long! Why should we not invoke newer heroes? Why should we not indulge in abstract philosophy? I suppose the answer is that Washington put these men into his Cabinet and could never get them out. He had caught two tartars.

The subject of this essay is 'Thomas Jefferson's Thousand Years.' Any who care may change it to 'Alexander Hamilton's Thousand Years.' But I think Washington was a better Jeffersonian than he understood or knew.

This Cabinet meeting with Hamilton and Jefferson present represents the statesmanship and the demigod quality of Washington, more than his last Federalist years. Your truly fanatical Hamiltonian much prefers to assume that Washington was always a dull and patient man on horseback; but think it through, my friends. Look at this magnificent Hamilton, a burning genius, with no Randolph for a mother, no Peter Jefferson for a father; with a pride like Milton's Satan, a pride that had to be self-consuming; with an instinctive military splendor that would have made him a Napoleon in Europe; with the same sense of adventure, and a much higher code of personal honor. This Hamilton who had to ride high till he died because the ground tortured his feet!

Washington made him into a private secretary during the Revolution, when he openly wanted a great command and was obviously fitted for one. Washington forced the account book upon him over and over when he demanded a sword in his hand. His military genius was far beyond his unquestioned financial genius. One of the first sights we have of him is as a young commander with the only well-equipped and well-drilled troops for miles around; a boy, trotting along beside a cannon, caressing it as though it were his mistress. He was a proud medieval adventurer of the highest type; Richard Coeur de Lion would have been glad of him.

At the end of his heartbreaking career, he threw the election to Jefferson rather than permit Burr to be president, because he considered Aaron Burr a rotter. He gave America to his lifetime foe, because he knew him to be a Randolph and a gentleman.

Washington, with this high-spirited creature under his arm all through the Revolution, did not let him rise to be a young Napoleon. As a result, the young Hamilton finally quit in a huff, and reappeared at the Siege of Yorktown in a spirit of consistency only.

This Hamilton became the old General's counselor during the last of the old General's rule; thought his thoughts for him more and more; and received from the old General everything except a military opportunity, the one desire of his life. Washington may not have been the paragon of wisdom described by some; but certainly his system gave no young Napoleons a chance. When it looked like a war with France the year before Washington's death, when his eye had dimmed and his natural force had abated, it was then and only then that he allowed Hamilton to slip into the place of actual supreme command, with Washington for nominal commander of the American forces. There is more in this battle between the psychology of Washington and that of Hamilton than meets the eye. We can be at peace with people all our lives, and yet at war with them. We can be their masters, and yet their slaves.

If Alexander Hamilton had been kept busy Indian fighting on the frontier instead of having a place in Washington's Cabinet, if he had had a great military instead of a great financial opportunity for his imperious genius, perhaps he would not have looked at Jefferson with so much wrath in this mystical Cabinet meeting, or found his ideas so infuriating. Perhaps the Federalist Party, a very useful instrument, would not have blown up so soon. But Washington kept these two men by him as long as he could and 'regretted' losing either. By the same method, Abraham Lincoln filled his Cabinet with his deadliest rivals for the Presidency, every one of whom wrote home to his wife that he was the only man who could save the Union. Be it said for Jefferson and Hamilton that they were not guilty of this type of confidential communication with their dearest ones; and on the whole, very little guilty of disrespect to General George Washington of Virginia.

Let me insist that I have brought the gallant figure of Hamilton into the discussion only because one cannot mention Jefferson without discussing Hamilton. I would leave his praise to those who can surrender to the task with more abandon.

This is, after all, a discussion of Thomas Jefferson's thousand years. I say, the debate will go on in this mystical symbolical George Washington Cabinet meeting for a thousand years. The General will always be in the chair; the two other gallant figures at each other with all the fury of high souls in wrath. Possibly the conclusion of good Americans should be that Washington must have been the Father of his Country, indeed, to have kept this argument under one roof. These two are not as Montague and Capulet, cutting throats in the street; nor yet as Guelph and Ghibelline.

For my part, I say that at the end of a thousand years Jefferson's ideas will prevail in the Washington Cabinet meeting. But Hamiltonians are surely entitled to vote the other way.

Meanwhile, I hear a boy's violin by the fireside at the old Raleigh Tavern, playing a backwoods' tune.

Switzerland

(Continued from page 9)

ica, the young gravitate to the cities. In the church services it is noticeable that elderly men and women and children are in the majority. Frutigen's unusual industrial advantages have kept some of the young women at home, but most of the enterprising young men are absent. The ambitious who are not bound by home ties go away—many to Paris, London, Rome, Florence or Milan; some to America.

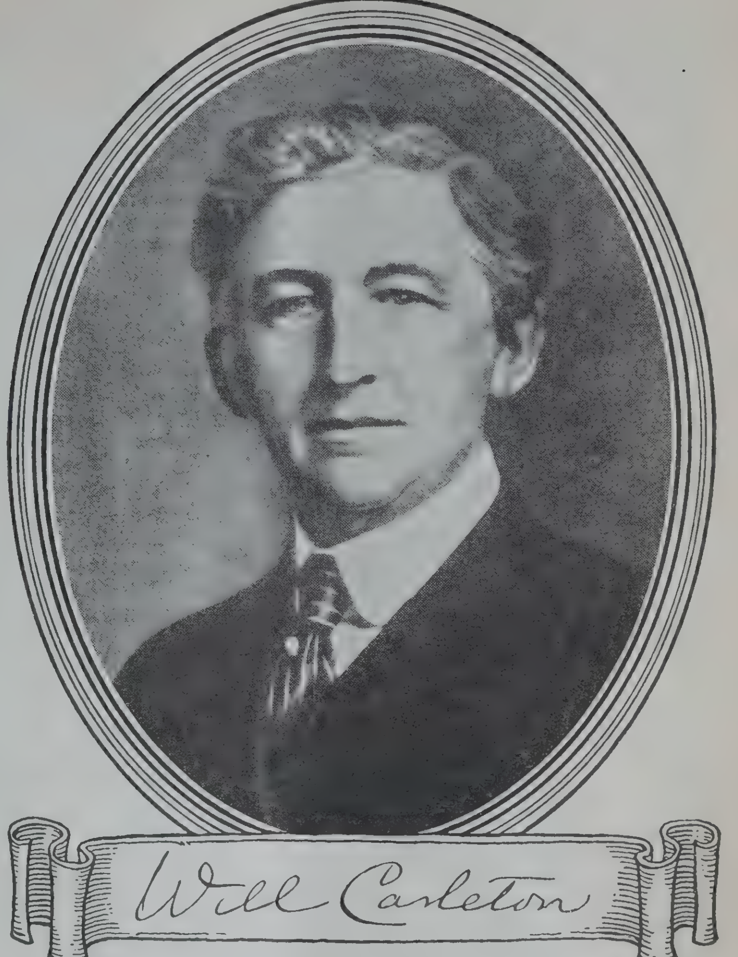
Frutigen might rightfully be called 'Pleasant Valley.' The name would be appropriate, religiously, socially, and industrially. There is but one church and one religion, with the exception of a modest brick Salvation Army barracks; no very rich or very poor; no labor unions and no commercial clubs.

As primitive as Frutigen is, it is nevertheless progressive. A mountain stream has been harnessed to furnish electricity for light, power and heat, and a mountain lake has been tapped for its water supply, public fountains being erected on every street. The water is also piped into houses which were built long before it was known what could be done with electricity as a labor-saving agent; and the cars that connect Frutigen with the outside world—one entrance into the valley being through the Simplon and Loetschberg tunnels and the other through Hondrich Tunnel, with Bern only a few miles away—are run by electrical power, doing away with smoke.

The Swiss are schooled to habits of simple living and industry. Being jealous of their independence, they mind their own business and do not interfere with what does not immediately concern them. As a rule they are thorough workmen, though the specializing of industry has crept in and reduced the number of all-round artisans. However, when a Swiss leaves his mountain valley to mingle with the world, he is giving up a great deal.

He SANG to the HEART

By N. L. VAN WEGEN



A SMALL boy listening wide-eyed to an imported lecturer in a southern Michigan village straightway determined that he would become a public speaker.

A young man not two years out of college, confronted with a phenomenal reception to a poem printed gratuitously in the Toledo *Blade*, thereupon decided that he would also make of himself a poet.

The episodes of the small boy and the young man are high lights in the life of Will Carleton, Michigan's ballad writer who became a lecturer and poet of international fame. The anniversary of his birth is celebrated yearly in the state on 'Carleton Day,' October 21.

When the small boy got back to his farm home, he proceeded to address emotional opinions on divers subjects to the cattle, the sheep, and the horses; persisting in his oratorical efforts even though his father opined that he was 'spoiling a tolerably good farmer to become an intolerably bad orator'—to borrow the words of the son in later years.

Once when asked where his boy was, the unsympathetic but observing father is said to have replied, 'Oh! Will is probably in some apple tree writing an oration to deliver to the horses this evening.'

The young man, finding himself famous overnight as the author of 'Betsy and I Are Out,' a poem depicting the marital difficulties of a couple who, after living together happily for most of their lives, had agreed to disagree, promptly turned to the writing of colloquial verse.

He did not, however, abandon his liking for the platform. Instead he combined the two vocations, added several journalistic ventures, and for more than forty years traveled up and down the land, in Canada and through Europe, giving lectures and interpretative readings of his ballads to audiences ranging from newsboys to notables.

His emotional intensity, his searching insight into Middle West rural character, and his ability to alternate real humor and pathos, made these offerings deservedly popular.

A recital at the Nottingham Institute in England was reported by the *Guardian*, which had this to say:

'It was a strange and interesting effort, a poetical monologue, judiciously interspersed with delightful recitations of beautiful poems, which went straight to the heart. Jest and earnest, gayety and gravity, were deeply interwoven; laughter and tears alternated for the mastery, people being compelled to laugh through their tears and cry in the midst of their laughter.'

As a reciter for 'Moody's Ragamuffins,' Chicago street urchins who were gathered in large groups by Dwight L. Moody in the first flush of his great evangelical work, Carleton is said to have so completely captivated the boys that they would accept no one else of an evening—urging him on until, becoming exhausted, he would escape through a side door.

'Over the Hill to the Poorhouse,' the above-mentioned 'Betsy and I Are Out,' 'The First Settler's Story,' 'Gone With a Handsomer Man,' 'The New Church Organ,' 'Out of the Old House, Nancy,' 'Uncle Sammy,' and a score more of his more popular ballads, are literally the poetic element extracted from the most ordinary things and treated in such a manner that it reaches all audiences.

Will was christened 'William McKendree' Carleton. His birthplace was a farm two miles east of the village of Hudson, Lenawee County, Michigan, near the southern boundary of the state. His parents, John Hancock and Celestia E. Smith Carleton, were pioneer settlers, having located upon the uncleared land, ten years before the year of his birth, 1845.

Will Carleton passed his earliest years in the plainest of rural surroundings. The youngest of a family of brothers and sisters, he was frail, sensitive, and dreamy.

In later years he liked to tell an anecdote of himself which affords a glimpse of his boyhood.

Carleton had gone to the fair grounds of a neighboring town to hear Cassius M. Clay, the Kentuckian, make a speech, but found so large a crowd that he could see nothing of the eloquent Southerner. Crawling between people's feet he came to a tree not far from the stand and climbed up to a branch upon which he perched well satisfied.

All went well until the orator, to illustrate the ignorance of his political opponents, cried out with an emphatic gesture, 'They don't know any more about it than that boy there in the tree.' A thousand eyes were at once focused upon the bashful youth.

'The sensation,' said Carleton, in telling the story years later, 'was very much as if some ice water were being poured down my back. I tried to conceal myself among the branches but that would not work, and I was not long in shinning down and making myself scarce. At home I had no sympathy; they told me I should have stayed and fought it out.'

James O'Donnell Bennett, reporting in the Chicago *Record-Herald* of Monday, October 28, 1907, the 'home-coming' of Will Carleton after years spent in the East, affords an excellent picture of Carleton's first school and home, and the esteem in which he was held by the neighborhood:

'It is a striking thing that a farming region for a radius of fifty miles should pour out its plowmen and parsons, school children and its shopkeepers to honor the man who had taught them that there was poetry in every aspect of their practical lives and the sedate landscape.

'Half a mile down the highway from the Carleton farm stands the stocky, boxlike little white schoolhouse where the poet learned his three "R's." They call it now the "Carleton School," and a portrait of him hangs on the walls along with one of the President. A flag fluttered in the doorway. Great sprays of asparagus and red berries were the interior decorations.

'To this one-story, one-room structure, which stands in a lonely place at the intersection of the roads, the pilgrims repaired at nine o'clock.

'In accordance with ancient district

school tradition the room was insufferably hot, a sheet-iron stove working overtime in the center aisle. On the blackboard in the round, correct hand of the teacher were chalked these words:

"Boys flying kites haul in their white-winged birds;
You can't do that way when you're flying words.
Thoughts unexpressed may sometimes fall back dead,
But God Himself can't kill them when they're said."

'The lines were signed "Carleton."

'There was much speech making at the schoolhouse, which was packed with old friends, who were called upon as if they were still school children. Mr. Carleton, when he mounted the chair, addressed the assemblage as follows:

'"Fellow Pupils, and Schoolmaster and Boys and Girls—I look around this room and I pick out the places where I used to sit: sometimes it was over by that window, sometimes there, sometimes, I grieve to say, on the floor when I had been bad and was caught at it. In a general way, I may say that I sought the best place and then held it down as long as I could. I have been trying to do that in life ever since."

'He told how he had been larruped by the schoolmaster when he was detected writing a combination of epigram and epitaph that should embalm the failings of that long-gone pedagogue, and he insisted that he never would have been caught if the rime had not stumped him in the last measure and caused a fatal delay. A baby began to cry lustily while he was speaking and there were ominous whispers from some of the committeemen: "That kid was named after me. Don't put him out. I can talk louder than he can. It's all right."

'Then he spoke of the old days and he thought they were good, "but these are better," he said; "we must not fondle the past too much. We want to go forward. Look ahead. You'll be happier for it. Keep on the pilot of the engine if you can."

'Then he recited that rich, racy old poem of his, "The Schoolmaster's Guests," and after that the pilgrims trooped down the highway to the homestead, where there were more speeches, great handshaking, and album signing, and good old-fashioned visits, and the singing of "My country, 'tis of thee."

'Thus was the poet of the farm crowned by the people of Michigan with the maple leaves of gold and scarlet that he loves. They did it because he has added something to the body of poetry that all the world knows and has committed to the heart of memory.'

THE Carleton homestead was then a trim white two-story dwelling with one ell. The latter covered the site of the original Carleton home—a log house of one story and one room.

After completing the course of the district school, Will walked five miles a day to attend a graded school at West Hudson. This was in 1861. Although at the time he was literally absorbing all the books within his reach, the actions of folk had a more lasting effect. This was true throughout his life. He built his ballads upon the little everyday happenings of those around him.

'Betsy and I Are Out' was based on data he collected while reporting a divorce suit in a country court room for a local paper. 'Over the Hill to the Poorhouse' was inspired when he talked with the inmates of a county home for the destitute near Hillsdale. 'The First Settler's Story' was largely taken from incidents in the lives of his father and his mother while they were clearing their lands.

He was often required to leave school to assist his father on the farm. And when, in 1862, he matriculated at Hillsdale College, he augmented his finances by writing carriers' addresses for neighboring journals, contributing to local newspapers, composing music for country brass bands, teaching in district schools, and, toward the last, reading his poems to small audiences in nearby towns.

Huge posters, printed with a paintbrush by himself on the back of a cheap grade of wall paper and posted on prominent corners, announced Carleton's first reading. The handful of hearers who attended his initial performance are said to have remained near the door in order to step out quietly if the reading proved uninteresting. Instead, they not only remained but suggested at the close of the recital that the young entertainer repeat his readings the following evening in church, which he did.

When he was graduated, as class poet, he read at commencement a poem entitled 'Rifts in the Cloud,' which so affected the college president, 'usually a self-contained, undemonstrative man,' that he rose quickly from his chair, grasped a bouquet of flowers, and enthusiastically threw it at the descending student.

Out of college, Carleton spent the summer and fall as a writer at twelve dollars a week with *The Western Rural*, an illustrated agricultural and family magazine published in Chicago. Here he gained experience sufficient to return to Hillsdale to become editor and part owner of the *Standard*.

This he gave up to assume charge of the Detroit *Weekly Tribune*.

As his duties on the *Tribune* occupied only about two days of the week, Carleton continued his lectures and writing, building up a local reputation that shortly after leaving the paper—in about a year—enabled him to receive from his lecture-recitals seventy-five to a hundred dollars an entertainment. As he averaged five nights a week with the latter, and in addition conducted a book and news store in Hillsdale under another name, and published a small volume of his poems which sold readily, his income soon grew to considerable proportions.

He wrote 'Betsy and I Are Out' less than two years after leaving college. From having a wide local reputation, he became known almost overnight from coast to coast. Publishers fought for his verses, which he supplied principally to *Harper's Weekly*, laying plans in the meantime to undertake the publication of a literary monthly at Detroit. The panic of 1873 seems to have shattered his plans.

Carleton's first trip East to confer with his publishers was made in 1872. He visited cities and historical shrines, and met the *litterateurs* of New York, including Mark Twain and John Hay. He returned, enthusiastic over the reception given him, and over the favorable outlook for his prospective book, *Farm Ballads*.

Farm Ballads was published the next spring, the sales passing fifty thousand within a year. Carleton lived in Hillsdale for about five years, though much of his time was occupied in travel, in fulfilling lecture engagements, and in meeting celebrities such as Tom Nast, Walt Whitman, Whittier, and others. Little journeys to literary and historical shrines in the United States and abroad were a passion with him.

Becoming convinced that Boston offered inducements, Carleton settled, with his mother, in that city. There, as he said, he was to 'lecture about half the time, and live the other half with books and opportunities.' With the exception of a few short home-comings, he never returned to Michigan.

CARLETON subsequently moved to Brooklyn, New York, which was his home for the rest of his life. In the same year—1882—he was married.

Leading the simple, busy life of lecturing, writing, and traveling, Carleton toured Europe, giving lecture-recitals in the British Isles.

He issued three volumes of verse, and founded the magazine *Everywhere*, which he had contemplated back in the early seventies. It was devoted to poems, short stories, and timely topics, and was successful while Carleton held control—until his death eighteen years later. The editor was its chief contributor, although the best writers were regularly featured.

The last years of Carleton's life were perhaps as full of work as any of his career. After his wife's death in 1904, Carleton settled into a routine comparable to that of Mark Twain's. His mornings, unless he was on a lecture tour, were spent in his study, provided he felt inclined to rise at all in the forenoon. He did much of his writing in bed. The afternoons would be given over to business details at his New York office or printing establishment. In the evenings he would read, receive friends, or fulfill engagements.

Of his work *In Old School Days*, written in 1908, Hudson Maxim said in a letter to the poet: 'Shall I say that the "Old School Days" have come to hand, or that they have returned. It is one of the best things you ever did—one of the best things anybody ever did.'

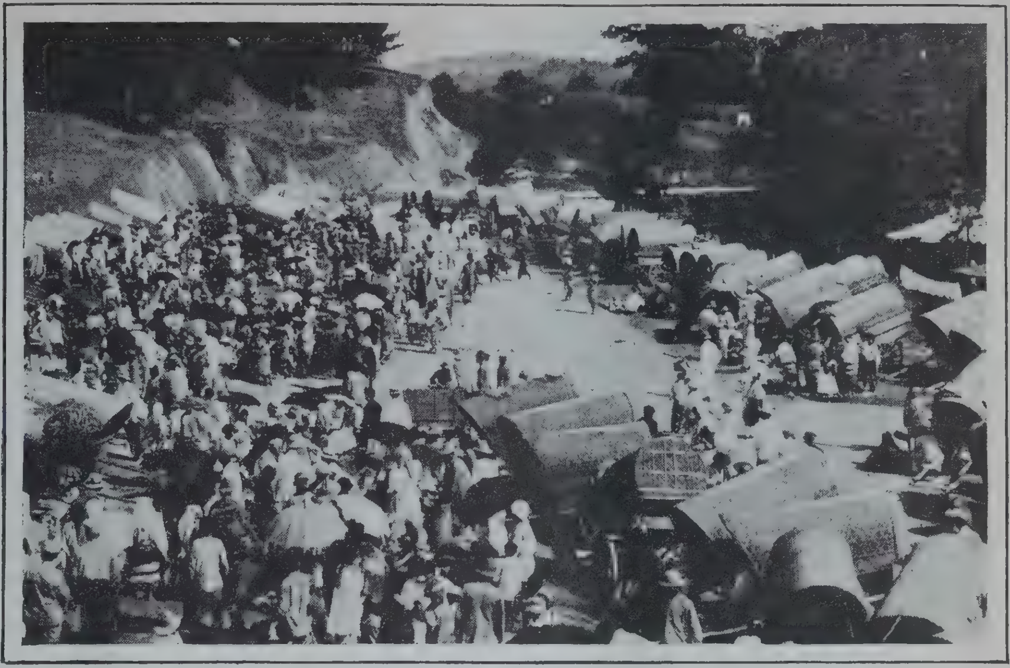
In the same year Moffat, Yard and Company published *Drifted In*, a book replete with quaint philosophy, wit, and sentiment. Four years later *A Thousand Thoughts* was published by the Everywhere Publishing Company, of which Carleton was president and treasurer. This was the last volume of his poems.

Carleton started on an extensive lecture tour early in December, 1912. He was taken ill with bronchitis but refused to abandon his trip. Growing worse, he was persuaded to return to his home, but refused to remain in bed. Pneumonia presently set in, and on December 18 he fell into a coma and entered upon his last sleep.

The self-sufficiency with which Will Carleton carried on his various enterprises dominated his whole career. While he sustained griefs which penetrated to the very roots of his being, there were few outward signs of depression. Success came early. He never peddled his poetical wares; nor did he need to cultivate the lecture field. His work was conducted in a businesslike way like that of a successful merchant. He even went so far on one occasion as to send gratis a poem for which he could not get his price, giving as his reason, 'I don't feel that I can turn my soul wrong side out and pound it for a month for less than an even half-hundred.'

A Visit to a DOG MARKET

By WILLIAM L. STIDGER



A bustling scene at the market in Baguio, Philippine Islands.

ONE Saturday evening as we were driving outside Baguio in the Philippines, we suddenly came upon a pack of yelping, barking dogs held on the end of bamboo sticks in lieu of ropes. They were accompanied by naked Igorrotes. 'What is this, a dog convention?' I asked.

'No, those are dog salesmen who have gone down into the lowlands and bought up sick, lean, and cast-off animals. They bring them up here on Saturday, keep them all night under the trees as you see, and then sell them at the dog market Sunday morning.'

They were a humble lot. I went in and out among them with caution, but soon found that they didn't have enough pep to seize a piece of meat.

'They look half-starved,' I said.

'They *are* starved—that's the system. They are starved for several days, so that they will have voracious appetites. Then the Igorrotes buy them, take them home, and feed them rice. Then the Igorrotes kill them and roast them over a big fire.'

'At what time is the dog market?'

'About daybreak. The most interesting part is over by eight o'clock. The bargaining and haggling over the leaner dogs is at an end by then.'

The problem from then on was that of getting up in time for the dog market. But Betty, who is seven years old, had another problem that worried her. Her problem was how she might save at least one of those dogs from being eaten.

The Igorrote prince who scorned the author's money at the dog market.

Some of the dogs offered for sale.

'Just buy me one poor little dog, daddy. If you'll buy me one, we'll take him home and he won't get eaten up.'

All of Saturday evening, after hearing the story of the dog market and the dog feast, she cried. She didn't want us to go to the market . . . she couldn't eat for thinking about those poor dogs!

Finally day came and we found ourselves in a strange setting. The sun was just rising. The market place was crowded with naked Igorrotes, their bronze bodies glistening in the early light. The yelps and cries of hungry, starving dogs rent the quiet of that beautiful Easter morning.

The crowd itself was intensely interesting. In the dark hours, files of Igorrotes had been slowly winding their way over mountain trails to the dog market. Their naked bodies, clad only in blankets thrown over their shoulders, had shivered in the cold. Groups had come from as far as twenty-five miles away.

Bronzed girls, naked to their waists, with brass bracelets on arms and necks, and with a certain shyness about being photographed, sauntered lazily and gracefully about among the tied, barking dogs. They were looking them over, with watering mouths no doubt, anticipating the dog feast of the next day back in the mountains.

Then I found a naked boy who looked as though he might be the last human being on earth. There was all the lostness of a lost tribe in his face. He was afraid. He didn't want me to take his picture. But the sight of money took away his fear and I snapped him. Then I saw a big chieftain with a beautiful body, his waist like a young girl's, his shoulders as broad as a prize fighter's, bulging with beautiful muscles of copper brown. I think that I have never seen a more splendidly beautiful body. When he moved, his muscles flowed like water over brown stones. His skin glistened in the early sun like the leaves of a maple tree in autumn. There was an erectness about his posture that marked him Chief.

His headdress was simple and dignified. His bolo was in his 'G string.' Outside that and his beautiful silver earrings, he wore nothing. He looked out over that throng of naked Igorrotes as if he held the allegiance of them all. He was the king that he looked, his every gesture princely.

I was not surprised, therefore, when I offered him money for posing for a picture to have him refuse it with quiet scorn. I was ashamed in his presence for my mistake!

After a time Americans began to arrive,

dressed in immaculate white. Army officers with their wives from Camp John Hay—missionaries, teachers, business men, white children; and they contrasted strangely with the brown-bodied children of the natives who gathered in curious throngs to see the white people.

A row of covered carts stood at rest. They looked like our old prairie schooners. The *carabao* had pulled them in with market produce from the mountains.

Abject-looking human beings sat for hours without moving even to dislodge the flies. Crimson, gold and yellow G strings with a certain artistic touch splashed color here and there against brown bodies. Brass, gold, and silver ornaments flashed from the full breasts of women and from their unbound hair, black as midnight, which flowed to their feet as they walked.

The sound of bamboo pipes against their bare arms, combined with the nose pipes also made of bamboo, sent forth a really beautiful music in the morning air.

But back of it all—back of the color, back of the music; back of the squatting, bargaining groups of naked men and women; back of the splashes of color in the closely woven G strings of the men; back of the gold, silver and brass ornaments of the women; back of the earrings in the ears of men and women alike; back of the sprinkling of white men and women—back of it all, howled the dogs that were being sold.

The Forest of Arden

(*Continued from page 4*)

the castle and went tramping through the woods. All at once, a figure in black barred his way—it was the Devil. The Evil One offered him his every wish, and Baron Henry told him that if he could have the power of leading his men against his father's enemies, he was willing to give anything that the Devil asked. It was so agreed, and Henry won many victories on the field, to the honor of his family.

One day while he was gone, his sister disappeared, and no trace could be found of her. Henry at once went and reproached the Evil One, only to find that he had taken her as the payment. In a rage, when he saw an apparition of his sister in the distance, he attacked the Devil but had not struck a blow before he was himself felled.

The next day his servants found his dead body by the side of a murmuring fountain—the last of the barons of La Roche. It is said that the spirit of the dead sister can still be seen at times, floating in the vicinity of the castle and the fountain, but there was no one left to care for the castle and it gradually fell into the ruin that it is today.

All of the castles of the Ardennes are not total ruins, however, the one of Veve-Celles being a notable exception. It stands not far from Dinant, and we were told that it was always so unlucky a place that the last owner suddenly left it, and never returned. It is in a terrible state of disorder, but could be repaired without much trouble. Ancient hangings may still be seen; tattered books cover the floor of the library, and a few faded pictures hang on the walls. It gives the visitor a very good idea of the interior of an old castle, certainly much better than most of the ruins that we had seen throughout Europe, and still is impressive.

The Lost Colony of Roanoke

(*Continued from page 7*)

interested in these people and he began to study them. As he came closer to them and their history, so far as it was known, he became convinced that in them at last was found the solution of the mystery of the Lost Colony. In 1885, through his efforts, the General Assembly of North Carolina recognized the unique character of these Indians and, giving them the name of Croatans, authorized separate schools for them and prohibited their intermarriage with Negroes. Still later they were given legally the name 'Cherokees of Robeson County.' Two years later Mr. McMillan published a pamphlet containing the results of his investigations and his theory of the origin of the Croatans has been generally accepted. All later investigations have tended to strengthen the belief that here is the Lost Colony of Roanoke.

WHEN the whites first came in contact with the Croatans they found them friendly and hospitable. They spoke and continue to use remarkably good English, which bears little resemblance to the speech of the whites and Negroes with whom they were thrown. *Not a single Indian word or name was in use among them.* In their common speech were preserved forms now out of use but common in Elizabethan England.

Remarkable as their speech is, a more striking proof of their origin is to be found in the names existing among them. Thanks to John White's account of the Roanoke colony, we know the names of all those who were lost.

They were:

Mr. McMillan found among the Croatans in 1885 every name which is in italics. It will be noted that of the ninety-five different surnames, forty-one, including the names Dare (changed to Darr, Durr, or Dorr), Stevens, Sampson, Harvie, Cages, Willis, Viccars, Berry, Chapman, Lasie, and Cheven, none of them common in that part of North Carolina, are preserved among them, and that in six cases there is the reappearance of the full name. In addition nearly all the Christian names in the list were to be found among them.

They believed firmly that their ancestors came from 'Roanoke in Virginia.' By Virginia, it was discovered, they meant eastern North Carolina which was of course the original Virginia. They were familiar with the name 'Croatan' only as the old home of their people. Roanoke meant pretty much all of the North Carolina coast from Kitty Hawk to Beaufort, including Dare, Tyrrell, Hyde, Craven, Carteret, and Jones counties. They were familiar, too, with the story of Virginia Dare, with the change of the name to Darr, or Dorr. All were familiar with the fact that their chief man had once been made 'Lord of Roanoke.' This identifies them with the Hatteras Indians since Manteo, or chief of the latter, had been given that title by the early settlers. So, whenever the Croatans gave themselves any distinctive name they called themselves 'Hattoras.'

A visitor or stranger is always addressed as *mon*. They say *whing* for wing, *hit* for it, *ax* for ask, *lovend* for loving, *mension* for measurement or size, *hosen* for hose, *housen* for houses, *knowledge* for wit. *Crone*

is to push down. They regularly call cow *cyow,* cart *cyart,* card *cyard,* girl *gyirl,* kind *kyind,* father *fayther,* James *Jeams.*

Among them are to be found numerous Indian traits. They love bright colors, particularly reds, pinks, greens, and various plaids.

They are apt still to walk in Indian file. They generally prefer to live apart from other people and off the road. They never forget an enemy or a friend, and are scrupulous about the payment of every debt. Whisky has had upon them the blighting effect which it has exerted upon Indians generally, and under its influence, or when otherwise aroused, the Croatan can be as deadly as any Apache or Sioux.

Against all this, in contrast with Indians generally, they are notably clean, their houses being kept scrubbed and spotless and their yards neat and in good order. They are fond of flowers, those of bright colors usually being found in great profusion about their homes. They are quick-witted, thrifty, industrious, and ambitious for education.

They are religious and have many churches divided about evenly between the Baptists and Methodists. In their social relations they do not resemble other Indians and in the memory of man have had no tribal organization.

Normally they are law-abiding and from their first contact with the whites they displayed an understanding of white men's law and white men's justice which has always been lacking among either Indians or Negroes in the mass.

FROM the close of the Revolution until 1835 these Indians had the right to vote and practised it. The constitution of 1835, however, disfranchised 'free persons of color,' and this was so interpreted as to include the Indians. As a result, in the course of time, they came to be regarded as mulattoes.

For a Croatan there is no more deadly insult than to call him a Negro and, deeply offended, he had less and less to do with his white neighbors. In 1868 they were reënfranchised, but they were left without opportunity of education since they were excluded from the white schools and would not attend those for Negroes.

During the period after the Revolution, as the tribe increased in number, emigrations occurred. Some, in whom the characteristics of the whites predominated, went to the mountains of western North Carolina where they passed as white people.

A darker group were probably the progenitors of the Melangeons of Hancock County, Tennessee.

Others still moved down the Pee Dee River in South Carolina. A considerable group went north, some reaching Canada, and others joining an Indian tribe on the shores of Lake Michigan. A small group went to Ohio.

In 1913 the Croatans in North Carolina numbered between six and seven thousand, nearly all of them living in Robeson County. Pembroke, where the Croatan Normal School is situated, is in the center of their settlement. They deserve more attention than they have received and a greater opportunity for education and advancement.

The Discovery of Alta California

(*Continued from page 2*)

Inner garden of San Luis Rey Mission, near San Diego.

relief ship *Jose* which was sent out later from Mexico by De Glavez and never heard from, Portola made the long journey back to San Diego by land. Reaching there only half-alive he found the colony in a deplorable condition. He decided to abandon the project and have all return to Mexico.

BUT right there Portola came up against the zealous immovableness of Junipero Serra, which characterized that padre's relations with later California governors and became the basis of the great temporal success of the missions.

Two weeks after the colonizing expedition reached San Diego, the first California mission had been founded by Father Junipero, July 16, 1769. In January following, when Governor Portola returned from his unsuccessful search for the Bay of Monterey, and ordered the retreat to Mexico, Junipero Serra violently objected. He was not of the caliber that ever turns back! Portola was equally obdurate and set March 20 as the day of the return unless a relief ship came to their assistance.

Since every human means had failed, Father Junipero sought a spiritual. With the other padres he prayed fervently for a sail to appear. Weeks passed and there was no answer. When their eyes swept the horizon on the morning of March 19 no gleam of white caught the rays of the rising sun. But on the eve of that last day the sail of the *San Antonio* was sighted. She had been forced to return to replace an anchor lost in the Santa Barbara Channel—forced to return, no doubt, by the hand of Providence to secure California for her brilliant future!

So the colony remained and Portola, showing that he possessed the right metal after all, traveled again by land in another attempt to find Monterey Bay, while Junipero sailed on the *San Antonio* for the same port.

This time the quest was not in vain and on June 3, 1770, Junipero Serra founded, on the shores of the bay, the second California mission, San Carlos, at Carmel, which was always so dear to him.

Junipero Serra founded nine of the twenty-one missions, toiling for fifteen years in a crude, new country to lift half-barbarous men to a semblance of civilization. When he was more than seventy years old he made the long trip from Monterey to San Diego on foot, visited all the missions—set a day's foot journey apart—and stopped to shed his benign cheer at many of the Indian villages.

Who more worthy to walk along El Camino Real than this venerable padre, lost in love for that dusky, primitive race!

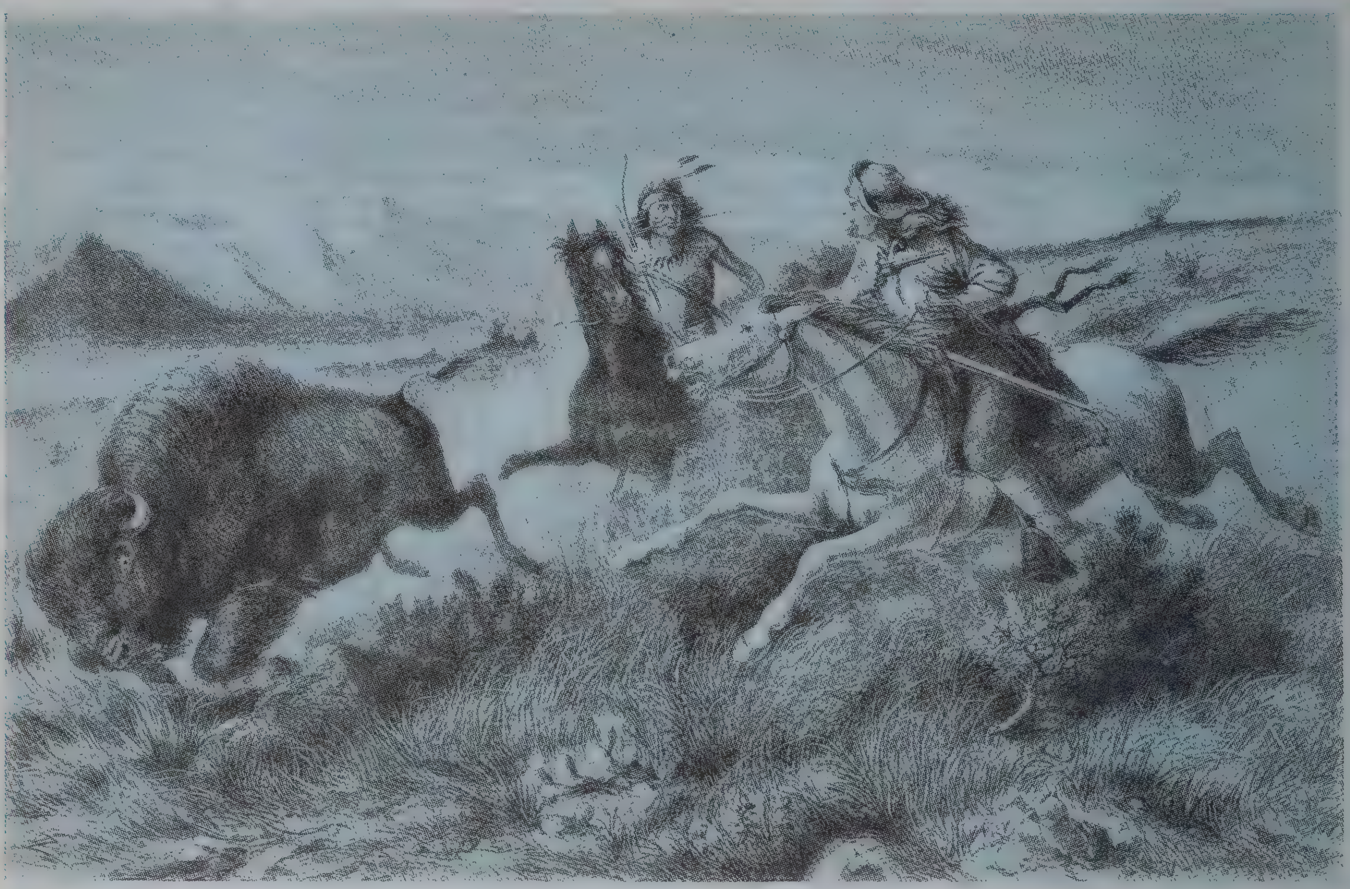
In Monterey, 1783, his labors ceased, and the 'significance of his work lies in the fact that the Indians loved him.' His tomb is in the sanctuary that he loved, San Carlos.

The founding, growth and decline of the California missions mark a unique historical episode. During a period of fifty-four years twenty-one missions were established, reaching from San Diego north six hundred miles to Sonoma County.

The padres wisely based the civilization of a savage race upon industrial education. The missions became great industrial centers where Indian women were taught to spin, weave, sew, cook, et cetera, and were decently married. The men were taught to grow grains and fruit on the wide mission lands; to herd horses, cattle and sheep over the great ranges; and they learned every trade from the making of adobe bricks and tile to the construction of the missions whose picturesque ruins remain a monument to those simple, primitive people who had never worked—to their valiant effort to rise out of savagery into a degree of civilization. A monument, also, to the self-sacrificing zeal of those pioneer padres who, through their hard and patient work as well as the great amount of labor at their command, created the mission wealth.

San Luis Rey in San Diego County, called the 'King of the Missions,' had several thousand baptized Indians, 24,000 head of cattle, 10,000 horses, 100,000 sheep, and harvested 14,000 bushels of grain annually.

(*This is the first of a series of articles on this subject. The next will follow in an early issue.*)



MANIFEST DESTINY. —After a picture by W. M. Cary in *Aldine Magazine*, 1871.

HUNTING the BUFFALO

By WILLIAM A. SIMONDS

FOUR days on the Platte, and yet no buffalo! Francis Parkman, traveling westward from St. Louis in 1846, thus wrote in his notebook as he wondered what had become of the herds of the preceding year. Wolves were plentiful; he was able to take pot shots at them from his pony as he rode along the trail; but nary a buffalo was to be had.

Came the fifth day. Parkman and his friend, Henry Chatillon, were making their way up a small ravine. Suddenly, outlined against the farthest hill, they saw a long procession of buffalo walking in Indian file, slow and stately and wholly unaware of a white man's presence. Chatillon shot two.

And now young Parkman came upon another interesting spectacle of the prairie country. He saw moored in the river eleven boats which were laden with buffalo and beaver skins. They were taking the *bourgeois* down from Fort Laramie with the products of the winter's trading. Already en route a full month, the party needed to make full speed because the river was daily growing more shallow.

This warning was proved worth while when Parkman and his companions came to the South Fork, the usual fording place. His notes indicate that although the stream was sprawled over half a mile at this point, it was only eighteen inches deep and consisted mostly of sand bars.

On June 7 an entry appeared in his diary:

'Four men are missing; R., Sorel and two emigrants. They set out this morning after buffalo, and have not yet made their appearance; whether killed or lost, we cannot tell.'

A council was called immediately among the other emigrants, and one or two declared they had seen Indians crawling like wolves, dogging the footsteps of the missing quartet along the ridges of the hills. But on the next day, when the wanderers returned, they reported no sign of the much-feared redskins, only 'millions of buffalo.'

Those who stalked the bison in that day had two methods—Parkman called one 'running,' the other 'approaching.' The method of hunting called 'running,' he explained, consisted of attacking the buffalo from horseback and shooting it with bullets or arrows when at full speed. In 'approaching,' the hunter concealed himself and crawled on the ground toward the game or lay in wait to kill it.

Another method of pursuing the shaggy brutes was described in *Harper*, January, 1869, thus:

'A few months since, passengers on the way to Denver and Salt Lake by the Smoky Hill route had frequent opportunities of seeing herds of buffalo from the cars of the Union Pacific railroad; and on several occasions the buffalo were sufficiently close to the trains to be killed by shots from the car windows and platforms; the engineer being accommodating enough to slow the locomotive sufficiently to keep pace with the buffalo, which were seemingly engaged in a race with the iron horse. 'When buffalo were killed the train was stopped, the game secured being granted a free ride in the baggage car. It would seem to be hardly possible to imagine a more novel sight than a small band of buffalo loping along within a few hundred feet of a railroad train in rapid motion, while the passengers are engaged in shooting, from every available window, with rifles, carbines and revolvers. An American scene, certainly!'

Some of the indications that the buffalo were disappearing were enumerated by this writer as follows: 'The Indians tell you that the herds are less numerous; the "rancher" vouches for the same fact; the trader has raised the price of the robe; and many of the eastern trails are "mossed over" from disuse. The Indians and buffaloes are moved about as far west as they can well go.

'If you hunt buffalo you must consider the fact that you are in the "Indian country"; and it is a well-known fact that our aboriginal nomad will kill his white brother if the opportunity offered is a good one. So don't venture too far from the government post or the ranch without a sufficient escort to fight if need be . . . Don't tempt him too far, for the flesh is weak and the red baby must be made familiar with the different varieties of hair—and blonde tresses are highly prized among the tepees.'

Although the buffalo possesses both size and strength, one wonders if the earlier Parkman was not overenthusiastic when he described the bull as the most ugly and ferocious of *all* beasts in aspect.

'At first sight of him, every feeling of sympathy vanishes,' declared that writer. 'No man who has not experienced it can understand with what keen relish one inflicts the death wound, with what profound contentment of mind he beholds its fall. The cows,' he added, 'are much smaller and of a gentler appearance as becomes their sex . . . Against the bulls we waged unrelenting war. Thousands of them might be slaughtered without causing any detriment to the species.'

It was at the water holes that the bulls were downed—these places affording a method described as easiest and laziest. In one of his interesting experiences Parkman encountered a great herd of the roaming beasts, 'a heavy, dark column stretching to the right and left as far as I could see.'

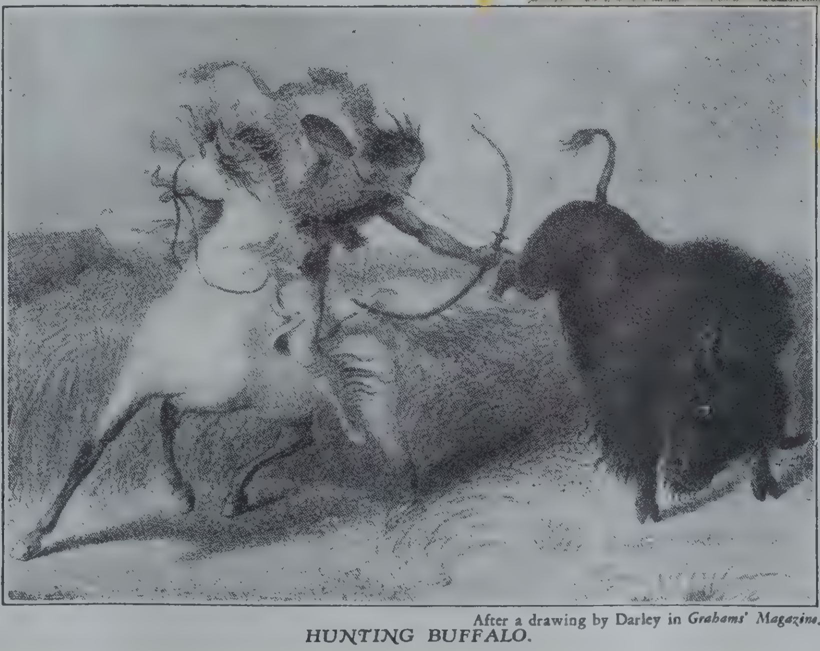
His approach did not alarm them in the least; they were mostly cows and calves, with bulls ranging along the flanks. As he walked toward the column, the bulls turned and glared at him with such 'a shaggy and ferocious look that I thought it best to proceed no farther.' The party shot five bulls before the rest trotted away.

Some of the perils of the buffalo hunt, as chronicled by the writers of seventy-five years ago, seem ludicrous when compared with the dangers of big-game hunting in the present day.

One writer in *Harper* warns the sportsman that it must not be supposed 'he can ride directly into a herd of buffalo without danger.'

'In the excitement,' this writer goes on to say, 'the horse may stumble and fall; or as is frequently the case, you may, before you are aware, ride into a dog village, and the wide, deep holes that are to be seen in almost every square yard are traps that it is impossible to avoid entirely.

'The buffalo, too, is sometimes known to turn with a surprising quickness of movement; and then, too, you must bear in mind the fact that the wounded bull is not as safe a companion as you might select if you had a choice.'



After a drawing by Darley in *Grahams' Magazine*.
HUNTING BUFFALO.

On another occasion, when Parkman was sojourning among the Indians not far from the Black Hills, he participated in a 'hunt' staged by the natives. They ascertained the location of the herd by querying a cricket, called by the Indians 'they-who-point-out-the-buffalo.' This insect was picked up by one of the Indians, held between fingers and thumb, and respectfully asked:

'Tell us, father, where we must go tomorrow to find the buffalo.'

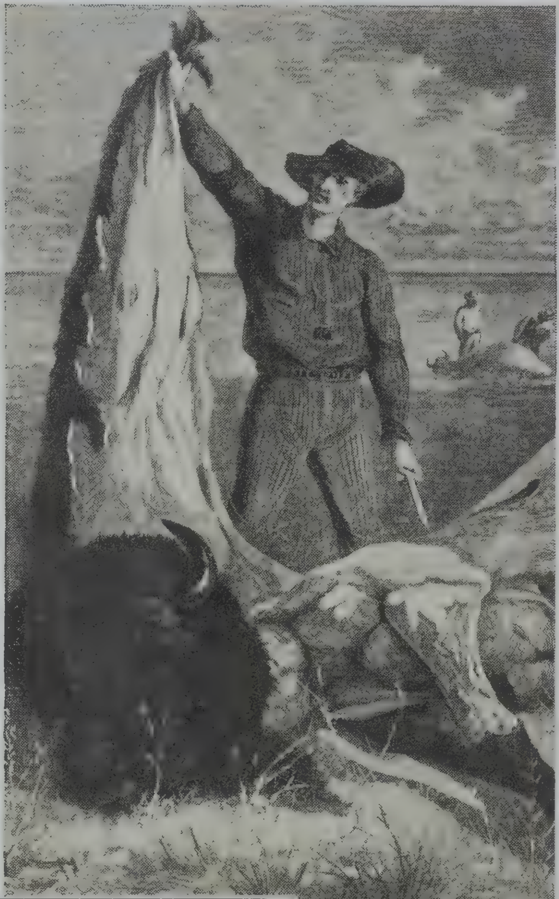
Finally the cricket pointed, or seemed to point, to the westward; and thither the tribe went, to find shortly a splendid herd of cows ready for the morrow's attack.

One can imagine the thrilling sight as the advance scouts waved their robes in signal of the herd's proximity. There was the change to fresh horses, the swift girding of bows, arrows and thongs, the scramble up the ridge and then—just across on the other side, the feeding animals. One can hear the shrill yells as the onsweeping Indians, violently beating their mounts, rode headlong at the herd.

'We were among them in an instant. Amid the trampling and the yells I could see their dark figures running hither and thither through clouds of dust, and the horsemen darting in pursuit. The uproar and confusion lasted but for a moment. The dust cleared away, and the buffalo could be seen scattering as from a common center, flying over the plain singly or in long files and small compact bodies, while behind each followed the Indians, lashing their horses to furious speed, forcing them close upon their prey and yelling as they launched arrow after arrow into their sides. The large black carcasses were strewn thickly over the ground.'

That night the burdened horses brought to the lodges great piles of hides and meat for the squaws to unload. Women and children explored the piles for dainty portions which they roasted on sticks before the fires. Late that night the fires blazed and the banquet continued, although the warriors themselves had fallen asleep in the tents. These were well carpeted with soft buffalo robes; some had pillows of whitened deerskin stuffed with feathers and ornamented with beads.

A strange scene it must have been that night around the council fire when the old men and the warriors of repute, with white robes drawn close about their shoulders, sat together and passed the pipe from hand to hand. The occasion was one of great dignity . . . the Great Spirit had blessed the huntsmen and the kill had been unusually heavy. Except for low gutturals, infrequently spoken, the silence was profound. How shattered must have been their gravity when the irrepressible Parkman dug out some fireworks he had been saving—'squibs and serpents'—and lighted them from the glowing peace pipe. As these weird spluttering crackers went whizzing over the heads of the astounded natives, one cannot wonder much at their consternation, or at the name they gave the famous writer—'Fire-Medicine.'



From *Harper's Weekly*, 1874.
SLAUGHTERED FOR THE HIDE.

The Senate of the Fiftieth Congress

(Continued from page 15)

fornia during the first half of the war. He was one of the 'big four'—Huntington, Stanford, Hopkins and Crocker—who built the Central Pacific railroad.

When Stanford died on June 21, 1893, his fortune was estimated at fully fifty million dollars. His son Leland Stanford Jr., an only child, had died and he founded Leland Stanford Junior University as a monument. He gave it twenty millions. His wife Jane, dying some ten or twelve years later, gave it almost as large a sum, and a million acres of California land.

Henry M. Teller of Colorado went to the Senate in 1876, when Colorado was admitted to the Union. He left the Senate to become Secretary of the Interior in Arthur's Cabinet in 1882 but went back to the Senate when his term as secretary had expired. With his gray hair brushed straight back over his head, Teller looked like a deacon of the old school. He was one of the leaders in the free-silver movement and bolted the convention that in 1896 nominated McKinley on a gold standard platform. A few of the free-silver Democratic senators considered a scheme to procure the nomination of Teller in the Democratic convention that followed, and some of the delegates arriving at Chicago those hot July days were importuned to pledge themselves to the Colorado senator. There never was a chance for Teller, however, and Bryan, returning from Jacksonville, Illinois, whither he had gone to bury his mother, made his 'cross of gold' and 'crown of thorns' speech which swept the convention.

Orville H. Platt of Connecticut was one of the most useful men in the Senate. In no way pretentious, Platt brought to bear on national affairs a sound common sense that was invaluable. He was a tall, angular, melancholy-looking man who did not smile often. He was the author of the so-called Platt Amendment, adopted March 2, 1901, under which the transfer of Cuba to the keeping of its people was conditioned upon the new republic's consenting in perpetuity to intervention by the United States 'for the preservation of Cuban independence and to maintain a government capable of protecting life, property and individual liberty.'

SHELBY M. CULLOM and Charles B. Farwell, both Republicans, were the senators from Illinois. Cullom wore a fringe of gray whiskers under his chin. It pleased him to have it said that he looked like Lincoln, whom he knew well when Lincoln was in the Illinois legislature and he himself was practising law in Springfield. He had served several terms in the House and two as governor of Illinois when he came to the Senate in 1883; and there he remained for many years. Farwell, his colleague, was a wholesale merchant in Chicago, whither he had gone when the town had about thirty thousand people. He grew rich with it.

Iowa's two Republican senators were William B. Allison and James F. Wilson. Senator Allison helped to 'organize volunteers in the beginning of the war for the suppression of the rebellion,' but he did not see active service. That was his sole military activity. Thereafter he served in Congress from March 4, 1863, until elected to the Senate. He had been a member of the convention that nominated Lincoln in 1860 and again and again he sought the Republican presidential nomination. He was in his eightieth year when he died on August 4, 1908. A heavily built, handsome old man he was, with thick thatch of gray hair. He was cautious in his utterances and hedged them about with many reservations.

Senator Wilson of Iowa served in the House during the Civil War. He had been a harness maker for eight years, gaining an education while he worked. In the House he was chairman of the judiciary committee and was one of the managers in the impeachment of Andrew Johnson.

Eugene Hale and William P. Frye were Maine's senators, both Republicans. The one was twenty-four, the other twenty-nine years old when the Civil War began, but neither entered the service. Hale married a senator's daughter and his son is one of Maine's present senators. Grant wished to make him postmaster-general and Hayes offered him a Cabinet position, but he declined each offer. Hale was always very well clad, a Vandyke beard adorned his full face, and his gray hair was carefully parted in the middle. He was intensely partisan and at times somewhat bitter. Frye had served twelve years in the House when Blaine resigned from the Senate to become Garfield's Secretary of State. He was given the Senate seat then which he occupied until his death. He was a member of the Paris commission that made the peace with Spain.

HENRY L. DAWES and George F. Hoar, Republicans, were senators from Massachusetts. Dawes served in the House for eighteen successive years, his term of service beginning before the Civil War. He was for eight years a member of the House and was on the Tilden-Hayes electoral commission. Entering the Senate in 1877, he remained there until his death on September 30, 1904.

Michigan was represented by Thomas W. Palmer and Francis B. Stockbridge, Republicans both. Palmer was born in Detroit on January 25, 1830, when Detroit had only 2,222 population. It took eighty-one ballots of the legislature to put Palmer in the Senate, when he was nearly fifty-four years of age. Stockbridge entered the Senate in 1887 and there remained until his death within two years of the beginning of his second term.

Dwight M. Sabin and Cushman K. Davis were Minnesota's senators. Sabin served from 1883 to 1889. A thoroughly practical business man who had long been active in state politics, he was a useful but not a conspicuous senator.

Nebraska was represented in the Senate by Charles F. Manderson and Algernon S. Paddock. Paddock went to Nebraska in territorial days, was a delegate to the convention that nominated Lincoln in 1860, and became territorial secretary in 1861. In that office he served until the war was over. He was in the Senate for the term of 1875-1881. Then Arthur made him a member of the Utah commission, where he remained four years. He returned to the Senate in 1887 for a term ending in 1893. He died four years later.

John P. Jones and William M. Stewart, senators from Nevada, had each passed his thirtieth year when the Civil War began and neither entered the service. Jones was English born but looked like a Welshman. He went to California 'in the days of gold' and fared indifferently, but had better luck in Nevada, where he became superintendent and one of the owners of the rich Crown Point mine on the Comstock. Jones made his legislative reputation by a three-day speech on silver. First elected in 1873, he served thirty years in the Senate. In his later period of service he was irregular in attendance; he made Senate appearance chiefly when the free coinage of silver or the sugar tariff was under discussion. Then he was present and alert.

STEWART, his colleague, a ponderously built man with a large head from which depended a long white beard, resembled the conventional Santa Claus in appearance but not in disposition. The discovery of gold in California drew him to the coast when he was twenty-one and he became a pick-and-shovel miner with such success that early in 1852 he began to study law. A few months at a few books sufficiently qualified him in that day to become a district attorney; when he was only twenty-seven he became attorney-general of California. With the development of the Comstock lode, he moved to Virginia City, Nevada, specialized in mining litigation and received some notable fees. He served in the Senate from 1864 to 1875 and then for twelve years practised law on the coast. In 1887 he again became a Nevada senator in succession to James G. Fair. He sensed the trend of realty values in Washington and built a great stone house known as 'Stewart's castle' far out on Dupont Circle before fashion had drifted thither, but he lost his holdings before he died.

New Hampshire's senators were Henry W. Blair and William E. Chandler. Chandler was born in December, 1835. He was therefore about twenty-five when the war began. He was in the state legislature during the war and was given a civil post in the Navy Department a few weeks before Lee surrendered. The Senate rejected him when Garfield nominated him to be solicitor-general, but Arthur made him Secretary of the Navy and there he served with high constructive efficiency for three years. He was senator from June 14, 1887, until March 3, 1901.

William M. Evarts was then serving his term as senator from New York, his colleague being Frank Hiscock. Evarts, having been graduated from Yale in '37, was chairman of New York's delegation and supported Seward in the convention that in 1860 nominated Lincoln. He was attorney-general for the United States for one year of Johnson's administration and principal counsel for Johnson in the antecedent impeachment trial. He was chief counsel for the United States before the Geneva arbitration tribunal that made the Alabama claims award, and was chief counsel, too, for the Republican

The RETURN *of the* DANCE

Everyone enjoys the old-time dances. They are easy to learn. They are being taken up enthusiastically by schools, clubs and community groups.

Piano Music for twenty popular old American dances is available. Price 50c the set.

Orchestrations of 13 parts each, including saxophone, for 20 dances. Specially priced $2 the complete set.
Single Orchestrations 15c each.

Edison, Columbia *and* Victor have recorded Old American Dance Music as played by the Henry Ford Orchestra. Your local music dealer handles these records.

THE methods of the world-famed Ford School of Dancing at Dearborn are now made available to everyone in the specially prepared manual entitled

'GOOD MORNING'

Compiled by Mr. and Mrs. Henry Ford

This 169-page manual contains complete information with instructions on each of the dances. Calls, music and pictures visualizing the various steps are given. There is also detailed information on how to arrange and conduct a successful dance.

The origin and etiquette of dancing, style and deportment are also fully described. This feature makes *Good Morning* a valuable reference book, especially in connection with the training of children.

Send for this book today. 50c a copy, postpaid.

The Dearborn Publishing Co.,
Dearborn, Mich.

Please send me the items checked below for which I enclose remittance of
$...............

Table of Contents 'GOOD MORNING'

- The Return of the Dance
- Style in Dancing
- Deportment in Dancing
- Arranging for a Party
- Positions of the Feet in Dancing
- Dictionary of Dance Terms
- Floor Manager
- Prompting
- Quadrilles
- The Lancers
- Novelty Quadrilles
- Contra Dances
- Minuet
- Exercising the Knee Joints
- The Waltz and Other Round Dances

(*Continued from page 26*)

party in the Hayes-Tilden contest. As he became Johnson's attorney-general after the impeachment trial, so he became Hayes' Secretary of State. Evarts died February 28, 1901, in his eighty-third year after a life filled with notable experiences.

Ohio's senators were John Sherman and Henry B. Payne. Sherman was thirty-seven when the Civil War began. General William T. Sherman was three years older than his statesman brother John, who, when the war broke out, had already proceeded far upon that distinguished political career that was to absorb his entire life. He had been a delegate to the national Whig conventions of 1848 and 1852 and was chairman in 1855 of the first Republican convention ever held in Ohio. In that year Sherman entered the House and there remained until elected to the Senate in March, 1861. He served in the Senate continuously until March, 1877, when he became Secretary of the Treasury under Hayes and brought about the resumption of specie payments. Hayes' term being ended, Sherman at once became senator again and served until he resigned in 1897 to become Secretary of State under McKinley. In that office his long and distinguished career came to an end.

Henry B. Payne was one of the rich men of the America of his day. He dealt in railroads, had extensive manufacturing interests and was a charter member of Standard Oil. His extraordinary success in business did not prevent lifelong immersion in politics. He was a candidate for United States senator as early as 1851, contested for the Ohio governorship against Salmon P. Chase in 1857, and was a delegate, not only to the Democratic convention in Cincinnati in 1856, but to that at Charleston in 1860 where he tried in vain to check the secession sentiment. Moreover he was chairman of the Ohio delegation that, unhappily for the party and for the nominee, named Horace Greeley for president. So he came fairly enough, if late, to his Senate seat, for he was in his seventy-fifth year when elected for the term that began March 4, 1885. He died September 9, 1896, when nearly eighty-six years of age, in the melancholy belief that his party, nominating Bryan and advocating free silver, had committed suicide.

Oregon was represented by Joseph N. Dolph and John H. Mitchell. Each was twenty-five years of age when the Civil War began but neither enlisted. Dolph, in 1862, served as orderly sergeant in a company called the 'Oregon Escort,' raised by congressional authority to protect emigrants crossing the plains from hostile Indians. In October he settled in Portland. Dolph was strongly opposed to free silver and lived long enough to rejoice over Bryan's first defeat. He died in March, 1897. Mitchell was a man of striking appearance with a beard that almost rivaled Stewart's.

In addition to Matthew Stanley Quay, whose career has already been noted, Pennsylvania claimed James Donald Cameron as senator. 'Don' Cameron, of the Princeton class of '52, was son of Simon Cameron, who in an earlier day was Pennsylvania's political boss. Simon, a senator in the forties, had joined the Republican Party at its formation and was sent to the Senate in 1856. He was Lincoln's first Secretary of War; he resigned in 1862 to become minister to Russia. In 1866 he again became senator and was reëlected yet again six years later. Resigning, he made a personal gift of his Senate seat to his son Don, who was then Grant's Secretary of War as he himself had been Lincoln's. Once in the Senate, Don remained. He was reëlected in 1879, 1885 and in 1891.

Nelson W. Aldrich and Jonathan Chace were Rhode Island's Republican senators. Beyond the fact that Chace was a cotton manufacturer who could afford the luxury of politics and knew how high a tariff was desired by the industry in which he was interested, there is little to be said of the single term he served.

TWO Republican senators of unusual strength and prestige represented Vermont in the Senate. One was George F. Edmunds, a great constitutional lawyer, the other Justin S. Morrill, a legislative veteran, 'the father of the Senate.' Edmunds went into the Senate a year after the close of the war, was reëlected four times, and at last resigned in 1891. He was a member of the Hayes-Tilden electoral commission. Morrill, born in 1810, entered the House in 1854 and served during the Civil War years. There he framed the Morrill tariff that provided revenue for the war's needs. Becoming senator on March 4, 1867, he remained in the Senate until his death at the age of eighty-eight on December 28, 1898. In House and Senate he served forty-four years. Time had bent him somewhat in his later days but he remained alert until the end.

Philetus Sawyer of Oshkosh was one of Wisconsin's Republican senators. Sawyer was over seventy when he entered the Senate but he had served ten experimental years in the House. He knew his limitations and never attempted to hitch his senatorial wagon to an impossible oratorical star. He kept his feet on the ground. Plain in appearance and even old-fashioned, he made no display.

So ends the roll of the Republicans of the Senate of the Fiftieth Congress. No member of the Senate now in legislative life was serving then. Presently it will be with the Senate that is and with the senators that are, as it has been with Senates not very remote and with senators who were. Their shadows at the best are short. There are degrees in greatness. Ordinary greatness lacks substance to endure.

(*This is the second and final installment of an article dealing with the Senate of the Fiftieth Congress.*)

Flamingoes

By E. R. GAMMAGE

THE long-legged, long-necked flamingo is a curiously formed bird, a connecting link between wading and swimming birds. Its stilt-like legs are like those of a heron while its feet (which are webbed) are like those of a duck. Its long, slender neck resembles that of the crane; its thick, fleshy tongue is similar to that of the duck, while in various other respects the bird resembles the goose. It is, with all its numerous likenesses to other birds, an interesting subject of study.

The flamingo lives and breeds near shallow lagoons, where it can easily secure its food. Its curious beak is peculiarly adapted to the kind of food upon which it lives and the method by which the food is secured. The lower part of the beak forms a broad deep box into which the upper part fits like a cover and the whole is bent abruptly downward in the center.

The margins are provided with ridges arranged crosswise as in the duck's bill. The bird feeds upon small Crustacea, mollusks, and the vegetable matter which grows in the shallow waters. The food is taken into the beak, together with a great deal of mud which is later strained out between the furrows on the bill.

In its native haunts, the adult flamingo is a beautiful bright-red color, while the young birds are white. In captivity, however, the color will fade to a pale pink shade.

The flamingo builds a mud nest, often laying the foundation fifteen inches in the water. It is then built up about six or eight inches above the water with a diameter of about fifteen inches at the top. Upon this the mother bird sits, her long neck neatly curled among the back feathers. Her legs are doubled up and stuck out behind her. It was formerly believed that the flamingo sat astride her nest and let her legs dangle, and it was for that reason the nest was built so high from the ground. However, it has been proved that it is only for protection from the water that the nest is thus built.

The flamingoes have decided social instincts, for they live in large flocks, feed together, with sentinels posted for protection, build their nests by the thousands in citylike groups, and fly in catenary formation.

The eggs, which are two or three in number, are well incased in a thick outer chalky coat which covers an inner greenish-blue shell. The young birds do not possess the peculiar crooked beak until maturity.

The flamingoes are not so numerous as they were and in the whole world there are only eight species, most of which inhabit the tropical and subtropical countries. One species only is found in the United States, the favorite haunt being in the marshes of Florida and Louisiana. The accompanying photograph was made in old Mexico.

The voice of the flamingo resembles the 'honk' which is made through a large tin horn. It is a deep, resonant bass and has no claim to being musical.

CHATS WITH OFFICE CALLERS

'Jurisdictional quarrels between big unions have been expected for some time,' said the ***Labor Leader.*** 'It was Gompers' tact and persuasiveness which formerly kept them in hand.

'Gompers always contended that the federation was a voluntary organization and that each union had the right to complete autonomy in the conduct of its affairs. It was this idea (which is the essence of craft unionism as distinguished from industrial unionism) which caused the breach between Gompers as president of the cigarmakers' union and the knights of labor, and which ultimately resulted in the destruction of the latter body.

'Craft unionism has the essential weakness of creating jurisdictional disputes which are the bane of the labor movement for workers and employers. Rows between unions as to who shall perform certain work have cost millions of dollars to both sides.

'Gompers had the two qualities which are absolutely essential to any truly great director of men—courage and idealism. Within his limitations he was a great man, an honest, unselfish American patriot, a fearless fighter, and to paraphrase his own words, he tried to serve his people as best the light was given him and as best his judgment impelled him.'

* * *

'Louisiana occupies an anomalous position as a Democratic state in spite of inherent Republican beliefs and interests,' said the ***Man From New Orleans.*** 'There is no Republican Party in the state with the exception of a handful of Federal officeholders and an even smaller handful of Negroes.

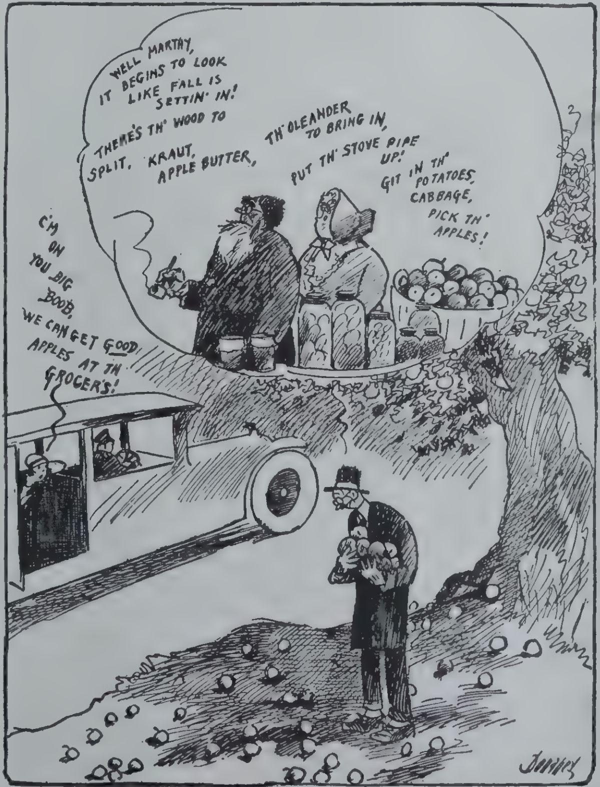
'Nevertheless, President Harding received a phenomenally large vote in Louisiana. He accomplished the epochal feat of carrying five out of the 253 precincts in New Orleans! But the thirty-eight thousand votes cast for Harding were nearly all cast by *Registered Democrats*, and at the election for governor five months before that for president, only 1,400 Republican votes were cast in the entire state.

'The reason back of all this, be it explained for the Northern States where the colored brother casts his ballot unchallenged, is this:

'Under the Fifteenth Amendment no Negro can be restrained from voting at a general election. But private political clubs certainly have the right to include or exclude members. No one, for example, could compel the Isidore Garibaldi McSchultz Marching Club of Milwaukee to take in members who were not desired. And the Isidore Garibaldi McSchultz Marching Club of the Umpth Ward of Milwaukee is a political organization and votes—solid.

'Enlarge upon the Umpth Ward of Milwaukee until you have the entire State of Louisiana and in place of the I. G. M. Marching Club, call it the Democratic Party Club—and there you have the situation. Every white voter in Louisiana, with the exception of a few who have other party affiliations for the sake of fat Federal customhouse plums at the country's second port, New Orleans, is a member of the Democratic Party. There are always two candidates, and usually more; but they are all Democrats. Consequently the Democratic Party primary is really an election. As it is strictly a club affair, only members are allowed to vote at the primaries and only whites are members of the lodge. That is on primary day.

'About two months later, election day strolls along and some 20,000 or 30,000 bored voters go to the polls—out of the 200,000 or more in the state. On the same day from 1,000 to 1,500 Republicans, who wish the record to show how they stood, vote for a Republican candidate of whom no one has ever heard.'



WELL MARTHY, IT BEGINS TO LOOK LIKE FALL IS SETTIN' IN!
THERE'S TH' WOOD TO SPLIT, KRAUT, APPLE BUTTER, TH' OLEANDER TO BRING IN, PUT TH' STOVE PIPE UP! GIT IN TH' POTATOES, CABBAGE, PICK TH' APPLES!
C'M ON YOU BIG BOOB, WE CAN GET GOOD APPLES AT TH GROCER'S!

—Donahey, *Cleveland Plain Dealer.*

YES, ED DESCENDED FROM A HARDY RACE.

* * *

'Many people are saying,' said the ***Preacher,*** 'that real religious feeling in America has disappeared, that the church has become a purely social and political institution, that the country is in the grip of what Anatole France has called Protestant clericalism, though what Anatole France knew about it remains to be proved.

'Just now there is more writing about religion than about almost any other single thing. The head of a great publishing house which by no means confines itself to religious books said not long ago that the religious publications really carried his house—a *Life of Christ* is one of the best sellers—and a debate between a fundamentalist and a modernist is headlined in the newspapers.

'But these positives and negatives do not quite cancel out; they are unrelated aspects of something which goes deeper. If folks were at all familiar with Isaiah, they would urge that the church—which is not the same thing as religion—had quite forgotten the text: "In returning and rest shall ye be saved; in quietness and in confidence shall be your strength." This, they might add, is likely due to the fact that those who make a profession of religion do not know upon what to return or wherein to rest.

'With all its show of action and with all its constituency of the really sincere and devout, religion today is at close quarters with challenging forces which demand readjustments. It has not yet been able to manage all these readjustments, be they the contempt of the intellectual, the heat of the fundamentalist, the concession of the modernist or the exodus of the "seeker" who is busy about the discovery of new religions or the importation of old ones—all these are varying aspects of one central strain upon the old, old structure of our faith.'

* * *

'Throughout West Virginia's coal area one hears a wish,' said the ***Coal Man.*** 'It almost amounts to a prayer. It is this—that out-of-state newspaper and magazine correspondents shall come into the coal area during periods of "peace"; that these correspondents shall dig down to the roots; and that, after unearthing these roots, the correspondents shall write impartially and fearlessly about their findings.

'Up to this time, correspondents have come into the coal area only during spectacular flares in the merciless warfare that is always on between operators of coal mines and both union and nonunion miners of coal. When the flare is off, they leave. During flares, a lot of fat is dumped on the fire. Malignant people who have no business there join in. Barbarism sets the fashion. Weird happenings result. There are plenty of exciting things to write about. Any newspaper reader knows what the last sentence means if he recalls the lively front-page stories that have appeared about these coal area flares.

'Barbaric doings, however, are penned up in one to three counties. The entire area is but a part of West Virginia. Yet correspondents so word the stories they send out as to give an impression that fiendish disorder is rampant over the seventeen thousand square miles of West Virginia coal area. In the same stories, outrageous conditions are said to be a matter of course during periods of what passes for "peace." And the impression is spread that the coal area is all there is to West Virginia.

'If correspondents knew actual facts as they are in the coal area, and if they knew that West Virginia is a good deal more than a big lump of coal, they'd tell a different story. If anybody can get the facts to Congress and to the American people it will do the state of West Virginia and the United States a wonderful lot of good.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. Why is the letter 'J' omitted in the designation of regimental companies of the Regular Army? What letters are used in these designations?

Answer. The letter designations of regimental companies of the Regular Army include the alphabet from 'A' to 'M,' exclusive of 'J.' The letter 'J' is omitted because of its similarity, when capitalized in script, to the letter 'I'; its use might therefore be confusing.

* * *

Q. Which industries have made the greatest gain in the last ten years or so?

A. According to Census Bureau calculations the following industries have made the greatest gain in the quarter of a century between 1899 and 1925: Automobiles, 4,666 per cent increase; chemicals, 365 per cent; metals and nonmetals (not iron and steel), 321 per cent; paper, printing, and related industries, 317 per cent. Lumber is at the bottom, having gained only 6.8 per cent; shipbuilding is next with 22.2 per cent gain. Textiles gained 96.5 per cent; food, 119.6 per cent; tobacco, 168.7 per cent. The average gain for all industries has been 178.4 per cent.

* * *

Q. Who introduced the Confederate Stone Mountain Bill which authorized the coinage of five million fifty-cent pieces to aid in the construction of the monument? To what committee was the bill referred and what was the report of the committee? When do the present plans call for the completion of the monument? What is the design, and has the original design of Gutzon Borglum been adhered to?

A. The bill authorizing the coinage of the Stone Mountain Confederate memorial half-dollar was introduced into the Senate by Senator Reed Smoot and into the House by Representative Louis T. McFadden. In the Senate the bill was referred to the Finance Committee and in the House to the Committee on Banking and Currency. Both committees reported favorably. The bill passed Senate and House by unanimous vote and was approved by President Coolidge on March 17, 1924. The figures of President Davis, General Lee, and General Jackson are now in process of being carved on Stone Mountain, in accordance with the design of the sculptor Augustus Lukeman. The figure of Lee and his horse will be ready to be unveiled by January of next year, or thereabout, and the figures of Davis and Jackson will be ready around midsummer of next year. The remainder of the central group, representing the Confederate high command, will consist of four outstanding Confederate generals, and should be carved about two years or so after the completion of the three figures now in process. The second unit will consist of a great memorial hall, to be carved out of solid granite at the base of the mountain, directly underneath the central group. In front of the hall will be a great esplanade and reflection pool. It is estimated that this unit will require three years for completion; and very probably work on it cannot be started until the central group above it has been finished. The design of Mr. Borglum has not been adhered to in the present undertaking, Mr. Lukeman, on his engagement, having been given a free hand in designing the sculpture and the memorial hall.

* * *

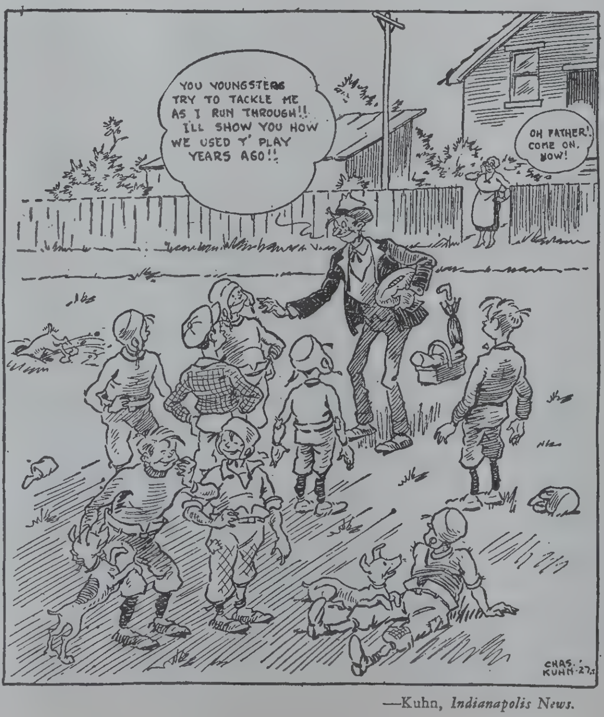
Q. Will you please give a list of the vice-presidents of the United States?

A. The following is a list of the vice-presidents of the United States with the years in which each qualified for office: John Adams, 1789; Thomas Jefferson, 1797; Aaron Burr, 1801; George Clinton, 1805; Elbridge Gerry, 1813; Daniel D. Tompkins, 1817; John C. Calhoun, 1825; Martin Van Buren, 1833; Richard M. Johnson, 1837; John Tyler, 1841; George M. Dallas, 1845; Millard Fillmore, 1849; William R. King, 1853; John C. Breckinridge, 1857; Hannibal Hamlin, 1861; Andrew Johnson, 1865; Schuyler Colfax, 1869; Henry Wilson, 1873; William A. Wheeler, 1877; Chester A. Arthur, 1881; Thomas A. Hendricks, 1885; Levi P. Morton, 1889; Adlai E. Stevenson, 1893; Garrett A. Hobart, 1897; Theodore Roosevelt, 1901; Charles W. Fairbanks, 1905; James S. Sherman, 1909; Thomas R. Marshall, 1913; Calvin Coolidge, 1921; Charles G. Dawes, 1925.

* * *

Q. Do any positions under the Civil Service Act require yearly examinations in addition to the one required for appointment? Are employes of the Civil Service Commission selected through examinations or are they appointed? What percentage of Government employes secure their offices through examination and what percentage are appointed?

A. The railway postal service requires of railway postal clerks periodical examinations on mail distribution schemes. These examinations occur approximately once each year. Post office clerks are also given a similar examination annually on city distribution schemes. The Patent Office gives annual examinations to its examiners with a view to promotion. All such examinations are regarded as administrative matters in the departments concerned, no examinations of this kind being held by the Civil Service Commission. In the civil service of the United States there is a system of annual efficiency ratings administered under the Bureau of Efficiency, upon which promotion and retention in the service depend. The only presidential appointments in the office of the Civil Service Commission are the three members of the commission, the chief examiner, and the secretary. All other positions are in the competitive classified service. Of the entire Federal executive civil force, numbering at the last count (June 30, 1927) 559,138, approximately 77 per cent, or 430,000, come under the provisions of the civil service law. Of the 130,000 positions in the Federal executive civil service outside the operation of the civil service law, the majority are included in the class of unskilled labor, or are other minor positions. The so-called presidential positions—that is, those which are filled through nomination by the president subject to the confirmation of the Senate—number approximately 17,000. About 15,000 of these are postmasterships at first-, second- and third-class post offices. While these so-called presidential positions are outside the operation of the civil service law, under executive orders the Civil Service Commission holds examinations for postmasterships at first-, second- and third-class offices when requested to do so by the Post Office Department. The executive orders provide that when a vacancy has occurred or is soon to occur the Postmaster-General shall ask the Civil Service Commission to hold an open competitive examination unless it is decided to fill the vacancy through the promotion of a postal employe upon noncompetitive examination.



YOU YOUNGSTERS TRY TO TACKLE ME AS I RUN THROUGH!! I'LL SHOW YOU HOW WE USED T' PLAY YEARS AGO!!

FAMOUS LAST WORDS.

BRIEFLY TOLD

When a deep-sea naturalist is preparing a skeleton of a specimen for mounting he removes the skin, loosens the flesh and lowers the body into the sea until it hangs just clear of the bottom; he then allows the sea fleas, active little crustaceans with voracious appetites that swarm the bottom of the sea, to denude the bones for him.

The Federal Reserve Bank of New York handles on the average of thirty-five tons of coins a day. By the machines used to count and weigh these it is found that a thousand dollars' worth of dimes weighs fifty-three pounds, that fifty bags of nickels total ten thousand dollars and that a ton of pennies fill sixty bags and are worth three thousand dollars.

The broken-nosed wooden hobbyhorse, once the toy of Napoleon, was recently sold at auction for several hundred dollars.

A blind man is employed by the Royal Mint in London to 'ring' the coins and detect those that are not perfect.

Early British residents in India built one-room, partitioned dwellings called 'bungalows' from the Hindu word *bangla*, meaning thatched hut. From these came our word bungalow.

The Pullman Company owns 4,154,450 hand towels, 2,607,646 sheets and 2,163,198 pillowcases.

General Sherman, the largest tree in the United States in the Sequoia National Park, is 280 feet high and 36.5 feet in diameter.

An apple tree in the orchard of Henry French, Springfield, Massachusetts, recently displayed the 'freak' combination of rich, ripe fruit with clusters of blossoms attached to the same twig.

Superstitious Arabs believe that the stork possesses a human heart, while the crow has the heart of a devil.

Eyes, or holes in Swiss cheese, are an index to its quality and flavor, experts declare. The proper size of eye for this delicacy is that of an American quarter or the Swiss franc.

Extract from a letter written by a Chipola, Florida, resident on July 18, 1828: 'Lands have risen at least 300 per cent in price and are daily advancing; the tide of emigration is flowing in rapidly, and the country still proves uninterruptedly healthy; the physicians, to avoid starvation, are moving away.'

From September 30, 1777, to June 27 of the following year, the Continental Congress of the struggling states met in the little courthouse of York, Pennsylvania, fleeing from Philadelphia after Washington's defeat at Brandywine. This October, York observed its sesquicentennial, one of the main features of the celebration being a gigantic pageant depicting much of the city's history.

According to Dr. William Root of the University of Pittsburgh, intelligent people think twenty times faster than they can write and the arm is so far behind the activity of the brain that poor writing results.

The longest English word recorded by any dictionary is *antidisestablishmentarianism*.

About one out of every 4,240 persons in the United States is listed in *Who's Who*, published every two years.

In Honolulu there are two coconut fiber caskets, shaped somewhat like an Egyptian mummy case, containing the bones of King Liloa, who reigned over Hawaii in A. D. 1500, and his great-grandson, Lenoi-kama.

A gold wedding ring said to be more than a hundred years old was found in the stomach of a silver side salmon, caught near Fort Bragg, California.

A wig store in New York employs three bald-headed clerks to exhibit wigs and toupees to customers.

Golconda is a ruined city in India, seven miles northwest of Hyderabad. The diamonds cut and polished in Golconda were once world-renowned. From 1512 it was the seat of a powerful government until it was taken by Aurung-Zeb in 1687 and made a Mogul province.

ABOUT NOW—

According to an old custom, rice is thrown after a newly married couple to appease the evil spirits that are believed to accompany them.

Since 1923 more than 45 per cent of the windmills of Holland have been removed or demolished.

That business men spell little better than their stenographers was proved by a spelling bee given by the Omaha Chamber of Commerce in which 'breasy,' 'accomadate,' 'pidgeon,' 'vituals' and 'extrem' were a few of the glaring errors found.

It is believed by scientists that by weighing hair the race of the owner can be determined, the hair of a Caucasian being lighter than that of a Mongolian.

According to the *London Medical Journal* in 1815, it was believed that a silver ring worn constantly would cure a case of epilepsy.

The song 'Yankee Doodle' was written as a joke by Dr. 'Dicky' Shuckburg of the King's army in derision of the backwoods Colonial militia. Instead of giving offense, the song made a hit with the entire American militia.

London has a tipless hotel. Patrons are firmly but courteously notified that it is against the rules of the hotel to offer tips. The servants are well paid, and reservations at this hostelry are always at a premium.

Robert Raikes, a publisher of Gloucester, England, is credited with establishing the first Sunday school in 1780. Grieved at seeing so many children 'cursing, rioting and profaning the Sabbath,' he hired people to teach the children on Sunday, later organizing a regular Sunday school.

The gift presented by Croesus to Delphi, 600 years before Christ, would be valued at about $300,000,000 in modern currency. Included was a pyramid of precious metal surmounted by a lion, two solid gold bowls of 5,400 gallon capacity, besides a present of $13 to every man in the city.

Foolscap paper is so called because a device of a fool's cap and bells was originally used as a watermark for paper of that size.

Scotland Yard is seeking the world's tiniest portrait, stolen from the exhibition of the Royal Photographic Society. Produced by Professor Golberg of Dresden, the portrait is so small as to require enlargement 150,000 times to make a picture about the size of a half-dollar.

Poison gas is being spread by airplane in Florida swamps to exterminate mosquitoes.

NOTES ❧ COMMENTS ❧ CRITICISMS

MR. FORD'S Page this week defines a working man.

* * *

Frances Holbrook Pfeiffer, who writes of early days in California, is herself descended from pioneers of that state. Both her father and her mother settled on the West Coast in 1850, one year after the rush of the 'forty-niners.' Further back in her family history are to be found other pioneers, those who settled in New England.

She writes, 'I have an inborn admiration and regard for heroic women of every age.' Her article on *Alta* California is first of a series. (p. 1)

* * *

Whether the Forest of Arden, wherein Shakespeare has placed his comedy of *As You Like It*, is the Ardennes Forest in France, Belgium and Luxemburg, is a mooted question. Such authorities as the *Britannica* aver that the Forest of Arden was located in England and was well known to Shakespeare. In the play itself, however, are such characters as the Duke of Burgundy, Jacques, Amiens, and many others clearly of French extraction. Joseph Warren believes the French forest to be the locale of the comedy. (p. 3)

* * *

One quotation which may throw some light on the geography of the Forest of Arden is from the early scenes of the play itself:

'They say he is already in the Forest of Arden, and a great many merry men with him, and there they live like the Robin Hood *of England*, and fleet the time carelessly as they did in the Golden World.'

Why did Shakespeare include the phrase 'of England' in describing Robin Hood, if the forest was in England rather than in France?

* * *

Virginia Dare occupies quite a niche in American history, for she was the first person of English blood born in America. Yet she and more than a hundred others disappeared from Roanoke in the latter part of the 16th Century and, despite all the efforts Sir Walter Raleigh made to find them, were never seen again. Did they go to North Carolina? (p. 5)

* * *

One's fancy is intrigued by the thought that those gray-eyed 'civilized' Indians referred to by early writers as living south of Albemarle Sound might be descendants of the lost colonists. The comparison of names—those of the colonists with those to be found in the 'Croatoan' region today—is equally intriguing.

* * *

In the village of Frutigen, walled in by the Alps, about two thousand humble Swiss find profitable employment at time-honored agricultural pursuits, interspersed with modern manufacturing tasks provided by the leading citizen, Joseph Brugger. Brugger has invented machines for making matches; likewise for making fine watch jewels. By absorbing the population not needed for farming in this little valley, Brugger has made possible a prosperous region. (p. 8)

* * *

Among the collections of Japanese color prints which have attracted admiration is that of Herbert Asbury, who has studied this hobby for many years. Today's prints, he finds, do not equal those of the old masters, 'for the artist has gone to school too often to the Occident.' His article is illustrated with a number of prints from his own collection. (p. 12)

* * *

'A collection should be formed primarily for the enjoyment of its owner and his friends, and the collector who acquires the things because he loves them will seldom buy a print just because it is important historically or because it is rare. He will buy the one from which, vulgarly speaking, "he gets a kick." Which is as it should be.' (p. 12)

* * *

There are degrees in greatness, writes Barnes Cooley in his concluding article on the Senate of the Fiftieth Congress. Ordinary greatness lacks substance to endure. Presently, he avers, it will be with the Senate that is and with the senators that are, as it has been with Senates not very remote and with senators who were. Their shadows at best are short. (p. 15)

* * *

Thomas Jefferson, when he ordered a bust of himself, ordered at the same time one in the same fashion of his greatest political enemy, Alexander Hamilton. The two busts faced each other in the great room at Monticello. So Jefferson at eighty-three could write letters to his ancient foe, John Adams, who was ninety-one. (p. 16)

* * *

A young reporter, just out of college, attended a divorce trial to obtain the news for his paper. The story he wrote of the case, its participants and the reason for which they were separating have all been forgotten. But not so the poem which he wrote shortly afterward, 'Betsy and I Are Out.' Almost overnight Will Carleton became famous from coast to coast. N. L. Van Wegen tells of the great poet whose birthday anniversary, 'Carleton Day,' has just been marked at Carleton. (p. 19)

* * *

The art and artifice of hunting the buffalo have given place to a thousand new methods of the hunt. Sportsmanship, like everything else, changes and grows; and some of the old methods would seem unsportsmanlike today. Perhaps the harshest method of all was shooting the bison from a train. (p. 24)

REMARKS BY OUR READERS

Macon, Georgia.

Recently I read in one of your issues a poem by Gamaliel Bradford. I wonder sometimes whether people really appreciate the works of this Massachusetts man. His depth of learning and the manner in which he treats the various subjects he describes, whether in prose or in poetry, have created for him a strong clientele in the South.

The editor of the Macon *Telegraph*, W. T. Anderson, together with Julian Harris, son of Joel Chandler Harris of 'Uncle Remus' fame, decided to honor Mr. Bradford on his last birthday, October 9, when he was 64. The articles which they published, while highly complimentary to Mr. Bradford, were richly deserved.

Many of us in the South consider Mr. Bradford the greatest American biographer of the present day.

OLIVER ORR.

Cloquet, Minnesota.

I desire to take the liberty of writing that I liked your editorial in the issue of August 6, on 'Rewriting Scripture.'

T. J. COTTEN, M. D.

St. Ausgar, Iowa.

I greatly enjoy THE DEARBORN INDEPENDENT, and find it very helpful in my work as pastor serving three rural churches.

I have come to learn the truth of the statement Woodrow Wilson once made—that the public policies of America were always eventually determined by the crowd that gathered in the country store forum on Saturday night. These forums, so characteristic of the small Middle Western town, afford the outsider an opportunity of learning just how America is thinking. And as she thinks, so she will be.

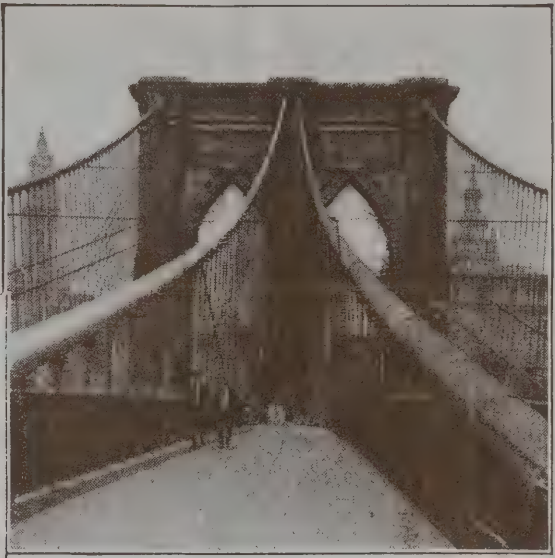
OTIS MOORE.

San Jose, California.

I was pleasantly surprised to find in your last issue an article on the tar-pits of California. I thought you were neglecting us, although you have had many articles about the East, North and South. California has interesting historical points, too.

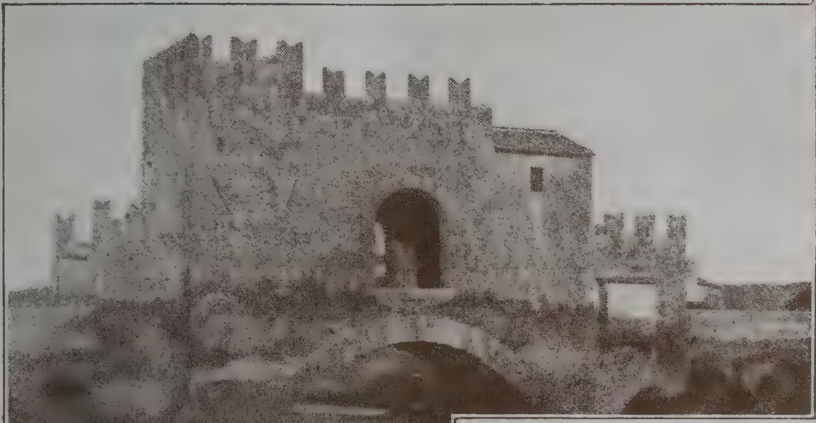
C. C. CALVIN.

BRIDGES *That* Have Seen HISTORY



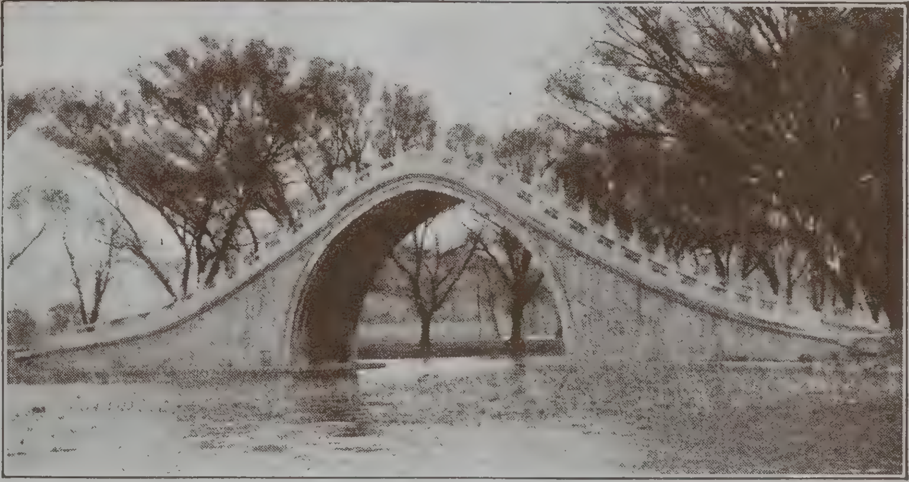
—Ewing Galloway.

Famous Brooklyn Bridge may be torn down and rebuilt if these cables slip much farther. The cables are incased in iron tubes. Colonel Roebling, who built the bridge forty years ago, says there is no immediate danger.



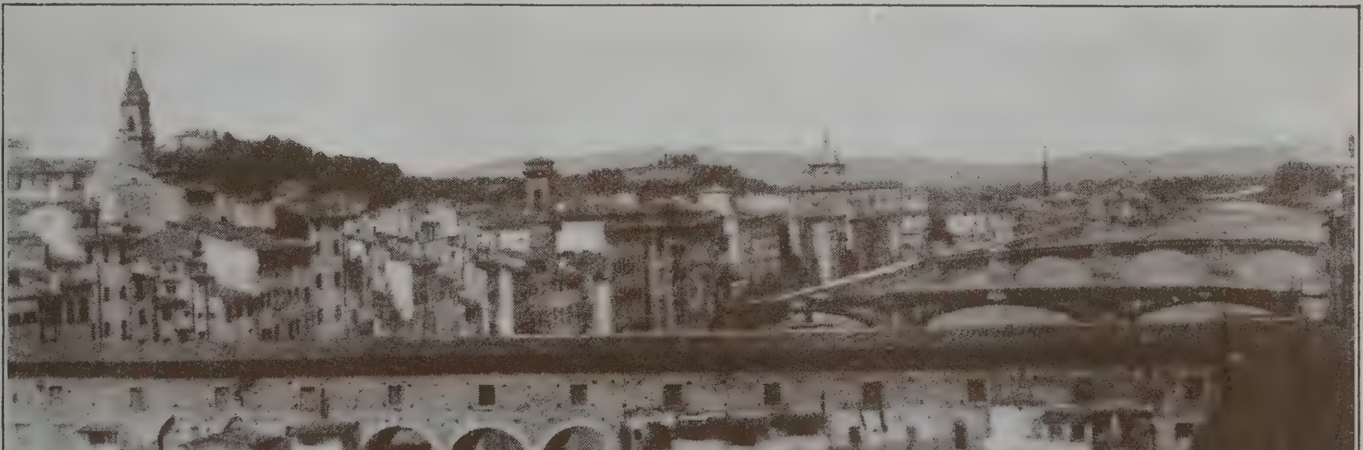
—Publishers' Photo Service.

Picturesque Ponte Nomentano, Rome, Italy, is a Sixth Century bridge surmounted by 13th Century forked battlements. This bridge crosses the willow-fringed river Anio, which legend tells carried the cradles of the babes Romulus and Remus. It is also the river into which Sulla caused his ancient rival, Marius, to be thrown.



Famous camel-back bridge in the summer palace grounds in Pekin, the celestial capital, is a beautiful arched bridge built to allow boats to pass under it. The empress built the summer palace buildings and grounds.

—Ewing Galloway.



—Publishers' Photo Service.

Quaint and picturesque Ponte Vecchio since the time of the Medici has been flanked with goldsmiths' shops. The bridge was said to have existed as early as the Roman period and was finally rebuilt by Taddeo Gaddi in 1345.

MANY people are busy trying to find better ways of doing things that should not have to be done at all. There is no progress in merely finding a better way to do a useless thing. There comes a time when, instead of making dead branches less ugly, the axe should be laid at the root of the tree. Instead of making elaborate arrangements for relieving the effect, the evil at the root must be eradicated.

Shepherd in the Texas range country.

—Allen Studio.

By CHARLES J. FINGER

TWENTY years or so ago, I rode into Amarillo, hitched my horse to the rail outside *Jake's Place*, and then went inside for a glass of beer and a free lunch of barbecued meat and bread and bean soup, taking the soup last because of my impatience to get to the solids, for the ride had been a dusty one. The houses were mostly shacks erected by men with rudimentary notions of architecture, and the sidewalks seemed to be results of the wild and glorious visions of property owners, for they were fantastically arranged as to height and width; and, as to material, each man had evidently made havoc of stereotyped ideas, seizing upon what offered: lumber scraps, packing cases, corrugated iron. So there was a complex charm about the main street, especially at night, because a walker in the dark encountered unexpected and novel things. In the daytime most of the varied population used the middle of the road—cowboys, depressed Indians, Mexicans, strangely indifferent dogs, combative gentlemen who said things in bare and precise language, a few stray pigs, some poultry.

Half a year ago I went to Amarillo again, as the guest of one of those active-minded women who are so important nowadays as giving their serious attention to education and social activities and civic affairs. She was a Master of Arts of some Eastern college, and her home—like the homes of her neighbors—radiated culture. Many fine personalities were present, men and women whose aims and hopes were high; people large, tolerant, sympathetic. As we talked about libraries and books and music, I recall distinctly that from the window near which I sat I had a view of big modern buildings; of well-paved and brilliantly lighted streets; of a fine hotel with many cars parked near; of gardens with flower beds and trees.

So, from the two reminiscent pictures you may have some idea of what west Texas has become in a short time. And Amarillo is typical of hundreds of Texas towns—notably Wichita Falls, Beaumont, Port Arthur, San Angelo. Indeed, there is an air of well-being about the entire state. It is no longer a cattle country, but a place of immense variety of interests.

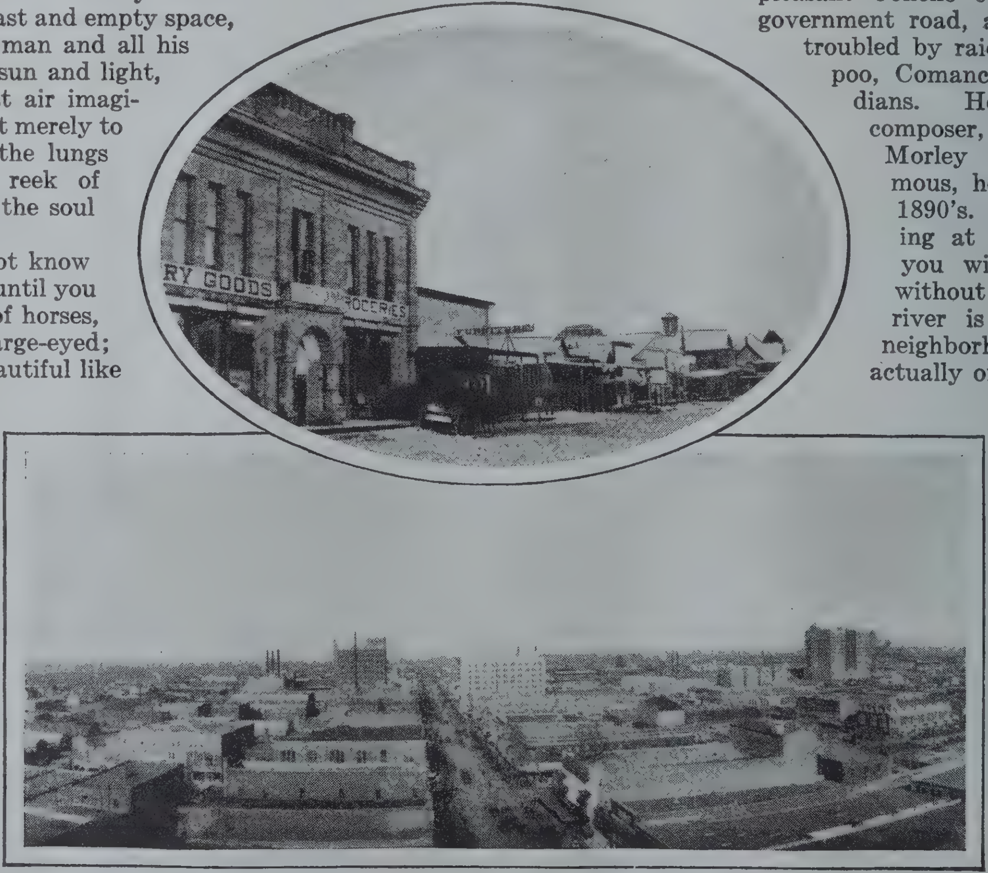
Twenty miles south of Amarillo there is a place to which you should go if you care for rare sights. It is a natural wonder, a mighty canyon formed by the Palo Duro. I do not remember having seen so startling a sight, for I came upon it unexpectedly, not even suspecting its existence until I stood on its edge at a place where the land dropped down sheer for a thousand feet. It is more than a mile wide in places, and seems of immeasurable length. Everywhere it is most precipitous, and at places yawning gulfs run far into the land from the main chasm. But the wonderful sight is the variegated color, especially when seen in the rose flush of dawn or in the sunset time. For then there are towers flushed with delicate pink, and there are what seem to be ruined castles of the color of gold. From where I stood, an immense wall of green and blue with horizontal strata of bright red made a picture insurpassable in tone. Beyond that, rose walls of purple and crimson and violet.

The best course to set from the canyon is south, bearing slightly east, with a preference for some of the byways instead of the highway, because, while the country is somewhat fenced up, there are gateways aplenty. And when I say that it is best to take such a course, I have in mind seeing the plains country proper, so that an idea may be gained of the range country. And when you have seen the range country of west Texas, you will know the range country of The Argentine, of Montana, of Africa, and of Australia, except for slight differences of vegetation.

One of the watering places or 'tanks,' in the Hueco Mountains.

First, it is not desert country. Old maps mark it as 'desert tract,' and writers of wild-west fiction seeking a background for their dramatic tragedies have described the plains as sterile wastes; both are wrong. Also, let it be said, old-time monopolizing ranchers were very willing to have the Staked Plains country reputed as dangerous. The Staked Plain is, really, a grassy sea in which a bunch of cedar trees or a prominent rock or a distant hill or, at night, the stars, form landmarks. Also there are windmills, tall and stilted, miles apart.

As my friend Cunninghame-Graham puts it, writing of the country that I have in mind: 'A vast and empty space, empty, that is, of man and all his works; but full of sun and light, and of the sweetest air imaginable, so sweet that merely to think of it keeps the lungs fresh among the reek of towns, and makes the soul rejoice.'



Part of modern Amarillo, and, in oval, how the town appeared in 1900.

But you will not know the range country until you see it with troops of horses, long-maned and large-eyed; horses fleet and beautiful like the horses of a thousand fairy tales, horses that dart away at the sight of a stranger to stand out of danger, gazing curiously, heads erect, whinnying loudly their indignation at the intruder. You may see a coyote, too, suspicious and lean, going about his business with mechanical, unhurried run: and prairie dogs by the thousand at the entrance of their holes, very vigilant but very unconcerned, disappearing as if by magic at suspicion of danger; also black tarantulas, sometimes a rattlesnake, often horned toads—all of which, like men, bear reputations for evil largely in excess of their merits. Old-world armadillos too you may see, strange creatures that look as if they carried the secret of prehistoric times about with them; also scurrying jack rabbits, always in a state of panic or terror.

And of course there are cattle, and sometimes herds of sheep scattered over a square mile or two and guarded by a lone Mexican herder who seems to have stepped out of the pages telling about Biblical characters. There he stands with his sling, motionless, unconcerned, incurious, a picture of patience. It is his duty to guard sheep, but not to be sociable with strangers. If, in the impertinent way of those unaccustomed to travel, you should ask him questions about the countryside, he would probably shrug his shoulders and say: 'But what know I?' and there would be an end to the interview. So you might set him down as being taciturn to a point of unpleasantness. But should you see him at night, after his flock has bedded and when some friend visits him, the atmosphere of cheerful vitality would probably astonish you. No people on earth are more cordial and hospitable to visitors than the Mexicans.

Heading south, you will strike the pleasant Concho country on the old government road, a place once much troubled by raiding Lipan, Kickapoo, Comanche and Kiowa Indians. Here David Guion, composer, was born. Here, Morley Roberts, now famous, herded sheep in the 1890's. But before arriving at the Concho River you will pass the Pecos without suspecting that a river is anywhere in the neighborhood until you are actually on its banks. For it runs in a deep, straight-edged canyon, and its course is here as straight as if it were a canal dug by man, but there as crooked as a barrel of snakes. Also it is dangerously swift, and ten feet deep. Nor are there always trees upon its banks; nor habitations, for its

(Continued on page 19)

The Story *of* HOME, SWEET HOME

By
E. IRVINE HAINES

IT HAS been said that more than five thousand songs are written or composed each year, but that only a small percentage of them are ever set to music. The comparatively few that are sung in the cabarets or on the vaudeville stage live for a season and are forgotten almost as soon as they are heard. A song must have something divine or spiritual, as it were, to live for even a dozen years. How many can recall the songs that their grandmothers, or even their mothers, used to sing, or remember the names of the composers?

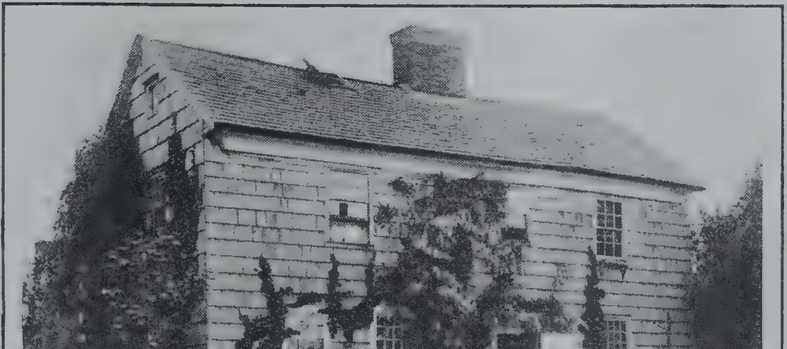
One of the feature numbers in a musical revue on Broadway last season was the rendering to banjo music of the songs of seventy years ago. The verses were thrown on the screen at the same time and the audience was invited 'to join in.' The feature was a 'hit'; yet few of the audience who attended the various performances remembered the songs or had even heard of them before.

—Underwood & Underwood.
John Howard Payne as he appeared when he was a student at Union College.

Those who are familiar with the history of literature and music know that every great poem, song, or story is an inspiration of the author. That great national anthem, 'The Star-Spangled Banner,' was an inspiration of Francis Scott Key while he was detained on a British man-of-war during the memorable attack on Fort McHenry in the War of 1812. Again, there is Poe's 'Raven,' inspired by the death of his beloved wife. 'Home, Sweet Home' was an inspiration of that remarkable genius, actor, dramatist, and journalist, John Howard Payne.

It is the atmosphere that the song 'Home, Sweet Home' creates, the simple phrasing, the great truth of its words, 'Be it *ever* so humble there *is* no place like home,' that has endeared it to our hearts. It is a favorite song of the exile. It has been sung in every language and in every clime. The Eskimo in his snow hut 'mid 'Greenland's icy mountains' and the Hindu 'on India's coral strands' are not unfamiliar with it. This one effort has so much the touch of nature in it that the whole world becomes akin in acknowledgment of it and in love for its author. No one can hear the beautiful song without thinking of home and loved ones:

'A song that will live forever,
Forever and for ay;
Though ages may come and ages may go,
That song will live alway.
No matter where we may wander,
Upon the land or foam;
A song that will live forever,
Is "Home, Sweet Home."'



—Underwood & Underwood.
The original 'Home, Sweet Home.'

Like Francis Scott Key, John Howard Payne was a journalist, and when but fourteen years of age he edited a weekly paper called the *Thespian Mirror.* He was born at 33 Pearl Street, New York City, on June 9, 1791, of English parentage. Some of his ancestors were among the earliest settlers of Eastham, Massachusetts, in 1622.

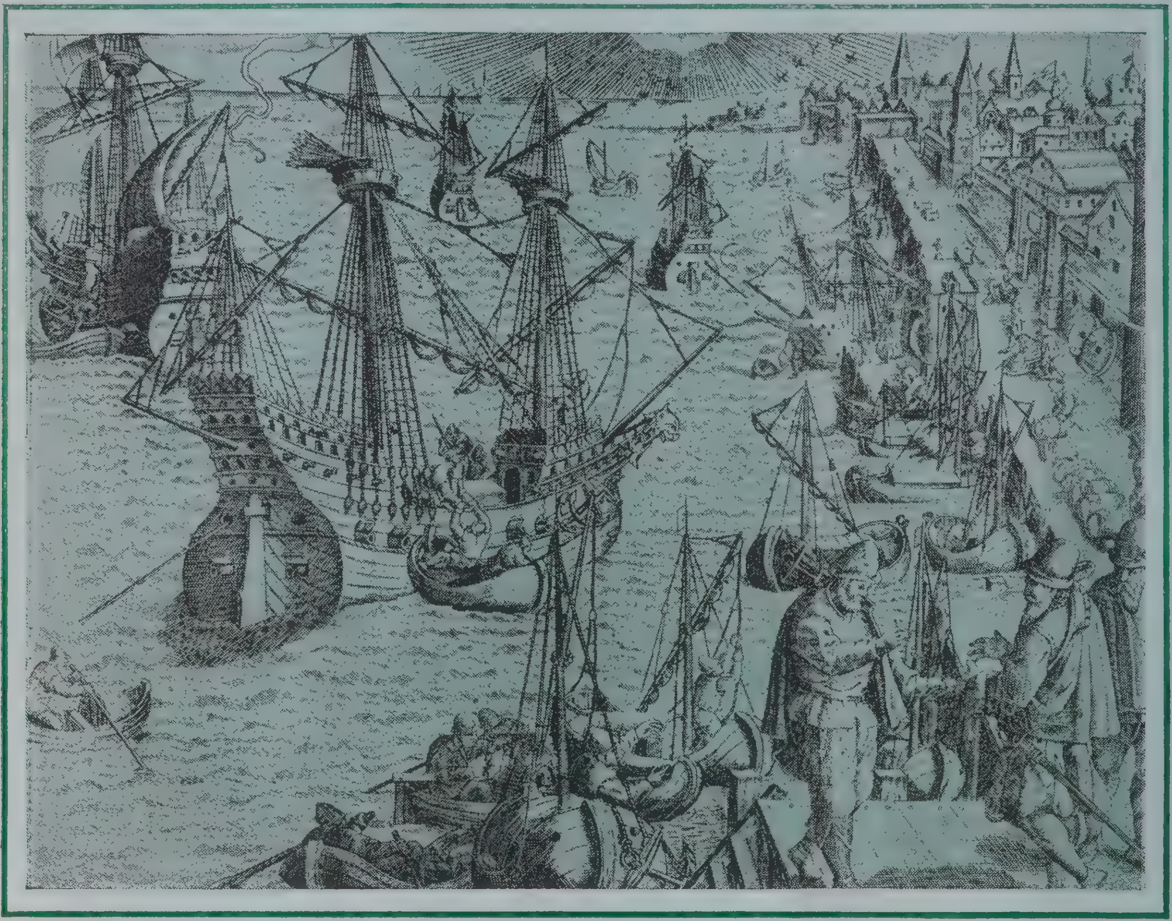
VILLEGAIGNON *and* Antarctic France

By LOUIS C. KARPINSKI



—From De Bry's *Grandes Voyages*, 1593.

Ships being made ready to sail from Honfleur to Brazil, with South America's first Protestant colony.

THE papal bull which accorded to Spain and to Portugal the rights of colonization in the New World, on one side and the other, respectively, of a papal line of demarcation, met with little favor in France and England.

France, torn by internal struggles, was not in position to launch any large ventures to dispute the Spanish or Portuguese claims. That able minister, Admiral Gaspard de Coligny, recognized, however, the desirability of colonial expansion, and in 1555 saw the opportunity to contest Portuguese rights in Brazil, thus entering a wedge against the claims of Portugal and of Spain.

Coligny was at that time sympathetic with the Huguenot cause, although not yet an avowed adherent. In his mind's eye, the Admiral doubtless beheld a flourishing French colony in Brazil enjoying religious tolerance. Coligny called to his aid the Chevalier Villegaignon, vice-admiral of Brittany, a true soldier of fortune with a proud record of achievement. A lover of adventure and dispute, Villegaignon was then at odds with the head of his order and apparently minded to consider new fields of glory.

With other Knights of Malta, Villegaignon participated most valiantly under Charles V in the siege of Algiers. Later when the Moslems threatened Malta the Chevalier with six friends passed through the lines and rendered able assistance in the successful defense. Most notable was his service as a seaman, in 1548, for he had passed around the north of England by the Hebrides, returning with Mary Stuart of Scotland (then six years old), whose life was threatened by the English.

In what manner Villegaignon became interested in the Huguenot cause remains unknown. The infection of the ideas of Calvin and Luther as disseminated from Geneva spread rapidly through France and touched even the nobility, among them the Prince de Condé and Henry of Navarre, and the Princess Renée of France. The Chevalier was doubtless touched likewise. Villegaignon could not resist the lure of the New World even though coupled with the equally hazardous adventure into the ideas of Calvinism.

A strange conglomeration of folk started from Havre in July, 1555, some gathered from the prisons of France and some seeking an escape from the bondage of religious persecution. Five months of travel followed by the arduous labor of subjugating the wilderness brought disillusionment to many.

The glory of the beautiful Bay of Rio de Janeiro with its mountains and islands and its tropical verdure was counterbalanced by the necessity of wielding the axe. Many grew faint and a few returned on the same ships that brought them.

Thevet who had already visited the Levant was one of the original colony. The Huguenot atmosphere was too much for him and when a supporting expedition arrived at the colony early in 1557, he returned with the ships to France. Thevet tells of the wonders which he saw, but little about the life of the colony. Thevet describes the banana, the sweet potato or yam, the pineapple, and numerous trees and animals. What disturbed Thevet most was that the savages wore no clothing. After mentioning the fact early in the work, Thevet later devotes a chapter to the subject, and to the various objections even to the lightest garments which the Europeans tried to impose upon the Indians.

Thevet's *Les singularites de la France Antarchique autrement nommee Amerique* was published in 1558. An Italian edition appeared three years later and an English edition in 1568, styled: 'The new found world or Antarctike by that excellent learned man, master Andrew Thevet imprinted by Henrie Byneman.'
